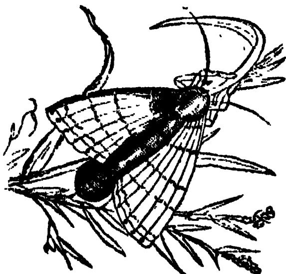
Gioja del Colle, a town in the province of Bari, S. Italy, 26 miles S. of Bari by railway. It was founded in the 6th c., and in the vicinity, at Monte Sannace and Santa Sophia, have been found valuable ancient vases and Greco-Roman coins. Pop. 13,094. G. is also the name of three small towns in S. Italy.

Giojo'sa, a town in the S. of Italy, province of Catanzaro, on a fertile slope of the Apennines, and near the railway from Taranto to Reggio. Its inhabitants are noted for their beauty. G. stands near the site of *Locri Epizephyrii*, and seems to have arisen after the destruction of that place in the 12th c. Pop. 6889.

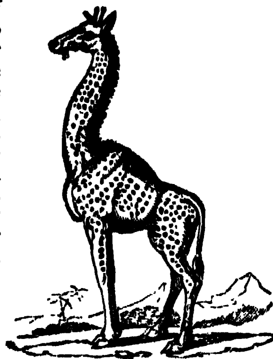
Giorda'no, Luca (surnamed *Luca, fa presto*, from the rapidity with which he worked), a dexterous painter, born at Naples in 1632, studied under Spagnoletto, and at the age of sixteen entered the studio of Pietro da Cortona at Rome. The art of his later years shows the distinct influence of Paolo Veronese. G. is said to have painted the large altar-piece of the Jesuits at Naples in less than thirty-six hours. He was fertile in invention, a master of perspective, his colour was tender and harmonious and his touch free and vigorous; but he was wanting in individuality, and in all his pictures the same types of character are reproduced. In 1679, on the invitation of Charles II. of Spain, he visited that country, and was employed in the decoration of the Escorial, in which he painted a vast number of immense pictures—'Death of the Virgin,' 'Last Judgment,' 'Passage of the Red Sea,' 'Triumph of the Church Militant,' &c. He died about 1704. G.'s works are everywhere. His frescoes may be best studied at Naples, Rome, and at the Escorial; his easel pictures in the Louvre and the museum of Madrid. See Sir William Stirling-Maxwell's *Annals of the Artists in Spain* (1848).

Giorgio'ne, properly **Gior'gio Barbarell'i**, one of the greatest of the Venetian colourists, was born at Castelfranco in the N.E. of Italy, in 1478, and studied, together with Titian, under Giovanni Bellini. He decorated a number of the buildings of Venice with noble frescoes. His portraits are among the most beautiful of the Italian school. His compositions, mostly scriptural and pastoral scenes, are fresh and original, and his colour royally rich. No one before his day wielded the pencil with his decision and firmness of touch, and no one carried the art of producing effect at a certain distance higher than he. G. died prematurely at Venice in 1533. A 'Holy Family' and 'Concert' are in the Louvre; numerous portraits and a 'Virgin and Child' in Venice; a 'Nymph and Satyr,' 'Moses Rescued,' and 'Concert' at Florence; and many other examples in Madrid, Vienna, Dresden, and Munich. See Vasari, *Vite de' più eccellenti Pittori* (Flor. 1550); and Rigollot, *Essai sur le Giorgione* (Amiens, 1852).



Giott'o, properly **Angiolott'o** or **Ambrogiott'o Bordo'ne**, one of the greatest of the old Italian masters, distinguished as painter, sculptor, architect, and poet, was born about 1276 at Colle, about 33 miles S. of Florence. In boyhood, while engaged tending sheep, it was his custom to amuse himself drawing on slates and rocks. One of his sketches came under the notice of Cimabue, who took the boy into his studio and instructed him in art. The pupil eventually excelled the master, chiefly by abandoning the traditions of the Byzantine school and devoting himself to nature and truth. His series of thirty-two pictures at Assisi, representing the life of St. Francis, may be said to be the earliest example of allegorical painting. His mosaic of the 'Navicella' or boat of St. Peter, in the great church at Rome, is considered his greatest work. It has been much injured by successive restorations. 'The Last Supper' in the refectory, and 'The Coronation of the Virgin' in the church of Santa Croce, Florence; 'St. Francis,' now in the Louvre; his six great frescoes representing 'The History of Job' for the convent of Campo Santo, Pisa, are also fine specimens of his genius. The beautiful campanile of the cathedral, Florence, was built after G.'s design, and the *bassi-rilievi* of that building were executed by him. His portraits of Dante, Donati, and other famous contemporaries are not more remarkable as works of art than valuable for fidelity and individuality. He went to France on the invitation of Pope Clement V., and painted many frescoes there. He was the author of a poem, *Giotti, pintor di Florentia, sopra la poverta.* G. died 8th January 1336 at Florence, and was buried in the church of Santa-Maria-del-Fiore, which he himself had designed. See Vasari, *Vite de' più eccellenti Pittori* (Flor. 1550).

Giovann'i (San) a Teduccio, a small straggling town, 3 miles E. of Naples, on the highroad to Pompeii. It stands in a fertile, densely-peopled district, and its name is said to be a corruption of Theodosius, that emperor's name having been found on a column near G. It is a place of great antiquity. Pop. 7298.—**San Giovanni in Fiore**, a town in the S. of Italy, province of Cosenza, 20 miles N.W. of Cotrone. It stands on the Neto, in the beautiful hilly region of La Silva, amid rich woods and pastures. Pop. 9239.—**San Giovanni Rotondo**, a small town of S. Italy in the province of Foggia, near the Adriatic, 7 miles N.W. of Manfredonia. It stands in a hilly district, and has linen and woollen manufactures. Pop. 6865.



Giovinazz'o, a seaport in the province of Bari, S. Italy, 15 miles N.W. of Bari by railway. It has an active trade in oil, wine, and fruits, and is richly girt with olive and almond groves. Among its public institutions are an asylum for the poor and a large reformatory. Pop. 9108. G., supposed to be the Roman Natiolum, has remains of ancient walls towards the sea. It was taken by the Greeks in the 11th c., and subsequently passed to the Gonzaga family.

Gip'sies. See GYPSIES.

Gipsy-Moth (*Hypogymna dispar*), a species of Moths (q. v.) belonging to the family *Arctiidæ*, in which the antennæ of the males are deeply notched, the wings being bent downwards in repose, and the proboscis small or wanting. The genus *Hypogymna* has no proboscis, and the wings are opaque. The feelers are comb-like in both sexes, and the male abdomen has a tuft at its tip. The male G.-M. is of dark-brown colour; the female, greyish white. The front wings are marked with four transverse and wavy brown bands, and a V-shaped mark exists at the middle of their anterior margin. The G.-M. is common on the Continent.

Gipsy-Moth.

Giraffe' (*Camelopardalis giraffa*), a remarkable genus of *Mammalia* belonging to the *Ruminant* section of the *Ungulate* or hoofed order. It is the only living species of its genus, and occurs in Africa. The horns are covered with a hairy skin, and tufted at their tips; the neck is exceedingly long, but consists of only seven vertebræ, the ordinary number among mammalia; the lips are hairy and not grooved; the tongue is extensile; and the tail, which is of moderate length, has a tuft of hair at the tip. The height of the full-grown G. is about 18 to 20 feet. The back slopes in a very marked manner, but the legs are of nearly equal length. The tongue is well adapted for seizing the foliage of trees, which the animal is enabled to reach by the length of its neck. The general colour of the body is a very light brown, marked by definitely rounded patches scattered over the entire surface. The food of the G. consists of grasses in addition to the leaves of trees. The G. is of a gentle disposition, but when enraged, manages to defend itself most effectually by kicking with its strong hoofs. It is easily tracked by its *spoor* or footprints, and runs awkwardly owing to the great weight and size of its fore-parts. It lives gregariously in small herds of from five or six to fourteen or more in number, one large male being the leader of his herd. The flesh is palatable, and the hide is made into strong leather.

Giraffe.

Giral'dus Cambren'sis ('Gerald the Welshman,' the name usually given to Gerald de Barri), the son of William de Barri, a Norman noble, and Angharad, the daughter of a Welsh princess, is one of the liveliest and most interesting of English mediæval authors. He was born in the castle of Manorbeer, Pembrokeshire, about 1146, and was educated by his uncle, the Bishop of St. David's. He distinguished himself at Paris University, returned to England in 1172, and obtained church preferment; but the king refusing to sanction his election to St. David's bishopric, he resumed his scholar's life at Paris until 1180, when he came back to England, and was made administrator of St. David's see. In 1185 he travelled with Prince John through Ireland, and in 1187 accompanied the Archbishop of Canterbury on a tour through Wales—these journeys forming the subjects of his *Topographia Hibernia* and *Itinerarium Cambriæ*. G. visited France with Henry II. in 1189, and after being again elected to St. David's bishopric, and set aside by the Archbishop of Canterbury's influence, spent his last years in studious retirement, and died at St. David's in 1223. G. was both a fine scholar and a keen-witted man of the world. His works give the vivid impressions of a traveller through Ireland and Wales in the middle ages, and afford a valuable and entertaining picture of his times. They are full of quaint gossip and bright witty sallies, their credulity and frank egotism are pleasing rather than otherwise, and their Latin is delightfully clear and vivacious. G. was the earliest English pamphleteer, and has been called the 'father of our popular literature.' He made fearless attacks on the civil government, and poured forth fierce invectives against the Angevin kings. Besides the accounts of his Welsh and Irish tours, G. wrote *Expugnatio Hiberniæ, Descriptio Cambriæ; De Vita Galfridi Archiepiscopi Eboracensis; Speculum Ecclesiæ*, an attack on the monkish orders, &c. See Brewer and Dimok's *Giraldi Cambrensis Opera* (7 vols. completed in 1877). There is an English version of G. in Bohn's *Antiquarian Library*.

Girardin, Émile de, a French journalist noted for his sparkling style and his political fickleness, was the illegitimate son of General Alexandre de G., and was born in Switzerland about 1802. After working in a stockbroker's office, he became connected with various periodicals, married Mdlle. Delphine Gay (q. v.) in 1831, and in 1836 produced *La Presse*, the earliest penny paper, which met with vast popularity. G. has shifted incessantly in his political opinions, writing with equal ability and with seemingly equal ardour in favour of conservatism, republicanism, constitutionalism, and socialism, and justly earning the sobriquet of *La Girandole* ('the weathercock'). He sold his share in *La Presse* for £32,000 in 1856, again became editor of the paper in 1862, but soon retired from it to edit *La Liberté*, and in 1867 was fined 5000 francs for assailing the Napoleonic administration in his new journal. He ceased to edit *La Liberté* in 1870. He has written several dramatic pieces and a

number of pamphlets. A collection of his articles was issued in 1858, entitled *Questions de mon Temps*, 1836 *à* 1856.

Girardin, St. Marc, a French professor and author, born at Paris, February 19, 1801. He studied at the Collége Henri IV., and in 1827 was made professor in the Collége Louis le Grand, and received a prize from the Academy for an *éloge* on Bossuet. In 1830 he visited Germany, where he became intimate with Hegel, and on returning to France, was chosen to succeed Guizot as Professor of History in the Faculty of Letters. He received the chair of Poetry in 1834, and being already known by his political articles in the *Débats*, was elected to the Chamber of Deputies in the same year. He was made an Academician in 1844, and Minister of Public Instruction in 1848. He continued to work as a professor and as a journalist until 1863, when he gave up his chair in the Sorbonne. In 1869 he succeeded St. Beuve as editor of the *Journal des Savants*. Among his works are *Tableau de la Marche et des Progrès de la Littérature Française au XVIème Siècle* (1828); *Rapport sur l'Instruction Intermédiaire en Allemagne* (1835-38); *Cours de Littérature Dramatique*, his chief work (1843-68); *Tableau de la Littérature Française* (1861); *Souvenirs et Voyages* (1861); *Essai de Littérature et de Morale* (2d ed. 1863); *La Fontaine et les Fabulistes* (1867), &c. He is a moderate Liberal in politics, and is very clear-sighted, impartial, and catholic in his critical verdicts.

Gir'asol (Lat. *gyrus*, 'a circuit,' and *sol*, 'the sun'), a variety of Opal (q. v.), bluish white, translucent with reddish reflections when turned to the sun or any bright light; also applied to the asteriated sapphire (Pliny's *asteria*), which exhibits a pale star-like opalescence.

Gir'der, a structure supported at the ends, and used for carrying a load placed between the points of support. It is thus the same as *beam*, the latter word being commonly used in theoretical works, while G. is more distinctly technical. A G. is commonly made either of cast or wrought iron or steel. The first-named material is used frequently for such girders as occur in buildings, on account of its comparative cheapness in these cases. In Bridges (q. v.), on the other hand, cast iron is seldom used, wrought iron being employed in the great majority of cases. A 'continuous' G. is one supported vertically at one or more places besides the ends. Such girders have many advantages over simple girders in economy of material, but their theory is much more complex. They are now largely used by engineers. A G. bridge differs from a suspension bridge or an arch in being complete in itself, requiring only vertical support, and not being dependent on the pull of anchor chains or the thrust of abutments for its stability.

Gir'dle of Ve'nus (*Cestum Veneris*), a peculiar animal organism belonging to the *Cœlenterata* (q. v.), and to the order *Ctenophora* (q. v.) of the class *Actinozoa*. It is met with off the British coasts and in warm seas, and is a long ribbon or band-like structure, which may attain a length of 3 or 4 feet and a breadth of 3 or 4 inches. It is allied in its nature and structure to the more familiar *Beröe* or *Cydippe*. Two tentacles extend away from the mouth. The G. of V. is markedly phosphorescent, and resembles at night, as it swims through the sea, a long waving band of flame. See also PHOSPHORESCENCE, ANIMAL.

Gir'geh (from *Girgis* or George, the patron saint of the Coptic Church), a town of Upper Egypt, of which it was formerly the capital, on the left bank of the Nile, 108 miles W.N.W. of Thebes. It is beautifully embowered among palms, above which rise its eight minarets. Its Roman Catholic convent is the oldest in Egypt, and it has a fine bazaar and some cotton industry. G., however, is suffering much from the encroachment of the Nile. Pop. 10,000.

Girgen'ti. See AGRIGENTUM.

Girnar', a mountain in the peninsula of Kattywar, India, rising abruptly about 3000 feet. It is a frequented place of pilgrimage, and the summit is studded with Jain temples. At the foot is a rock with Pali inscriptions, which date back to the 3d c. B.C.

Gironde', the largest department of France, is formed out of part of Guienne, and is bounded N. by Charente-Inférieure, E. by Dordogne and Lot-et-Garonne, S. by Landes, and W. by the Bay of Biscay. Area, 3761 sq. miles; pop. (1872) 705,149. The surface is for the most part flat or undulating. In the W. stretch the Landes de la G., a sterile waste of heath and shifting sand, broken only by occasional forests of pine; while in the E., and especially along the beautiful banks of the Garonne, most of the soil is under the vine. G. is watered by the Garonne and its tributaries. It produces much wheat, maize, hemp, garden fruit, and famous wines (Lafitte, Latour, Château-Margaux, Sauterne, and Vin de Grave) to the extent of 44,000,000 gallons annually. Other industries are the rearing of sheep and cattle, fishing, sugar-refining, shipbuilding, and iron-smelting. The coast, 90 miles long, is lined with lagoons (as the Bassin d'Arcachon and Étang de Carcan), which yield much salt. Turpentine, pitch, and charcoal are got from the pine forests. Bordeaux is the capital, and other towns are Lesparre, Blaye, Bazas, and Libourne. G. is traversed by the Paris-à-Bordeaux and Bordeaux-à-Bayonne Railways.

Giron'dists, or **Giron'dins**, the name given to the moderate party which sat in the French Legislative Assembly from 1791 to 1793, because several of its chief members came from the Gironde. At first the G., who were ardent patriots and men of greater culture than most of their associates in the Assembly, opposed the court and proposed stringent edicts against the priests and nobles. The king chose four of them for his ministers in 1792, but shortly dismissed them, the consequence being a rising in Paris which led to their recall, August 11, 1792. They then showed utter incapacity to meet the difficulties of the time, threatened the Jacobins with the guillotine, and before the middle of 1793 had brought France to the brink of ruin. Marat, whom they had sought to impeach, in turn demanded their arrest, and in 1793 the Parisian rabble drove them from the Convention. Several of the G. fled into the provinces and strove to gather an army at Caen, but their supporters were easily crushed by the energy of the Jacobins. A number of their leaders—among others Brissot, Vergniaud, Sillery, Lacaze, Ducos, Fauchet, Lasource—were sent to the guillotine, October 31, 1793, singing the *Marseillaise* on their way to execution. During 1794 many others of the G. perished. The G. were well-intentioned and true lovers of freedom, who wished to establish a moderate republic, but they had not the energy, determination, and zeal of the Jacobins. See Lamartine's *Histoire des G.* (Par. 1847).

Gironné ('girdled;' from Lat. *giro*, 'the lower part of the tunic, a skirt;' a word, however, of Teutonic origin), in heraldry, a field divided into several parts or gyrons. A gyron is an ordinary composed of two lines issuing from the dexter chief point, and meeting in an acute angle at the fesse point.

Gir'van, a seaport of Ayrshire, Scotland, at the mouth of a small river of the same name (Celt. 'the short stream'), opposite Ailsa Craig, and 21 miles S.W. of Ayr by the Glasgow and South-Western Railway. It has a good harbour and a brisk export trade in coal, chiefly to Belfast, distant 65 miles. Its fine beach and beautiful environs attract many summer visitors. Pop. (1871) 4776.

Gi'sors, a town of France, department of Eure, on the Epte, 30 miles N.W. of Paris, with which it is joined by railway. It has an old castle and a church which dates from the 13th c., some trade in grain, wool, cattle, and copper and zinc works. Pop. (1872) 3834. Here Richard I. defeated the French, October 10, 1198.

Gitsch'in (*Jičin*), a town of Bohemia, capital of a circle of the same name, on the Cydlina, 50 miles N.E. of Prague, with which it is connected by railway. It was formerly the capital of the duchy of Friedland; became the residence of Wallenstein, whose bones were placed in a neighbouring Carthusian monastery in 1636; and has a beautiful church after a Spanish model, a Jesuits' college turned into barracks, and an active corn trade. Pop. (1869) 5715. A victory was gained by the Prussians over the Austrians at G. on the night of June 29, 1866.

Giuli'ni, Giorgio, an Italian historian, born at Milan in 1794. He studied at Padua, and, after a life of learned research, died in 1780. Of his works, which are marked by deep erudition and incisive criticism, the chief are *Memorie spettanti alla Storia, al Governo, ed alla Descrizione della Città e della Campagna di Milano nè Secoli bassi* (1760-75), which throws much

light on the mediæval history of Milan; *Continuazione delle Memorie spettanti*, &c., which carries the Milanese history down to 1447; *Di Giulia Drusilla* (1756); *Sopra l' Anfiteatro di Milano* (1757). G. likewise wrote dissertations on Latin poetry, antique gems and inscriptions, &c. See Fabroni's *Vitæ Italorum* (Pisa, 1778–1805).

Giu'lio Roma'no, properly **Pippi**, the favourite pupil, the heir, and the artistic successor of Raffaelle, and a painter, architect, and engineer of high original genius, was born at Rome in 1492. Raffaelle, who had availed himself of G.'s assistance in carrying out some of his greatest designs, as 'The Battle of Constantine' and the frescoes in the Vatican, left directions at his death (1520) that his unfinished pictures should also be completed by G. One of these works, so completed, was the famous 'Transfiguration.' Of the great works independently executed by G., and which still show the influence of Raffaelle, are the embellishments of the villas Madama and Lante, both of which he had himself built, and which are distinguished for nobleness, variety, and elegance in design. Among his frescoes of the earlier period is 'The Martyrdom,' in the church of St. Stephen, Genoa, which for splendour of colour recals 'The Transfiguration.' A well-known and favourite picture of the same period is 'The Holy Family' (Dresden), in which the mother is preparing to wash the child. The child stands in a basin, and the young St. John sportively sprinkles him with water. G. was docile and tractable under the master-spirit of Raffaelle, and seemed at times to breathe the same air. After the death of his preceptor, however, he abandoned himself to an inferior class of compositions. He painted classical and mythological subjects—many of the latter being treated with reprehensible license. Invited to Mantua by Duke Frederico Gonzaga, he resided there many years, during which he built and decorated the famous Palazzo del Te. The Hall of Giants, in which he represents the defeat of the Titans, shows astonishing power, and proves G. to have been in some respects equal to Buonarotti. At Mantua he remodelled the cathedral and built a number of palaces and churches. He also drained the Mantuan marshes, which had previously suffered from the overflowing of the Po and Mincio. G. died at Rome, 1st November 1546.

Giurge'vo ('St. George's town'), the chief town of the district of Vlachka, and the river-port of Bucharest, in Wallachia, on the left bank of the Danube, opposite Rustchuk, and 40 miles S. of Bucharest by railway. It has a thriving trade, the exports chiefly consisting of grain, maize, and salt. In 1873 the imports amounted in value to £750,000, and 1237 steamers cleared, of which number 669 belonged to the Austrian Danube Co. The town is connected by a bridge with the fortified island of Slobodse. G. was originally the Genoese settlement of St. George, and later a fortress of the Turks, who were defeated here by the Russians in 1854. Pop. 15,000.

Gius'ti, Giusepp'e, a great Italian poet, was born at Monsuannano, near Pescia in Tuscany, in 1809. He studied law at Pisa, but the subject was distasteful to him, and he early withdrew into a retired life, mingling only with a few such friends as Manzoni, D'Azeglio, and Capponi, and issued patriotic and satiric lyrics, which became universally popular, and did much to stir up his countrymen against Austria. He was elected to the Tuscan Chamber in 1848, and after the fall of Capponi's Ministry was attacked as a reactionary. G. died at Florence in 1850. He was an ardent patriot, and a moderate Liberal in politics. His writings are full of satiric wrath relieved by playful and incisive wit. Among his works are *Stivale*, an exquisitely humorous and sarcastic allegory, in which Italy is represented as a *boot* that has undergone no end of misfits, repairs, bad usage, &c.; *Gingillino*; and *Re Travicello*. A complete edition of his writings was published at Florence in 1852. See Horner, *The Tuscan Poet Giuseppe Giusti and his Times* (Lond. 1864).

Gi'vet, a fortified French town in the department of Ardennes, on the Meuse, 145 miles N.E. of Paris. It consists of three parts, *Le Grand G.*, *Le Petit G.*, and the *Citadelle-de-Charlemont*. It is well built, was fortified by Vauban, and is still a place of strength. It has manufactures of leather, glue, lead pencils, and clay pipes. It belonged to Luxembourg until 1699. Pop. (1872) 5104.

Givors, a town of France, department of the Rhone, at the confluence of the Rhone and Gier, 14 miles S. of Lyon. It has considerable trade, the chief manufactures being silk, leather, and glass. There are also foundries and brickworks. Pop. (1872) 9886.

Gla'ciers (Lat. *glacies*, 'ice') are fields of ice which rest on the flanks or fill the lower valleys and ravines of snow-capped mountain ranges. They are the result of the gradual descent of the accumulated snow below the line of perpetual winter. The continual formation of snow on the heights, and the melting of the glacier ice and abstraction of the water to form rivers, lakes, and seas, while the glacier itself does not sensibly recede or diminish in size, prove conclusively that G. move down the valleys. This motion, however produced, must exert a powerful influence in wearing away the rocks over which the ice-mass passes; and the resulting waste is shown in the existence of the *moraines*, which are differently named according to their position. The *lateral moraines* are lines of débris, composed of blocks of varying sizes, which form along the margins of the glacier. When two G. unite, the moraines along their contiguous margins combine to form one; and the single glacier thus produced has three longitudinal moraines, two *lateral* and one *medial*. In this way, by the union of several of these ice-streams, a glacier may ultimately present on its surface a number of medial moraines. The heat of the sun is constantly melting the surface of the glacier; and by this means a block originally imbedded in the ice seems to rise towards the surface, while one on the surface, by the protection it affords to the ice on which it rests, is gradually raised upon a pillar of ice as the surrounding surface melts away. This pillar of course ultimately gives way; but the block, precipitated on the surface, again rears for itself a pillar. A glacier is thus a powerful agent in the transportation of more or less huge blocks of stone; and these, deposited at the termination of the glacier, form the *terminal moraine*. The curved form of this moraine, with its convexity presented *down* the valley, has an important bearing upon the theory of glacier motion, which will be considered afterwards. Another striking feature is the crevassed appearance of the mass. These crevasses are due to the splitting of the ice, and run, as a rule, from the margin towards the centre, generally directed obliquely *up* the glacier. Such are the general characteristics of a glacier. Its effects are seen in the worn surface of the rocks, in the scooping out of valleys, and in the deposition of boulders far from their parent rock. These peculiar appearances, especially the *roches moutonnées*, the striated rocks, and the terminal moraines stretching across the mouths of valleys, are visible in many regions where G. do not now exist, and indicate to the geologist a time when a more rigorous climate rendered their existence a possibility, and even a necessity.

To account for the motion of G., two theories were early put forward—the *gravitation* theory of De Saussure, which regarded the glacier as merely sliding down an inclined plane by its own weight, aided by the fusion of the ice in contact with the warmer earth; and the *dilatation* theory of De Charpentier, which explained the motion as due to the expansion of the water in the innumerable fissures as it became ice, thus forcing the mass in the direction of least resistance, *i.e.*, down the valley. The former cannot explain of itself the motion of a glacier through a *sinuous* channel, while the latter is in direct contradiction to physical law. For water at 0° C. cannot be frozen through contact with ice at the same temperature, and the presence of water as well as ice in a glacier renders it impossible for the ice to be of a lower temperature. Besides, if the dilatation theory were true, the lower portions would be pushed forwards further, on account of the accumulation of displacements, than the higher portions, and the distance between any two points on the glacier would be constantly increasing. To test these theories all that was necessary was a series of accurate observations; but no great step was taken in this direction until the late Principal Forbes took the subject in hand. The estimates of the rate of motion of G. were especially varied and conflicting. According to Ebel, the G. of Chamouni advance 14 feet every year, and those of Grindelwald 25 feet, while De la Beche gives 200 yards a year as the motion of the Mer de Glace. Hugi was perhaps the first to point out the correct method to measure the advance of a glacier, and he determined the motion of the

glacier of the Aar at about 240 feet a year, an estimate which is now known to be very correct. The complete confusion that existed regarding this most important point is brought out by Rendu, Bishop of Annecy, in his most ingenious paper on G. 400 feet and 40 feet a year are both given as the rate of motion of the Mer de Glace. This discrepancy Rendu attributes to the different velocities of the centres and sides. The same author compares a glacier to a river, and forestalls in some measure Forbes' viscous theory. He, however, felt the lack of observations, and was unable to decide which of his various speculations was the true one. For several years previous to 1840 Agassiz had been at work among the G. of the Alps, testing the various theories which had been given. He adopted a modification of De Charpentier's theory, and regarded the sides of a glacier as moving faster than the centre, being more rapidly melted by the heat reflected from the rocks, and this theory he deemed supported by the generally upwardly-directed *crevasses*. In company with him, in the autumn of 1841, Forbes visited the glacier of the Aar. It was at this time that Forbes observed the veined structure of glacier ice—perhaps his greatest discovery in the subject—which has such an important bearing on the theory of stresses in general, and of glacier motion in particular. He at once saw the necessity of making accurate scientific measurements; and the succeeding year saw him on the Mer de Glace with his theodolite, prepared for a thorough investigation, and quite unbiassed by a belief in any theory. Later observations in the Alps and in Norway fully bore out the theory to which he was led, and which, in his own words, is as follows:—'A glacier is an imperfect fluid, or a viscous body, which is urged down the slopes of a certain inclination by the mutual pressure of its parts.' The facts established by Forbes are—the greater velocity of the centre and surface than of the sides and the bottom, the deep-seated character of the longitudinal ribboned structure produced by stress parallel to its direction; and his theory furnishes complete explanation of many minuter points, such as the concavity of the dirt-bands, and the convexity of the crevasses, to the source of the glacier; for, as demonstrated by Sir W. Thomson, a viscous mass under action of a stress splits in a direction perpendicular to the line of greatest tension. Hopkins took objection to Forbes' theory on the ground that ice was rigid; but it must be remembered that viscosity or plasticity (Forbes used the terms indiscriminately) merely expresses the capability of a body to continuously alter its form under the action of a continuous stress. This capability glacier ice evidently possesses; but the *property* of ice upon which this capability depends is quite a different question. The next conspicuous Alpine traveller is Professor Tyndall, who fell foul of Forbes' theory on the same grounds as Hopkins, arguing that, though ice may act as a viscous body under pressure, the existence of crevasses proves that under tension it splits like a brittle substance. He advances a theory, which, he professes, accounts for the plasticity possessed by ice under pressure, viz., that the 'brittle' ice by its descent is crushed and broken in small fragments, which, however, freeze together in accordance with the phenomenon known as *regelation*. This phenomenon, which might be better termed 'congelation,' was first observed by Dollfuss-Ausset, who compressed into one mass fragments of ice under a Bramah press, and later and independently by Faraday. This alternate fracturing and freezing may and probably does occur along the surfaces of contact of the ice and rock; but of its existence in the body of the glacier, where the ice is strained by a shearing stress, there is no evidence. And does not this regelation require explanation as much as glacier motion? The discovery by Professor James Thomson of the lowering of the freezing-point of water has thrown a flood of light upon the whole question. This property of water, which is merely a particular case of the conservation of energy, affords an explanation of the physical phenomenon exhibited in the making of a snowball, and of the curious laboratory experiment in which a thin wire hung over a block of ice, and stretched by suspended weights, passes through the block without permanently cutting it. Under pressure ice melts, cools, contracts. The contraction relieves the pressure, and the water freezes, warms, expands. Thus by compression, with the necessary alternation of melting and freezing, the descending snow becomes ice, and the ice moulds itself to the configuration of the valley in which it accumulates, flowing down as a glacier under the action of gravitation. The ice of G. differs considerably from the ice produced by the freezing of water. The latter possesses a stratified construction, which is not present in the former, and glacier ice has besides a peculiar deep blue colour.

The G. of the Alps, which are undoubtedly the best known throughout the world, occupy a superficial area of nearly 1500 sq. miles. The largest is the Aletsch Glacier, which is 15 miles long, while the famous Mer de Glace above Chamouni is only 9 miles. G. of unknown extent abound in the fjords of Scandinavia, in Spitzbergen, Novaya Zemlya, Greenland, Patagonia, and the inaccessible shores of the Antarctic. Among the Himalayas huge ice-rivers exist, one in Tibet measuring, upon the authority of Captain Austin of the Indian Survey, 36 miles in length. The Southern Alps of New Zealand vie with the Alps of Switzerland in the grandeur of their glacier system—the largest one, the Tasman Glacier, being about 18 miles long. The G. of Europe formerly extended to much lower altitudes, as evidenced by the ice-markings on the rocks. This, however, does not imply that they were much larger, because the snow-line itself was also probably lower. To account for this Glacial Period several theories have been advanced, the most plausible of which is the coincidence in some past time of the maximum eccentricity of the earth's orbit with the earth's aphelion falling in our winter. See Rendu's *Théorie des Glaciers de la Savoie* (1841; edited and translated by Prof. G. Forbes, 1875); Agassiz's *Études sur les Glaciers* (1841), and *Nouvelles Études sur les Glaciers* (1847); Forbes' *Travels through the Alps* (1843), *Norway and its Glaciers* (1853), and *Occasional Papers on the Theory of Glaciers* (1859); Tyndall's *The Glaciers of the Alps* (1860), and *The Forms of Water* (1872); Croll's *Climate and Time* (1875); and James Geikie's *Great Ice Age* (2d ed. 1876).

Gla'cis (Fr.; from Lat. *glacies*, 'ice;' hence 'what slides or is slippery like ice'), in fortification, a smoothly sloping mass of earth serving as the parapet or breastwork of the covered way, also to mask or protect the general works of the enceinte; but chiefly to bring assailants within the direct sweeping fire of the fortified works.

Glad'bach (*München-G.*), the chief industrial town in Rhenish Prussia, on the Niers, 16 miles W. of Düsseldorf by railway. It has active manufactures of linens, cottons, silks, ribbons, druggets, velvets, tobacco, machinery, &c., besides large bleach-fields, and dye-works. Pop. (1875) 31,962. G. was founded in the end of the 8th c.—**G.** (*Bergisch-G.*), a town of Rhenish Prussia, 8 miles E.N.E. of Köln by railway. It has manufactures of paper, nets, and percussion-caps, and was included in the former Duchy of Berg. Pop. (1871) 6195.

Gladiator (Lat. *gladius*, 'a sword'), a general name applied to men trained to fight with deadly weapons for the amusement of the Romans at public funerals, in the circus, and in the amphitheatre. The practice originated in the ancient belief that the spirits of the dead took pleasure in human blood. Gladiatorial exhibitions were imported from Etruria to Rome in 264 B.C., when M. and D. Brutus matched three pairs of gladiators in the Forum Boarium at the funeral rites of their father. In the Ludi Funebres 216 B.C. twenty-two pairs fought, the same number in 200 B.C., and sixty pairs in 183 B.C. These combats rapidly grew in popularity. On one occasion Julius Cæsar presented 320 pairs of gladiators to the people. Under the Empire this brutal taste rose to a frenzy. Titus regaled the Romans with an exhibition for 100 days. When Trajan triumphed over the Dacians, 10,000 men were matched together or with wild beasts during a period of 123 days. Cicero, Augustus, Tiberius, and others tried to limit these contests; but no attempt to interdict them was made till the time of Constantine (325 A.D.). They were revived by succeeding emperors, and finally suppressed by Honorius. Gladiators were instructed in schools (*ludi gladiatorii*) by a trainer (*lanista*), at first with heavy wooden swords (*rudes*), then with steel. They consisted at first of captives, malefactors, and slaves; but under the more worthless emperors, knights, priests, senators, and even high-born ladies entered the arena. Gladiators were classed according to their equipments. In all cases they were sworn to fight to the death. The shows were announced by bills, containing a description of the numbers, names, and exploits of the combatants. The contest began on a signal given by the president (*editor*). When a G. was wounded his an-

tagonist cried *Hoc habet* ('it is a hit'), whereupon the president, if the injury were such as to disable the sufferer, replied *Habet*. The wounded G. then held up his finger in token of submission, and his life or death depended on the president, who generally allowed the spectators to decide. If they raised their thumbs, he was spared; if they depressed them, he was slain by the victor.

Gladi'olus (Lat. 'a little sword'), a large and very beautiful genus of Iridaceous plants, found principally in Eastern Europe and Africa. Many fine hybrid forms with very showy flowers are cultivated in gardens under the name of sword-lilies. They have starchy underground corms or stems, which are eaten by the Hottentots.

Glado'va, or **Klado'vo** (Turk. *Fet-ül-Islam*, 'rock of Islam'), a village of Servia, on the Danube, immediately below the 'Iron Gate' (*Dolni-Demir-Kapu*), and 2½ miles above the remains of Trajan's Bridge. The goods of the Danube Navigation Co. are conveyed to G. overland from Orsova, a distance of 13 miles, to avoid the rapids. Pop. 1125.

Glad'stone, The Right Hon. William Ewart, an illustrious English statesman and author, was born at Liverpool, December 29, 1809. He was the fourth son of the late Sir John G., Bart., of Fasque, in Kincardineshire, a Liverpool merchant who originally belonged to Leith. Educated at Eton and at Oxford, where he graduated with a double first class in 1831, he was returned to Parliament in the Conservative interest in 1832, and soon won the notice of Sir Robert Peel, who made him a junior Lord of the Treasury in 1834, and in 1835 Under Secretary for Colonial Affairs. In 1838 he published *The State in its Relations with the Church*, which called forth a vigorously hostile review from Macaulay, the critic, however, praising G.'s 'desire to penetrate beneath the surface of questions.' He was appointed Vice-President of the Board of Trade in 1841, and President of the Board in 1843. In 1846 he succeeded Lord Stanley, the late Earl of Derby, as Colonial Secretary, and during the Corn-Law struggle supported Peel with great ardour and eloquence. His labours to repeal the Corn-Laws lost him his seat for Newark (a pocket borough of the Duke of Newcastle), but after being a short time out of Parliament, he was returned for Oxford University in 1847. In 1850–51 he visited Naples and published *Two Letters to the Earl of Aberdeen on the State Prosecutions of the Neapolitan Government*, exposing the loathsome cruelties to which the Bourbons of Naples subjected their political opponents. These letters had a vast circulation, and made a deep impression throughout Europe. G., who had become gradually alienated from the Tories, despite his High-Church sympathies, during the discussions on University Reform and the removal of the Jewish disabilities (1847–51), finally withdrew from his old party in 1851. When Lord Aberdeen's 'Coalition' Ministry was formed in 1852, G. was made Chancellor of the Exchequer, and on the fall of that Ministry before Mr. Roebuck's motion to inquire into the state of the army at Sebastopol, became a member of the Palmerston Government, but resigned in a few weeks. G. was then partly in opposition to Lord Palmerston, to whose defeat on the China question in 1857 he greatly contributed by a powerful speech. He declined to take office under Lord Derby, but went as a special commissioner to the Ionian Islands in 1858–59, and in 1859 became again Chancellor of the Exchequer under Lord Palmerston. In the same year he was chosen Rector of Edinburgh University. His bill to repeal the paper-duty, after being passed in the Commons, was flung out by the Lords in 1860, but was carried in 1861. He lost his seat for Oxford in 1865, but was returned in the same year for South Lancashire. On the death of Lord Palmerston in 1865 he became leader of the House of Commons and Chancellor of the Exchequer in Lord Russell's Ministry, which resigned in 1866 on the rejection of Lord Russell's Reform Bill. G. then vigorously attacked and successfully amended Mr. Disraeli's curious Reform Bill, and brought forward in 1868 resolutions to disestablish the Irish Church, which were carried through the Commons, but were rejected in the Lords. In 1868 G. lost his seat for South Lancashire, but the Greenwich electors, anticipating his defeat, had a few days before returned him for their town, which he continued to represent till his election for Mid-Lothian in 1880. In the same year, on the resignation of the Disraeli Government, he became First Lord of the Treasury; and the Liberal party being at this time firmly united and having a majority in the Commons of about a hundred members, G. was enabled to carry a series of important measures. The Irish Church Disestablishment Act was passed in 1869, the Irish Land Act and the Elementary Education Act in 1870; religious tests for admission to university degrees and offices were abolished in 1871, and in the same year purchase in the army was removed by the exercise of the royal prerogative; the Ballot Act was passed in 1872, and the Judicature Act in 1873. The University Education Bill was, however, flung out in 1873, through the union of the Catholic with the Conservative members, whereupon G. resigned; but Mr. Disraeli refusing to take office, G. was forced to rearrange the Cabinet, himself taking the offices of First Lord of the Treasury and Chancellor of the Exchequer. In 1874 he suddenly dissolved Parliament, and in the ensuing election a Conservative majority of nearly fifty members being returned, G. resigned, and in 1875 withdrew from the Liberal leadership. After a year or two, however, he resumed the discussion of political topics, and in particular took up the Eastern Question with characteristic earnestness and fervour. During the years 1876–80 his polemical activity, both oral and literary, has furnished one of the most extraordinary spectacles in human history. It may, indeed, be doubted if the world ever witnessed such a tremendous exhibition of oratorical energy as was displayed by G. in his Mid-Lothian campaigns of 1879 and 1880. Challenging the whole policy, both foreign and financial, of Lord Beaconsfield's Government in a series of the most powerful speeches ever delivered to popular audiences, he succeeded in kindling to a fiery heat the enthusiasm of his party throughout the entire kingdom, while he himself received everywhere the most impassioned welcome from the masses of his fellow-citizens. The result was seen at the general election of 1880, when the Conservative majority of fifty was turned into a minority of one hundred and twenty, exclusive of Home Rulers. Again called to become the head of the new Liberal ministry, he succeeded in forming a singularly strong and able Cabinet. G. is a scholar as well as a statesman, his chief works being *Homer and the Heroic Age* (1858); *Juventus Mundi, Gods and Men of the Heroic Age* (1869); *Homeric Synchronism* (1876); but these only faintly represent a literary exuberance which baffles description. The pamphlets and articles that have proceeded from his pen are incalculable, and even his post-cards would probably fill volumes. Of the former the most notable are *Ritualism*, which appeared in the *Contemporary Review* for 1874; *The Vatican Decrees in their Bearing on Civil Allegiance*, a pamphlet against the Roman Catholic Church (1874); *Vaticanism, an Answer to Replies and Reproofs* (1875); and *The Turk in Europe* (1876). His Mid-Lothian speeches have also been published (1880). G.'s career is a splendid record of unbroken progress in the path of political freedom. Beginning public-life as 'the rising hope' of the 'stern and unbending Tories,' he has gradually passed onward to the borders of philosophical Liberalism, and after fifty years of service to the State, his eager spirit still burns with a quenchless desire for the increasing triumph of those principles which he believes to be for the honour of his country and the welfare of mankind.

Glagolitz'a, or **Glag'ola** (*i.e.*, 'word,' 'letter'), the name given to the Old Slavic, in contrast to the Cyrillic, alphabet. Concerning its origin, antiquity, and extension much uncertainty prevails. Undoubtedly it was devised for the old Slovenian language, and passed from the Slovenians in Pannonia to those in Bulgaria. Amongst the Croats its use was maintained till modern times; and profane as well as ecclesiastical works continued to be printed in it at Venice and at Rome up till the end of the 18th c. In Russia, Servia, and Bohemia it was also known. The oldest document in this character is the *Glagolita Clozianus*, dating from the 11th c., and published at Vienna in 1836. Tradition assigned the invention of the G. to St. Jerome.

Glamor'ganshire (Cymr. *Glann Morgant*, 'the valley by the sea-shore'), the most important county of Wales, lies between the rivers Burry and Rumney, and is bounded S. by the Bristol Channel, W. by Carmarthen, N. by Brecknock, and E. by Monmouth. Area, 547,070 acres; pop. (1871) 397,859. The surface in the N. is hilly, reaching an elevation of 1859 feet in the Llangeinor; the broad woody expanse of the S. is known as 'the Vale of Glamorgan.' Among the rivers, all of which flow S. to the Bristol Channel, are the Taff, Neath, Llwchwr, and Tawe,

The chief features of the coast-line (90 miles long) are the peninsula of Gower and Swansea Bay. The climate is mild and healthy. A rich soil, chiefly of reddish clay, yields good crops of wheat, barley, oats, and potatoes; dairy-farming and cattle-rearing are extensively pursued in the beautiful upland pastures and valleys of the N. The formation of G. is almost entirely Carboniferous, and includes one of the largest coal-beds in Great Britain, consisting of true coal, anthracite, and coking coal. Ironstone, lead, and limestone are also found, while the iron-works (chiefly Merthyr-Tydvil and Dowlais) are among the largest in the world; and there are extensive copper, tin, and lead-smelting works at Swansea, Neath, &c. The county, which has an excellent railway and canal system, returns two members to Parliament. Its pop. has increased with great rapidity during the present century—in 1801, 70,879; in 1851, 231,849; in 1861, 317,752; and in 1871, 397,859. The finest architectural remains are Oystermouth, Caerphilly, Cardiff, Coch, and Coity castles, and Morgan Abbey.

Glan'ders is defined as a contagious malignant disorder, chiefly seen in horses, and arising from the introduction within the system of a poison which, besides its effects generally upon the system, specially affects the Schneiderian or mucous membrane of the nose, the lungs, and the lymphatic system. A variety of G. named Farcy (q. v.), together with G. itself, appears to originate spontaneously in the horse, ass, and mule. From these animals the disease is capable of being transmitted in all its virulence to man, and from man it may in turn affect these animals. Aristotle and other ancient writers noted it. The disease occurs in temperate climates, and is rarely seen in hot or cold regions. It exhibits four varieties, known as *acute G.*, *acute farcy*, *chronic G.*, and *chronic farcy*. Its cause appears to consist in some special poison generated under such influences as old age, insufficient or bad food, exhausting diseases, overcrowding, and bad ventilation. Horses crowded on board ship, for example, are very liable to G. The disease is preceded usually by a form of *diabetes* (*D. insipidus* or *polyuria*), in which large quantities of urine, indicating an increased tissue-waste, are passed. The *latent period* of G. is short; on the second or third day after inoculation the glands swell, and at periods varying from the third to the sixth day a discharge from the nostrils appears. The general *symptoms* of G. in the acute form, which is always and very rapidly fatal, are found in the presence of high *fever*, inflammation and ulceration of the pituitary membrane and of the lymphatic glands, while from the eyes and nostrils a foul and irritating discharge flows. In bad cases the nasal bones may become necrosed. The lungs evince symptoms and conditions analogous to those seen in cases of tubercular disintegration, and many authorities hence argue for the near relationship of G. and *tubercle*. Modes of treatment are only available for chronic G. The Contagious Diseases (Animals) Act provides for the destruction of horses affected with G. The general treatment includes attention to diet, good food, tonics, such as copper and iron and arsenite of strychnia (5 gr. doses of arsenious acid with 1 drachm of nux vomica); whilst the local applications include the treatment of swellings by blistering and by the application of the biniodide of mercury ointment. Ulcerated surfaces are to be treated by the application of nitrate of silver, and carbolic acid lotion must be freely used both as a curative and as an antiseptic measure. The *preventive* treatment consists in cleaning and disinfecting the stables, and in giving horses liable to be affected, 2 oz. of the hyposulphite of soda or 2 drachms of chlorate of potash with every meal for two or three weeks.

Gland'ford Brigg, or simply **Brigg**, a market-town in Lincolnshire, on the Ancholme, 18 miles W. of Great Grimsby by railway. It has a corn exchange, a horticultural society, railway works, malthouses, breweries, cornmills, and a large river trade in corn, coal, and timber. The river is navigable for sloops from the Humber. Pop. (1871) 2646.

Glands. These are special organs distributed throughout the body for the purpose of secreting or separating certain materials from the blood. Although differing amongst themselves very much in structure, they are all essentially formed on the same general type. A secreting apparatus essentially consists of a simple membrane named the *basement membrane*, on one side of which we find a layer of secreting cells, and on the other numerous blood-vessels. By modifications of this simple structure, all the various G. are formed. There appear to be four types of gland structure, viz.:—(1) *Simple glands*, including a straight tube as found in the gastric G. of the stomach, a sack or pouch, and a coiled tube, as seen in the sweat G. of the skin; (2) *multilocular crypts*, which may be either of a tubular or of a saccular form, as exemplified in the wax G. of the ear; (3) *racemose glands*, which contain a number of little saccules clustered round the extremities of a branch duct; and (4) *compound tubular glands*, consisting of numerous tubes opening into each other, as seen in the structure of the kidney. Racemose G. are so termed on account of their resemblance to such an object as a bunch of grapes, in which the stalks represent the various ducts of the gland. As examples of this kind of gland may be mentioned the pancreas, the salivary, lachrymal, and mammary G., the G. of Brunner in the small intestine, and numerous small G. in the mouth, throat, and windpipe. The various parts of G. are intimately bound together by connective tissue and blood-vessels, and recently it has been shown that they are richly supplied with nerves, some filaments of which actually terminate in the cells of the gland. For details as to the functions of G. see SECRETION.

Glands, Diseases of.—The lymphatic glands are subject to enlargement from acute inflammation, as in Adenitis (q. v.), frequently resulting from inflammation of the lymphatics connected with them. There may be also chronic hypertrophy, without inflammation, depending upon strumous disease or chronic irritation, which may be permanent or may terminate in suppuration. The glands principally affected in such cases are the submaxillary, the glandulæ concatenatæ, the axillary and inguinal; and they frequently have the appearance of large, indurated, and nodulated tumours. D. of G. are dependent upon various causes, and no line of treatment applicable to all cases can be indicated.

Glan'vill, Ranulf de, the author of the earliest work on English law, was sheriff of Yorkshire in 1174, when he captured William the Lion of Scotland near Alnwick, and in 1180 was chief justiciar of England. He was imprisoned by Richard I., who extorted a large fine from him, and whom he accompanied to Palestine. G. died at Acre in 1190. His *Tractatus de Legibus et Consuetudinibus Regni Angliæ* is very valuable for the light which it throws on the early English constitution, and for preserving a number of old and interesting customs.

Gla'rus, a Swiss canton of triangular shape, is bounded N.E. by St. Gall, S.E. by the Grisons, and W. by Schwytz and Uri, and in the W. and N. touches the lakes Lucerne, Zuger, Zürich, and Wallenstadt. Area, 267 sq. miles; pop. (1870) 35,150. It is almost entirely covered by the Sand Alps, which reach their greatest height of 11,887 feet in Tödiberg or Piz Rusein, and are intersected by the beautiful valleys of the Linth, Sernf, and various minor streams. The Linth rises at the base of the Tödi, and flows N. to the Wallenstadt lake, which is now connected with Lake Zürich by the Linth Canal, constructed (1807–22) at a cost of £60,000. G. has a severe climate, and is rich in rare plants, crystals, minerals, springs, glaciers, petrifactions, &c. The chief occupations are cattle-breeding and the manufacture of cottons (250,000 spindles), woollens, silks, paper, &c. 'Schabziger,' or 'scraping cheese,' the famous aromatic green cheese of G., is coloured by an infusion of meliot or blue pansy, and its odour is perceptible in most of the villages. The chief towns, all in the Linth valley, are G., Nettstall, Mollis, and Näfels. G. is a pure democracy, under constitution of 22d May 1842. G. achieved its independence of the Hapsburgs by the victories of Näfels, and joined the Swiss confederation in 1388.—**G.** (Lat. *Glarona*), the chief town, on the Linth, and at the base of the Vorder-Glärnisch and Schilt, has some weaving industries, and a pop., with Klönthal (1870), of 5517. It was in great part destroyed by a fire in 1861; and the site of the old church where Zwingli preached from 1506 to 1516 is now occupied by the courts of justice. The new Romanesque church is used for both Protestants and Catholics.

Glas'gow, a city and a royal and parliamentary burgh in the lower ward of the county of Lanark, Scotland, is situated on both banks of the Clyde, the larger part lying on the N. side of the river. For the importance of its commerce and manufactures, G. hardly yields precedence to any city in the United Kingdom except London. It occupies an area of nearly 5 miles E. and W., by 2½

from N. to S., and is distant by rail from London 405¼ miles, and 47 from Edinburgh. The principal streets run E. and W., parallel to the river, and the houses are substantially built. The handsome crescents and terraces on the rising ground to the W. of the city are the homes of the wealthier citizens. The oldest part of the city, lying between the Cathedral and the river, has long been notorious for the squalid misery of a great part of its inhabitants, though, under the City Improvement Act of 1866, the Town Council has been diligent in replacing streets of noisome dens, never free from pestilence, by airy and wholesome habitations. The Royal Exchange, the new Stock Exchange, the City Hall, capable of holding 4000 persons, a still larger new Public Hall, and the Post-Office, now (1877) being entirely rebuilt, are prominent public buildings; and many of the banks and other commercial houses possess handsome offices. The venerable Old College has made way for a railway station; but the magnificent new University buildings, on a very advantageous site at Gilmorehill, westwards from the city, is the most imposing of the public structures. G. is proud of its old cathedral church, an admirable specimen of the Early English style, founded in 1176. Among its public and charitable institutions are the Infirmary, the Fever Hospital, the Blind Asylum, and Gartnavel Lunatic Asylum. Besides the ancient University, the institution known as the 'Andersonian University' provides a varied educational course; the municipality has established a museum in Kelvingrove Park, and it possesses a collection of pictures in the Corporation Galleries; there are normal seminaries for the training of teachers; the Free Church has here a theological college; and numerous schools provide for primary and secondary education. Statues of John Knox, Sir Walter Scott, Sir John Moore, Watt, Peel, Nelson, the Queen and Prince Albert, are found in the streets or public places of G.; and there are four large public parks.

A chief source of the wealth of G. is the river. The Clyde, now spanned by five bridges, was once a narrow and shallow stream navigable only by flat-bottomed boats. Some attempt was made to deepen its channel as early as 1566; in 1775 it was so effectively deepened as to admit vessels of 7 feet draught to the Broomielaw. Now there are upwards of 2 miles of quays, and ships of nearly 2000 tons are able to lie in the river. The influx of sewage and of refuse from manufactories has reduced the water to a very filthy condition, and called forth numerous schemes for its purification, none of which has yet been adopted. The Highland scenery of the Firth, however, provides in some measure for the health and recreation of the citizens; and a perfect fleet of passenger steamers plies perpetually between G. and the innumerable watering-places on the Clyde. Coal and iron are abundantly found in the W. of Scotland, and contribute largely to the prosperity of the trade of G. Iron is extensively manufactured as well as exported. G. shipbuilding, both in iron and timber, is one of the greatest industries in the kingdom. Clyde-built vessels are known all over the world, and sail under every flag. G. has long been a centre of the cotton trade in Scotland; and linen, woollen, silk, and mixed fabrics are woven in large quantities. Carpet-weaving, cotton printing, bleaching, and dyeing, are carried on on a large scale. The chemical industries of G. are the most varied in the world, and include, on a large scale, the soda and bleaching-powder manufacture, the preparation of alum, bichromate of potash, dynamite, gunpowder, iodine and other products of seaweed, soap, matches, tin, salts, acids, india-rubber, prussiates of potash, &c., copper, zinc, and lead. Two great chemical manufactories have chimneys, the one 435, the other 454 feet high. Pottery is largely made, and there are great distilleries and breweries. An abundant supply of the best water is drawn from Loch Katrine, 34 miles distant. The works required for the undertaking were completed in 1859 at a cost of £918,000. G. has established public wash-houses and bathing institutions. G. is a terminus of the Caledonian, the North British, and the Glasgow and South-Western Railways; and in September 1876 a new central station in the heart of the city was partially opened for traffic. In 1875 there entered the harbour 5131 vessels of 1,410,324 tons, and cleared 6195 of 1,774,170 tons.

The extent of the leading industries of G. may be estimated from the following figures:—In 1874 there were in Scotland 163 blast-furnaces, nearly the whole of which belonged to the G. district. Their output of pig-iron was 807,677 tons. In the nineteen malleable-iron works which centre in G. there are 342 puddling furnaces, and 49 rolling mills in operation, while a very extensive steel-work on the Siemens-Martin principle turns out about 30,000 tons of steel rails, &c., annually. The following table represents the Clyde shipbuilding of the six years 1871–76:—

	Vessels.	Tonnage.		Vessels.	Tonnage.
1871 ...	231	196,200	1874 ...	225	266,800
1872 ...	227	224,000	1875 ...	276	228,200
1873 ...	194	261,500	1876 ...	260	200,000

In 1875 the cotton factories of G. numbered 84, and contained 1,500,000 spindles and 27,500 power-looms, giving employment in all to 33,276 persons. At St. Rollox Chemical Works alone 1200 people are employed; 80,000 tons of raw material are annually transformed into soda, bleaching-powder, and sulphuric acid, the coal consumed in the various processes weighing 110,000 tons.

Besides several evening and weekly journals, G. has three daily papers, the *Glasgow Herald*, the *North British Daily Mail*, and the *Glasgow News*.

The city sprang up around the abode of St. Kentigern, now commonly known as *Mungo*, 'the beloved,' who is said to have settled here in 580. The etymology of the Celtic name of the city is variously given; either from *glas gow*, 'white smith;' from *clais ghu*, 'dark ravine;' or from *eaglais dhu*, 'black church.' The Cathedral was founded by Joceline, Abbot of Melrose, in 1176 on the site of a still more ancient church. In 1180 G. became a burgh of barony by royal charter, with the right of holding an annual fair. The first stone bridge over the Clyde was built by Bishop Rae in 1345. The see was made archiepiscopal in the time of Blacader, who died in 1550; the University having been founded in virtue of a bull from Pope Nicholas V. in 1450. The Cathedral was defended by the craftsmen of the city from the demolition decreed against it in 1578. The population of G. was in the 14th c. between 2000 and 3000, in the 16th about 5000, and at the end of the 17th c. had reached about 12,000, G. becoming now the second city of Scotland. The subsequent rapid growth of G. in size and prosperity began with the opening of the West Indian trade, especially the tobacco trade, to Scotland. Soon after the Union G. began to trade with Virginia, Maryland, and Barbadoes, but the first G. vessel that ever crossed the Atlantic left G. in 1718—the pioneer of that fleet of merchant ships now found in every quarter of the globe. A new and powerful impulse was given to the enterprise and wealth of G. by the application of steam-power to navigation, carried out on the Clyde in 1812 by Henry Bell. Since the beginning of the century, the population has been very rapidly increasing. In 1801 the pop. was 77,058 (less than that of Edinburgh and Leith); in 1871, 477,156; in 1876, 545,144. The city returns three members to Parliament.

Glas'gow, Univer'sity of, was founded in 1450, by a bull of Pope Nicholas V., obtained through the exertions of Bishop Turnbull. In 1460 a college was established by James Lord Hamilton on the site in High Street, where, with various additions, it remained for 410 years. The new foundation was declared to have the same powers of creating masters and doctors as any other *studium generale* in Christendom, and consisted of a chancellor and rector, of various masters and doctors in the faculties of theology, canon law, and the arts, and of the incorporated students. The Reformation caused great confusion in the University; and in 1577 James VI., besides granting additional endowments, modified the constitution of the University by a new charter, drawn up according to the suggestions of the then principal, the famous scholar Andrew Melville. This *nova erectio* made provision for the support of a principal and three regents. The principal was to teach theology and the Hebrew and Syriac languages. Of the regents, the first taught Greek and rhetoric; the second, dialectics, morals and politics, arithmetic and geometry; while the third had assigned to him the provinces of physiology and geography, chronology and astronomy. Contrary to the former arrangement, the regents were to abide from year to year by the same subjects. Hitherto each regent carried the same students through their whole curriculum. At the Restoration the University suffered much, and remained in a depressed condition till the Revolution. Since then it has steadily increased in prosperity. Twelve of the professorships have been founded in the present century. As early as 1846 there had been negotiations for the transfer of the University buildings to a better site; but it was not till 1864 that the

Old College was sold to the City of Glasgow Union Railway. An admirable site was obtained on Gilmore Hill, an eminence near the West End Park; and the present handsome edifice, built from designs by Sir G. Gilbert Scott at an estimated cost of £350,000 (since considerably exceeded), was formally opened in 1870. Besides £100,000 obtained for the Old College and a grant of £120,000 from Government, nearly £160,000 has been raised by voluntary subscription. Some of the Glasgow citizens showed a princely munificence in their gifts. The University Library—now extensive and valuable—is nearly coeval with the University, and enjoys, besides occasional donations, an annual grant of £707 from the Treasury. There is a separate Divinity Hall Library. One of the most valuable possessions of the University is the Hunterian Museum, bequeathed by the eminent physician William Hunter, and consisting of books, manuscripts, coins, paintings, anatomical preparations, zoological and mineral specimens, and archæological relics. Amongst the famous names on the roll of the University are those of John Major, Andrew Melville, James Melville, Boyd of Trochrig, Robert Baillie, Zachary Boyd, John Spottiswoode, Robert Simson, Francis Hutcheson, Adam Smith, Thomas Reid, William Cullen, and Joseph Black.

The University is a corporate body, consisting of a chancellor, rector, dean of faculties, principal, professors, and students. Its governing bodies are the University Court, the Senatus, and the General Council of Graduates, which last has, along with the Council of Aberdeen University, the privilege of sending a member to Parliament. The chancellor is elected for life by the General Council, over which he presides. The rector is chosen every third year by the matriculated students, divided for the purpose into four 'nations,' according to birthplace (*Natio Glottiana*, consisting of students born in Lanarkshire; *N. Transforthiana*, of those born N. of the Forth; *N. Rotheseiana*, of students from the counties of Bute, Renfrew, and Ayr; *N. Loudoniana*, of all students not included in the other nations). Another ancient system of nomenclature divided the students into four classes according to their year of study—the first year's class being designated *Bajan*; the second year's, *Semi*; the third, *Baccalour*; the fourth, *Magistrand*. The dean of faculties is elected yearly by the Senatus, and the principal is appointed for life by the crown. There are twenty-eight professors—nine in the faculty of arts, four in theology, two in law, and thirteen in medicine. The number of matriculated students in session 1875-76 was 1601, viz., in the faculty of arts, 942; in theology, 74; in medicine, 415; and in law, 170. Students of humanity, Greek, logic, ethics, and natural philosophy are *Togati*, wearing a red cloak or gown during the University session. The University has the power of conferring the following degrees—D.D., LL.D. (both honorary), M.A., B.D., LL.B., B.L., M.B., C.M., M.D., and B.Sc. It has in its gift over 230 bursaries, university prizes, and scholarships, of which the most considerable are fourteen Snell exhibitions of £110 each, which enable Glasgow students to proceed to Oxford, and four Clark scholarships, each worth £200 a year and tenable for four years.

Glass (Lat. *glacies*, 'ice') is an amorphous compound consisting essentially of silicates of sodium or potassium and calcium, and of other basic substances, which vary according to the nature and purposes for which the G. may be intended. G. is usually transparent, but by the admixture of various substances it may be prepared of an opaque white or any other desired colour. Its manufacture dates from a very remote antiquity, the earliest traces of it being found in Egypt. In the British Museum there is an amulet of G. bearing the name of Nuantef IV., a monarch of the eleventh dynasty, who, according to Lepsius, reigned between B.C. 2423 and 2380; and Sir J. Gardner Wilkinson states that representations of G. bottles containing red wine occur on monuments of the fourth dynasty, besides contemporary paintings illustrating all the processes of the manufacture. The British Museum also contains a G. vase from Nineveh, inscribed with the name of a king who reigned about B.C. 700. From Egypt the Phœnicians probably obtained the secret of the manufacture, and to them are attributed the numerous small vases of brilliantly coloured G. which are found in tombs on the shores of the Mediterranean. Both by the Egyptians and the Phœnicians beads of G. were very extensively fabricated, and used as a medium of barter with the barbarous races in the interior of Africa, and with the tribes of Western Europe. Among the later examples of Phœnician workmanship are numerous specimens in the form of fruit, heads, &c., which obviously have been prepared in moulds.

From these ancient centres a knowledge of G.-making travelled with the progress of civilisation into the various countries which border on the Mediterranean; and in Rome especially the art reached a high degree of excellence. The Romans applied the material to a great variety of purposes, including the glazing of windows. The splendid iridescence displayed by most of the ancient Roman G. is the result of a partial decomposition induced by its great age. The Romans moulded, engraved, and stained G., and combined opaque coloured G. into mosaics of great beauty, which were much used for lining walls and forming the floors of rooms. Engraving is found on G. vessels, cameos and intaglios in imitation of gems. The famous Portland or Barberini Vase in the British Museum is the most magnificent ancient example of cameo engraving, and shows the perfection of technique as well as artistic treatment to which the Romans attained. The estimation in which fine works in G. was held in Rome may be judged from the fact that the Emperor Nero paid 6000 sestertia for two small vases.

With the fall of the Roman Empire the glory of G.-making, as well as of many other important arts, passed away for centuries, although G. continued to be made at Constantinople. In mediæval times some highly prized vessels of G. manufactured at Damascus, gilt and enamelled, found their way into Western Europe, a few of which are still preserved. But it was not till towards the end of the 13th c. that the art again revived in Europe, and then at Venice it quickly attained an artistic perfection unequalled in classical times, and which cannot be rivalled by the knowledge, skill, and resources of the present age. It is probable that the fall of Constantinople in 1204 drove many workers in G. from that capital to settle in Venice, and thus gave the first impulse to the craft in that famous centre. In the earlier years the manufacture was chiefly confined to the fabrication of beads and imitations of precious stones and gems, and no authentic Venetian G. vessel of a date earlier than the middle of the 15th c. is known to exist. Ancient Venetian G. is generally very thin and light, being blown with marvellous skill into infinite varieties of graceful shapes. It is found to be very often ornamented in gold and enamel colours after the fashion of the Oriental G., which doubtless served as patterns for the early workers. The stems of the vessels were frequently worked in an elaborate manner in knots, wings, and various graceful and fantastic forms. The varieties of early Venetian G. have been thus classified by Mr. A. W. Franks:—1st, Vessels of transparent or of single-coloured G., the beauty of which depended on the skill of the blower. 2d, Gilt and enamelled G., which was necessarily made heavy to bear the heat of the enamelling kiln without losing its form. 3d, Cracked G., the rough surface of which was produced by sudden cooling when the object was half-blown, then reheating and expanding the cracked surface to its full size. 4th, Schmelz G., an opaque variety of mixed colours, imitating agates, jasper, chalcedony, and other stones. 5th, Millefiori or mosaic glass, made by combining numerous small rods of many colours of opaque G. into one cane, from which beads were made; or it was sometimes worked into vases and other forms. 6th, Reticulated or lace G. had fine threads of opaque, generally white, but sometimes coloured G., running through it. It was in making this variety that the greatest triumphs of the mediæval Venetian artists were attained.

The manufacture of decorative or artistic G. is known to have been prosecuted in France and Germany about the middle of the 16th c. The German works consist most frequently of large cylindrical cups of greenish G. ornamented in enamel colours with arms, heraldic devices, and figures. Vessels made in imitation of characteristic Venetian forms are wanting in the lightness and elegance which belong to the work of their Southern rivals. The beautiful ruby G. of Germany is said to have been first made in 1679 by Kunckel, the director of the G.-works at Potsdam, and one of the early specimens bears the cypher of Friedrich the Great.

Evidence exists that G. was manufactured in England as early as 1447, as in that year it was stipulated that for the windows of Beauchamp Chapel at Warwick there was to be used 'no glasse of England.' Stow the historian states that 'the first making of Venice glasses in England began in London about the beginning of the reign of Queen Elizabeth by one Jacob Vessalina, an Italian.' In 1670 under the patronage of

the Duke of Buckingham, a G.-work was established at Lambeth by Venetian workmen, and there bevelled mirrors in imitation of Venetian and coach G. were manufactured.

Manufacture of Glass.—G.-making, as conducted at the present day, embraces many distinct industries; the material has very numerous applications, and a large number of distinct styles of ornamentation are applied to it. The different varieties of G. may be classified as follows, the classification being based partly on composition, and partly also on method of manufacture and application:—1. Window G., including (*a*) sheet or rolled G., (*b*) crown G., (*c*) patent or blown plate G., (*d*) cast plate G. 2. Bottle G., including ordinary dark-green or 'black bottle' G., and the greenish-tinted G. used for aerated waters, acid carboys, &c. 3. Flint G., under which are included (*a*) crystal or cut table G., (*b*) pressed or moulded table G., (*c*) optical G., (*d*) Strass or paste G. 4. Enamel or opaque G. The raw materials and processes employed in the manufacture of these different varieties of G. will be briefly noticed under their respective heads. In the preparation of the molten material, or 'metal,' as it is termed, the following details and operations are common to all kinds of G.

The raw materials are melted in *pots*, which are placed in *furnaces* in the *G.-house*. The G.-house is usually a conical erection open at the top, and in the centre of the area is placed the furnace. As this construction is subject to an enormous heat, the bricks and fireclay of which it is built must be of the most refractory and infusible description. The arrangement of the furnace is modified in several particulars for the different kinds of G., but the accompanying plans of an ordinary window-G. furnace will serve to indicate the general features of the structure. The ground plan and perpendicular section of such a furnace are represented in the accompanying illustrations. It consists essentially of an arched space *A*, in the middle of which is the fire-grate *B*, above the *cave* or ash-pit *C*. On each side of the fire space are two raised banks or *sieges D*, on which are placed the pots *e*. Opposite each pot is a small

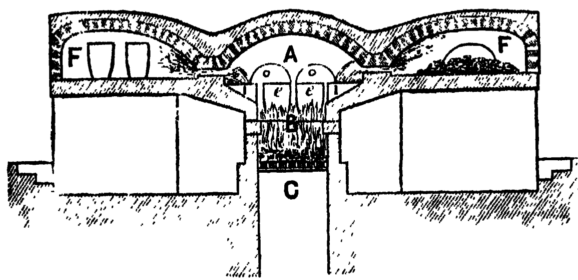


Fig. 1.—Section of Glass Furnace.

opening—the *work-hole*—through which the pots are charged and emptied. Between each work-hole there is a short dividing wall. The flame, after being reverberated from the arched roof on the surface of the G. pots, partly passes into two lateral

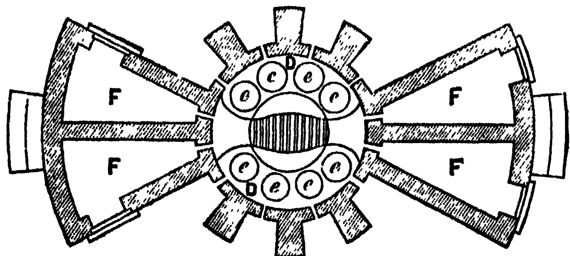

Fig. 2.—Ground Plan of Glass Furnace.

ovens *F*, called *arches*, in which new pots are prepared for being placed in the furnace, and the mixed ingredients for charging the pots are calcined and fritted. Two principal forms of pot or vessel in which the raw materials are melted are employed. The pot for bottle or ordinary window G. is an open vessel (*a*, Fig. 3) of the form of a truncated cone, the narrow end of which forms the bottom; but for melting flint G. a closed or covered pot (*b*, Fig. 3) is used, with a mouth or opening in its upper side towards the work-hole. The material of which melting-pots are made in this country is exclusively a kind of fire-clay obtained at Stourbridge, and their preparation is a work of the greatest labour and patience. The clay is ground up with a proportion of fragments of old pots to a fine dust, mixed with water, and left for some time in wooden bins to temper or sour, during which time it is periodically turned over and kneaded under the naked feet of the workmen. The pots are built up very gradually of small pieces firmly kneaded together, not more than from three or four inches in height being added to any pot in a day. After finishing they are allowed to dry very gradually in a loft, and subsequently the drying is completed in a heated chamber. They are then stored for a considerable time. Before being placed in position, they are taken to the annealing furnace or arch, in which they are slowly raised to a red heat, in which state they are moved as rapidly as possible into the furnace. The setting of a pot is not only a very critical but also a most laborious and difficult task, requiring severe exertion in the presence of a temperature which the workmen cannot endure more than a few moments at a time.

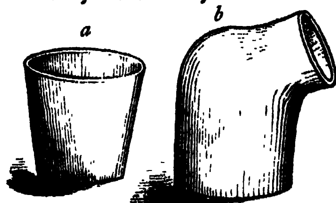

Fig. 3.

The various ingredients of G. are intimately mixed, and usually calcined or fritted in the arches—an operation in which carbonic acid and water are driven off, and a partial agglomeration effected. It is then in a succession of charges introduced into the pots, and all openings being closed up, the heat is forced as much as possible. From time to time test samples are withdrawn to determine the progress of vitrification. When the whole mass is reduced to a fluid condition, a scum consisting of the uncombined alkaline substances forms on the surface. This scum, which is termed G. gall or sandiver, is skimmed off. The molten mass is kept as highly fluid as is practicable for some time, to clear it and to expel all air-bubbles, after which the temperature is lowered to a point which renders the metal sufficiently viscous to be worked.

After G. has been fashioned into the form it is intended to retain by the processes hereafter indicated, it undergoes the operation of Annealing (q. v.). G. which is very suddenly cooled from the heat of fusion assumes the peculiar condition exemplified in the well-known Rupert's drops. These consist of drops of G. allowed to fall into water, when they assume a pear-like form. The G. is externally excessively hard, but if the smallest fraction is broken from the thin end, the whole mass crumbles into fine dust with explosive violence. This result is owing to the unequal tension of the molecules of the G., caused by rapid external cooling and setting, while the interior is yet hot and dilated. In the annealing furnace the material is first exposed to a high temperature, which by various expedients is so gradually lowered that all parts of the G. are throughout the process kept at a uniform and gradually-decreasing temperature. A method of annealing by which a hardened (improperly called a toughened) G. is prepared has been introduced and patented within very recent times by M. de la Bastie. Bastie's process consists in plunging the article to be annealed at a red heat into an oleaginous bath of high temperature, which, however, varies for different qualities and thicknesses of G. The effect produced is analogous to case hardening, a thin external skin of excessively hard G. being produced, by which the breaking strain of the material is very greatly increased. When, however, such hardened G. does fracture, it resolves itself into innumerable fragments like Rupert's drops, to which it is, indeed, analogous. Bastie's process can only be applied to G. made in one piece, and is consequently inapplicable to stalked vessels like wine-glasses, &c. It cannot be cut with the diamond.

Sheet Glass.—This, as well as *Crown G.*, noticed below, is a compound of silicates of sodium and calcium, the materials used for both being composed of 100 parts of sand, 35 to 40 of chalk, 30 to 35 of soda ash, and 100 to 150 of cullet, or fragments of broken G. All these materials, excepting the cullet, are mixed and fritted, as before mentioned, previous to their introduction into the melting-pot. When the metal is in a state fit for working, the blower gathers on the end of a long iron tube, in succes-

sive layers, a ball of G. sufficient for the sheet to be made. The ball, by manipulation on an iron table, assumes a pear form (*a*, Fig. 4), and the workman first moulds this mass by combined

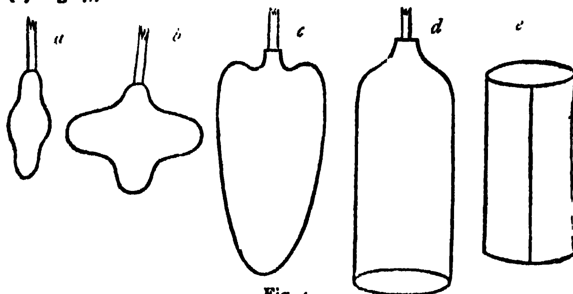

Fig. 4.

rotation and blowing into the form shown in *b*, and by degrees the cylinder is expanded till it assumes the form shown at *c*. Thereafter it is burst at the lower end, which is then opened out to the form shown at *d*. The neck is next detached from the blowing tube, and to obtain a cylinder open at both ends it is only necessary then to detach the shoulder or upper bent portion. This and the longitudinal slitting of the cylinder are accomplished by passing a red-hot iron around the neck and then along the surface of *e*. The opening of the cylinders is a subsequent operation, performed in a flattening or annealing furnace, which is divided into two compartments. In the first of these, the cylinders are gradually raised to a heat which allows of their being opened out flat on a smooth table in the lower part of the furnace, and when so flattened they are piled up in the next chamber for annealing.

Crown Glass is a much older form of window G. than the above, but sheets of only limited dimensions can be obtained from it. A globular gathering of metal is obtained on the end of the blowing tube, and this the blower distends till it forms a very flat spheroid. When so dilated, a solid rod tipped with a small piece of glass is attached to the nipple or prominence in the centre of the lower part of the spheroid, and the blowing tube is detached. The opening thus made is gradually enlarged, and the operative, holding the G. in front of a circular opening in the furnace, by a rapid twirling motion gradually still further spreads out the opened sides till it is ultimately flashed into a disc or flat circular table. By holding this disc in front of the furnace fire, and continuing the rapid rotation, centrifugal force expands the disc to a diameter of 5 to 6 feet, the sheet thus formed being remarkably smooth and of uniform thickness, except at the centre, where the 'bull's eye' or thick portion remains, on account of the slow motion of rotation at that point. Crown G. containing potassium is used for optical purposes.

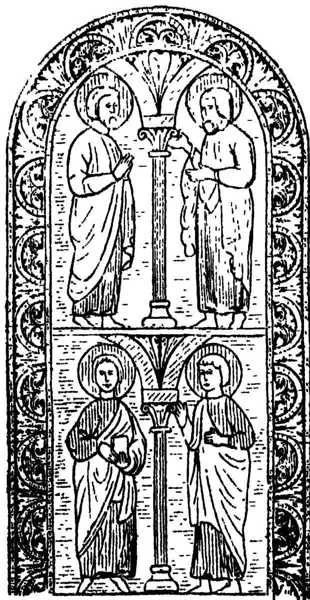
Patent Plate or *Polished Sheet Glass* consists of sheets of selected sheet G., which are smoothed by rubbing two together with emery powder placed between them, and subsequent polishing with very fine emery and rouge.

Plate Glass is generally of similar composition to crown and sheet, but it sometimes contains a small proportion of potash. The materials for this kind must be selected with great care, in order to produce a pure bright metal, as otherwise, owing to its thickness, any colour would be readily perceptible. The ingredients are usually 300 parts of pure white sand, 100 of carbonate of soda, 43 of slaked lime, to which about 300 parts of cullet are added. When the materials are thoroughly melted, the pots are taken from the furnace to the casting-table, on which the metal is poured out in front of a heavy iron roller. The roller is moved from end to end of the table, and spreads out the metal in a plate of uniform thickness, which thickness is regulated by strips of iron at the sides on which the roller moves. After solidifying sufficiently to bear removal, it is conveyed to the annealing furnace, and after annealing, the G. is in the condition of rough plate, frequently used for glazing roofs and other places where perfect transparency is not required. In this state the G. has a very wavy irregular surface, to remove which it has to undergo a tedious process of polishing. For this purpose one side of the plate is embedded in plaster of Paris, and the opposite surface is first ground to a uniform plane with sand and water. It is then polished by the aid of machinery with seven different qualities of emery powder, increasing in fineness, and the polishing is finished by means of fine rouge in a liquid state, and rubbing with the hand. Plates are made up to about 17 feet long by 10 wide, and in the rough state they vary from ⅛ to ⅞ of an inch in thickness. The polishing of plate G. makes the material necessarily much more expensive than ordinary kinds, but the mechanical improvements introduced in recent years have both greatly reduced its price, and rendered the production of sheets of great size practicable.

Bottle Glass, which varies in colour from the opaque dark green of the ordinary black bottle to the slightly tinged variety seen in acid carboys, soda-water bottles, &c., is a compound, of greater or less impurity, of numerous silicates. The materials for ordinary bottle G. are about 100 parts of ferruginous sand, 80 parts of soap-maker's waste, 5 of common clay, and 3 of rock salt. The G., therefore, consists of silicates of aluminum, calcium, iron, magnesium, and sodium. The olive-green tint of the clearer varieties of bottle G. made with more carefully selected materials is due to the presence of magnetic oxide of iron. The making of G. bottles is a very extensive industry, and although the bottles are partly fashioned in moulds, the processes involved are numerous, and demand great dexterity on the part of the workmen. Messrs. Chance of Birmingham at one time made a G. similar in appearance to black bottle G. from a kind of basalt called Rowley rag, and recently a patent has been obtained for utilising blast-furnace slag for the manufacture of bottles and similar articles.

Flint Glass is the type of those varieties which contain lead instead of the calcium or lime, and potash in place of soda is used. It is the glass generally used for table and decorative purposes, being remarkably brilliant and highly refractive. When it is massive and cut, it usually receives the name crystal or crystal G. It is very dense, and much more fusible than the other varieties of G., but it is comparatively soft, and scratches readily. In addition to being used as table G., it is much employed for optical purposes. According to the purpose for which it is designed, the proportion of lead used varies, but the following may be taken as the average quantities of the various ingredients:—300 parts of fine white sand, such as is obtained at Lynn in Norfolk, or from Fontainebleau in France; 200 of minium (red oxide of lead); 100 of pearl ash, or its equivalent in potash or other potassium salt; and about 30 of nitre. From a half to a third of cullet or broken glass is added to these materials. Flint G., as before mentioned, is always made in pots with covered or enclosed tops; and the materials, being thus screened from the direct action of the heat, are longer in melting than the charges in open pots, although the mixture is really much more fusible. Flint G. is fashioned into an innumerable variety of forms by the blowers, and within recent years moulded or pressed G. has attained a perfection which in sharpness of outline almost rivals the numerous articles made of cut flint G. *Strass* or *Paste* only differs from ordinary flint G. in having an excessively high proportion, never less than 53 per cent., of lead in its composition. On account of its high refractive power, it is employed to imitate the diamond, and, when properly coloured, other precious stones. See GEMS, IMITATION.

Enamel Glass consists of coloured or white G. rendered opaque by the addition of oxide of tin. It is prepared by first calcining at a low red heat a mixture of 1 part of tin with from 1 to 6 parts of lead, the ash so prepared being added to the other ordinary ingredients of G. Various other substances communicate opacity to G., among which may be mentioned phosphate of lime, which yields the opalescent shade used for thermometer scales, gas globes, &c.



Coloured Glass.—Many metallic oxides communicate various shades of colour to G. without destroying its transparency, but some colours so produced are so intense that only a thin coating of the coloured material can be flashed over a body of ordinary pure G. Thus we have two varieties of coloured G.—(1) Whole-coloured or pot-metal, and (2) flashed G. The flashing is accomplished by the workman first gathering a proportion of uncoloured metal on his blowing tube, which he then inserts into a pot of coloured G. He has thus a nucleus of uncoloured covered with a skin of coloured G.; and in blowing, both expand together, a stratum of coloured G. always remaining on the surface, thick in proportion to the quantities originally gathered. Red colours are obtained by means of chloride of gold, protoxide of copper, and iron oxide; yellows are yielded by antimo-

niate of potassium (G. of antimony), and various silver salts. Oxide of uranium yields a greenish yellow; blue is produced by oxide of cobalt, and sometimes oxide of copper; green results from chrome oxide, oxide of copper, and protoxide of iron; violet is yielded by black oxide of manganese; and from a mixture of oxides of iron, copper manganese, and cobalt, black is obtained.

Decoration of Glass.—G., in addition to the decorative forms it assumes under the hands of the skilled workman, is ornamented in several ways by operations not connected with the art of the G.-blower. In addition to painting in enamel colours and gilding, it is ornamented by cutting, engraving, and etching. Cutting is done on wheels with materials of varying degrees of fineness, and besides its decorative application, it is much resorted to in preparing G. for optical purposes. The G. is first ground with sand and water, and the rough surface so left is gradually smoothed and polished with increasingly fine emery powder, putty powder (oxide of tin), and rouge. G. engraving is done on small copper wheels, and in this art everything depends on the taste and artistic ability of the workman. G. etching or hyalography results from exposing certain surfaces of G. to the attacks of hydrofluoric acid, which combines with the silica. The sheet or article to be etched is covered with a protecting coat of wax; the pattern is then traced out, and the wax removed from the portions to be acted upon.

Water Glass or *Soluble Glass* consists of silicates of sodium or of potassium; but this material has neither the properties nor applications of ordinary G. It is soluble in water, and is used as a *dung substitute* in calico-printing; for rendering wood, linen, cotton, &c., uninflammable; as a cement; for preparing artificial stone; and as a basis for external paint-work, &c. See Neri, *De Arte Vitraria* (Amst. 1669); Vinnkel, *Vollständige Glasmacherkunst* (Nürn. 1785); Sauzay, *Marvels of Glassmaking in all Ages* (1870); and Apsley Pellat's *Curiosities of Glassmaking.*

Glass-Painting, the art of painting on transparent white or stained glass with vitrescent pigments. The colours employed are oxides or other combinations of metals, and nearly all of them are mixed or fused with fluxes and applied to the glass in a finely-powdered state in a vehicle of thickened oil of turpentine. G.-P. is practised by two methods, distinguished as the *mosaic* and the *enamel* methods. In the mosaic method several pieces of stained glass, either *pot metal* with the colour throughout, or *flashed*, that is, with only a coating of colour on one side, are joined together with ribs of lead, which add to the general effect by marking the outlines of the parts of the figure. A working drawing shows the disposition of the leads and pieces of coloured glass. The pieces of glass, first 'matted' or brushed over with tracing colour, are arranged on a sheet of plain glass over the cartoon, and shading and outlining details not expressed by leads are painted on, and graded lights are formed by removing the mat and clearing the glass. The colours are then burned into the glass in a kiln at red heat, after which the glass is allowed to cool slowly. The glazier next adjusts and solders the pieces in the leaden ribs. White glass stippled and hatched with colour is employed for flesh-tints in stained glass-work. In enamel G.-P. a large sheet of pure white glass is employed, and on it the outlines of the design are traced in a dark colour, and the enamel pigments are applied in varying thicknesses according to the depth of colour required. By red-heat firing the colours are fused on the surface of the glass, and are usually intensified by retouching and refiring.

Glass Painting in the Marienburg Church, Helmstadt.

The use of coloured glass in windows can be traced back to the 5th c. of our era. The earliest existing painted windows are believed to be those of the Abbey of Tegernsee in Bavaria, belonging to the 10th c. Early windows were formed by the mosaic method, and a striking feature in them is the intensity of the colours, among which ruby and blue predominate. The art of G.-P. was carried to great perfection in the 13th c., and it continued to flourish till the 16th c., when the use of semi-opaque enamel colours began. These furnished a greater variety of tints, but were inferior in beauty and brilliant transparency. The art declined in the 17th c. The 19th c., however, has witnessed a great revival of G.-P. in England, Germany, and France; and stained or painted glass is becoming a popular feature not only of ecclesiastical but of domestic decoration. See GLASS.

Glass'ites are a sect of Christians who derive their name from John Glass, who was born 1695, ordained minister of the Established Church at Tealing, Forfarshire, 1719, and died in 1773. For uttering views differing from those of the Church regarding the kingdom of Christ, Glass was deposed in 1730. A small body of his parishioners adhered to him, and the first Glassite congregation was formed. He maintained that all national establishments of religion 'were unlawful and utterly inconsistent with the true nature of the Church of Christ,' with other opinions which have since received the name of Voluntaryism. In regard to church government, he maintained 'that a congregation with its presbytery or eldership is in its discipline subject to no jurisdiction under heaven, but to Christ alone.' His followers were hence called Independents, but had no connection with the English Congregationalists, from whom indeed they differed on several points. The distinctive teaching of the sect was before long affected by the views of Robert Sandeman, Glass's son-in-law, from whom the sect received in England and America the name of Sandemanians. The chief tenets peculiar to the G., besides the above, are:—A plurality of pastors in each congregation, for which office no special education or separation from secular employment is required; a weekly observance of the Lord's Supper, with a love-feast between morning and evening services; the washing of each other's feet; and the kiss of charity to new members. They hold it unlawful to eat or drink with excommunicated members, to join in prayer with one not a brother or sister in Christ, to lay up treasure on earth, and to eat blood or things strangled. See Glass's *Testimony of the King of Martyrs* (1728), and *Acts of the Gen. Assembly.*

Glass-Snake (*Ophisaurus ventralis*), a species of *Lacertilia* or Lizards found in N. America, and so named from its snake-like aspect, the limbs being wanting. It is included in the family *Chalcidæ*, to which also belong several peculiar lizards, such as the *Chirotes* of Mexico, in which only the front limbs are developed; and the African *Bipes*, in which only the hind limbs are represented. The palate in the G.-S. is toothed, and two deep grooves extend along the sides of the body, which is marked with lines of black, yellow, and green, the belly being bright yellow, and the head mottled on its upper surface. The upper parts are occasionally black, and the under grey; but great variations of colour are observable. The name 'G.-S.' is derived from the brittle nature of the animal's body, the sudden contraction of the tail-muscles causing the body to break in two when the animal is incautiously handled. The common blindworm (*Anguis fragilis*) exhibits the same peculiarity. The G.-S. is very common in plantations, and is often dug up in autumn along with the sweet potato (*Convolvulus batatas*). It feeds on insects, smaller reptiles, &c.

Glass'wort, a common name for species of *Salicornia*, a genus of Chenopodiaceous marine plants. Several species grow abundantly on the coast in S. Europe and N. Africa, and yield a large quantity of soda, which is used in the manufacture of soda and glass, hence the popular name G. *S. herbacea*, not uncommon in salt marshes, is the only species indigenous to Britain. The *Salsola kali* (saltwort or prickly G.) and *Suæda maritima* (the white G. or sea-blite) are both British plants.

Glas'tonbury ('the town of the Glæstings'), a town in Somersetshire, 25 miles S.W. of Bath, and 158 from London by

rail, stands on the river Brue, on a height almost surrounded by marshes. It has several interesting buildings, among which are the Church of St. John the Baptist, with a tower 140 feet high, the Church of St. Benedict, and the ruins of the old abbey. The best-preserved part of the abbey is St. Joseph's Chapel, a very fine example of Transition architecture. Near the town is the Tor Hill, on which formerly stood the monastery of St. Michael, of which only a tower remains. The chief industry is the making of gloves, and leather, tiles, bricks, and pottery are also manufactured. The monastery was founded by Ine, King of Wessex, about the beginning of the 8th c., and probably took its name from the English family of the *Glaestings*, who had settled here. G. was a famous seat of learning in pre-Norman times, the story that a second St. Patrick had rested here making it the resort of many Irish scholars. Dunstan was born at G., and was for a time abbot of its monastery. It was long believed that King Arthur and Queen Guinevere were buried in the abbey, and their supposed tomb was visited by Henry II. In 1539 the monastery was seized, its abbot hanged, and its wealth confiscated by Henry VIII. Pop. (1871) 3670.

Glatz (Bohem. *Kladsko*), a fortified town of Silesia, Prussia, on the left bank of the Neisse, between the mouths of the Biela and Steina, 50 miles S.S.W. of Breslau by railway. It has an old castle 1070 feet above the sea, forts on the surrounding heights and on the opposite bank of the river, an old church with tombs of the Silesian dukes, three nunneries, large barracks, and manufactures of linens, damasks, plush, rose garlands, wooden wares, brandy, &c. The valley of the Neisse can be laid under water. Pop. (1871) 11,821 (including a garrison of 2000), most of whom are Roman Catholics. G. suffered in the Thirty Years' War, and capitulated to the Prussians in 1742.

Glau'ber's Salt. See SODA.

Glauch'au, the second manufacturing town in the kingdom of Saxony, on the Mulde, 15 miles W. of Chemnitz by railway. It has two castles, and its manufactures are chiefly cottons, woollens, mixed textiles, iron, and machinery. Pop. (1875) 21,743.

Glau'cium, a small genus of Herbaceous plants, belonging to the Poppy family, found generally on the sea-coasts of Europe and America. There are two British species, viz., *G. luteum*, the yellow horned poppy, and *G. phœniceum*, the scarlet horned poppy. Several species are cultivated for their showy flowers. Most of them have an acrid poisonous juice.

Glauco'ma (Gr. *glaukos*, 'sea-green'), a disease of the eye, the distinctive character of which is a green or greenish colour of the pupil. It occurs in cases of arthritic iritis, and in acute and chronic choroiditis, the eye presenting a green reflection behind the pupil. G. is generally a disease of the crystalline lens alone, but it is sometimes accompanied with Amaurosis (q. v.) from the very commencement.

Glau'cus (*Glaucus*), a beautiful genus of Gasteropodous *Mollusca*, belonging to the Nudibranchiate or 'naked-gilled' section of that class, and to the family *Æolidæ*, of which the nearly allied *Eolis* (q. v.) is the type. The G., of which *G. Pacificus* is a familiar example, is also named the 'sea-lizard.' Its colour is dark blue, streaked with white above, and pearly white on the under parts. The head is white with a median line of blue. The G. is very commonly met with floating in the Atlantic Ocean, and, according to Mr. F. D. Bennett, subsists on the jellyfishes, *Velellæ*, &c., which exist in immense numbers in the track of the ocean currents. The gills are supported on three stalks or lobes on each side of the body.

Glaux, the generic name of a pretty little Herbaceous plant of the Primrose family. It grows abundantly in salt marshes in Britain, hence its Latin name *G. maritima*, and its popular names sea-milkwort and black saltwort. G. has been used as a pickle.

Glaze. See POTTERY.

Glean'ing. It used to be thought that by the law of England the poor might glean on another's ground after harvest. It has now, however, been decided otherwise, the practice having been held to be productive of vagrancy and other evil consequences. But in spite of the legal authority, G. is generally allowed to the poor by the proprietors and farmers of England. At a meeting of farmers in Hertfordshire, August 11, 1845, certain hours of the day were fixed during which G. would be permitted, and a resolution was passed depriving able-bodied labourers between eighteen and sixty years old of the liberty. In Scotland it has been repeatedly decided that the poor have no legal right to glean.

Glebe (Lat. *gleba*, 'a clod or lump of earth') is the land belonging to a parish church in England, or of which the rector or vicar is seised in right of the church. By 5 and 6 Vict. c. 54, the Commissioners for the Commutation of Tithes (q. v.) are empowered, with consent of the ordinary and of the patron, to exchange the G. lands for others, if conveniently situated. The executor of an incumbent who has manured the G. lands and sown them with corn is entitled to the profits of the crop; but if the successor be inducted before severance of the crop from the ground, he is entitled to the tithe. In Scotland, as in England, the parish minister is generally entitled to a G. in addition to his stipend, but ministers in royal burghs proper cannot claim a G., unless there be a landward district annexed. The G. must be taken as near the manse and as convenient for the minister as possible, a provision intended for the benefit of the proprietors as well as of the incumbent, so that the latter is not entitled to choose remote lands on account of the superiority of the soil. The incumbent cannot alienate any part of the G., and in Scotland it is doubtful if he can make a feu contract (see FEU) regarding it. The court has refused to sanction this, even when the feu-duty offered was four times the agricultural rent, the reason being that the value of land continually increases, while that of money does the reverse. Trees in the G. are thought to belong to the incumbent.

Glee (Old Eng. *glig*), a vocal composition for three or more parts, each part being in a manner an independent melody. The great G. period was 1760–1830, and among G. writers may be named Callcott, Stevens, and Bishop.

Gleim, Johann Wilhelm Ludwig, a German poet, was born near Halberstadt, 2d April 1719. Till 1747, when he settled finally in Halberstadt as cathedral secretary, he had been engaged as tutor and secretary in families of distinction. G.'s indefatigable efforts to encourage poetical and literary promise, and his zeal in promoting German unity and national feeling, have, quite as much as his own writings, secured for him the affectionate title of *Father Gleim*, by which he is generally called. He died 18th February 1803. Of his own poems, his *Kriegslieder* (Berl. 1778) are by far the best. *Halladat*, a didactic poem, had appeared in 1774; and *Fabeln und Erzählungen* were posthumously published in 1810. G.'s *Sämmtliche Werke* were edited in 7 vols. (Halb. 1811–13; new ed. 8 vols. 1841) by by Körte, who also wrote his life (Halb. 1811).

Glei'witz, a garrison town in the S.E. of Prussian Silesia, on the Klodnitz, a branch of the Oder, 115 miles S.E. of Breslau by railway. It is the central point of trade in Upper Silesia, and has large coal and iron mining and smelting industries. Pop. (1871) 13,018, of whom many are Polish-speaking Jews.

Glencoe (Gael. *Glencòin*, 'the narrow pass,' not 'the vale of weeping'), a wild, solitary glen in the N. of Argyleshire, is traversed by the Cona of Ossian, which rises in a dreary tarn, and enters Loch Leven on the E. side at Invercol, the residence of Macdonald of G. The glen is enclosed by two lofty porphyritic ranges, and its mouth, fringed with beech, pine, and ash trees, looks out on Loch Leven to the island burial-place. *The Massacre of G.*—To break the power of the disaffected Highlanders in William's reign a plan was devised by the Earl of Breadalbane, and assented to by the Master of Stair, then Secretary of State, the former receiving £20,000 to gain the allegiance of the chiefs, while a proclamation was issued by the Privy Council declaring all to be traitors who did not take the oath by the 1st January 1692. Old Mac-Ian Macdonald of G. offered to do this at Fort-William only on the 1st January. He found that the sheriff was at Inverary, and this occasioned a further delay of a few days. The roll was then returned with a certificate explaining the delay. The certificate was suppressed, and G.'s oath deleted from the roll, for which more than suspicion attaches to Stair, who immediately procured the signature of William to an order 'to extirpate that set of thieves.' Some 120 soldiers, mostly Campbells, the sworn foes of the doomed clan, were quartered at G., and were received with unsuspecting hospitality. At four o'clock on the morning of the 12th February they massacred thirty-eight men and women, about 150 escaping to the hills. The

tale of perfidy and blood excited widespread indignation. A parliamentary inquiry was only averted by the nomination of a royal commission, which found (1695) 'that William's instructions afforded no warrant for the measure.' Stair was severely censured, but was left to be dealt with by the king. William was addressed to prosecute Glenlyon, Major Duncanson, Captain Drummond, &c., then in Flanders. And so the matter ended. See the histories of Macaulay and Burton; *Report of the Commission; Papers Illustrative of the Condition of the Highlands*, issued by the Maitland Club; and Paget's *Examen*.

Glendower', or **Glendwr, Owen**, or **Owen of Glendowerdy**, a Welsh leader who, in the reign of Henry IV., declared himself the descendant of the old Welsh princes, and stirred up a rebellion against the English, being provoked by Lord Grey de Ruthyn's seizure of part of his lands. 'The whole country rose at his call' (Green). G. strove with varied success until 1402, when he decoyed Lord Grey into an ambush and captured him, receiving 10,000 marks for his ransom. Along with Earl Percy (Hotspur) and his Scotch prisoner, Earl Douglas, he formed a conspiracy against Henry IV., but arrived too late to save his confederates from defeat at Shrewsbury in 1403. G. next entered into an alliance with Charles VI. of France against England in 1404, but this gave him no substantial aid, and after several years of perilous guerilla warfare, in which his fortunes alternately darkened and brightened, he was driven back when invading Shropshire and forced to fly to the mountains of Snowdon. He died in his daughter's house in 1415. So far as we can judge, G. seems to have been a brave, patriotic, and able, though rash and ambitious, leader. His character is portrayed in Shakespeare's *Henry IV.*

Glenliv'et, a valley in Banffshire, about 20 miles W.S.W. of Huntly, watered by the Livet, which joins the Avon, an affluent of the Spey. The whisky made in the district is deservedly famous.

Glenroy' is a narrow precipitous glen in the county of Inverness, Scotland, through which the Roy, a small tributary of the Spean, flows. It lies in the Lochaber district, a few miles N. of Ben Nevis. Its great interest arises from the three distinctly-marked terraces, known as the *Parallel Roads of G.*, which can be traced almost continuously on both sides of the valley. Each forms a gently sloping shelf from 3 to 30 feet in width, and the most striking characteristic of all is their absolutely constant level. The highest (1144 to 1155 feet) can be traced from the col, 1151 feet in height, at the head of G.—which forms the lowest part of the watershed between the Roy and the Spey—to Bohuntine Hill near the mouth of the glen. The second shelf (1062 to 1077 feet) runs parallel to the first, but can be traced round Glen Glaster, which opens into G. just below where the first road terminates. This second road corresponds in height to the col (1075 feet) at the S.E. end of Glen Glaster, which is part of the watershed between the Glaster and the Feitheil, a small tributary of the Spean. The third and lowest shelf (850 to 862 feet) can be traced right round Glen Roy, Glen Glaster, and Bohuntine Hill, and away eastward along Glen Spean to a little below Loch Laggan. It corresponds in height to the col (848 feet) at Muckall above Loch Laggan, which forms part of the watershed between the Spean and Maskie, a tributary of the Spey. In Glen Gloy, to the W. of G., is another similar road at a height of from 1156 to 1175 feet. The col at the head of this glen, which looks over to G., is 1172 feet above the sea-level.

The constant level at which each of these roads remains suggests at once that they have been the shores of former lakes or seas. The marine theory advanced by Darwin, who regarded the glens as former arms of the sea, is not now generally believed. The hypothesis which ascribes them to fresh-water lakes was first brought forward by Macculloch, and taken up by Sir T. Dick Lauder. They were forced to assume the former existence of gigantic barriers of *débris*, which were gradually washed away by the water, kept for more lengthened periods at the heights of the various shelves. The difficulties of this theory are, first, where did the *débris* come from; and second, where did it disappear to, without leaving even the slightest trace of its existence. Such difficulties do not exist in the bold speculation of Agassiz, who finds the necessary barrier in a huge glacier which slid down from Ben Nevis. This theory is supported by the numerous evidences of former glaciers in the district. Suppose a glacier to fill all the lower portion of G. up to where the highest road terminates above Glen Glaster. The water collected in the glen could escape only at the col at the head of G. Let the glacier now recede till it reaches the points where the second road terminates on Bohuntine Hill. Glen Glaster will now be open, and the waters will be discharged over the lower col at the head of that glen. Let the glacier now recede quite out of G. and stretch across Glen Spean below Roy Bridge. The water will then fall to the level of the lowest possible outlet, which is the col at Muckall above Loch Laggan. See Tyndall's Lecture in the *Pop. Science Rev.* (1876).

Glidd'on, George Robins, antiquarian and ethnologist, was born in Devonshire, England, in 1809. His father was United States' consul in Egypt, where he himself lived for twenty-three years, and filled for some time the post of vice-consul at Cairo. In 1840 he visited London, Paris, and the United States, where he lectured in all the principal cities on Egyptian antiquities. In 1857 he became agent of the Honduras Inter-Oceanic Railway, and died the same year, November 16, at Panama. His works are *Ancient Egypt, her Monuments, Hieroglyphics, History, and Archæology, &c.* (1850); *Discourses on Egyptian Archæology* (1841); *Memoir on the Cotton of Egypt* (1841); *Appeal to the Antiquaries on the Destruction of the Monuments of Egypt* (1841); *Otia Ægyptica* (1849); and, together with Dr. J. C. Nott of Mobile, Alabama, *Types of Mankind* (1854), and *Indigenous Races of the Earth* (1857). G.'s knowledge was great in certain directions, and his industry was unflagging; but his writings, especially the *Types of Mankind*, are so marred by bitter prejudice, rash speculation, and bad reasoning, that they have not been received even with the modified respect to which they are entitled.

Gli'res (pl. of Lat. *glis*, 'a dormouse'), a name formerly given by zoologists to an order of *Mammalia* (q. v.) now better known as *Rodentia* (q. v.) or gnawing quadrupeds. It is represented by the rats, mice, squirrels, porcupines, beavers, dormice, &c.

Globe (Lat. *globus*) is a round spherical body, and is frequently used as a synonym for the earth. *Artificial globes*, constructed of pasteboard, wood, metal, &c., are intended to give a clear notion of the arrangement of the stars and constellations in the heavens, or of the form of the earth, and of the true surface configuration of land and water. These are termed respectively *celestial* and *terrestrial* globes. In the celestial G. the constellations are not represented as they appear to an observer on the earth; they are drawn as viewed from the *outside*, and are therefore reversed. The Armillary Sphere (q. v.) is a particular form of G. in which all but certain important circles are cut away.

Globe-Fishes, the popular name applied collectively to various genera (*Diodon, Balistes, Tetraodon*, &c.) of Teleostean fishes, belonging to the division *Plectognathi* of that order, from the peculiar appearance of their bodies, produced by their inflating themselves with air. See DIODON, FILE-FISHES, &c.

Globe-Flower, the popular name given to *Trollius Europæus*, a Herbaceous perennial plant belonging to the natural order *Ranunculaceæ* (q. v.). It is not uncommon in mountainous pastures and open woods in sub-alpine districts throughout Britain; it is also abundant on the Swiss Alps. The G.-F. is frequently grown in gardens for its large globose, pale-yellow flowers. In Scotland it is called the 'lucken gowan.'

Globe-Flower (*Trollius Europæus*).

Globigeri'na, a very common genus of *Foraminifera* (q. v.) found in great abundance in existing oceans, and also in the true chalk formations. The latter are, in fact, made up in very considerable part of the minute shells of these Foraminifera. *G. bulloides* is the familiar species, and the G. of the chalk appear to be indistinguishable from

their existing representatives. It would appear from recent researches that the shells of G. in their perfect state have an outer coating of delicate spines, which become detached, when the shells fall to the bottom of the ocean, where they aid in forming the ever-accumulating mass of chalky ooze, which only requires elevation and consolidation to convert it into a true chalk deposit. The shell of the G. consists of a number of minute rounded spheres or chambers of limy matter, aggregated in an irregular fashion; the walls of the chambers being perforated for the emission of the *pseudopodia*, or extensions of the soft protoplasm of the body.

Glo'bus Hyster'icus, or **Ball in the Throat**, a term applied to one of the more marked symptoms of Hysteria (q. v.).

Glock'ner, Gross, the chief peak in the Noric Alps, 12,431 feet high, and on the border of Tyrol, Carinthia, and Salzburg in Upper Austria.

Glog'au, Gross, a fortified town in Prussian Silesia, on the Oder, 35 miles N.N.W. of Liegnitz by railway. It has a cathedral of 1120, beautifully situated on a river island; also a castle, two gymnasia, and manufactures of woollens, printed calicoes, tobacco, paper, sugar, &c. Pop., including the garrison (1871), 22,265. In Slavic, *glog* means 'the whitethorn,' and Glogau is therefore 'the town of the whitethorn.'

Glogg'nitz (Slav. 'the town of the whitethorn'), a market-town of Lower Austria, on the Schwarza, at the N. base of the Semmering Alps, 45 miles S.S.W. of Vienna by railway. It has a castle, and manufactures of machinery, white-lead, &c. G. is the station at the beginning of the ascent of the railway from Vienna to Trieste, which goes over the Semmering. Pop. (1869) 3777.

Glomm'en, the greatest river of Norway, rises in Lake Aursund, 2419 feet above the sea, flows first S.W., then S.E., and again S.W. into Skager Rack at Fredrikstad after a course of 400 miles. After being joined by the Vormen, it is called the *Stor-Elv* or 'great river.' Its course is much impeded by falls, of which the chief is Sarp-fos, 60 feet in descent, and 10 miles from the sea.

Glo'ria in Excel'sis (Angelic Hymn or Greater Doxology) originally consisted of its opening sentence, taken from Luke ii. 14. Variously ascribed to Telesphorus, Bishop of Rome (128–138), and to Hilary of Poictiers (350–367), it was probably adopted as a Eucharistic hymn in its present form in the 6th c. —**Gloria Patri**, or Little Doxology, which originally consisted of its first clause, taken from Matt. xxviii. 19, 20, in its present form is the result of the Arian controversy.

Glorio'sa (**Methon'ica** of some authors), a genus of Liliaceous climbing herbaceous plants, natives of India and Africa. All the species have remarkably handsome flowers, several of which are grown in hothouses. They are said to be extremely poisonous.

Glo'rious Vir'gin, or **St. Mary the Glorious**, an ecclesiastico-military order of knighthood in Venice, the organisation of which was sanctioned in 1260 by Pope Urban IV. The protection of widows and orphans, and the furtherance of the interests of Italy, were the objects of the society.

Gloss, in its first departure from the classical usage of Gr. *glōssa* 'tongue, speech,' meant a word requiring explanation, a book containing all such words with their explanations being a *glossary*. G. next came to mean the explanation itself, and thus to have its modern meaning of a note to any word or phrase, for the purpose of interpretation or illustration. Scripture glosses are of two kinds—(1) Explanations drawn from the Greek glossarists on words occurring in the Scriptures; (2) marginal notes, which in the Hebrew gave rise to some of the K'ri readings, and in the LXX. and the New Testament to a number of the various readings. There is still another meaning of G. in the history of exegesis. When the *catenæ* of comments, which were so common in the 6th c., became too copious, abridgments were compiled from them, which were called glosses. Such was the *Glossa Ordinaria* of Walafried Strabo (9th c.), a *marginal* G. The first *interlineary* G. was made by Anselm in the 12th c.

Glossi'tis (Gr. *glōssa*, 'the tongue'), inflammation of the tongue, is a rare affection, more particularly when occurring idiopathically; but it may result from acrid substances taken into the mouth, from the specific action of mercury, or from such zymotic diseases as scarlet-fever or small-pox. The tongue in such cases is greatly infiltrated with serum and blood, becomes much enlarged, causing inability to swallow or to speak, and even threatening suffocation. G. is frequently accompanied with profuse salivation. Treatment:—A long and free incision along the dorsum of the tongue, on either side of the medial line, should be made; but if the patient can swallow, saline purgatives should be administered first.

Gloss'op, a town of Derbyshire, England, on high ground to the N. of the Peak, and overlooking the Dinting Vale, 11 miles E.S.E. of Manchester by railway. It is the chief seat of the cotton industry in Derby, and has, besides, woollen and paper mills, iron-foundries, dyeworks, bleachfields, &c. Pop. (1871) 17,046.

Glott'is. This is the chink or opening forming the superior aperture of the Larynx (q. v.).

Gloucester, the titular name of several English historic families, of which the following are the most prominent members: —1. **Robert, Earl of G.**, a natural son of Henry I. He took the part of his sister Maud in the long civil war between her and Stephen, in obedience to the oath he had sworn to their common father; defeated and captured Stephen at Lincoln in 1141, but was himself made prisoner in the same year. He and Stephen were exchanged for each other. G. subsequently went to France to persuade Matilda's husband, the Comte d'Anjou, to come to her help. He did not succeed, but he brought back with him the young Prince Henry (afterwards Henry II.), and by his persistent efforts not only made it impossible for Stephen to securely maintain himself on the throne, but prepared the way for the succession of Matilda's son. He died 31st October 1147. G. was the Mæcenas of his age, and a man of great talent, sagacity, and accomplishment. To him William of Malmesbury dedicated his *History of the Kings of England*, and Geoffrey of Monmouth his *Historia Britonum*. The former closes his work with an eloquent tribute to the virtues and munificence of the Earl, while the latter pronounces him 'an accomplished scholar and philosopher, as well as a brave soldier and expert commander.'—2. **Gilbert de Clare, Earl of G. and Hertford**, fought at the battle of Lewes on the side of Simon de Montfort, Earl of Leicester. Afterwards he quarrelled with his leader, who justly suspected the sincerity of his alliance, and on the escape of Edward from captivity, put himself at the head of his forces and joined the Prince. He had a share in the victory of Evesham in 1265, where De Montfort was slain. A later revolt in which he was concerned cost him by way of penalty 20,000 marks. During the absence of Prince Edward in the East he was appointed chancellor of the kingdom by Henry III., and died in 1295. Like his father, a turbulent and fickle member of the baronage, G. lacked insight, conviction, and patriotism. His only son, **Gilbert, Earl of G.**, by his marriage with Johanna, daughter of Edward I., fell at Bannockburn in 1314—

> 'The Erl of Glousister ded was thar,
> That men callit Schir Gilbert of Clar.'
> —*Brus.* cvii. l. 27, 28.

3. **Thomas of Woodstock, Duke of G.**, youngest son of Edward III., was born 7th January 1355, and married Eleanor Bohun, eldest daughter of Humphrey, Earl of Hereford, Essex, and Northampton—a union which brought him great wealth and the dignity of Grand Constable of England. In 1377 he was made Earl of Buckingham, and in 1385 Duke of G. He was the head of the party among the nobles who wished to carry on the war with France, crushed the peace party, and by a bill of impeachment hurried its leader, the Earl of Suffolk, into exile and death. Popular resentment was aroused against him, and the young king, Richard II., threw off his guardianship. G. was seized and carried off to Calais, where he was murdered in September 1397.—4. **Humphrey, Duke of G.**, youngest son of Henry IV. by his marriage with the second daughter of Humphrey Bohun, became after the death of his brother, Henry V., guardian of the infant king, Henry VI., along with the Duke of Bedford (q. v.). While the latter carried on the war in France, G. governed the realm at home. On the death of Bedford in 1435, he became sole guardian of the king. He married Jacqueline of Brabant in 1425, divorced her in 1430, quarrelled with Burgundy, and after the marriage of Henry VI. with Margaret of Anjou, fell into disgrace through the intrigues of

the Bishop of Rochester, the Earl of Suffolk, and the Queen. Accused of high treason in 1446 and thrown into prison, he was one morning found dead in his bed. He was the leader of the war party among the English nobles, and as long as his great brother the Duke of Bedford was alive to be the terror of France, G.'s position was secure. But the disasters that followed Bedford's death made peace necessary, and enabled his enemies to accomplish his overthrow, and encouraged them to complete it with a crime.—5. **Richard, Duke of G.**, son of Richard, Duke of York, ascended the throne of England in 1483 as Richard III. (q. v.).—6. **William Henry, Duke of G.**, born 25th November 1743, was the third son of Frederick, Prince of Wales, a brother of George III., and was proclaimed Duke of G. in 1764. Two years later he was privately married to the widowed Countess of Waldegrave. This morganatic union was the cause of animated discussions in Parliament. His career was otherwise insignificant, and he died in dignified obscurity, 25th August 1805. His son, **William Frederick, Duke of G.**, born at Rome, 15th January 1776, distinguished himself in the campaign of 1799 in Holland, and married in 1816 the Princess Mary, a daughter of George III. He nevertheless ranged himself on the side of the Whig opposition, especially in the trial of Queen Caroline, but latterly went over to the Tories, and died childless at Bagshot Park, 30th November 1834.

Gloucester, Robert of, a monk of Gloucester Abbey who lived in the latter half of the 13th c., and wrote a chronicle of England from the siege of Troy to 1272. This work, which must have been composed after 1297, as the author alludes to the canonisation of St. Louis in that year, is largely based on Geoffrey of Monmouth's *Historia Britonum*, and is written in rhyming English verse, the lines being very long and somewhat irregular. It is cast in the Southern dialect, and is very free from Romance words. R. of G. is also held to have written metrical *Lives and Legends of the English Saints*. The only complete edition of his chronicle is that by Hearne (Oxford, 1724). Several of the *Lives of the Saints* appear in Furnivall's *Early English Poems* (1862). See Morris and Skeat's *Specimens of Early English* (Oxford, 1872).

Gloucester, the chief place in the county of G., stands in a fertile district on the left bank of the Severn, 114 miles W.N.W. of London by rail. It is a very handsome town, with several fine public buildings. The cathedral, begun in 1058 (and restored 1875), a beautiful building in various styles, is 427 feet long, 154 feet in extreme breadth, and has a fine tower 223 feet high, topped by four singularly graceful pinnacles. The choir is scarcely surpassed as an example of Perpendicular architecture, and its roof is covered with exquisite fan-tracery. There are twelve churches, several other places of worship, a theatre, assembly rooms, gaol, and lunatic asylum. The two channels of the Severn are spanned by two fine stone bridges, and the G. and Berkeley Canal enables large vessels to enter the docks. G. has considerable coasting and foreign trade. In 1875, 2785 vessels of 301,623 tons entered, and 3500 of 165,045 cleared. The chief imports are timber, corn, wine, and spirits; the chief exports, iron, coal, bricks, salt, malt, and pottery. There are brass and iron foundries, flour and saw mills, chemical, soap, marble, and slate works, tanneries, &c., and ship-building is also carried on. The city returns two members to Parliament. Pop. (1871) 18,341. G. was the British *Caer-Glow* ('the bright fortress'), the Roman '*colonia*' *Glevum*, and the *Gleaw-Ceaster* of the West Saxons, who occupied it about 580. It afterwards belonged to Mercia, and suffered greatly from the Danish invaders. It was a favourite abode of William I., was almost destroyed in 1087 during the struggle between William II. and his brother Robert, and supported Maud firmly against Stephen in 1141. Edward I., Richard II., and Henry IV. held parliaments at G., which stubbornly and successfully resisted the Royalists in the great civil war. The see of G. was united with that of Bristol in 1842. Many Roman remains have been found here.

Gloucester, a seaport of Massachusetts, U.S., 28 miles N.E. of Boston, with which it is connected by railway. It has a fine harbour, is much resorted to for summer bathing, and carries on a large fishing trade. In 1873 the produce of the fisheries amounted to $4,000,000. Pop. (1870) 15,389. G. was settled in 1623, incorporated a town in 1642, and became a city in 1874.

Gloucestershire, an inland county in the S.W. of England, bounded N. by Warwickshire and Worcestershire, E. by Oxfordshire, S. by Somersetshire and Wiltshire, and W. by Herefordshire and Monmouthshire. Area, 1258 sq. miles; pop. (1871) 534,640. The surface of G. is very varied. In the W. of the county is the picturesque sylvan district known as the Forest of Dean; along the river lies the rich grassy Vale of the Severn, and in the E. the Coteswold Hills (q. v.) separate the basins of the Severn and Thames. The formations are mainly oolite and lias, with new red and carboniferous limestone in the W. The chief rivers are the Severn, Wye, Upper and Lower Avon, the Churn, and the Thames or Isis, which drains the district E. of the Coteswolds. The climate is mild; the Vale of the Severn produces large crops of wheat, barley, and rye, and abounds in fruit, which ripens very early, while the Coteswolds afford excellent pasture. The chief products of G. are butter and cheese, and the G. cows and Coteswold sheep are famous breeds. Much cider is made in the Forest of Dean. The chief manufactures are woollens, cotton, and iron, brass, &c., at Bristol. The chief places are Gloucester, Bristol, Stroud, Cheltenham, Cirencester, Berkeley, and Tewkesbury. There are many Roman relics and remains of British, Old English, and Danish works. The county returns four members to Parliament.

Glove, a word of uncertain origin, but probably meaning a covering for the hand, and perhaps connected with the Scotch *loof*. Gloves appear to have been worn in England early in the 11th, but were not common till the 13th c. White silk gloves beautifully embroidered and jewelled were worn by the clergy. In the 16th c. New Year's gifts took the form of gloves, and when money was given it was called 'G.-money.' Leather is the chief material of which gloves are now made—silk, cotton, and worsted, however, being also used. The manufacture of gloves in England is conducted at the following places:—Worcester, Yeovil, Ludlow, and London for leather; Derby and Nottingham for cotton and silk; and Leicester for mixed woollen gloves. Large quantities of leather gloves are made in France, Belgium, Denmark, and Italy. Britain imported in 1874 from Continental countries, especially France, 1,126,078 dozen pairs of leather gloves, valued at £1,546,716. The finest leather G. is made of the skin of the sucking kid. Cheap 'kid' gloves are invariably made of fine thin lambskin, and 'dogskin' gloves of ordinary sheepskin. Cheveril, the skin of the young goat, buckskin, doeskin, and shamoyed leather are also used for G.-making. Kid is cured and rendered soft and pliable by 'tawing' in a paste consisting of wheaten flour, egg yolk, alum, common salt, and water. Spotted kid is unsuitable for white or delicately-dyed gloves, it is therefore dyed of a dark colour. In 'cutting out' care is taken to have as little waste as possible, and in this the French excel. Kid gloves may be cleaned by stretching them on a wooden stock and rubbing them over with benzine, spirits of turpentine, or with an inodorous composition of one part of soap shavings dissolved in two parts of distilled water, to which a small quantity of ammonia is added.

Glov'er, Richard, an English poet, born at London in 1712, became a merchant in his native city, entered Parliament as member for Weymouth in 1760, and died in 1785. His chief poem, *Leonidas*, published in his twenty-fifth year, is a serious epic, was popular for a generation, and passed through several editions, but has now dropped out of human remembrance. A continuation entitled the *Atheniad*, which appeared two years after G.'s death, is equally forgotten; but his ballad of *Hosier's Ghost* (1739), intended to rouse the national feeling against Spain, has still some faint vitality, though not enough to awaken interest. G. also wrote two tragedies, *Boadicea* and *Medea*.

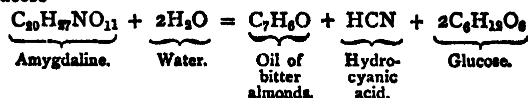
Glow-Worm (*Lampyris noctiluca*), a genus of insects belonging to the *Coleoptera* or Beetle order, and to the family *Lampyridæ*, in which the body is long and flat, the head small, the chest or thorax extending over the head, and the antennæ toothed. In the genus *Lampyris* itself, no rostrum or beak exists, and the females are wingless. Both males and females are luminous, although the males do not emit such brilliant phosphorescence as their mates. The females are grub or larva-like, and their appearance has suggested the popular name, 'glow-*worm*.' The light appears to be emitted from the extremity of the abdomen, and its function is supposed to be that of guiding the males to their mates. The female G.-W. attains a length of about half an inch, and is of a

blackish colour, the legs being red. The eyes of the male are very prominent. The larva feeds on snails, slugs, and other insects, and has a kind of brush-like appendage attached to the abdomen. The G.-W. is common in the S. of England, and is but rarely found in Scotland. See also FIRE-FLY and PHOSPHORESCENCE, ANIMAL.

Gloxin'ia, a genus of tropical American plants belonging to the order *Gesneraceæ* (q. v.), several species of which are grown in British hothouses for their richly-coloured foliage and graceful flowers.

Gluchov', a town in the S. of Russia, on an affluent of the Seim, 112 miles E. of Tchernigov. It stands in a fertile district, is girt by an earth-wall, and has cloth manufactures and a trade in corn and brandy made from a fine kind of cherry. Fine porcelain clay is found in the vicinity. Pop. about 9000.

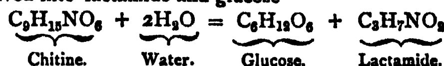
Gluci'na. See GLUCINUM.



Gluci'num, or **Beryll'ium**, is a comparatively rare metal contained in certain precious stones and minerals. The emerald is a double silicate of aluminum and G., coloured green by a small quantity of chromium. Beryl has much the same composition, but is paler in colour than the emerald. Chrysoberyl is a compound of the oxides of aluminum and G. G. is also contained in euclase, gadolinite, leucophane, phenacite, helvine, &c. G., or rather its oxide glucina, was discovered in the year 1797 by Vauquelin in the emerald. Metallic G. was obtained by Wöhler in 1827 by the action of potassium on its fused chloride. It is a white, very light metal (sp. gr. 2·1), and may be hammered into leaves and rolled at ordinary temperatures. It does not decompose water even at a red heat. Its atomic weight is 9·25, and the symbol for its atom Gl or Be. In its chemical properties it resembles on the one hand magnesium, on the other aluminum. The first observers, indeed, mistook its oxide (glucina) for the oxide of aluminum (alumina). Glucina (GlO) is obtained from beryl by fusing that mineral with carbonate of soda. The fused mass is then dissolved in water acidulated with hydrochloric acid, and evaporated to dryness, to render the silica insoluble. It is again dissolved in water, the solution filtered from the silica, and carbonate of ammonia is added in excess; this precipitates alumina, but dissolves the glucina. On cooling the solution, carbonate of glucina ($GlCO_3$) separates as a white precipitate, and this when heated gives up carbonic acid, and glucina (GlO) remains. The salts of G. are characterised by their sweet taste—whence the name of the element.

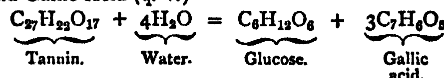
Gluck, Christoph Willibald, Ritter von, a famous musical composer, was born at Weidenwang, near Neumarkt, in the Upper Palatinate, Germany, 2d July 1714. When only three years old, his father removed to Bohemia, where G. received his education. At the age of twenty-two he went to Vienna, where Prince Melzi of Lombardy having heard him sing and play, brought him to Italy and put him under the training of Sammartini of Milan, then a very celebrated teacher. Here he brought out his first opera, *Artaserse* (1741). It was followed by seven others in the received Italian style. Meanwhile, he had gone to London, where his fame had preceded him, but in 1746 returned to the Continent. His great triumphs were achieved in Vienna and Paris. He conceived the design of reforming the abuses of the existing opera, and began to compose works after a nobler and fuller plan. Genius, industry, and a quick impetuous mind fitted him for this task. He studied literature, and especially poetry with earnestness, and was much furthered in his projects by the poet who wrote his librettos. His great operas, which give him the right to be called the founder of 'a new era in dramatic music,' are *Orpheus and Eurydice*; *Alcestis* (1762); *Iphigenia in Aulis* (1774); *Armide* (1777); and *Iphigenia in Tauris* (1779). G. died at Vienna, 15th November 1787. See Schmid's *Christoph Willibad, Ritter von G.* (Leips. 1854).

Glück'stadt, a port of Slesvig-Holstein, Prussia, on the Elbe, near the Kremper Marsh, 30 miles N.W. of Hamburg. It has harbour room for 200 vessels, is intersected by canals, and sends out ships to the whale-fishing. Pop. (1871) 5073. G., which was formerly the chief town in the duchy of Holstein, was founded in 1620, and had fortifications till 1815.



Glu'cosides. The G. form a large group of substances derived from animal or vegetable products. They possess the common property of yielding Glucose (q. v.) and other products when they are boiled with dilute acids, or are acted on by certain ferments. They may be regarded as ethers of glucose. Most of them occur in the vegetable kingdom, comparatively few are of animal origin. The majority contain the elements carbon, hydrogen, and oxygen only; others contain nitrogen and a few other elements. None of the G. have been prepared artificially. The following are among the most interesting:—

Amygdaline, a crystalline body occurring in bitter almonds. When gently warmed in aqueous solution with *emulsine* (the ferment which occurs along with it in the almond), amygdaline is resolved into oil of bitter almonds, hydrocyanic acid, and glucose—

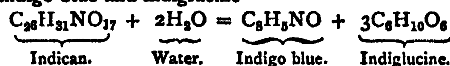


$$\underbrace{C_{20}H_{27}NO_{11}}_{\text{Amygdaline.}} + \underbrace{2H_2O}_{\text{Water.}} = \underbrace{C_7H_6O}_{\text{Oil of bitter almonds.}} + \underbrace{HCN}_{\text{Hydrocyanic acid.}} + \underbrace{2C_6H_{12}O_6}_{\text{Glucose.}}$$

Chitine (q. v.), the substance forming the solid parts of insects. When boiled with dilute acids, it takes up water and is resolved into lactamide and glucose—

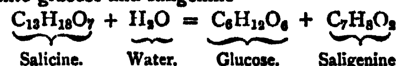
$$\underbrace{C_9H_{15}NO_6}_{\text{Chitine.}} + \underbrace{2H_2O}_{\text{Water.}} = \underbrace{C_6H_{12}O_6}_{\text{Glucose.}} + \underbrace{C_3H_7NO_3}_{\text{Lactamide.}}$$

Gallotannic Acid or Tannin (q. v.) is contained in gall-nuts. When boiled with dilute acids, it takes up water and yields glucose and Gallic Acid (q. v.)—



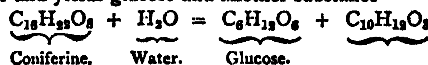
$$\underbrace{C_{27}H_{22}O_{17}}_{\text{Tannin.}} + \underbrace{4H_2O}_{\text{Water.}} = \underbrace{C_6H_{12}O_6}_{\text{Glucose.}} + \underbrace{3C_7H_6O_5}_{\text{Gallic acid.}}$$

Myronate of Potash is contained in the seeds of the black mustard, and is resolved by the action of *myrosine* (a ferment) which occurs along with it in the mustard-seed) into sulphocyanate of allyl (oil of mustard), acid sulphate of potash, and glucose—



$$\underbrace{C_{10}H_{18}KNS_2O_{10}}_{\text{Myronate of potash.}} = \underbrace{C_3H_5CNS}_{\text{Oil of mustard.}} + \underbrace{KHSO_4}_{\text{Acid sulphate of potash.}} + \underbrace{C_6H_{12}O_6}_{\text{Glucose.}}$$

Indican, a colourless substance occurring in woad (*Isatis tinctoria*). Boiled with dilute acids, it takes up water and yields indigo blue and indiglucine—



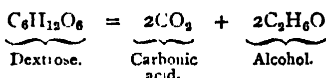
$$\underbrace{C_{26}H_{31}NO_{17}}_{\text{Indican.}} + \underbrace{2H_2O}_{\text{Water.}} = \underbrace{C_8H_5NO}_{\text{Indigo blue.}} + \underbrace{3C_6H_{10}O_6}_{\text{Indiglucine.}}$$

Salicine, a crystalline substance occurring in the leaves and young bark of the poplar. When boiled with emulsine (the ferment contained in bitter almonds), it takes up water and is resolved into glucose and saligenine—

$$\underbrace{C_{13}H_{18}O_7}_{\text{Salicine.}} + \underbrace{H_2O}_{\text{Water.}} = \underbrace{C_6H_{12}O_6}_{\text{Glucose.}} + \underbrace{C_7H_8O_2}_{\text{Saligenine.}}$$

Coniferine, the crystalline principle contained in the different species of the pine-tree. When treated with emulsine, it takes up water and yields glucose and another substance—

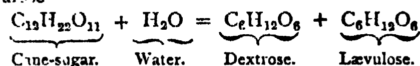
$$\underbrace{C_{16}H_{22}O_8}_{\text{Coniferine.}} + \underbrace{H_2O}_{\text{Water.}} = \underbrace{C_6H_{12}O_6}_{\text{Glucose.}} + C_{10}H_{12}O_3$$



The substance thus obtained along with glucose when oxidised with a mixture of bichromate of potash and sulphuric acid is converted into *vanilline* ($C_8H_8O_3$), the aromatic principle of vanilla.

Glu'cose. Under this title are included several distinct substances having the common formula $C_6H_{12}O_6$. They more or less closely resemble one another in their properties, and are either directly or indirectly prepared from animal or vegetable products. The most important members of the family of glucoses are the following:—

Ordinary G., Dextrose, or Grape-Sugar.—This occurs in considerable quantity in the juice of ripe fruits, especially in that of the grape; associated with lævulose in unripe fruits and in honey; and in considerable quantity in the urine of patients suffering from diabetes. It may be obtained by boiling starch, Dextrine (q. v.), Cellulose (q. v.), and cane-sugar with dilute acids, but in the case of cane-sugar lævulose is also produced. It may be prepared from the *Glucosides* (q. v.) by a similar treatment. Dextrose may be extracted from honey which has



become crystalline, by treating it with cold alcohol to dissolve lævulose, and then boiling the residue with alcohol. The solution on cooling deposits dextrose in crystals. To prepare dextrose from starch, 1 part of that substance, 4 parts of water, and from $\frac{1}{100}$th to $\frac{1}{10}$th part of sulphuric acid are boiled together for from six to thirty-six hours. The liquid is then neutralised with chalk, filtered, decolorised with animal charcoal, and evaporated to a syrup. From this syrup dextrose very slowly separates in the crystalline state. The conversion of starch into dextrose is also accomplished during the germination of seeds, and is brought about by the action of a peculiar ferment called *Diastase* (q. v.).

Dextrose crystallises from its aqueous solution in warty masses. These crystals contain a molecule of water of crystallisation, and therefore have the formula $C_6H_{12}O_6H_2O$. The water of crystallisation is driven off by exposing the dextrose to a temperature of 60° C. in dry air. Dextrose is characterised by the property possessed by its solution of rotating the plane of a ray of polarised light to the right (whence its name). It is less sweet and less soluble than cane-sugar. Heated to 170° C. it loses a molecule of water and becomes *glucosan* ($C_6H_{10}O_5$). At a higher temperature it loses more water and is converted into caramel and other products. It forms crystalline compounds with lime, baryta, oxide of lead, &c., and with certain salts—chloride of sodium or common salt, for instance. Boiled with a solution of caustic potash and sulphate of copper (or any other cupric compound), dextrose is rapidly oxidised, and the copper salt is reduced to red cuprous oxide (Cu_2O). Upon this reaction is based the ordinary qualitative and quantitative test for dextrose. Cane-sugar does not reduce the alkaline copper solution. A dilute solution of dextrose mixed with yeast, and maintained at a temperature of from 21-26° C., ferments, and is resolved into alcohol and carbonic acid—

$$\underbrace{C_6H_{12}O_6}_{\text{Dextrose.}} = \underbrace{2CO_2}_{\text{Carbonic acid.}} + \underbrace{2C_2H_6O}_{\text{Alcohol.}}$$

Lævulose generally occurs with dextrose. It is present along with that body in honey and in the juice of fruits. It is obtained in equal quantities with dextrose when cane-sugar is boiled with dilute acids. The mixture of the two sugars thus prepared is called *inverted* sugar. The dilute acid simply causes the cane-sugar to take up water, and to split into equal parts of dextrose and lævulose—

$$\underbrace{C_{12}H_{22}O_{11}}_{\text{Cane-sugar.}} + \underbrace{H_2O}_{\text{Water.}} = \underbrace{C_6H_{12}O_6}_{\text{Dextrose.}} + \underbrace{C_6H_{12}O_6}_{\text{Lævulose.}}$$

Lævulose may be separated from dextrose by taking advantage of the property it possesses, of forming an insoluble compound with lime. The inverted sugar obtained from 10 grammes of cane-sugar is mixed with 6 grammes of slaked lime and 100 grammes of water. A solution at first results, but after a time the whole of the lævulose separates, in combination with the lime, as a white precipitate. This is separated from the soluble lime compound of the dextrose by pressure, and is decomposed by an equivalent quantity of oxalic acid dissolved in water. Lævulose remains in solution, and by evaporating off the water may be obtained as an uncrystallisable syrup. In most of its properties lævulose resembles dextrose. It is distinguished from dextrose, however, by its action on polarised light, its solution rotating the polarised ray to the left; also by its forming the insoluble lime compound before alluded to, and by its fermenting less rapidly than dextrose.

Galactose, produced by boiling sugar of milk (see LACTOSE) with dilute acids, is more readily crystallisable than dextrose, ferments with greater rapidity, and has a greater dextro-rotatory power on the polarised ray. Unlike dextrose and lævulose, it does not yield saccharic acid when oxidised with nitric acid, but an isomeric substance called mucic acid.

Maltose, a variety of dextrose, produced by the action of diastase on starch, differs from dextrose only in its greater dextro-rotatory power. It is converted into dextrose by boiling with dilute acids. The other glucoses are unimportant.

Mannitose is produced by the slow oxidation of Mannite (q. v.) by platinum black.

Inosite occurs in the muscles of the heart and other organs, also in green kidney-beans and in the unripe fruit of several plants. It does not ferment with yeast.

Sorbin occurs in the juice of ripe berries of the mountain-ash. It does not ferment with yeast.

Eucalyn, an uncrystallisable and unfermentable glucose, separates during the fermentation of melitose—a variety of saccharose occurring in the Tasmanian eucalyptus. It is dextro-rotatory.

Glucosu'ria. See DIABETES.

Glue, Marine. In shipbuilding and other arts glue is required that will resist the solvent action of water. M. G., having no gelatine in its composition, meets this requirement. It is prepared by dissolving caoutchouc in naphtha, and adding shell-lac to the solution.

Glume, the term applied to the outer scales of the flowers of Grasses (q. v.) and sedges. (See CAREX.) Hence these plants have been placed in the Monocotyledonous sub-class *Glumiferæ*.

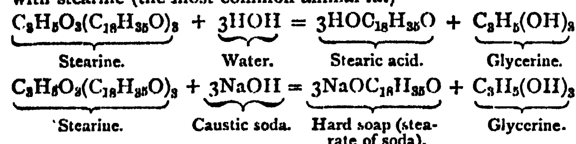
Glutæ'us (Gr. *gloutos*, 'the buttock') is a term applied to various muscles which form that region.. In man they are three in number, viz., the G. maximus, the G. medius, and the G. minimus—of which the first is the chief extensor of the hip-joint, while the two latter remove the thigh from the median plane of the body (that is, they are *abductors*), and they assist in supporting the body on one limb during the act of walking.

Glu'ten (Lat.) is readily obtained from white fibrous tissue and from the animal part of bone. It forms a thick jelly from a solution 1 part to 100 of water; and tannic acid forms a cheesy precipitate with it, even when added to a solution of the strength of 1 part of G. to 5000 of water. Creosote gives with G. a 'milky turbidity.' By boiling G. in caustic potash it is decomposed, and along with the escape of ammonia, glycine and leucine are produced. Chondrin is obtained from cartilage alone, and most acids which have no effect on G. will precipitate chondrin. Gelatine cannot be detected in the blood or in the healthy tissues of the body. Probably gelatinous compounds are formed from the protean or albuminous ones, when the latter are converted into fibrous tissue. Modern physiologists incline to the belief that gelatinous compounds never serve as a formative basis for any of the structures of the body, but are to be simply regarded as presenting material for vital combustion. Again, the gelatinous tissues are never associated in the living body with other than purely mechanical uses, exemplified by their forming ligaments for the union of bones, whereas vital and actively functional organs are of albuminous composition.

Glutt'on (*Gulo luscus*), a genus of Carnivorous *Mammalia*, belonging to the family *Mustelidæ* (q. v.), or that of the Weasels (q. v.), and also known by the name of wolverene. The popular name of the animal originated from the tales of its ferocity, which are now well ascertained to be without foundation. It was said to pounce upon animals from the branches of trees, and to exceed larger carnivora in its rapacity. The G. inhabits N. America, Siberia, and N. Europe. It is of bear-like aspect, and attains a length of about 2½ feet. Its fur is a brownish-black, the muzzle and paws black, the large claws white and lustrous, and highly esteemed as ornaments by savages. A lightish-brown band runs across the head from ear to ear. The paws are large when compared with the size of the body. The tail is short and somewhat bushy, and a rudimentary anal gland exists. The ears are short and rounded. The teeth number six incisors, two canines, and eight premolars in each jaw; while two upper and four lower molars are developed. The food of the G. consists of small quadrupeds; and the flesh of the beaver in particular is said to be a favourite, while it causes much annoyance to the fur-trappers by stealing their bait, and taking the captured animals out of the traps. The G. itself is caught in traps, and its fur is highly valued. The young, numbering two at each birth, are born in May.

Glutton.

Glyce'ria, a genus of Grasses (q. v.). See MANNA GRASS.

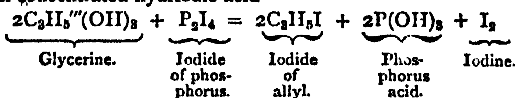


Glycerine was first obtained in the year 1779 by Scheele by boiling fats with oxide of lead and water, and was called by him *the sweet principle of oils*. All the oils and fats occurring in

nature which can be *saponified—i.e.*, which yield soap when boiled with an alkali—are ethers of G. These compounds are all formed on the same type or plan, and may be represented by the formula $C_3H_5O_3F_3$, where F. denotes the radical of a fatty acid. When these bodies are boiled with an alkali (caustic soda, for example) they are resolved into three molecules of the alkaline salt of the fatty acid (*soap*), and one molecule of G.—

The old process for preparing G. consisted in heating olive oil with litharge (oxide of lead) and water. The oxide of lead gradually decomposed the oil, and united with its fatty acid (oleic acid) to form insoluble oleate of lead (lead plaster), whilst the G. remained in solution, and was purified by removing traces of lead by a current of sulphuretted hydrogen, and concentrating to remove water.

This process, however, is now entirely superseded by a method indicated by Guy-Lussac and Chevreul in 1825, but first carried out on the manufacturing scale by Wilson and Payne in 1854. This method consists in heating fats in copper or iron stills, and passing a current of superheated steam through them, at such a temperature that a thermometer placed in the still stands at from 288–315° C. Under these conditions the fats absorb water, and are resolved into fatty acid and G.—a reaction precisely similar to the saponification of a fat by an alkali. Thus with stearine (the most common animal fat)—

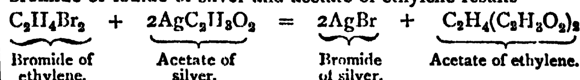


Both the fatty acid and G. are carried over with the steam, and are found in the condenser. The fatty acids, being specifically lighter than the solution of G., rise to the surface, and are removed by decantation. The solution of G. is concentrated by evaporation.

Pure G. is a colourless syruppy liquid of sp. gr. 1·260 at 15° C. Occasionally crystals of G. separate from cold liquid G., but the exact conditions necessary for the formation of this crystalline G. are not understood. G. rapidly attracts moisture from the air, and for this reason is often employed as an application in cases of chapped hands, cracked lips, &c., in order that the skin may be kept moist. It has also been employed in the manufacture of moist water-colours, which retain their consistency in a dry atmosphere.

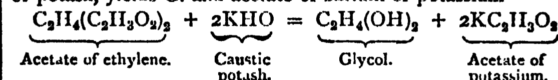
When heated, a certain quantity of G. volatilises unchanged; but the greater part is decomposed into acrolein and other products. G. cannot therefore be distilled under ordinary conditions, but in vacuo it passes over unchanged.

G. is a triatomic alcohol (see ALCOHOLS), and contains a radical called glyceryl (C_3H_5'''), which under certain conditions becomes monatomic, and is then called allyl. Iodide of allyl (C_3H_5) is prepared by acting on G. with phosphorus and iodine, or with concentrated hydriodic acid—



From the iodide of allyl thus prepared Oil of Mustard (q. v.) and Oil of Garlic (see GARLIC, OIL OF) have been obtained.

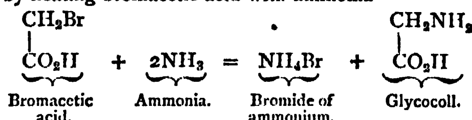
Ethers of G. are obtained by heating it with the corresponding acids, and in this manner Berthollet succeeded in preparing fats artificially.



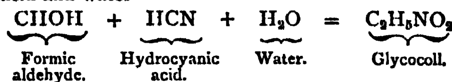
The following are among the most interesting derivations of glyceryl and allyl:—Glycerine $C_3H_5(OH)_3$; monochloryhydrine $C_3H_5(OH)_2Cl$; dichlorhydrine $C_3H_5(OH)Cl_2$; trichlorhydrine $C_3H_5Cl_3$; acrolein C_3H_4O; acrylic acid $C_3H_4O_2$; glyceric acid $C_3H_6O_4$; allyl alcohol C_3H_5OH; iodide of allyl C_3H_5I; oil of garlic (sulphide of allyl) $(C_3H_5)_2S$; oil of mustard (sulphocyanate of allyl) C_3H_5CNS.

Glyc'ogen, a substance identical in chemical composition with starch, found in the liver, placenta, tissues of the embryo, and in many of the tissues of the adult. Its formula is $C_6H_{10}O_5$, and when separated from the liver is a white mealy powder. It is insoluble in alcohol, and is turned brownish-red by the action of iodine. Regarding its important physiological relations, see LIVER. Bernard, its discoverer, believes that G. is converted into sugar either by a ferment present in the liver or in the blood. G. is isomeric with starch, both having the composition represented by the formula $C_6H_{10}O_5$. It may be obtained from the liver by washing it with water, straining and filtering the aqueous extract and precipitation with alcohol. The G., separating in white flocks, is purified by boiling it with potash; dissolving in acetic acid, re-precipitating with alcohol, and subsequent treatment with ether, give a white amorphous substance closely resembling starch in appearance and properties. It is, however, coloured brownish red by iodine, and not blue, as is the case with starch. Boiled with dilute acids, it yields dextrine (or a substance closely resembling it), and later dextrose.

Glyc'ol. This substance was discovered in the year 1856 by Würz, and was the first diatomic alcohol obtained. (See ALCOHOLS.) To prepare it, bromide or iodide of ethylene is heated for some days with acetate of silver and acetic acid, when bromide or iodide of silver and acetate of ethylene results—



The acetate of ethylene thus prepared, when boiled with baryta or potash, yields G. and acetate of barium or potassium—



G. is a colourless, inodorous, slightly viscid liquid, having a sweet taste. It is rather heavier than water (sp. gr. 1·125), and boils at 197·5° C. It is soluble in all proportions in alcohol and water, but is insoluble in ether. Like other alcohols, G. yields ethers when heated with acids. A whole series of diatomic alcohols, similar in properties to G., and having the general formula $C_nH_{2n}(OH)_2$ (when *n* represents the number of carbon atoms), have since been obtained. These diatomic alcohols are called as a class the Glycols.

Glyc'ocoll, Gly'cine, Glyc'ocine, Ami'do-Acet'ic Acid, or **Sugar of Gelatine,** a crystalline nitrogenous substance, first obtained by Bracconu by acting on gelatine with sulphuric acid. It may also be prepared from bile, from uric acid, and from various animal products. Its synthesis was accomplished by Perkins by heating bromacetic acid with ammonia—

Gerhardt obtained it by acting on formic aldehyde with hydrocyanic acid and water—

G. is a crystalline substance. It has a sweet taste, and its solution reddens litmus paper. It unites with acids, bases, and salts.

Glycos'mis, a genus of Asiatic trees and shrubs belonging to the orange order. *G. citrifolia*, is the best-known species, from its deliciously flavoured fruit.

Glycyrrhiz'æ Radix, or **Liquorice Root,** the root or underground stem of the *G. glabra*, fresh and dried, cultivated in Great Britain. G. is used in medicine, in catarrhal affections, irritation of the mucous membrane of the bowels and urinary passages, and as an adjunct to bitter and irritating vegetable substances. It is prescribed in the form of extracts and powders.

Glyp'todon, an extinct genus of Edentate quadrupeds most nearly allied to the existing Armadilloes (q. v.). The fossil remains of the G. occur in the Recent or Post-tertiary deposits of S. America—that is, in the region where existing armadilloes

are found. This coincidence exemplifies Owen's 'organic succession of animal forms.' A well-known specimen is the *G. clavipes*, 9 feet long. The G. had no divisions of its armour-plating, which, as in the armadilloes, consists of bony pieces of hexagonal shape, firmly united by suture, thus rendering all movement of the casing impossible. The head and tail had each a cuirass of plates. The vertebræ of the spine were fused into a solid mass. The feet were large, and the last joints of the toes short and massive. No canine or incisor teeth were developed, but there were eight molars on each side of each jaw. The crowns of the latter teeth were fluted and divided into lobes.

Gme'lin, the name of a German family continuously distinguished in science for nearly two centuries. The first was **Johann Georg G.** (1674-1728), in his time a famous chemist. His son (1709-55), who bore the same name, was one of the first botanists of his age, and his *Flora Sibirica* (4 vols. St. Petersb. 1749-70) is still remembered. **Johann Friedrich G.** (1748-1804), nephew of the preceding, was Professor of Medicine and Chemistry in Göttingen. His edition (the 13th) of the Linnæan *Systema Plantarum* was a work absolutely indispensable to his contemporaries. But probably the most distinguished member of the family was **Leopold G.**, son of Johann Friedrich, who was born August 2, 1788, at Göttingen. After completing his studies at Tübingen and Vienna, and travelling for a year in Italy, he settled in 1813 at Heidelberg, where he was appointed Professor of Chemistry in 1817, and where he died, April 13, 1853. His principal work is his *Handbuch der theoretischen Chemie* (4 vols., completed by Schossberger and List, Heidel. 1841-55), which is a masterpiece of clearness, fulness, and method.

Gmünd (*Schwäbisch-G.*), a town of Würtemberg, on the Rems, 30 miles E. of Stuttgart by railway. It was formerly a free city of the empire, was added to Würtemberg in 1803, and has considerable manufactures of hardware, hosiery, bijouterie, &c., and a large trade in hops. Pop. (1871) 10,739.

Gmun'den, a town of Upper Austria, at the outflow of the Traun from the Traun or G. Lake, 36 miles S.W. of Linz by railway. It is the seat of an imperial 'direction' for salt-mines and forests, and has considerable fisheries and an active river trade. The fine castle of Ebenzweier stands out in the lake. Pop. (1869) 5623.

Gnapha'lium, a genus of Composite plants. See CUDWEED.

Gnat (*Culex*), a genus of *Diptera* or Flies, forming the type of the family *Culicidæ*, which is distinguished by a very long rostrum or beak composed of seven pieces. The head is small, and the antennæ of the males are plume-like. In the genus *Culex* itself, the palpi of the males are larger than the thorax, while those of the female are small. The common G. (*C. pipiens*) is noted for its power of inflicting irritating wounds. The female gnats are most voracious, and have a proboscis of sharp-pointed bristles, adapted for puncturing the skin of animals, and for sucking up blood. Gnats' eggs are deposited in water, and appear to be glued together in masses for security. The larvæ, active, large-headed creatures, breathe by means of air-tubes in the terminal joints of the tail, which is exposed above the surface of the water. The pupæ are also aquatic, and the perfect insect emerges from the pupal skin. Swarms of these insects may be seen rising from the water on a summer day, exercising their newly-found powers of flight. The Mosquito (q. v.) is closely allied to the G.

Gneis'enau, August, Graf Neidhardt von, one of the most distinguished Prussian commanders in the wars of 1813-15, was the son of a lieutenant of artillery, and was born at Schilda, in Prussian Saxony, 27th October 1760. He served amongst the German auxiliaries during the American revolution, and entered the army of Friedrich the Great in 1786. Here he rose steadily, and as lieutenant-colonel gained distinction by his defence of Tilsit in 1807. He retired from service during the peace, but joined the army at the rising in 1813, and took a very distinguished part in the war of liberation. After the peace of Paris he was raised to the rank of Graf, and was presented by the King with an estate. In 1815 G. was the chief of Blücher's general staff, and had his full share in the glories of Waterloo, especially in leading the Prussian pursuit. In 1825 G. became general field-marshal, and died at Posen, 24th August 1831. See his Biography by Pertz (1864-69).

Gneiss is a Metamorphic rock with the same mineral ingredients as granite, from which it differs in having a more or less stratified structure. This arrangement in layers is sometimes so evident that it closely resembles the fissile mica-schist, and at other times is so hidden that it becomes very difficult to distinguish the rock, especially hand specimens, from granite. It has been sometimes termed schistose granite; but this is somewhat misleading, since G. is not really a granitic or igneous rock, but has been formed from an originally laminated sandstone.

Gne'sen (Pol. *Gniezno*), a town of Prussia, province of Posen, 30 miles E.N.E. of the town of Posen. It lies on the Wrzesnia among hills and lakes, has a fine old cathedral, and is the residence of the Archbishop of Gnesen-Posen. Here the Polish kings were crowned up to 1320. There are some slight manufactures of linen cloth, and two horse and cattle fairs are held here. Pop. (1871) 9050.

Gneta'ceæ, a natural order of small Monochlamydeous trees. See SEA-GRAPE.

Gnome (Gr. *gnōmōn*, 'wise'), in the Cabalistic and Rosicrucian mythology, a spirit who dwelt underground and guarded hidden treasures. They were male and female, the former being hideous dwarfs. A G., Umbriel, plays an important part in Pope's *Rape of the Lock*. See ELEMENTAL SPIRITS and ROSICRUCIANS.

Gno'mon, in geometry, is the six-sided figure made up of any three of the four parts into which a parallelogram is divided by two lines intersecting at a point in its interior, and drawn parallel to the sides.

Gnos'tic, a name afterwards appropriated to heretics, was originally applied, although not in the New Testament, to Christians possessed of the so-called *gnosis* (Gr. 'knowledge'), or true spiritual knowledge. *Gnosis*, as used in the New Testament, means a more profound spiritual perception of the truths revealed for the salvation of man, in this sense, that it is regarded as a gift of God not less than faith, which is the basis of it, and to which *gnosis* is sometimes opposed as an additional and pre eminent quality (*cf.* 1 Cor. xii. 8, 9, xiii. 2). It is also to be accompanied by a development of holiness, and, in short, is to be a comprehension of 'the breadth, and length, and depth, and height of the love of Christ,' so that those who have it may 'be filled with the fulness of God' (Eph. iii. 18, 19). In the First Epistle to Timothy (vi. 30) there is mention of a *gnosis* which was unaccompanied by this progressive holiness, but was rather associated with speculations about the oppositions of good and evil, and which is declared to be a *gnosis* 'falsely so called.' In the tendency here referred to is apparent the germ of what was known as Gnosticism. Clement of Alexandria, however, applies the epithet G. to orthodox Christians who cultivated the true *gnosis*. According to the Alexandrian theology the *gnosis* consists of absolute knowledge, such as agrees with the reality of existing objects. It presupposes faith as the basis on which it rests, the Scriptures forming the objective source of both, so that the G. Christian is described as one who has grown grey in the study of the Scriptures. An essential part of this *gnosis* is allegorical interpretation, by which it is able to explain all Scripture in its harmony with reason and with itself. It is thus the spiritual interpretation taught by Christ to his disciples (Matt. xiii. 11), and became the possession of the Gnostics by education (being transmitted from the apostles through those who succeeded them in presiding over churches), faith, and reason, through the inworking of God's Holy Spirit. From this it appears that whilst the G. Christian professed to adhere to apostolic tradition alone, the ultimate principle by which he determined the meaning of the Scriptures was speculation. Further progress in the same direction produced the heresy of Gnosticism.

Among the Alexandrian Jews, under the influence of Platonism, a philosophical system of religion had been formed which exalted itself above the popular faith. The presence of a similar tendency in Christianity almost from the first is apparent from the use of *gnosis* as indicated above, which denoted the religion of absolute knowledge as contrasted with the faith of the multi-

tude. The genuine Pauline conception of faith, which implied an accompanying elevation of mind, had been lost sight of, and instead 'faith was regarded as a kind of trust on outward authority, which by itself alone could not obtain the reward of eternal life.' Such a faith might reasonably be regarded as a subordinate phase of the Christian life, and furnished Gnosticism with a pretext for depreciating it. The first principle of Gnosticism was that the beginning of perfection is the knowledge of man, and absolute perfection the knowledge of God. Again, Christianity had furnished a simple, practical solution of every problem that had occupied thinking minds, in the shape of a faith in great historical facts on which the religious convictions of men were to depend; whereas Gnosticism wished to make religion depend on a speculative solution of these questions.

Gnosticism was produced, then, speaking generally, by the craving for a philosophy of religion to which the old faiths of the world, as well as Christianity, should each contribute their share. Accordingly in all the G. systems there are to be traced in various proportions elements of Greek philosophy, especially Platonism, Jewish theology, and Oriental theosophy. The so-called founders of the different systems properly only gave expression to different phases of the spirit of inquiry which pervaded the intelligent part of the Christian world, and which, according to the local colouring, produced a mythological, cabbalistic, or Zoroastrian G. Claiming to be philosophical Christians, and also the possessors of a secret tradition on which their system was founded, as that of the common herd of Christians was on certain external historical facts, the Gnostics desired to found schools of Christian *mysteries*, to which should be admitted only the select few who possessed the higher spiritual faculty withheld from the commonalty.

Different classifications of Gnostics have been made on various principles. Mosheim treats Gnosticism as produced exclusively by the combination of Oriental philosophy with Christianity. Neander classifies them according to their affinity with or opposition to Judaism; Gieseler, according to countries and the preponderance of dualism or emanation, as Syrian and Egyptian; Matter, as Syrian, Roman, Egyptian, and of Asia Minor; Hase, as Hellenistic, Syrian, and Christian. Baur's classification is:—(1) The Valentinian, which admits the claims of Paganism, together with Judaism and Christianity; (2) the Marcionite, which refers especially to Christianity; and (3) the Pseudo-Clementine, which espouses the cause of Judaism in particular. Referring for details to the several articles BARDESANES, BASILIDES, CARPOCRATES, CERINTHUS, MARCION, OPHITES, SATURNINUS, SIMONIANS, VALENTINUS, it must suffice here to indicate the general character of Gnosticism. The problems to be solved were these:—'How the transition from the infinite to the finite, and the beginning of creation, are to be explained?—how it is possible to conceive of God as the author of a material world so alien to his own nature?—whence, if God is perfect, are the imperfections of this world?—whence the destructive powers in nature?—whence is moral evil, if a holy God is man's creator?—whence the great diversity of characters among men themselves, from the truly godlike to those which appear to be utterly abandoned to blind passions, without a vestige of a rational and moral nature?' The theory which in its fundamental principles was held by Gnostics in general, with many variations in detail, and in which a solution of these questions was found, was as follows:—One supreme, infinite, and self-existent Being has existed from all eternity, and is the original source of all beings, having within his own intelligence the Pleroma (Gr. 'fulness, sum') of Æons (Gr. 'ages'). By the impulsive principle of love 'the only-begotten Son,' the Nous, is evolved from the Supreme, and from him a series of emanations (see EMANATION), coming each from the preceding in successive evolution. But with each successive emanation in the series the divine life diminishes, and the connection with the Supreme becomes feebler, till the boundary of the Pleroma is reached. At this point there arises a defective or abortive emanation, which, being unable to retain its connection with the divine life, sinks into the dead, the unsubstantial, the darkness, the void, the chaos, the sluggish stagnant water which limits from without this evolution of life. The hitherto dead and inert mass receives vitality from this drop of the divine life, and there arises an active opposition to the divine on the part of this nature—power or matter—direct products of which are evil spirits and wicked men. Otherwise, the abortive emanation referred to above produced the Demiurge, whose mission it was to give life and a plastic energy to matter. Under his hand evil spirits of every grade took their being from the unmixed principle of evil in matter. But good and evil are variously combined in human souls, which were classed as Spiritual, or those who seek to return into the Pleroma; Psychical, or those who are subject to the Demiurge; and Carnal, or those entirely under the power of matter. The only essential variation from the above, which is the Alexandrian theory, and which regards the Demiurge as a remote emanation from the Supreme, and as fashioning matter according to the ideas of the Supreme, is to be noted in the Oriental Gnosticism, according to which matter was eternally the residence of evil, or the Demiurge or creator of the world was a being directly opposed to the Supreme, who sought continually to check and suppress the divine life by confining it in a prison of matter.

All systems of Gnosticism alike had a scheme of redemption, the effect of which was to be the final separation of good from evil, or the liberation of the divine life from its degrading confinement in matter. In the Saviour Jesus Christ were united, without amalgamation, a human form—real according to Alexandrian Gnosticism, a mere vision according to the Oriental—and one of the divine Æons. The passion of Christ was brought about by the Demiurge, in a vain attempt to defeat the plans of the Supreme, and retain the souls of men under his control. See Burton's *Bampton Lectures* (1829); Neander's *Geschichte d. Christl. Rel. u. Kirche* (Hamb. 1852, Eng. trans. 1858); *Pflanz. u. Leit. d. Christl. Kirche* (Hamb. 1833; Eng. trans. 1859); Baur's *Die Christl. Gnosis* (Tüb. 1835); Irenæus' *Adv. Hæreses* (Camb. ed.); Hippolytus' *Philosophoumena* (ed. Miller); Mansell's *Gnostic Heresies of the First and Second Centuries* (Lond. 1875).

Gnu, or **Gnoo** (*Connochetes* or *Catoblepas*), a peculiar genus of *Antilopidæ* or Antelopes (q. v.) inhabiting S. Africa, and known under the name of 'wildebeest' by the Dutch settlers. The horns are broad at the base, are curved outwards and downwards on the sides of the head, and recurved at the tip. The tail is long and hairy throughout. The head is very large; and the massive, shaggy chest and neck contrast with the slender hind quarters and limbs. These animals live in large herds, and appear to be active, watchful, and timorous. When alarmed, they paw the ground and pursue each other in circles. Attempts to domesticate the G. have not been successful. The common G. (*C. Gnu*) is brownish-black, and has a black chest-mane. The brindled G. has no mane, and is brown striped with grey. The average length is 6½ feet, and the height about 3½ feet.

Gnu.

Go'a (*Crocodilus palustris*), a species of Crocodiles (q. v.) belonging to Asia and Australia, known also as the 'marsh crocodile,' and 'mugger.' A large specimen may attain a length of 33 feet. The G. travels overland for considerable distances during the dry season in search of water.

Goa, the capital of the Portuguese dominions in India, on the western coast, about 250 miles S. of Bombay. It was conquered from the Mohammedans by the great Albuquerque in 1503. Three cities have successively borne the name; the present G. is the nearest to the sea on a river mouth that is gradually silting up; pop. estimated at 10,000. The second G. is still the headquarters of the Catholic mission; it contains a fine church with the bones of St. Xavier and many relics. Area of the territory, 1451 sq. miles; pop. about 537,517, mostly Roman Catholics; revenue estimated at £80,000.

Goalpa'ra, the chief town of the district of the same name, province of Assam, British India, on the left bank of the Brahmaputra. Pop. about 6000.—The *district* of G. was originally part of Bengal, and G. town was long the N.E. frontier town of the empire. The district was transferred to Assam in 1874, having previously been augmented by the Eastern Dwars, which were annexed from Bhotan after the war of 1863-64. Area, 4433 sq. miles; pop. (1872) 444,761.

Goalun'do, a town in the district of Furidpur, province of

Bengal, British India, at the junction of the main streams of the Ganges and Brahmaputra, 152 miles N. of Calcutta by rail. It is the terminus of the E. Bengal Railway, from whence the Assam steamers start, and the registration depôt of the coolies for the tea plantations. The railway station and protective works against the river currents, erected at a total cost of £100,000, were swept away in the floods of October 1874, and are now abandoned. There is a trade in dried and salted fish. During the first six months of 1876 the traffic in boats was valued at £700,000; by railway at £600,000.

Goat (Old Eng. *gât*, 'the goer or leaper:' comp. Gr. *aix*, from *aïssō*, 'I leap or spring'), a genus of Ruminant (*Ungulata*) *Mammalia* belonging to the family *Ovidæ*. There are horns in both sexes, and the lachrymal glands are undeveloped. The throat has a 'beard,' which may be present in both sexes, or in the males alone. The horns are erect and compressed, are curved backwards and outwards, and have a prominent ridge in front. All goats emit a strong and peculiar odour, which is wanting in sheep. The common G. (*Hircus ægagrus*, or *Capra hircus*) is known by the horns being compressed in front and rounded behind, the anterior ridge being rugged or irregular. These animals in their wild state live in herds. They inhabit mountainous districts, and are fleet and agile, climbing the most inaccessible places. Their food is mainly grass and herbage. The milk of the G. has a somewhat disagreeable flavour, but is highly esteemed for its nutritious qualities. The G. generally produces two young at a birth. The G. and sheep have been bred together; and though the hybrids have been sparingly fertile, the experiment seems to prove the specific identity of these animals. Two of the best-known varieties are the Cashmere G. (q. v.) and the Angora G. (q. v.). The Jemla G. (*C. Jemlaica* or *Hemitragus Jemlaica*) and the Berbera or Ram Sagul of India are also well known. The former inhabits the loftiest mountain ranges of India, and is distinguished by the hairy mane which depends on each side of the head and neck. The colour is a pale greyish fawn, with a black spine-mark and a brown mark on the forehead. The Berbera G. has no beard, but a very large 'dewlap.' The Syrian G. has long pendant ears, and the Spanish G. is hornless. See also BOQUETIN and IBEX.

Goat, Rocky Mountain, is generally included in the Antelope family, under the designation of the *Antilocapra furcifera*. It is sometimes known as the Prongbuck or Cabrit, and appears to combine the characters of the antelopes and the goats. Its horns, which are oval, rise straight from the forehead, and then curve inwards and backwards. A short prong is given off in front of each horn. This animal is found in the central prairies of N. America, and between the Rocky Mountains and Pacific.

Rocky Mountain Goat.

Goat-Moth (*Cossus ligniperda*), a species of nocturnal *Lepidoptera* (q. v.), or Moths (q. v.), belonging to the family *Hepialidæ*, in which group the antennæ are short and the proboscis rudimentary or wanting. In the genus *Cossus* the antennæ are as long as the thorax, and are serrated quite to the tip in both the male and female. The G.-M. is one of the largest British moths. The wings are large and downy, and like the body are of a sombre grey and brown colour, banded with dark markings. The larva is large, and has a smooth reddish body, with an oval patch of chestnut on the upper surface of each joint. The head is triangular. The larval condition lasts for three years. The larvæ exude a strong-smelling fetid substance; they enclose themselves, in their pupa or chrysalis stage, in holes which they excavate in the trunks of trees.

Goat-Moth.

Goat's-Beard, the common name for the species of *Tragopogon*, a genus of plants belonging to the natural order *Compositæ* (q. v.). There are three indigenous to Britain, one of which is *T. porrifolius*, the purple G.-B., or Salsafy (q. v.).

Goat's-Rue, the popular name for *Galega officinalis*, a Leguminous plant indigenous to the S. of Europe. It is grown for forage, and is said to increase the milk of cows that feed upon it. Formerly it was medicinally used in cases of fevers.

Goat'sucker, a very large family of Fissirostral *Insessores* (q. v.), or perching birds, so named from an absurd notion, formerly current, that they sucked the teats of goats and sheep. They form the family *Caprimulgidæ*, in which the bill is short, flat, and broad, and the tarsi short; the toes are long and powerful, and the hinder toe is united at its base to the inner digit. Like all *Fissirostres* (q. v.) the G. has a wide 'gape' fringed with bristles, to assist them in securing their insect prey. The colours of these birds are, as a rule, sombre—black, grey, and brown being the prevailing tints. The genera *Steatornis*, *Podargus*, *Ægotheles*, *Caprimulgus*, *Scotornis*, *Macrodiptex*, and *Chordeiles* include various species of this interesting group. The genus *Caprimulgus* includes the typical species, and is distinguished by the second quill being the longest, and by the tail being long and broad and occasionally forked. The middle toe is longest, and has a singular comblike development of its claw, the function of which appears to be that of clearing the bristles of the gape. The European G., or nightjar, is found throughout Europe, and arrives in Britain in May or June. The plumage is a pleasing variety of shades of black, grey, white, and brown; the male birds having white spots of oval shape on the inner side of the first three quill-feathers of the wings. The average length is 10 inches. These birds are useful to man from their devouring large numbers of cockchafers. The European G. is also known by the names of 'churn-owl' and 'jar-owl.' The Carolina G. (*C. Carolinensis*) is an allied American species, and the *C. vexillarius*, or long-winged G. of W. Africa, an exotic species.

Gobb'o, a name given to the pods of a species of Abelmoschus (q. v.) or Hibiscus (q. v.).

Go'belins, The, a celebrated manufactory of tapestry at Paris, deriving its name from Jean Gobelin, who in the reign of François I. erected a dye-factory on the banks of the stream Bièvre. Rabelais ridiculed the idea, and dubbed the concern *Folie-G.* Gobelin's successors carried on the manufacture of tapestry with great success. Subsequently Louis XIV. acquired the building for the nation, styled it the *Hôtel Royal des G.*, and devoted it to the production of the choicest works in Tapestry (q. v.).

Go'bi, or **Ko'bi**, the Mongolian name of the great wilderness of Central Asia, known to the Chinese as **Sha'mo** ('sand-sea'), between about lat 40° and 50° N. and long. 90° and 120° E., 1800 miles long, with an average width of from 300 to 400 miles. Though not absolutely barren, no part of it is fertile, its sterility being partly due to its great elevation (on an average 3500 feet) above the sea. It forms a tableland between the Altai and the Kuen-Lun, with only slight varieties of level, except in the eastern portion, which is cleft by a great rugged valley. In the W. the surface is mainly sand, which is sometimes drifted before the wind in great waves; in the E. it is rocky and gravelly, and sprinkled with many salt lakes and strips of pasture and wood.

Gob'lins and Bo'gles, spirits of popular superstition, generally held to be sinister in nature and grotesque in appearance. Goblin (Fr. *gobelin*, Armorican *gobilin*, 'a will-o'-the-wisp;' comp. Ger. *kobold*) perhaps comes through the Low Lat. *gobelinus* from the Gr. *kobalos*, 'a knave,' or is perhaps derived from the Fr. *gober*, 'to swallow.' The conjecture that *elf* and *goblin* are corruptions of Guelph and Ghibelline is an ignorant absurdity, as the former word occurs in *Beowulf* (v. 112), (a poem written ages before the imperial-papal strife began, or the families had risen into notice who gave it name. Goblin sometimes signifies merely a spirit, *e.g.*, Shakespeare: 'Be thou a spirit of health or goblin damned;' Milton: 'To whom the goblin full of wrath replied.' *Hobgoblin* may come from *Hop-goblin*, but is more likely a corruption from Robin, the spirit Robin Goodfellow or Puck being specially known as Goblin or Hobgoblin. Bogle, or Bogey, may be from the Welsh *brogwly*,

'to frighten;' Gael. *bwgwl*, 'fear;' N. Eng. *bogle*, 'to frighten.' The word *bogey* is used in Scotland for a bugbear.

Go'bony. See COMPONÉ.

Go'by (*Gobius*), a genus of Teleostean fishes belonging to the *Acanthopterygii* and to the family *Gobiidæ*. The body is long, the teeth small, the spinous and front part of the dorsal fin flexible, and less perfectly developed than the soft posterior part. The anal fin is soft, and the ventral fins are spinous. The latter are sucker-like, but are not adherent to the abdomen; and dorsal fins are developed. The rock-fish or black G. (*G. niger*) is a familiar example of the group, and is found in rock pools adhering to fixed objects by its sucker-like ventral fins. The body, like that of the Eels (q. v.), is covered by a mucous secretion. The polewig or spotted G. (*G. minutus*), another familiar species, is coloured grey, with black spots on the back and darkish patches on the sides, and a black spot on the dorsal fin. The two-spotted G. (*G. Ruthen-sparii*) has two brown spots on each side of the pectoral fin and tail. The Lumpsuckers (q. v.) or *Cyclopteri* are nearly allied to the G., and the Dragonets (q. v.) are also included in the G. family.

God (Ger. *Gott*, Goth. *Guth*; of uncertain derivation, but *not* connected with the adj. 'good') is the English name for the Supreme Being who is worshipped by most civilised nations. But belief in G., conceived as the primordial, self-sufficing being, the author and upholder of the universe, belongs to man in an advanced state of civilisation. It is a philosophical idea. The case of the Jews is an exception. It is difficult, if not impossible, to understand the first chapter of Genesis—assuming it to be the work of Moses—on any other hypothesis than that of a 'revelation.' But at any rate, no such view of G. is met with among savage tribes. It has been asserted that there is no tribe of men so degraded as to have no idea of a G., but this is contradicted at the present day by the best authorities (*e.g.*, Lubbock, *The Origin of Civilisation* and *Prehistoric Man*). The truth is, that the adoption of any religious ideas whatever marks an era in human development. The first G. that a savage worships is whatever he fears, whatever seems to have the power of doing him injury (see FETICHISM). And as his conceptions of G. are simply reflections of his own ideas, the gods of savages are invariably cruel and malignant. The next step, taken when the phenomena of nature are considered, is to Dualism (q. v.) and Polytheism (q. v.). Nature appears rent into two realms—a kingdom of light, virtue, and happiness, and one of darkness, sin, and misery—and a G., good or bad, is given to every newly-observed phenomenon, according as it is beneficial or hurtful. The highest phase, Monotheism (q. v.), passes of necessity through an inferior stage of anthropomorphism. The earliest Jewish conceptions of G. are from a philosophical point of view anthropomorphic in some respects; but the absolute creative power and self-sufficing being are not altogether absent; and as the nation grew, the conception of 'Jehovah' expanded and became profoundly spiritual. The point on which the East and the West were prevalently divided was—the relation of G. to nature or matter. The ancient Persian religion, while acknowledging one supreme being, was practically dualistic. The Greek philosophers agreed with the Hebrew prophets as to the harmony of nature with G., who was the cause of all movement, all production, all mental action. The Hindu religion, in the earliest Vedantic period, the later Brahmanic development, and as Buddhism, is fundamentally a system of Pantheism (q. v.). The G. of Christianity is a profounder expression of the Hebrew Jehovah. The paternal and providential features become clearer, but the divine nature is enveloped in a new mystery by the doctrine of the Trinity (q. v.).

Godav'ery (*Godavari*), a large river of India, rises near Nassick, a station on the E. Indian Railway, on the E. slope of the Western Ghauts, only 50 miles from the Arabian Sea, and flows through the S. of the Deccan, mostly in the dominions of the Nizam and the Central Provinces, until it breaks through the Eastern Ghauts in the province of Madras by a narrow pass at the village of Polaveram. It then passes Rajahmundry, and divides into two main branches, each about 55 miles long, flowing E. into the Bay of Bengal, the one at Point Gordeware, the other to the S. at Narsipur. The total length is 898 miles, and it drains an area of 112,200 sq. miles.—The *district* of G. lies in the N.E. of the Madras Presidency, at the mouth of the G. river. Area, 6224 sq. miles; pop. (1871) 1,592,939. The products are rice, maize, cotton, and sugar. The towns are Rajahmundry, Ellore, and Coconada, of which the last conducts a considerable coasting trade. The exports by sea were valued at £643,980 in 1872–73; and the imports at £138,321.—The *district of the Upper G.* is the name lately given to the S.E. tract of the Central Provinces. Area, 1971 sq. miles; pop. (1872) 52,120. The population is very sparse, consisting of hill tribes who cultivate by burning down the jungle; but the district has lately been opened out by the extension of navigation on the G. river.

Godavery Irrigation Works, commenced in 1844 to save the delta of the G. river from the vicissitudes of drought and flood, and also to assist navigation, extend over 840 miles of main channels, and command 780,000 acres. The water is taken off at Dhaleswaram, at the head of the delta, 22 feet above high water, by a masonry dam or anicut, 2½ miles long, 12 feet high, and 130 feet broad at the base. Branches are diverted along both banks, one of which is carried over an offshoot of the river by the Gunnarum brick aqueduct, 2248 feet long, on 49 arches. In 1864 an extension was sanctioned to connect with the Kistna Works (q. v.). In 1872–73 the total area irrigated was 264,717 acres, and traffic was conducted by 51,957 boats and rafts. The navigation project, on which three-quarters of a million had been expended, was finally abandoned in 1871.

Godd'ard, Arabella, an English pianist, was born in Brittany, January 1836. In 1848 she was placed under Mrs. Anderson, the Queen's pianist, and afterwards became the pupil of Kalkbrenner and Thalberg. Her first public appearance was in 1850. In 1854–56 she visited the Continent, and in 1873–76 America and Australia. She is again (1877) in London. G. excels in the performance of both classical and modern music.

Go'desberg, a village in the circle of Köln, Rhenish Prussia, on the left bank of the Rhine, 4 miles S. of Bonn. It has mineral springs and the beautiful ruins of a castle, commanding a splendid view of the Rhine valley and the Siebengebirge. Pop. (1871) 1775. The castle of G., built by Dietrich, Archbishop of Köln (1208–13), afforded temporary refuge to the deposed Archbishop Gebhard in 1582, suffered severely in the Thirty Years' War, and later was nearly destroyed by the French.

God'father and **God'mother** are the names given to Sponsors (q. v.), from the spiritual parental relationship which they are supposed to contract with those for whom they stand surety in baptism, and who, on the same principle, are called their godchildren. By a law of Justinian a man was forbidden to marry a woman for whom he had been godfather, 'because nothing does induce a more paternal affection or juster prohibition of marriage than this tie, by which their souls were in a divine manner united together.' The Council of Trullo (691) further decreed that it was unlawful for the godfather to marry the mother of the child; and the Council of Trent still further forbade marriage between the sponsors themselves. No such restrictions exist in the Anglican Church. The rubric of the English Prayer-Book appoints that 'there shall be for every male child to be baptized two godfathers and one godmother,' and for every female one godfather and two godmothers.'

Godfrey of Bouillon. See BOUILLON, GODFREY DE.

Godi'va, Lady, the wife of Leofric, Earl of the Mercians, according to a beautiful old legend (first recorded by Matthew of Westminster 200 years after the event), besought her husband to free the people of Coventry from a tax. He agreed to do so if she would ride naked through the streets, whereupon she ordered all the people to go indoors and shut their windows, and rode naked through the town, freed the people from the tax, 'and made herself an everlasting name.' Only one man, named Peeping Tom, looked out, and he was struck blind. The story forms the subject of an exquisite poem by Tennyson, and of another by Leigh Hunt. The worst thing about the legend is that it distorts and perverts the character of the great Mercian Earl of the 11th c., who was a genuine Englishman. The true name of the wife of Leofric was *Godgifu*, who founded a number of churches, and lived to a very old age. Mr. Freeman points out that 'Peeping Tom must have been one of King Eadward's Frenchmen,' for Englishmen did not use Scripture names at the time when Lady G. is said to have ridden through Coventry (q. v.)

Gödöll'ö, a small town of Hungary, 16 miles N.E. of Pesth by rail. It has a stately château, formerly the residence of the

Grassalkovich princes. On the neighbouring hills Gorgei gained two bloody victories over the Austrians, under Prince Windisch-grätz and the Ban Jellachich, April 14, 1849. Pop. 3361.

Godol'phin, Sydney, Earl of G., an English statesman, belonging to an old Cornish family, originally known as Godolcan, was born about 1635. He was made Secretary of State in 1664, was sent to Holland to forward an alliance between that country and England against France in 1678, became one of the Lords of the Treasury in 1679, and, along with Viscount Hyde and the Earl of Sunderland, had the chief direction of public affairs. He ingratiated himself into the favour of Charles II., whom he aided in the scandalous negotiations with Louis XIV., and who placed him at the head of the Treasury in 1684. Under James II. he held a post in the Treasury, and was Lord Chamberlain to the Queen. On the landing of William of Orange, G. was sent to treat with him, a task which he executed adroitly. William III. soon recognised his abilities, and he was one of the council which governed the country during the King's absence in 1695. Detected in carrying on a treasonable correspondence with James II. in 1697, he was deprived of office till 1700. After Anne's accession G. acted in concert with Marlborough, was made Lord High Treasurer in 1702, became Earl of G. in 1706, and about this time left the Tories for the Whigs. In the struggle which then began between him and Harley, G. was finally defeated, being ejected from office in 1710. G. died at St. Albans, September 13, 1712. He was cold, astute, and taciturn; and as a financier was unequalled by any contemporary.

Godoy'. See ALCUDIA, MANUEL DE GODOY, DUKE OF.

God Save the King, a formula appended to British state proclamations, and the refrain and title of the national anthem. The anthem, which bears some resemblance in language to the Roman Catholic *Domine Salvum*, was first sung at a dinner of the London Mercers' Company on George II.'s birthday, 1740, and appears in the *Harmonia Anglicana* of 1742 and *Gentleman's Magazine* of 1745. Both words and music are now generally assigned to Henry Cary, who was born in London about 1696, and died 1743. They were long ascribed to Dr. John Bull (died 1622) on account of his *God save Great James, our King*. See Chappell's *Popular Music of the Olden Time*.

God's Truce (Lat. *Treuga Dei*), the name given in the middle ages to the period of the year during which all private feuds were suspended by command of the Church. In a council held at Limoges in the 10th c. the nobles vowed to cease from private strifes and to protect the weak. In 1027 a synod held in Roussillon decreed that no one should assail another from Saturday to Monday. The G. T. being constantly broken, an attempt was made by a council which assembled in Aquitaine in 1041 to render it more stringent, by limiting it to the days between the Wednesday and Monday of the Passion Week. Eadward the Confessor introduced the G. T. into England. The institution was confirmed by various councils, but gradually fell into disuse. See Milman's *Latin Christianity*, book viii.

God'unov, Boris Feodorovitch, a Russian noble of Tartar descent, was born in 1552. After he had long been the virtual ruler under the weak Feodor I., and had by the final conquest of Siberia done much to strengthen and extend the empire, he was in 1598 called by the Bojars to the throne. Although he inaugurated serfdom (1595), his reign greatly advanced civilisation in Russia by many wise measures for the promotion of trade, education, and the strict administration of justice. He poisoned himself, 13th April 1605. His son Feodor G. (born 1589) succeeded his father as Czar, but was murdered in June of the same year by Demetrius, brother of Feodor I., who returned at the head of a Polish army. See DEMETRIUS.

God'win, Mary Wollstonecroft, an English authoress, born at Beverley, Yorkshire, April 27, 1759. In her youth she left her father's house and maintained herself as a schoolmistress and governess until 1787, when she entered on a literary life in London. Several tales which she issued won some notice, and in 1791 her *Vindication of the Rights of Women* made her generally known. She then visited Paris, where she became intimate with the leading Girondins, and formed a *liaison* with an American named Imlay, who left her in great distress. In 1797 she married William G., whose Radicalism she shared, and died in London, September 10 of the same year, in giving birth to Mary G., afterwards the wife of Shelley and authoress of *Frankenstein*. See William G.'s remarkably candid *Memoirs of Mary Wollstonecroft G.* (1798).

Godwin, William, an English political writer and novelist, the son of a Presbyterian minister, was born at Wisbeach, Cambridgeshire, March 3, 1756. He was a dissenting clergyman at Stowmarket 1778-83, but a study of the French 18th c. writers leading him into unbelief, he gave up the Church for literature. G. published *Sketches of History* in 1784, and nine years later his once famous *Political Justice*. *Caleb Williams* appeared in 1794, and was followed by other inferior novels, of which the best is *St. Leon*. In 1798 he married Mary Wollstonecroft, who died shortly after, and G. took another wife in 1801. Though for a time a celebrity, and even in a way a power, G. was never in easy circumstances, and during his later years, when the excitement caused by his early works was almost forgotten, was forced to write for his bread. Among his other works are *Life of Chaucer* (1801), *Lives of Edward and John Phillips, Nephews and Pupils of Milton* (1815), *Treatise on Population* (1820), *History of the Commonwealth of England* (1824-1828), *Thoughts on Man* (1833), *Lives of the Necromancers*, &c. Finally, the intractable revolutionist was made yeoman-usher of the Exchequer. He died in London, April 7, 1836. Though G. has lately come into notice from the publication of his *Autobiography* and *Letters*, he will perhaps be chiefly remembered as the father-in-law of Shelley. His *Political Justice* is lofty and generous in sentiment, and often ingeniously and closely reasoned. Its doctrines were borrowed from Rousseau, G., though he rejected the *a priori* theory of the rights of man, arguing for the abolition of all existing political institutions. G. has been called the 'father of English philosophic Radicalism,' but the title is far more applicable to Bentham. *Caleb Williams*, which was written to enforce G.'s political views, is an almost unique novel. Hazlitt said it could never be begun without being finished, and despite occasional clumsiness and a want of reality in the characters, it exerts an irresistible and sombre fascination over the reader. *St. Leon*, the only other novel of G.'s which is still read, is much less interesting, being in great measure an attack on the Inquisition. See C. K. Paul's *G., his Friends and Contemporaries* (2 vols. Lond. 1876), containing G.'s letters and a portion of an autobiography; also L. Stephen's *History of English Thought in the Eighteenth Century* (Lond. 1876).

Godwi'ne, Earl of Wessex, the first English noble who was distinguished as a statesman, was born about the close of the 10th c. He is said to have been at first a cowherd, and to have been raised by the favour of King Cnut's brother-in-law, whose daughter he married. He proved himself a bold and skilful leader in Cnut's Scandinavian wars, and after Cnut's death supported the Danish cause until after Harthacnut's reign, when a strong feeling arising in favour of the English dynasty of Wessex, he became the chief agent in bringing Eadward to the throne. Eadward's incapacity flung the chief power into G.'s hands, and for some time he governed wisely and successfully, until his love of self-aggrandisement and the unjust favour which he extended to his unruly son Swegen lessened his influence so greatly, that when he stood forward as the champion of the English against the king's Norman favourites, he was unsupported by the people, and Eadward was enabled to banish him and confiscate his estates in 1051. G. then withdrew to Flanders, but his old popularity among the English quickly revived, and when, after about a year, his fleet entered the Thames, the people forced Eadward to restore him to his estates and to expel a number of the Norman strangers. G. died shortly after this, in 1054, and was succeeded in his estates by his son Harold, afterwards King of England. G. was full of bold and subtle ambition, but he followed a truly national policy, and showed high administrative genius, being at once adroit, prudent, and courageous. See Freeman's *Norman Conquest*, vol. i., and Green's *History of the English People* (Lond. 1875).

God'wit (*Limosa*), a genus of Grallatorial or wading birds included in the family *Scolopacidæ* or Snipes (q. v.), and in the sub-family *Limosinæ*. The godwits are distinguished by the bill

being curved and inclined towards the tip. The first quill is the longest, and the outer toe is united to the middle one up to the first joint. Two species occur in England—the common G. (*L. rufa*), the tail of which is marked by brown and grey bars, and the black-tailed G. (*L. ægocephala*). The birds haunt marshy districts, and their nests are built on the ground, the eggs numbering four, and being of a light brown tinted with green. The general colour of the body in both species is brown above and grey below. The average length is sixteen inches, the females being larger than the males. The voice is harsh and shrill.

Godwit.

Goe'deke, Karl, a critic and historian of German literature, was born in 1814 at Celle, in Hanover, taught privately for many years at Göttingen, and was subsequently appointed a professor in the university there. G.'s principal work is a history of German poetry, *Grundriss zur Geschichte der Deutschen Dichtung* (3 vols. 1856-70). He has also published *Elf Bücher Deutscher Dichtung* (2 vols. 1849), *Deutsche Dichtung im Mittelalter* (1852), and has edited Lessing, Schiller, and Goethe, with notes and biographical introductions. His biography of Goethe has been published as a separate work.

Goes, or **Tergoes**, a fortified port of Holland, in the province of Zeeland, and in the N. of the island of S. Beveland, 10 miles E.N.E. of Flushing by railway. It has some shipbuilding, and a trade in hops, grain, salt, &c. Its harbour is linked by a canal to the E. Scheldt. Pop. (1873) 5205.

Goe'the, Johann Wolfgang von, one of the greatest poets of all ages, and the most brilliant and many-sided genius of modern times. He was born at Frankfurt-am-Main on the 28th August 1749. His father, the grandson of a Thuringian blacksmith, stood high in the esteem of his fellow-citizens, was a Doctor of Laws, and held the dignity of Imperial Councillor. To his mother, Elizabeth Textor, G. always traced his own universal receptivity, that poetic sympathy with all human and natural interests which distinguished him while yet a mere boy. The theatre maintained by the French army of occupation during the Seven Years' War, and the otherwise unwelcome presence of a French officer in his father's house, gave G. an early opportunity of mastering the French language. G.'s father destined him for the profession of law, and to this end he was in 1765 sent to the University of Leipsic. Here he took more delight in the lectures of Ernesti and Gellert than in the study of legal technicalities; and as the influence of Gottsched was still dominant, the poetical efforts made by G. at this time (*Die Laune des Verliebten, Die Mitschuldigen*) are marked rather by French taste than by the sympathy G. confessedly felt for Klopstock. In Leipsic, already boasting to be a 'little Paris,' G. mixed freely both in academic and in general society, and one of his many love affairs quickened his experience of life. A visit to Dresden was not without effect on his artistic tastes. At the old University of Strassburg in 1770 G. studied the *corpus juris* less than anatomy and chemistry, but took his degree in law after a session or two. Under the shadow of the fairy minster, G. fully felt the charm of medieval art; and the influence of Herder, whose acquaintance G. made here, combined with his enthusiastic study of Shakespeare, Rousseau, and Hans Sachs to remove G. still further from the formal spirit of French art, and awakened that contempt for the conventional which made G. the apostle of the 'Storm and Stress' revolution in German literature. At Wetzlar, then the seat of the high courts of the empire, G. was supposed in 1772 to complete his law studies, and here he passed through the experience that afterwards thrilled Europe in *Werther*. G.'s first great work, *Götz von Berlichingen* (1773), which took the heart of Germany by storm, was pronounced by Friedrich the Great, as mouthpiece of the old school, an *imitation détestable des mauvaises pièces Anglaises*. In 1775 happened an event that coloured all G.'s after-life. The Duke of Sachsen-Weimar invited G. to his court, and gave him a seat in the Privy Council. In the Duke's capital G. made henceforward his home, and save during a journey to Switzerland, a residence of two years in Italy, and a short sojourn with the army in Champagne during the invasion of France in 1792, he was seldom far from Weimar. Here he was the brightest ornament of the brilliant court circle which made the Thuringian court the heart and eye of Germany. Besides directing the theatre, which was a school for the whole nation, G. held important state offices. In 1779 he became a Privy Councillor, in 1782 President of the Chamber, in 1815 First Minister. He had been ennobled in 1782. After the death of his friend and patron in 1828, G. withdrew from all state affairs, but continued to busy with the delights of art and with the vigilant surveyal of all that was new in literature the last years of a serene and cheerful old age, active to the last, and till his death, on the 22d March 1832, revered by the world of letters as its archpriest and king. In 1806 G. was formally married to Christiane Vulpius, with whom he had lived in terms of closest intimacy since 1788. Their only son, **Johann August Walther von G.**, was born on the 25th December of that year, and after having held several offices in the service of the Duke, died in Italy in 1830, leaving three children, of whom two sons are still alive.

G.'s entry on court service at Weimar coincides with a marked change in the style of his poetic workmanship. In his first period of power he was substantially a popular poet, a poet of and for the people; and the novelty of matter, or the keenness and freshness of feeling and of thought, is much more remarkable than ingenuity of construction or polish of style. *Götz von Berlichingen* sets before us with vigour and almost naïve simplicity a true 16th c. knight at feud with his surroundings. In *Werther's Leiden* (1774) we have the experiences and the fate of a hero who succumbs to the agony of unrequited love. By writing *Werther* G. succeeded in shaking himself free of the morbid sentimentality of that period; but too many of his readers saw in the romance a justification of passionate self-indulgence in the luxury of sorrow, and even an apology for suicide. *Clavigo* (1778) and *Stella* (1776) are poor in comparison with their prototypes *Götz* and *Werther*, and the *Grosskophta* (1789) is but a minor work. But the lyrics, many of which belong to this period, are inimitable and unexcelled, possessing warmth of feeling and all the indefinable charms of true songs. For years after G. came to Weimar he published nothing of importance, but was at work on more than one of his second series of great works, though none was finished till the Italian tour. These are all marked by singular melody of language and beauty of form. As G.'s first period has been called *sentimental*, the second is frequently characterised as *ideal*. In *Iphigenia* (1786) G. has endeavoured with success to solve a problem he consciously set before him, that of clothing the wealth of modern thought with the grace and elegance of the ancient classics. As in *Iphigenia*, so in *Tasso* (1789) there is a striking want of outward action. In the latter especially the struggle of feelings takes the place of deeds, though for most readers they fail to inspire the same interest. *Egmont* (1785), with much of excellence in detail, is tame as an historical drama, and is irregular in the style of its execution. *Wilhelm Meister's Lehrjahre* (1796) illustrates more than any other work save *Faust* the marvellous universality of their author's genius; it is the first classical attempt to promote as well as depict social culture by means of romance, and, like all G.'s prose works, has done unspeakable service in smoothing and polishing the prose style of Germany. *Hermann und Dorothea* (1796), in hexameters, is unique amongst G.'s poems as glorifying, under forms of idyllic simplicity, strength, and beauty, the homely virtues of everyday life. *Faust*, the first part of which was published as a fragment in 1790, is a work unparalleled in ancient or modern literature. It is essentially a psychological drama, though the hero plunges into the vortex of life, and illustrates his inmost thoughts and passions in action on the human stage. The subject of *Faust* is man—man in the fulness of his unsatisfied cravings for superhuman wisdom, power, delight; and at least one of the deep lessons of the poem is the inability of human power to solve the problems which life sets us. *Faust* is intensely German, but being also intensely human, it has become a portion of universal literature. The *Xenien* (1796), full of humour, the translations from Voltaire, and *Die Wahlverwandtschaften* (1808) may all be reckoned to the second period. The latter work is unquestionably, in respect of composition, a very perfect romance, whatever may be thought

of its ethical teaching, and it shows that G.'s original productive power was still vigorous. *Dichtung und Wahrheit* (1811), a beautiful though not entirely accurate retrospect of his life as it appeared to the patriarch of literature, may be regarded as the transition to G.'s third period, in which the *didactic* and scientific tendencies predominate over the creative impulse. Under this head comes the *West-östlicher Divan* (1813). *Wilhelm Meister's Wanderjahre* (1821) is unequal and often tedious. The second part of *Faust*, completed the evening before the poet's last birthday (1831), is strangely unlike the first part; it is rich in beauties of detail, but full of mystical allegories. In these years G. worked with zeal at studies in the realm of natural science, and the published results comprise articles and treatises on subjects too numerous and various to be mentioned. Though many of G.'s views, especially that on which his theory of colours (*Farbenlehre*) is based, are at variance with scientific certainties, yet they almost all abound in fruitful thought, and in his *Morphologie* G. positively anticipated modern science.

The vast influence exerted by G. on the world ever since *Göts* and *Werther* were published is, of course, mainly due to the unfathomable power of the true poet; but it also partly depends on the fact that G. appeared after a period barren of poetic inspiration in all European countries. Besides his originality and force, some outstanding features of G. deserve to be noted. It was his maxim that all his poetry should be the outcome of his own experience, yet so faithfully did he strive to regulate and mould his inward impulses by the realities of nature, of life, of the world, that he is to be reckoned amongst objective, realistic poets. The harmony of form and matter in G.'s works is not more remarkable than is the harmony of development between the many sides in the nature of the poet, of the apostle of culture. The universality of G.'s interests is appreciated only by those who study his multifarious writings. Even within the realm of poetry the versatility of his powers is remarkable. He is equally at home in the merriest lyric trifle and in the lofty ode, in warm love strains or eerie ballads. But in G.'s very various dramatic efforts the limit of his genius is most plainly revealed. He had no enthusiasm for great historical movements, little sympathy or understanding for keenly national efforts and designs; so that, although one of the most German of men, although his works contributed powerfully to the national regeneration of Germany, he was too consciously cosmopolitan to be much moved by the outburst of the new national life in the War of Liberation; and it is also noteworthy that he failed to find a personal interest in that other great factor in the intellectual revival of Germany, the Kantian and post-Kantian philosophy. Hardly ever has any poet in his lifetime become so truly the hero of his country. Probably none has ever been so entirely idolised by his worshippers, or had the minutest details of his life so indefatigably sought out and chronicled.

Among biographies, that most accessible to Englishmen is practically as yet the best, *The Life and Works of G.*, by George Henry Lewes (1855, 2d ed. 1864, 8th ed. of German trans. 1872). Briefer is that by Goedeke (1st ed. 1859). Viehoff's work had reached a 5th ed. in 1872. The biographer had rich material in *Eckermann's Gespräche mit G.* (3d ed. 1869, trans. by Winkworth), and in G.'s copious correspondence with his friends, especially with Schiller. See also Bernay's *Der Junge Goethe* (Leips. 1875.) Criticisms and even commentaries on his several works are very numerous. As early as 1799 Scott translated *Gotz*. *Werther* has been translated into French and English by many different hands (the first French being in 1776; first English trans. in 1779). There are numerous English versions of *Faust*, the best being that by Bayard Taylor. *Wilhelm Meister* has been well rendered by Carlyle. The last edition of his own works, revised by G., was published in 1827-32, in 40 vols., to which a supplement of 20 vols. was afterwards added.

Gog and Magog, two warriors mentioned in the Scriptures, and the names of two figures 14 feet high, which stand on pedestals in the Guildhall, London. According to legend, G. and M. were giants whom the Trojans under Brut led captive to London, where they were kept as porters chained to the gate. G. and M. have been associated with London from very early times. Their effigies, which were carried in the Lord Mayor's procession, were burned in the great fire of 1666. The present statues were raised in 1708.

Gog'ari, a river of India, which rises among the hills of Nepaul, under the name of the Kamla, flows first S.W. and then S.E. through the British districts of Tirhut, Monghyr, Bhagulpore, and Purniah, and finally falls into the Coosy, a tributary of the Ganges, after a course of about 230 miles.

Go'go, a seaport in the district of Ahmedabad, Province of Bombay, British India, on the W. coast of the Gulf of Cambay, 190 miles N. of Bombay. Pop. (1872) 9571. The port is a safe anchorage, with a muddy bottom, and the inhabitants make excellent lascars.

Go'gol-Ivanov'ski, Nikola'i Vassilje'vitz, one of the most celebrated novelists of Russia, born at Vassiljevka, in the government of Poltava in 1808. He came to St. Petersburg in the beginning of 1829, and sought to be admitted to the theatre, but his *début* was unsuccessful. After some time he obtained a Government appointment, and in 1831 was appointed Professor of History at the Patriotic Institute. In 1843 he was made Professor of General History in the University of St. Petersburg, but held the post barely a year and a half. He afterwards lived abroad, principally at Rome, but returned to Russia, a victim of religious *melancholia*, and died at Moscow, 4th March 1852. G.'s great strength as a novelist lay in representing popularly and humorously the essential characteristic qualities of his countrymen. His chief works are *Vechera na Khutorie*, 'Evenings at a Farmhouse' (St. Petersb. 1832), which manifests vigorous talents, and is valuable as an accurate representation of peasant life in Little Russia; *Mirgorod* (1834), a volume of similar tales, permeated, however, by rare poetic feeling, and equally remarkable for powerful development of plot and dramatic and consistent management of character; *Revisor*, a comedy, in which the corruption of official life in the Russian provinces is ably satirised, and which won the commendation of the Emperor Nicolas; and the *Dead Souls* (1842), a satirical work written with the view of laughing serfdom out of existence. The collected works of G. appeared in 6 vols. (Moscow, 1856-57), and in 4 vols. (Moscow, 1862).

Gog'ra or **Ghog'ra** (*Ghagra*), a large river of India, which, in its upper part, is also called the Kali, Sarda, and Sarju. It rises, under the name of Kali, at an elevation of 18,000 feet, among the Himalayas, on the frontier of the district of Kumaon. It first flows S.W., receiving many hill torrents on either side, and forming the boundary with Nepaul, till it reaches the plain of Hindustan at Burmdeo, after a course of 148 miles. It then becomes navigable, and continues in the same direction through the districts of Oudh and the N.W. Province. After bordering the Bengal district of Sarun, it finally falls into the Ganges a little above Patna, after a total course of 600 miles. Its largest tributary is the Rapti on the left bank. The large traffic which it brings down, chiefly oilseeds, rice, wheat, and sugar, is now registered at Durowli in Sarun district; much of it is transhipped into larger boats at Revelgunge, or forwarded by rail from Patna.

Goil, Loch, a beautiful western arm of Loch Long, in Argyleshire, 6 miles long, and from 1 to 2 broad, is fringed on the E. with hazel woods, and overshadowed by lofty rugged hills. On a low sea-girt rock on the W. side stands Carrick Castle, a fortress of the Dunmore family. At the head of the inlet lies the village of Loch Goil-Head, which in summer has daily communication by steamer with Glasgow, and is a favourite summer residence.

Go'ito, a town of N. Italy, province of Mantua, on the Mincio, 15 miles N.W. of Mantua. It was taken by the Imperialists in 1630, by the allies and Imperialists successively in the Spanish Succession wars in 1701, and by the French in 1796. G. was also the scene of a battle between the Austrians and Italians in 1814, and of two encounters in the war of independence in 1848. Pop. 5274.

Goi'tre (Lat. *guttur*, 'the throat'), or **Bron'chocele**, a specific affection of the thyroid gland generally ascribed to the persistent use of water which has percolated through magnesian limestone rocks or strata, and containing in solution salts of lime. G. is a very widespread affection, having no connection with climate, for it is met with in certain districts having a similar geological formation, both in the tropics and the polar regions. It prevails in places where *pump-water* rather than *surface-water* is used, and more especially where water is obtained by tapping a

magnesian limestone rock. There are some goitrous districts in Switzerland, where the use of water issuing from the hollows of certain rocks and trickling along crevices in the mountains will produce G., or aggravate the disease in the course of a few days, while those who avoid such water are free from it. Captain Franklin, in his expedition to the polar sea, found G. to be very prevalent at Edmonton, but confined to those only who drank from the water of the river Saskatchewan; those who used *snow-water* only, or that derived from the rivulets which flow through the plains in summer, being exempt from it. G. is common in Derbyshire, where it is called *Derbyshire neck;* in Switzerland, where it is often associated with *Cretinism* or *Cagot* (q. v.); and in Oude and Nepaul, where it affects the inferior animals as well as man. G. may be simply hypertrophy of the thyroid gland, or it may be associated with *cystic tumours* in the gland, and in either case it may attain an immense size. The usual treatment consists in removing the exciting cause and the administration of iodide of iron internally and of iodine externally. In some cases a cure has been effected by the ligature of the thyroid artery, and occasionally by excision of the tumour. See Nièpce, *Traité du G.* (Par. 1851).

Go'lab Singh, the founder of the present dynasty of Cashmere, feudatory to the British Government of India. By descent a Dogra Rajput, he entered the service of Runjit Singh, the Sikh Rajah of the Punjaub, in 1820. Though he himself never joined the Sikh sect, he became the most favoured minister of Runjit, who conferred upon him the fief of Jummu, which lies at the mouth of the Cashmere valley. He used the Sikh soldiery to conquer for himself the additional province of Ladakh; and after the first Sikh war, in 1845-46, he received from the British the state of Cashmere, in consideration of paying £750,000 in a lump sum and an annual tribute of a few goats and shawls. Though often suspected, he continued loyal to the treaty then made, and on his death in 1857 his son succeeded to the state on the same terms. See CASHMERE, and Cunningham's *History of the Sikhs* (Lond. 1853).

Golcon'da, a fortress and ruined city in the Nizam's dominions, India, 7 miles W. of Hyderabad. It was the former capital of the Deccan, and contains many handsome tombs of granite with stucco ornaments. It is still the treasury and state prison of the Nizam. The far-famed diamonds of G. really came from a considerable distance, and were only cut and polished here.

Gold (Old Eng. and Low Ger. *gold*, Dut. and Low. Sc. *goud*, Dan. and Sw. *guld*, from the adj. *gelew* or *gealew*, 'yellow, bright') has been known from the earliest ages, and is frequently mentioned in the Bible. In the second chapter of Genesis it is spoken of as occurring before the Flood. Its brilliancy and unalterability, together with the ease with which it may be hammered and fashioned into various shapes, must have early attracted the attention of man—the more so as G. almost always occurs in the native or uncombined condition, and therefore requires no preliminary treatment to obtain it pure. The alchemists regarded G. as the most perfect, and therefore as the king of metals. They compared it with the sun, no doubt on account of its colour and brilliancy, and frequently called it 'sol' in their writings; indeed, the metal is always represented by them symbolically by the sun. The great effort of the alchemists was to convert the baser or less perfect metals into the perfect metal G., and to extract medicines from it. The physical properties of G. were described by Pliny, and according to him the metal was discovered by Cadmus, the Phœnician, on Mount Pangæus. Its discovery was also attributed to Thoas or Eactis, or to Sol, the son of Oceanus. Some of the chemical properties of G.—its solubility in a mixture of nitric and hydrochloric acids (aqua regia), for instance—were known to the alchemists; so also were a few preparations of the metal—fulminating G. amongst others.

G. is a brilliant yellow metal, capable of taking and retaining a high polish. In the pure state it is scarcely harder than lead, and therefore is unsuitable for the purposes of coinage, &c. To increase its hardness it is alloyed with small quantities of other metals. G. coin in this country contains 1 part of copper and 11 parts of G.; and G. jewellery, varying quantities of silver and copper. The addition of a small quantity of alloy produces very considerable changes in the colour of the G.

G. is remarkable for its ductility and malleability. An ounce of it may be hammered into 100 square feet of leaf; 15 grains may be drawn into a wire more than 2000 yards in length. In the manufacture of G. thread for embroidery, a cylinder of silver is coated with G. and passed through the draw-plates. In this manner 200 miles of thread may be obtained from 6 oz. of G. The metal is also remarkable for its high specific gravity (19·3); with the exception of platinum, it is the heaviest in general use. It melts at a higher temperature than either copper or silver, and crystallises in beautiful fernlike forms in cooling. It does not combine directly with oxygen, and for this reason it does not become tarnished by exposure to the air; neither is it acted upon by sulphuric, hydrochloric, or nitric acid. A mixture of the two latter, however, dissolves it, and on that account was called by the alchemists *Aqua Regia* (q. v.). G. is readily precipitated from its solutions as a purple powder by the action of reducing agents, such as sulphate of iron, oxalic acid, &c. The atomic weight of G. is 197, and the chemical symbol for its atom Au (from Lat. *aurum*, 'gold'). Among the more important compounds of G. are the following:—

Terchloride of G. (*Auric Chloride*), $AuCl_3$, obtained by dissolving G. in aqua regia, and evaporating in a water bath to a small bulk. On cooling, a compound of the chloride of G. and hydrochloric acid separates in yellow needles. From this the hydrochloric acid may be removed by exposure to a gentle heat. Heated to 150° C., the chloride loses two atoms of chlorine, and sub-chloride of G. (aurous chloride), AuCl, remains.

Peroxide of G. or *Auric Acid*, Au_2O_3, and the protoxide, or aurous oxide, Au_2O, are obtained by the action of caustic potash on the corresponding chlorine compounds.

Fulminating G. is obtained by adding ammonia to a solution of the terchloride. It explodes violently when heated.

Sel d'Or, used by the photographer, is a double hyposulphite of G. and sodium ($Au_2S_2O_3$, $3Na_2S_2O_3$, $4H_2O$), obtained in white needles by precipitating a mixture of the terchloride of G. and hyposulphite of soda with alcohol.

Purple of Cassius (q. v.) is obtained by mixing terchloride of G. with protochloride of tin.

Salts of G. are employed in glass and porcelain painting and staining to produce a rose colour.

Law Regarding G.—In England the standard for G. and silver coin is 22 parts pure and 2 of copper or brass; and 11 oz. 2 dwts. of fine silver and 18 dwts. of copper melted together are held the standard for silver coin, and are called sterling silver. By 7 and 8 Vict. c. 22, all G. wares of the standard fineness of 22 carats of fine G. in every pound troy, made since October 1, 1844, must be marked with a crown and the number 22, instead of the lion passant. By 17 and 18 Vict. c. 96, the Queen in Council is empowered to allow any standard for gold wares not less than one-third part in the whole of fine gold, and to appoint a stamp setting forth in figures the actual fineness according to the standard so declared. Any assayer or other officer marking gold ware with the mark of a higher standard than is due to its quality, incurs a penalty of £20 and dismission from his office; and all wares so stamped improperly are liable to seizure. By 18 and 19 Vict. c. 60, gold wedding-rings must be assayed and marked. See ASSAY, or ASSAYING. For Scotch law, see SILVER AND GOLD PLATE.

Gol'dau, a former village of Switzerland, canton of Schwyz, in a valley between the Rossberg and Mount Rigi, 5 miles N.W. of Schwyz. It had some 400 inhabitants, and, together with four minor villages, was overwhelmed by a sudden landslip from the side of Mount Rigi on the 2d of September 1806. One-third of Lake Lauwerz was choked up by the dislodged mass of rock and earth, and further devastation was wrought by the expulsion of its waters.

Gold-Beating, the art of reducing gold to infinitesimally thin leaves by hammering. The gold, pure or alloyed with silver or copper in variable proportions according to the colour required, is cast into a thin ingot, ¾ of an inch wide, 1½ inches long, and weighing about 2 oz. The ingot is then reduced between steel rollers to a long narrow ribbon, about $\frac{1}{800}$ of an inch in thickness, which, after being softened, is carefully divided into square inch pieces. Squares to the number of 150, with as many pieces of vellum 4 inches square, are next alternately piled up and enclosed in a parchment case called a *kutch*. This packet is beaten until the 1 inch squares of gold are expanded to nearly the size of the vellum. The leaf is then quartered, and

the pieces, placed between gold-beater's skin, are again beaten. Another quartering and beating follows, by which the leaf is reduced to about $\frac{1}{250000}$ of an inch in thickness. The finished leaves are next trimmed to an equal size of 3½ inches, twenty-five of which are placed in a book, the leaves of which are rubbed over with red chalk. The book is sold for 15d.

Gold-Beater's Skin, the peritoneal or outer membrane of the cæcum of neat cattle, used by gold-beaters for placing between leaves of gold. It is prepared by immersion in a weak potash solution, is scraped with a knife, then beaten, soaked in water, and stretched on a frame, where it is treated with alum water, isinglass, and egg-albumen. When dry, it is pressed and cut up into squares of 4½ inches, ready for use. Nine hundred squares of this membrane constitute a gold-beater's *mould*, and it takes 500 oxen to furnish this quantity.

Gold'berg ('gold mount'), a walled town of Prussian Silesia, on the Katzbach, 50 miles W. of Breslau. It was formerly noted for its gold-mines, which are said to have yielded 150 lbs. of pure gold weekly in the 12th c. There are now manufactures of broadcloth, hosiery, gloves, &c., and an active fruit trade. Pop. (1871) 6716. G. was seized by the Mongols in 1241, suffered in the Thirty Years' War, and was the scene of a Franco-Russian and a Franco-Prussian battle in 1813.

Gold Coast, a purely geographical name given to the maritime portion of Guinea lying between the Ivory and Slave Coasts, and including the seaboard of Ashanti (q. v.), Cape Coast Castle (q. v.), and Fanti (q. v.). The name is derived from the local gold-dust trade. See GUINEA.

Golden Age, the name given in classic mythology to that period in the infancy of the human race when men, untainted by degrading passions and vices, lived like the gods in happy security and plenty till death like a gentle slumber carried them away from their herds and harvests. The kindly earth then produced spontaneously all things necessary for the welfare of man, and war and bloodshed were unknown. Hesiod, Virgil, Tibullus, and Ovid have dedicated some of their finest verses to this charming theme, the last portraying with singular power and beauty not only the G. A. but the Silver, Brass, and Iron Ages which followed, each fraught with increasing wickedness and woe.

Golden Beetle, a general name given to various genera and species of beetles or *Coleoptera* (q. v.), but more especially to the genera of the family *Chrysomelidæ*, in which the body is rounded and the colours usually most brilliant, golden tints prevailing. These beetles belong to the *Tetramerous* group of the order, and have the antennæ widely separated, and the mandibles or larger jaws notched at their tips.

Golden Bull (Lat. *Bulla Aurea*; Ger. *Goldene Bulle*), a decree of Karl IV., King of the Germans and Emperor of the Holy Roman Empire, issued in 1356, which regulated everything in regard to the election of the King of the Germans. The number of Electors (q. v.) was fixed at seven; a majority of their votes was to decide every question; the election was always to be at Frankfurt; and the coronation at Aachen; the King of Bohemia was to be the first secular elector, and the Archbishop of Mainz the convener of the Electoral College. The G. B. added to the power of the electors, declaring their persons sacred, and making them independent princes within their own possessions. A G. B. of Andreas II. of Hungary fixed the privileges of the nobility in 1222.

Golden-Crested Wren (*Regulus cristatus*), a common British species of *Dentirostral* (*Insessores*) birds belonging to the family *Sylviadæ*, and to the sub-family of the nightingales (*Luscininæ*). In the genus *Regulus* itself the bill is short and broad at the base, and the nostrils are crescent-shaped and covered by a scale. The first quills of the wings are very short, and the fourth and fifth feathers are longest. The tail is slightly forked, and the tarsi are covered in front with one long scale. The G.-C. W. is common in hedgerows and copses, and is distinguished by the crest of golden feathers, which the bird can raise or depress. The average length is 3½ inches, and the colour is brown and green above, white on the wing-coverts, and yellowish grey on the throat. The crest is yellow tipped with orange.

Golden-Eye Fly (*Hemerobius perla*), a species of *Neuropterous* insects, so named from their large lustrous eyes. They are also called 'lace-winged flies,' from the delicate texture of their wings. They attain a length of about 1½ inches. The eggs are attached in moss-like clusters to plants, each egg being fixed on a stalk of a hardened glutinous secretion.

Golden Fleece. See ARGONAUTS.

Golden Fleece, Order of the, an order of knighthood founded by Philippe III., Duke of Burgundy, in 1429. It chose the fleece as its emblem, probably from wool being the chief manufacture of the Netherlands. Its grand-mastership was hereditary in the Dukes of Burgundy, until the order, along with their dominions, passed to Austria. Since Karl V.'s death the order has been held by the Spanish monarchs, though their claim has been disputed by the Austrian sovereigns. The order is at present the highest bestowed at the Spanish and Austrian courts.

Golden Legend (Lat. *Legenda Aurea*), a medieval collection of saintly legends and other tales written by Jacobus de Voragine, a Genoese Dominican of the 13th c. He based his work partly on a similar book in Greek by Simon Metaphrastus, and was indebted to the *Gesta Longobardorum* for many of the beautiful tales which he interspersed amid the stories of the saints, whence the G. L. was at one time known as the *Historia Lombardica*. Voragine's book was translated into French by Jean de Vignai, and was one of the sources from which Caxton's G. L. was compiled. The lives of the well-known saints were afterwards extracted from the G. L. The work contains several familiar tales, as the stories of the 'Seven Sleepers' and 'St. George and the Dragon.' It reflects the simple, credulous medieval devotion, as distinct from the logical casuistic theology of the schoolmen and the lofty mystical religion of men like Dante and St. Francis.

Golden Number. See EPACTS, METONIC CYCLE.

Golden Rod, the common name given to species of *Solidago*, a genus of Composite plants mostly natives of N. America. *S. Virgaurea* is the only British species, and at one time was largely used as a vulnerary. The fragrant leaves of *S. odora* have also been used in medicine. Several species are cultivated in gardens for their large spikes of yellow flowers.

Golden Rose was an ornament in use from about the end of the 11th c., of gold, musk, and balsam, typical of the divinity, body, and soul of Christ, of joy, spring, and Easter, by its sweetness, beauty, and pleasant taste. It was anointed with chrism and sprinkled with perfumed dust, and, after benediction and lying on the altar during mass, was sent or even carried by the Pope to some distinguished personage or eminent church. See Walcott's *Sacred Archæology* (1868).

Goldfields and Gold-Diggings. Gold is a widely-diffused metal, but nowhere has it ever been found in large quantities. It occurs only in the metallic condition, and generally, when found in veins, it is as minute specks or spread out in thin plates, which occasionally show an arborescent crystalline structure. The auriferous veins, which are found traversing rocks of various ages and different composition, are composed chiefly of quartz, with sometimes calc-spar and baryta. In these veins the gold is most frequently associated with iron pyrites and other metallic sulphides. By far the larger proportion of gold is, however, obtained from alluvial diggings in which the metal has been deposited by the denudation of auriferous veins. In these diggings the metal is found mostly distributed in loose specks, having been separated from the rock by the disintegrating action of the atmosphere and water. Occasionally, but not often, pellets and masses of considerable size are found in alluvial diggings, and these, when of the size of a hazel-nut and upwards, are known as nuggets. The largest mass known to have been found was the 'Welcome Stranger' nugget, which weighed 2280 oz., obtained in 1869 near Dunolly, Victoria, and numerous single pieces weighing from 100 to 400 or 500 oz. troy are recorded. There are few countries in which gold does not exist, but generally it is so sparsely disseminated that its extraction cannot be profitably undertaken. It is usually only on the first discovery of a goldfield that the alluvial diggings yield, without skilled labour or expensive appliances, exceptionally profitable results, and taking all circumstances and condi-

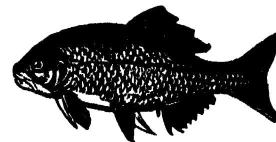
tions into account, there is no reason to believe that gold-mining is more lucrative than other industrial pursuits. A small quantity of gold is obtained as a by-product of certain metallurgical industries. Thus Spanish coppery pyrites contain very minute traces of both gold and silver; and in the treatment of that ore by the wet method for the extraction of copper, it is possible to extract both precious metals with profitable results.

Gold has been worked at various periods on a commercial scale in the United Kingdom, but at no time has the produce been sufficient to sensibly affect the total yield of the gold-producing countries of the world. In England, between the years 1860 and 1866, 12,800 oz. of gold were obtained in N. Wales, chiefly in the Vigra and Clogau mines in Merionethshire. In Scotland, during the reign of James VI., a considerable quantity of gold was obtained in the Leadhills, and in the winter of 1869–70 a good deal of agitation arose in connection with the discovery of auriferous deposits at Kildonan in Sutherlandshire. For a few months the so-called field was diligently worked, and although some amount of gold was obtained, the labour was not sufficiently remunerative to encourage its prosecution, and the undertaking was quickly abandoned. In Ireland, about the close of last century, a good deal of gold in the form of nuggets was obtained in Wicklow. One nugget weighing 22 oz. was obtained, and specimens are yet occasionally picked up.

The two most remarkable discoveries of gold in modern times have occurred in California and in the colony of Victoria, Australia. The produce of these localities had, and still exercises, a powerful influence on the commerce of the world, as, taken together, the regions they may be regarded as embracing produce more than one-half of the gold annually brought into the market. The discovery of gold took place in California about the beginning of March 1848, and the announcement of the fact produced a sensation throughout the world which is almost without parallel. Emigrants flocked thither from every quarter, and within a few months a teeming population filled the river valley in which the first discovery was made. Within four years—in 1852—the annual output of gold from the diggings exceeded £12,000,000, and in 1854 the produce reached £14,100,000. Since that period, although the auriferous region has been found to be widespread throughout the Pacific states, the yearly return has decreased; but it is estimated that California and its neighbouring states have already added £200,000,000 to the available bullion of the world. The G. of Victoria were practically opened up in 1851, and the discovery produced an effect scarcely less marked than in the case of California. In 1852 not less than £15,900,000 in value of gold was produced in the colony; but from that maximum the yield has declined, and in 1875 the output was only valued at £4,332,300. Victoria is estimated to have added upwards of £150,000,000 to the gold of the world since 1851. The other Australian colonies, and especially New S. Wales, S. Australia, and Queensland, as well as New Zealand, have all either developed important G. or otherwise demonstrated their wealth in the precious metal. The remaining gold-yielding regions of the world are indicated in the accompanying statement of their comparative yield in 1869, taking the produce of the Californian region as the standard at 100:—

Australian colonies (with New Zealand)	127
California and Pacific States	100
British North America	45
Mexico	35
Russia	31
Brazil, &c.	20
Asia and Africa	14
Europe	10
American localities not enumerated	9

The yield of the whole world for that year has been estimated at £60,000,000, but there is reason to believe that the total amount fell very much short of that amount. A more reliable calculation for 1874 puts the total produce of all G. at about £23,000,000.



In dealing with alluvial deposits gold-mining is a very simple process, as the gold can be readily washed out of the clay, sand, and gravel in which it rests by virtue of the superior gravity of its particles. To effect this washing a variety of devices are employed, the object in view in all cases being to remove by a current of water the light clayey particles of the 'pay dirt' or 'wash dirt,' as the auriferous soil is termed, and leave the gold either in the bottom of the vessel employed, or in the 'ripples' or cross bars of the sluice or shoot through which the current is sent. In some cases the gold, instead of being permitted simply to subside, is caught in and amalgamated with mercury, from which it is subsequently separated by distillation. In vein-mining, the auriferous quartz or other rock is obtained by blasting, and reduced to a fine powder in a stamping mill, after which the material is in a condition to be treated by washing and amalgamation in the same manner as wash dirt.

Native gold invariably contains some proportion of silver, and frequently it has traces of iron and several of the rare metals, such as platinum, iridium, and palladium. The following represents the analysis of the native gold of the principal auriferous regions :—

	Hungary.	Russia.	California.	Australia.
Gold	64·77	86·50	89·60	95·7
Silver	35·23	13·20	10·06	3·9
Iron and other metals	..	0·30	0·34	0·2

Gold'finch (*Fringilla carduelis*), a typical British species of Finches (q. v.) or *Fringillidæ*, distinguished by the greyish-brown tint of the upper parts, by the crimson band encircling the bill, and by the top of the head being black. The sides of the head are white, and the wing-coverts and the outer edge of the primary feathers of the wing yellow. The tail is black, and the under parts greyish white. The average length is 5 inches. The nest is made of grasses, wool, and hair; the eggs, numbering four or five, are white, with purple-brown markings. The G. is very readily domesticated, and can be taught to perform tricks requiring considerable dexterity. The food consists of thistledown and seeds of various kinds. The bird is found throughout Europe and in Asia. It is nearly allied to the Siskin (q. v.) or aberdevine and to the chaffinch (*F. cœlebs*).

Gold'fish (*Cyprinus auratus*), a species of the Carp (q. v.) genus (*Cyprinus*), distinguished by the golden colour of the scales. The familiar G. varies in colour; occasionally the golden is replaced by a silvery tint and dark markings. The G. was first domesticated by the Chinese, and was brought from China to Europe by the Dutch. It may be fed on bread-crumbs, flies, worms, &c. It appears to be acclimatised to the cold of our climate, and thrives in open-air ponds and lakes.

Goldfish.

Gold-Lace, a gold-thread tissue, the thread of which is formed by twining round a filament of yellow silk flattened narrow strips of gold, or more commonly of gilded silver, so closely that the edges meet and conceal the silk. The gilded silver is made by applying gold-leaf to a rod of silver, and drawing the rod out to a very fine wire, which is afterwards flattened between rollers. The ductility of the gold is so great that the wire is perfectly coated with gold surpassing gold-leaf in thinness. During the middle ages the G.-L. of Cyprus and Venice was much esteemed. In very early gold tissues, flattened gold wire was inserted with the needle, and the Chinese and natives of India still practise this primitive method.

Goldo'ni, Carlo, the chief comic dramatist of Italy, was born at Venice in 1707. He at first studied medicine at Rimini, and afterwards law at Pavia University, from which he was expelled for composing a satire against the citizens. On his father's death he settled as an advocate in Venice, but shortly abandoned the law, and led a wandering life with strolling players until 1736, when he married and returned to his birthplace. He now devoted himself to writing comedies of character modelled on Molière, but the fondness of the public for the improvised buffooneries of the *Commedia dell' Arte* debarred his plays from winning popularity. From 1741 to 1746 he journeyed to various Italian cities composing pieces for different theatrical companies, and for a time renewing his legal practice. On returning to Venice his comedies gained wide popularity, and began to displace the extemporised burlesques; but a piece of his bitter opponent Gozzi for a time depriving his dramas

of favour, G. repaired in 1761 to Paris, where several of his plays were acted with success, and where he was made Italian master to Louis XV.'s daughters. Shortly afterwards he was accorded a yearly pension of 3600 francs, which was suppressed at the Revolution, and restored to him on the day of his death, January 7, 1793. G.'s plays quickly regained possession of the Italian stage, and have been the model for all the chief modern writers of Italian comedy. He has been called the Italian Molière, and he thoroughly reformed the Italian comic drama. His plays are admirably fluent and sprightly, picturing the surface of society with entertaining fidelity, but the rapidity with which he was forced to write—he produced on an average one play a month—hindered him from giving due proportion to his work. Among the numerous editions of G.'s works, that published at Venice (44 vols. 1788-94) is the most complete; that of Florence (53 vols. 1827) the most elegant. See the *Mémoires de G.* (Par. 1787); the Biographies of Carrer (3 vols. Ven. 1824), Calvi (Mil. 1826), and Meneghezzi (Mil. 1827); and Copping's *Alfieri and G.* (Lond. 1857).

Gold'schmidt, Madame (*née* **Jenny Lind**), a great Swedish singer, was the daughter of a poor teacher, and born at Stockholm, October 6, 1821. She appeared in children's parts at the age of ten, but her upper notes failing somewhat in her twelfth year, she was withdrawn from the stage for four years. At the age of sixteen she appeared with success at Stockholm as Agatha in *Der Freischütz*. In 1841 she removed to Paris, where she was a pupil of Garcia, but failed at the Grand Opera—a failure which, it is said, made her determine never to sing again in France. On returning to Sweden she was welcomed with enthusiasm, and in 1847 appeared with triumphant success in London. In 1850 she visited the United States, receiving 302,000 dollars for her tour there, and in 1851 married M. Otto G., the pianist who accompanied her on her tour. Since her marriage, Madame G. has seldom sung in public. She has expended large sums on charities, and has laid out £40,000 in endowing schools in Sweden. Her voice is a peculiarly sweet and powerful contralto.

Gold'sinny, or **Gold'finny**, a popular name of certain *Teleostean* fishes allied to the Wrasse (q. v.) (*Labridæ*), and found on the N. European coasts. Their colour is a bright yellow, and the dorsal fin is very long. The G. is included in the genus *Crenilabrus*.

Goldsmith. Oliver, was born at Pallas, County Longford, Ireland, November 10, 1728. His father, the Rev. Charles G., removed in 1730 from Pallas to Lissoy, where Oliver was taught in the village school kept by an old quartermaster. At the age of eight he was deeply marked by the small-pox, and was sent after recovering to various schools, where he was generally viewed as 'impenetrably stupid.' In 1745 he went as a sizar to Trinity College, Dublin, where he studied little, and where his great delight was to hear his ballads sung on the streets. After a brief truanting from college, the first of his long wanderings, he took the degree of B.A. in 1749, and set out to study law in London, but having lost at a Dublin gaming-table the £50 given him for his outfit, came home and resolved to be a doctor. After staying eighteen months in Edinburgh without taking his degree, and spending some time at Leyden, he roamed on foot across Flanders, France, Switzerland, and part of Italy, maintaining himself by playing on his flute. He came back to England in 1756, and for some years was in deep distress, failing completely as a physician, and with difficulty supporting himself by writing for the *Monthly Review*. He now wholly abandoned medicine for literature. His *Inquiry into the Present State of Polite Learning in Europe* (1759) had considerable success, and his *Chinese Letters*—afterwards issued as *The Citizen of the World*—which began in the *Public Ledger* for 1760, made him well known in London. In 1761 he was introduced to Dr. Johnson, and thenceforth mingled with the chief authors of the town. The *Traveller* (1764) established his reputation, which was increased by the appearance of the *Vicar of Wakefield* in 1766. His comedy of the *Good-Natured Man* was produced in 1767, his *Deserted Village* was published in 1770, and *She Stoops to Conquer*, the best English comedy of the 18th c., was acted successfully in 1773, and has ever since kept possession of the stage. During his last years he earned about £400 annually, equal, says Macaulay, to £800 at present, but his constant charities, his fondness for gambling, fine clothes, and fine living, plunged him in embarrassment, and at his death, of a nervous fever, April 4, 1774, he was £2000 in debt. Among his other works are histories of England, Rome, and Greece, *Life of Beau Nash*, *History of Animated Nature*, *Retaliation*, a poem, &c. Thackeray calls G. 'the most beloved of English writers;' and there is an irresistible fascination in his gentleness, simplicity, and generosity, even in his half pathetic, half comic failings, as well as in the romantic story of his life, and in his exquisite and versatile literary powers. The *Vicar of Wakefield* has an undying charm from its graceful idyllicism and natural pathos; the *Citizen of the World* is full of piquant, naïve satire; *She Stoops to Conquer* abounds in the purest and most frolicsome humour; the *Traveller* and *Deserted Village* are suffused with a tender glow of descriptive beauty and reflective sentiment, and display in their polished verse a peculiarly rich music and pensive monotony of cadence; while *Retaliation* sparkles with playful, apt, and incisive epigram. G.'s prose style has been seldom rivalled in elegance, sweetness, and captivating ease. His *Miscellaneous Works*, in 4 vols., were published by Washington Irving in 1825, who also wrote a charming biography (Lond. 1849). But the standard work on G. is Forster's *Life of G.* (3d ed. 1862).

Golf, formerly **Goff** and **Gouf** (Dutch, *kolf*, Ger. *kolbe*, 'a club'), an outdoor game in Scotland, and a pastime that of late years has found many votaries S. of the Tweed. The game consists in driving a small gutta-percha ball round a course, and into a series of 'holes' (distant from each other not more than 500 yards), in the fewest number of strokes. It is played with clubs of various forms, of which the chief are known as the play-club, putter, spoon, sand-iron, cleek, and niblick or track-iron. These consist of two distinct parts—(1) the shaft, in all cases of hickory or lance wood; and (2) the head, which in the three clubs last mentioned is of iron, in the others of well-seasoned apple-tree or thorn, weighted with lead, and faced with a rim of horn. The different kinds of clubs are adapted to the 'hazards' or diversities of surface in the 'links' or downs where G. is played. The most suitable links are broken with deep furrows, sand-pits, pebbly reaches, furzy knolls, &c. The rival players are usually in pairs, but two may play against two, the partners striking the ball alternately. The game is reckoned either by the aggregate strokes in a 'round' or by scoring the holes won. Strength is required for driving 'long balls,' skill in avoiding hazards, and a sure eye and steady hand for 'putting' or holing. Among the finest links in Scotland are those at St. Andrews, Prestwick, Leven, Musselburgh, Edinburgh, N. Berwick, Gullane, Aberdeen, Carnoustie, and Montrose; in England those at Hoylake, Westward Ho, Wimbledon, and Crookham on the Berkshire Downs. Chief of the many organised golfing clubs in Scotland is the Royal and Ancient Union of St. Andrews; in England the Blackheath Club, dating from the reign of James I. G. was popular in Scotland as early as the 15th c., when many of the statutes refer discouragingly to 'golfe and uther sic unprofitabill sportis.' Among the royal players of G. are James IV. of Scotland, James I., Charles I., James II., and William III. See *G., a Royal and Ancient Game* (Edinb. R. & R. Clark, 1875).

Gol'fo Dul'ce ('sweet gulf'), a lagoon in Costa Rica, Central America, 25 miles long and 10 broad, communicating with the Gulf of Honduras by a small stream known as the Rio Dulce. The lagoon is 8 fathoms deep, but the mouth of the river is impeded by sand bars.

Gol'gotha is a Hebrew word meaning 'skull,' and the name of the place where our Lord was crucified. See CALVARY.

Goli'ath (Heb. 'an exile,' or perhaps from an Arabic word meaning 'stout'), a famous Philistine giant, belonging to Gath, who was slain by David in single combat (1 Sam. xvii.). His height was six cubits and a span, that is, about 10½ feet, or, according to the LXX. and Josephus, four cubits and a span, that is, about 7 feet. His conspicuous position in Scripture has made his name a personified symbol of huge size.

Goliath Beetle (*Goliathus*), a genus of *Coleoptera* or Beetles belonging to the *Pentamerous* group of the order, and so named from the large size of several species. These insects are found in tropical regions, especially in Africa.

Göll'nitz, or **Gölnicz** (a corruption of *Jelenze*, 'stag-town'), a town of Hungary on the river G., 130 miles N.E. of Pesth.

It has hardware industries, and in the vicinity are extensive copper and iron mines. Pop. (1869) 5205.

Goll'now, a walled town of Prussia, in Pomerania, on the Ihna, 15 miles N.E. of Stettin, has manufactures of woollens, silks, paper, tobacco, &c. Pop. (1871) 7444.

Golomyn'ka (*Comephorus Baikalensis*), a Teleostean fish found in Lake Baikal, and nearly allied to the gobies. (See GOBY.) It attains a length of 12 inches, and has no scales. Its flesh is oily, and its outer surface is protected by a mucous secretion, seen in other members of the goby family.

Golosh', or **Galosh** (Fr. *galoche*, 'a clog;' from Med. Lat. *calopedia*, 'a wooden shoe,' 'a patten or wooden shoe fastened to the foot with latchets'), an overshoe, generally made of vulcanised india-rubber, worn to protect the foot from damp, and made to clasp the boot firmly without fastenings. The sole and upper are cut from sheet rubber to the size of a metal pattern. The pieces are then arranged round an iron last, and the edges are cemented together with india-rubber solution. A glossy coating is next imparted to the shoe, which is afterwards submitted to the vulcanising process, which destroys the adhesive properties of the rubber, and renders it unaffected by heat or cold, while it preserves its elasticity.

Golun'da (*G. Barbara*), a genus of *Muridæ*, or Mice (q. v.), familiarly known as the Barbary mouse, from its occurring in that country. This elegant animal has a rich brown fur, striped longitudinally with yellow, while the under parts are white. It is about the size of the common mouse. The G. becomes very tame in captivity.

Go'marists were the Supralapsarian Calvinistic party in the Reformed Church at the time of the Synod of Dort. They derived their name from Francis Gomar, a colleague of Arminius in the University of Leyden, who took a leading part against the Arminians both at the Hague in 1610, and at Dort in 1618.

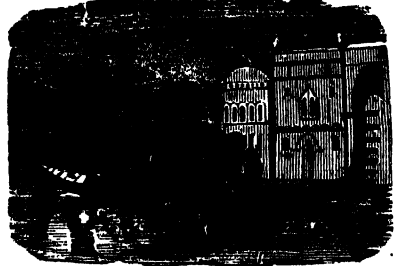
Gombrûn' (pron. *Gamrun*), or **Ban'dar Abb'as**, a seaport of Persia, at the mouth of the Persian Gulf, on the Strait of Ormuz, 198 miles S.E. of Shiraz. In the 17th c. it was the emporium of Persia, and still has a considerable trade, exporting carpets, tobacco, dried fruits, fish, and sulphur, and importing piece-goods, Indian cloths, China ware, &c. The port, destitute of any pier, in S. and S.E. winds is lashed by heavy surf. In the hot summer all but the very poorest desert G. for Minab, a town 14 miles inland, on the slope of lofty hills. Pop. 8000 or 9000. G. was founded in 1622 by Shah Abbas, after ousting the Portuguese from Ormuz, in which he was aided by the English. The English, Dutch, and French had facteries at G., but internal commotions soon drove the trade to other ports. G. is farmed to the Sultan of Muscat.

Gome'ra, one of the Canary Islands (q. v.) to the S.W. of Teneriffe, is 12 miles long, 9 broad, and has a pop. of 11,742. Its two towns are St. Sebastian and Villa Hermosa.

Gomorr'ah. See SODOM.

Gomu'to, Gommu'ti, or **Ejoo**, names given to the bristly horsehair-like fibre obtained from *Arenga* (*Saguerus* of some authors) *saccharifer*, or areng, a frequent palm in the Indian islands. The fibre is largely used for cordage and strong cables. Sago is also obtained from the arenga stem, and palm-wine or toddy from its flowering spike.

Gonaives', Les, a town on the coast of Hayti, on a bay of the same name, has a good harbour and trade. Pop. 4000.



Gon'da, the chief town of the district of the same name in the province of Oudh, British India, about 120 miles N. of Allahabad. Pop. (1869) 11,966.—G. *district*, which lies under the Himalaya, is watered by the Bapti and Gogra rivers, by which it exports to Bengal rice, other cereals, and oilseeds, and receives salt and iron. Area, 2629 sq. miles; pop. (1869) 1,167,816.

Gon'dar, or properly **Guendar**, the nominal capital of Abyssinia, on a ridge of the Wogra Mountains, 7000 feet above the sea, and 30 miles N. of Lake Dembea. It consists in great part of thatched huts, and is embowered in trees, above which rise the pinnacles and towers of its royal palace (the *Gemp*), and the high conical roofs of its forty-four churches. There are Mohammedan and Jewish quarters, and a considerable trade is carried on, chiefly in firearms, musk, wax, ivory, coffee, pottery, &c. The mean temperature is about 69° F., while much rain falls. The dirty, crooked streets are badly paved with basalt, and are often invaded by hyænas, foxes, &c. In the 17th c. G. is said to have had a pop. of 50,000, now decreased to 7000.

Gondhwa'na, a geographical name given to the large hilly and jungly tract of Central India, which is inhabited to a great extent by the Gondhs, a wild race akin to the Kandhs of Orissa, and believed to be of Dravidian (q. v.) origin. Their number amounts to upwards of a million, and before the incursions of the Mahrattas they were ruled by a powerful native dynasty. They are very backward in civilisation, devotees to demon-worship, and are known to have made a practice of human sacrifice up to a late period.

Gondok'oro, a trading place in the Bari country, on the steep left bank of the White Nile, 200 miles N. of Albert N'yanza Lake. It has been from antiquity a centre of the ivory and slave trade. A Roman Catholic mission was founded here by Dr. Knoblecher in 1849, and from that time to 1857, when the position was abandoned, sixteen out of twenty-four priests succumbed to the climate. G. was the headquarters of Baker during the Anti-Slave-Trade Expedition of 1871.

Gon'dola (Ital. diminutive of *gonda*), a boat from 25 to 30 feet long and 4 or 5 feet broad, much used on the canals and lagoons of Venice. Its two sharp ends rise high out of the water, the stem and stern are decked over, and amidships a cabin is placed for passengers. The hull is painted black, and the drapery of the cabin is of the same colour, giving the whole a funereal aspect; hence Byron (*Beppo*) describes the G. 'just like a coffin clapped in a canoe.' The rowers are called *gondolieri*.

Gondola.

Gon'falon (Ital. *gonfalone*), a flag the bearer of which, or *gonfalonier*, was the chief magistrate in many Italian republics of the middle ages, and notably in Florence.

Gong (Javanese), an Eastern instrument of percussion, usually made of bronze, 78 parts copper and 22 tin, and used for signalling in peace, and as a martial instrument in war.

Gon'gora, Luis y Argote, a Spanish poet, born 11th June 1561, at Cordova, studied law at the University of Salamanca, and after vainly courting fortune for many years, was appointed almoner to Philip III. He died at Cordova, 24th May 1627. G.'s early works, mainly songs, lyrics, and satires, are national in their spirit, and are among the best productions, in that kind, of Spanish genius. Desirous, however, of surpassing all his predecessors and creating a new and distinct school of poetry, he abandoned the old national feeling and form of expression, and adopted the *estilo culto*, or cultivated style, of which affectation, pedantry, obscurity, and confusion were the chief characteristics. His chief works in this style, besides numerous sonnets, *octavas*, *tercetos*, &c., were the long poems *Las Soledades*, *El Poliphemo*, *Pyramo y Thisbe*, published after his death. His followers were named *Gongoristas* or *Cultoristas*, and his poems gave rise in Spain to the school of the *cultismo*, which was vigorously attacked by Lope de Vega, who, however, did not always avoid its vices. The earliest edition of G.'s works is that of Lopez de Vicuña (Madr. 1627); the most complete, that of Gonzalo de Florez y Cordoba (Madr. 1633). There is a good *Coleccion* by Ramon Fernandez (Madr. 1789).

Gonias'ter, a genus of Starfishes (*Echinodermata*), including those familiarly named 'cushion stars.' The body is pentagonal, and flat on either side; the rays inconspicuous, and only to be seen distinctly on the under surface. The 'knotty cushion star'

(*G. equestris*) occurs abundantly round the British coasts. The genus is first represented in a fossil state in the Jurassic rocks.

Goniati'tes, a fossil genus of *Cephalopoda* (q. v.) belonging o the family *Ammonitidæ* or Ammonites (q. v.). The shells of G. occur first in the Upper Silurian rocks, attain the maximum of their development in the Carboniferous system, and die out in the Trias. They are discoidal in shape, and the 'sutures' (or external markings of the *septa* or partitions of the shell) are lobed or angulated, the *sipuncle* being dorsal in position. *G. Jossæ*, from the Carboniferous formations, is a well-known specimen. *Bactrites* (q. v.) is very nearly allied to G., as is also the genus *Ceratite* (q. v.).

Gonid'ia, a name given to the bright-green globular cells which form a layer under the cortical covering of the thallus of Lichens (q. v.). They partake of the character of both vegetative and reproductive cells.

Goniom'eter (Gr. *gōnia*, 'angle,' *metron*, 'measure'), an instrument for measuring angles formed by the sides of a crystal. That in common use is Wollaston's reflecting G., which by bringing two contiguous sides into the same position relatively to an outside object, and its reflected image viewed by the operator, is capable of measuring angles accurately to an error not exceeding one minute. The crystal is rotated with a graduated circle. and the angle through which it is rotated during the operation is the supplement of the angle of the crystal.

Gonorrhœ'a (Gr. *gonos*, 'progeny' or 'seed,' and *reō*, 'I flow') is a specific disease affecting the urethra, the mucous membranes of the genital organs in the male, and the vulva and vagina in the female. It is accompanied by inflammation and an abundant muco-purulent discharge of a highly contagious nature. In the early stages G. is a strictly local affection; but in many cases it is followed by a particular train of characteristic symptoms, apparently the result of constitutional infection, such as affections of the fibrous tissues, giving rise to rheumatism and inflammation of the testicles and the sclerotica, affections of the mucous membrane of the throat and eyes, and certain eruptions of the skin assuming a specific type. The first or incubative stage usually appears from the third to the fifth day after exposure, the symptoms being heat, itching, and general irritation of the parts. The second or inflammatory stage is characterised by a copious and thick muco-purulent discharge, great pain during micturition, and a diminished stream of urine. These symptoms usually continue for about a fortnight, when the sub-acute stage commences, which under proper treatment may subside in two or three weeks, but which may last for months or years and degenerate into a *gleet*. Though the inflammatory symptoms subside, the specific and contagious character of the discharge does not disappear, and the infective power may continue so long as the discharge keeps up. G. may be followed by *Stricture* (q. v.) after an interval of many years, resulting in the most serious consequences, or even in death, from retention of urine.

Gon'ville and Ca'ius College. See CAIUS COLLEGE.

Gonza'ga, a town of Northern Italy, in the province and 15 miles S. of the city of Mantua by railway. It stands amid fertile plains, was doubtless formerly of great strength, and is said erroneously to have been the cradle of the Gonzaga (q. v.) family. Pop. 17,526.

Gonzaga, House of, an old princely family of Italy, owes its origin to the Emperor Lothar. Ludovico G. brought the long-continued contention with the Bonacossi family respecting the supremacy of Mantua to a close by the murder (14th August 1328) of Passerino de Bonacossi and the expulsion of his dependants. Ludovico, now captain-general of Mantua, was appointed imperial vicar of the district by Kaiser Ludwig the Bavarian, and after his death the supremacy remained vested in his descendants with the title of Counts (from 1432 to 1530) and Dukes (1530 to 1707) of Mantua. Through the three sons of Ludovico III. the H. of G. came to be divided into three lines. From Federico, the eldest, sprang the Counts of Mantua, who were created dukes under Karl V. in 1530, and died out in 1726. From the younger sons, Giovanni Francesco and Ridolfo, sprang respectively the Dukes of Sabioneta and Castiglione, whose dukedoms were confiscated by the Emperor in 1692. The Guastalla branch of the G. family, founded by Ferrante G., governor of the dukedom of Milan for Karl V, became extinct in 1746. Petrino, younger son of Ludovico I., founded the family of the Counts of Novellara, extinct in 1728. Among the more notable members of the H. of G. are Ludovico III. (1444–78), named the 'Turk' on account of his successful campaigns as general of the Florentines and Venetians against the Infidel; Francesco II. (1484–1519), commander-in-chief of the united armies in Italy in the battle of Fornovo against Charles VIII. of France; Vincenzio I. (1587–1611), who fortified Mantua, and distinguished himself fighting on the side of the Hungarians against the Turks. His three sons were Francesco IV., Fernando IV., and Vicenzio II., the last of whom died in 1627. The nearest heirs should have been the Duc de Nevers, but Ferdinand II. of Guastalla laid claim to the whole inheritance and Carlo Emanuele of Savoy to Montferrat. In the Mantuan war of succession which followed, France, Venice, and the Pope supported the Duc de Nevers, Spain and Austria the Duke of Savoy. Peace was concluded in 1631, by which the Duc de Nevers was enfeoffed in Mantua and Montferrat. Charles I. (of Nevers) was succeeded by his uncle and afterwards by Carlo II., one of whose sisters (Maria) was first married to Vladislav IV. and afterwards to John Kasimir, King of Poland, while the other (Anna) became the wife of the Count Palatine of the Rhine, who, after playing a distinguished part at the French court, died at Paris in 1684, leaving behind him very attractive Memoirs (Lond. and Par. 1686). Carlo IV., who died in 1708 without issue, admitted a French garrison into Mantua, and joined the side of France in the Spanish war of succession. For this the Emperor Joseph I. placed him under the ban of the empire, whereupon Savoy took possession of Montferrat, and Austria of the dukedom of Mantua.

Gonzal'vo di Cordova (properly **G. Hernandez y Aguilar**), surnamed *El Gran Capitan*, 'the great general,' was born in 1453 at Montilla near Cordova, in Andalusia. When only fifteen he fought under his father, Don Diego G., against the Moors in Granada. In this war he displayed so much gallantry, especially at the capture of Tejara, Illora, and Monte-Frio, and he conducted the negotiations with King Boabdil for the surrender of Granada with so much ability, that the Spanish rulers conferred upon him a pension and an estate. His splendid successes against the French in Naples earned him the surname of *Gran Capitan*, and freed Italy from the invaders. He returned to Spain in August 1498, after having received from the King of Naples an estate in the Abruzzi and the title of Duke of San-Angelo. At the close of the 15th c. Louis XII. of France renewed the attack upon Naples, and G. was again sent to Naples to protect the Spanish interests there. Having previously captured Zante and Cephalonia, and restored them to the Turks, he landed at Sicily and took possession of Naples and Calabria. Dissensions naturally arose on the partition of Naples between the Spaniards and French, and again G.'s arms proved invincible against the latter, who were finally driven out of the peninsula. About this time King Ferdinand of Spain, moved by jealousy of the splendid success of his great general, and of the affection with which he was regarded by the people, withdrew his favour from G. Troubles again arising in Naples, the king commanded G. in April 1512 to organise another expedition to Italy. The force was no sooner assembled than Ferdinand ordered its disbandment in a slighting, capricious, insulting manner. The old warrior never regained the favour of his king, and, crushed by neglect and chagrin, he died at Granada, 2d December 1515. See Le Père du Poncet's *Histoire de Gonzalve de Cordoue*; Paul Jove's *Vita magni Consalvi*; and Quintana's *Vidas de Españoles celebres* (Madr. 1807).

Good, John Mason, M.D., was the son of an Independent minister at Epping, where he was born, 25th May 1764. He studied at Guy's Hospital, and practised medicine for a few years, but is chiefly known as an author. He died 2d January 1827. G. wrote dissertations *On the Diseases of Prisons and Poorhouses* (1795) and *On Medical Technology* (1808), *A History of Medicine* (1795), *A Physiological System of Nosology* (1817), *The Study of Medicine* (1822), and *The Book of Nature* (1826). He published besides translations of the Song of Solomon (1803), Job (1812), and of Proverbs (1821), and an English version of Lucretius in blank verse (1805). See the Memoir of G. by Dr. Olinthus Gregory, published in 1828.

Good'all, Frederick, R.A., an English painter, was born in London, September 17, 1822. He gained the Isis medal of the Society of Arts at the age of fourteen, and in 1839 exhibited his first picture at the Academy, 'French Soldiers Drinking in a Cabaret.' His 'Return from Christening' gained a prize of £50 from the British Institution, and in 1847 his 'Village Festival' won wide admiration. He was made an Associate of the Royal Academy in 1852, and a Royal Academician in 1863. His earlier pictures were largely representations of Breton life, G. having travelled in Brittany; but of late years he has essayed more ambitious subjects. Among his works are 'The Soldier's Dream,' 'Raising the Maypole,' 'The Swing,' 'The Return of the Pilgrims from Mecca,' 'Hagar and Ishmael,' 'Mater Dolorosa,' &c.

Good-Con'duct Pay, an increase of pay awarded in the army and navy for continued good conduct.

Goodenia'ceæ, a Dicotyledonous order of plants embracing twenty-three genera and about 200 species, chiefly natives of Australia and the South Sea Islands. *Scævola Taccada* of India and Ceylon, which belongs to the order, yields a fine pith, which has been used as rice-paper. Its young leaves are eaten as a pot-herb.

Good Friday is the Friday before Easter Sunday, and the anniversary of our Saviour's crucifixion, called in early times the Pasch of the Cross, Paraskeue ('Preparation') (*cf.* Mark xv. 42), &c., and in Germany, Still Friday. Observed from very early times as a solemn fast, it came afterwards to be distinguished by a peculiar ritual and customs: the bells were silent from midnight of Wednesday; the kiss of peace was prohibited; the altar was stripped of its ornaments and covering; the processions were without chanting; the lamps and candles were gradually extinguished during matins; a long series of intercessory collects were used; a cross was erected in front of the altar, blessed, and adored; there was no consecration of the Lord's Supper or celebration of the Mass, although until the 10th c. the faithful were permitted to partake in silence of what was reserved from the previous day. At the present day in the Roman Catholic Church no one partakes of the Eucharist but the celebrant.

Good Hope, Cape of, next to Cape Agulhas (q. v.) the most southerly point of Africa, and the turning-point from S. to E. in the voyage from Europe to India, in lat. 34° 22′ S. and long. 18° 29′ E. It is 25 miles S. of Cape Town, and is a bold promontory rising 800 feet above the sea, and forming the termination of the Table Mountain. Diaz, a Portuguese, who doubled it for the first time in 1486, named it *Cabo Tormentoso*, on account of the storms that he encountered; but the King of Portugal changed this forbidding appellation into that which it now bears, *Cabo de Bona Esperanza*. See CAPE COLONY.

Goods, Purchase and Sale of. By the Statute of Frauds (see FRAUDS, STATUTE OF), no contract for the sale of goods to the value of £10 or upwards is valid unless the buyer receive part of the goods, or give an Earnest (q. v.) to bind the bargain or towards payment, or unless there be written proof of the contract. With regard to goods under the value of £10, no contract is binding unless the goods are to be delivered within a year, or unless the contract be in writing. Delivery of a penny or of a glove is sufficient *earnest*. Acceptance of the key of the warehouse in which goods are deposited, or the payment of warehouse rent, is affirmative of the bargain. When no act remains to be done by the vendor, such as counting, weighing, or measuring, the moment the bargain is struck the property of the goods vests in the vendee, and the risk is his if they remain with the vendor. So if a horse die in the interval between sale and delivery, the conditions of the statute having been complied with, the vendor is entitled to his money. The general rule of law is that sale in open market not only binds the parties to it, but also binds any one having a right of property in the article sold. Open market in the country is only held in certain towns in a particular spot and on special days by charter or prescription, but in London every day except Sunday is market-day, and every shop in which goods are publicly exposed to sale is open market for such goods as the owner professes to trade in. Pawnbrokers in London or within two miles of London are excluded from this protection, and any goods wrongfully taken to them may be claimed by the owner. No writ of attachment against the goods of a debtor will affect the title to them acquired by a *bona fide* purchaser before execution, provided he has not had notice of the writ having been delivered to the sheriff. See SALE OR RETURN; WARRANTY OF GOODS; BILL OF SALE, under BILL. For Scotch law, see SALE and MARKET OVERT.

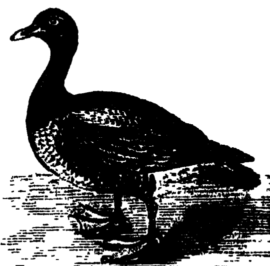
Goods and Chattels, a legal phrase signifying personal property. In Scotch law the corresponding phrase is goods and gear. The terms are seldom used except in wills.

Goods in Commun'ion are in Scotch law the movable effects belonging in common to a husband and wife. They comprehend all the movable property of both, except that which has been settled on the wife exclusive of the *Jus Mariti* (q. v.), and of the wife's *Paraphernalia* (q. v.). By the Act 18 and 19 Vict. c. 23, the representatives of a wife who predeceases her husband have not now, as they had previous to the Act, a share of the G. in C., and no bequest by the wife can affect them. When marriage is dissolved by predecease of the husband, and there is no child, the G. in C. are divided into two equal parts; one of which, the *Jus Relictæ* (q. v.), goes to the wife, the other, the Dead's Part (q. v.), going to the legatees or executors of the husband. When there is a child or children, the division is into three equal parts; one of which goes to the widow, another, the *Legitim* (q. v.), to the child or children, who are also entitled to the third part, unless otherwise disposed of by the father's will. The same division takes place in England by statute, if there is no will. (See DISTRIBUTIONS, STATUTE OF.) In Scotland the destination, which is by common law, prevails notwithstanding a will to the contrary; hence in Scotland, as regards movable property, a man cannot disinherit his wife and children; in England he can. In both countries the rights of a wife and children may be altered or set aside by antenuptial contract. See CONTRACT OF MARRIAGE, MARRIAGE, CONFIRMATION, EXECUTOR.

Good'sir, John, anatomist, was born at Anstruther in Fife, March 20, 1814. He was originally intended for the practice of dentistry, but after a short trial relinquished it for the medical profession. In 1835 he obtained the diploma of L.R.C.S.E., and shortly afterwards settled in Anstruther as a general practitioner. It was here that he made his first great contribution to anatomy, an essay *On the Origin and Development of the Pulps and Sacs of the Human Teeth*. This paper was so replete with originality and research, that it brought him at once into notice as one of the most gifted young anatomists of the period. Several important contributions to natural history rapidly followed. In 1840 G. removed from Anstruther to Edinburgh, which at that period was adorned by a wealth of young scientific talent. In 1841 he was elected curator of the Museum of the Royal College of Surgeons. In 1844 he was appointed demonstrator of anatomy to the third Monro, and on his death in 1846 G. was elected his successor in the anatomical chair. Notwithstanding the great amount of work which his professorial duties entailed, G. was constantly engaged in important and laborious original researches. His contributions to the literature of his department were numerous and important. His doctrine of nutritive centres, which paved the way for Virchow's cellular pathology, his researches on the inflammation of cartilage, his views on the motion and construction of joints, his lectures upon the structural dignity of man, &c., possess the highest merit. But it was not as a writer that G. was most distinguished, although he wrote clearly and forcibly. He excelled most as a teacher. Brimful of learning, not only relating to anatomy, but to physics, mathematics, history, and theology, he was able to bring the truths of every science to bear upon the elucidation of the subject in hand, as occasion required. G. prosecuted the study and advancement of anatomical science with such unremitting ardour that his health broke down in 1853. He passed the following winter abroad, but returned next summer to Edinburgh, and continued, in spite of increasing suffering, to deliver his lectures till within a few months of his death, which took place at South Cottage, Wardie, March 6, 1867. Such records of his labours and researches as could be collected are included in the two volumes of memorials, edited by Professor Turner and Dr. Lonsdale (Edinb. 1868). On account of his natural genius, his originality, his scientific enthusiasm, his Herculean energy and industry, and his numerous anatomical discoveries, G. deserves to be remembered better

than many who bulk much more largely in the annals of the medical profession.

Goodwin, Thomas, D.D., an English divine, born at Rollesley, Norfolk, 1600, studied at Cambridge, where he was made vicar of Trinity Church in 1632. Shortly afterwards he left the English Church, and withdrew to Holland, where he became pastor of the English church at Arnheim. He returned to England about 1640. In 1649 the Parliament made him President of Magdalen College, Oxford. After the Restoration he led a studious life in London until his death, February 23, 1679. Anthony Wood speaks of him as 'one of the Atlasses and patriots of Independency.' His works, which are theological, were published (Lond. 5 vols.) 1681-1704.



Goodwin Sands, a dangerous shoal off the E. coast of Kent, distant 5½ miles from the mainland, with which it runs parallel from N.E. to S.W. for 13 miles. The G. S. are 2½ miles broad, are visible at low tide, and are marked at various points by lightships. The sunken, shifting sands are extremely fatal to navigation, but they form a breakwater to secure the anchorage in the Downs (q. v.), which lie to the W., and between the N. and S. Foreland. Terrible shipwrecks occur on the treacherous sands almost every winter, although the lightships are provided with every means of signalling. A class of idle but intrepid boatmen along the coast, known as 'hovellers,' live by appropriating portions of wrecks, and often effect daring rescues. An account is given of the origin of the shoal, but is supported by slight evidence. The sands, it is said, consisted formerly of some 4000 acres of low land belonging to Earl Godwine, which were seized by William the Conqueror and bestowed on St. Augustine's Abbey at Canterbury. The abbot subsequently neglected the protecting dykes, and the sea bursting through, submerged the whole in 1100. A lighthouse, on fixed iron piles, was erected here in 1846, but was overwhelmed in the following year.

Good'year, Charles, born at New Haven, Connecticut, December 29, 1800, became an iron manufacturer in Philadelphia, and in 1830 began to experiment on the uses of india-rubber. In 1836 he invented a nitric acid process for fitting it to be worn as waterproof shoes, &c., and in 1839 he perfected a method of vulcanising india-rubber by sulphur. G. died at New York, July 1, 1860.

Goole, a river port in the West Riding of Yorkshire, 25 miles S.W. of Hull, on the River Ouse, at its confluence with the Don. G. is the terminus of a branch of the Lancashire and Yorkshire Railway, and, though recently but an inconsiderable village, it has now large docks and a thriving Continental and coasting trade. A new market-hall was erected in 1876. In 1876 it exported 5,093,400 lbs. of cotton yarn, 8,175,900 yds. of piece-goods, 1,622,100 lbs. of linen yarn, 1,075,200 lbs. of woollen and worsted yarn, and 1,941,800 yds. of worsted and mixed stuffs. G. has also alum and sugar works, iron foundries and corn-mills, and makes agricultural implements. In 1875, 1727 vessels of 27,835 tons cleared the port. Pop. (1871) 7680.

Gooroo', or **Guru** (derived from a Sanskrit word signifying 'heavy'), 'a person of weight or respectability,' a word used throughout India in two special senses—(1) for the village schoolmaster in the indigenous *pathsala;* and (2) the religious teacher or guide who communicates to his disciple the peculiar prayer which initiates him into any particular sect. In this latter sense it was commonly applied to the ten Sikh Gooroos, from Nanuk to Govind Singh, whose succession has now ceased. To this day the watchword of the Sikhs is *Wah gooroo* = 'Hail G.,' and Gurumuki is the name of the peculiar modification of the Sanskrit alphabet adopted by that sect. See Cunningham's *History of the Sikhs* (Lond. 1853).

Goose, the name given to various genera of Natatorial or swimming birds belonging to the sub-family *Anserinæ*, in which the bill is not longer than the head, while its ridge or keel is elevated at the base, and slopes to the tip of the bill, which is hard and horny. The knee is bare, and the hinder toe, short and furnished with a rudimentary lobe. The name G. is given to birds belonging to different sub-families; 'Solan G.,' for example, being given to the *Gannet* (q. v.), which belongs to the genus *Sula*, and to the sub-family *Pelecaninæ;* while the spur-winged G. (*Plectrophanes Gambensis*) belongs to a special sub-family, although it is nearly allied to the true G. Beginning with the genus *Anser* itself, we find the grey lag or wild G. (*A. ferus*) and the bean G. (*A. segetum*) exemplifying two familiar forms, from which the domestic G. and its varieties are believed to be descended. The former is common throughout the Old World, and has a pink bill tipped by a whitish 'nail.' The head and upper parts ashy brown, the hinder part of the back bluish grey. The lower parts are white, and the neck and breast grey. The full-grown male attains a length of 3 feet. The bean G. arrives in Britain from its Arctic habitat about October. Its beak is more slender and pointed than that of the wild G., and is coloured black with an orange centre. The upper surface is brownish grey, the tail-coverts and belly white, and the breast grey. The average length is about 2¾ feet. The domestic G. is of a white colour, although the darker grey of its progenitors is often noticeable. The flavour of the flesh of the wild G. is rather fishy and disagreeable, and to remove it sportsmen are accustomed to bury the bird for an hour or two in the ground. The curious genus *Cereopsis* includes the *C. Novæ Hollandiæ* or Cape Barron G., found in Bass's Straits. Its technical name is derived from the presence of a large *Cere* (q. v.), which forms a prominent object on the beak. The bill is short, the nostrils large and rounded, and covered by the cere. The first quill of the wing is short, and the hinder toe is not lobed. The colour of this bird is brownish grey marked with black on the wing-coverts; the head a light grey tint, while the bill is black, and the cere greenish yellow. The legs are pink. The bird breeds freely in England, but is less decidedly aquatic in its habits than the other species of G. The flesh is palatable. The spur-winged G., already mentioned, inhabits Gambia and Senegal, and is so named from having 'spurs' or horny appendages on the wings. The head bears a red crest, springing from the base of the bill, and forming an intimate part of the skull. The plumage is mostly a deep black, but the breast and belly are white. The tail is short and round, and the second, third, and fourth quills are the longest. Other species of G., more or less closely related to the genera and species just described, are represented by the Egyptian G. (*Chenalopex Ægyptiaca*), the Brent G. (*Bernicla Brenta*), and the red-breasted G. (*B. ruficollis*). The Canada G. (*B. Canadensis*) is very common in N. America, but lives and breeds freely in Britain. It is somewhat swan-like in appearance and proportions. Its colour is black with a semi-lunar patch of white on the throat. The pink-footed G. (*A. brachyrhynchus*) is noted for the shortness of its bill; this species is rare in Britain, but common in the Hebrides. The white-fronted G. (*A. erythropus*), sometimes named the laughing G., is found both in the Old and New World, chiefly in the Arctic regions. The average length is 26 or 27 inches, and the colour, grey with a white head. The Chinese G. (*A. Cygnoides*), has a protuberance on its mandible, from which it is also named the 'knobbed G.' Its native country is supposed to be Guinea, but it is domesticated in Britain. Geese are typically inhabitants of the northern regions, and usually fly southwards in winter in immense flocks, which appear to be led by regularly appointed leaders; each flock flying in the form of the letter V—the apex of the letter pointed forwards. They breed once a year as a rule, and pair during the breeding season. The varieties of the common G. most famous are the Emden and Toulouse G.; the latter including birds of large size. Lincolnshire with its fenny districts affords the chief supply of these birds to the London market.

Goose.

Goose'berry (a corruption of the Ger. ***krausel-beere***, 'hairy berry:' 'krausel' was Latinised in the medieval ages into ***grosella***, whence the Fr. ***groseille***, and the Low. Scotch ***grozet*** or ***groset***), the common name for the fruit of ***Ribes grossularia***, a prickly shrub belonging to the natural order Grossulariaceæ, and indigenous to Britain, many parts of Europe, and to Nepaul. There are now many varieties of G. cultivated in gardens. The ripe fruit, which is very wholesome, and varies much in flavour,

is either red, yellow, or green, and hairy or smooth on the surface. It is extensively used as a preserve, and in the unripe state for tarts. A champagne is also manufactured from it. The Peruvian G. is a species of *Physalis* (q. v.), a plant belonging to a different natural order.

Gooseberry Caterpillar, the name given to the larva of a moth (*Abraxas grossulariata*), striped with white and black, and moving by bending its body into 'loops.' It is very destructive to the leaves of gooseberry and currant bushes. The moth itself is a dirty white, marked with black and yellow. The larvæ of various other species of moths (*e.g.*, *Halias Vanaria*) also feed on the leaves of these plants, and are also known by this name.

Gooseberry Fly (*Nematus grossulariæ*), a species of *Neuropterous* insects allied to the well-known Sand-Flies (q. v.), and included in the family *Tenthredinidæ*. The antennæ are simple in the genus Nematus, and the tarsi are jointed. The G. F. is noteworthy from the ravages of its larvæ on the gooseberry trees and fruit.

Goose'bill Shell. See LINGULA.

Goose Grass, or **Cleavers**, the popular names given to *Galium aparine*, a common hedge plant. See BED STRAW.

Goph'er or **Mungofa Tortoise** (*Testudo gopher*), a species of *Testudinidæ* or tortoises found in America, of a brownish-yellow colour, mottled with dark brown. It attains a length of 13 or 14 inches, and the female is larger than the male. The back is greatly arched. The food of the G. T. consists of vegetable matter, and it is specially fond of the sweet potato. The eggs are larger than those of pigeons, and are highly esteemed as food.

Gopher Wood, the wood of which the ark was constructed (Gen. vi. 14), is supposed to be the produce of a species of Cypress (q. v.), or some other tree belonging to the same order.

Göpp'ingen, an industrious and thriving town of Würtemberg, on the river Fils, about half-way by rail between Stuttgart and Ulm. Its acidulous mineral waters are in high repute. The manufactures comprise linen, cotton, and woollen fabrics. Pop. (1871) 8649.

Go'ral (*Antilope Goral*), a species of *Antilopiodæ* or Antelopes (q. v.) found in the mountainous districts of Nepal, and somewhat resembling the Chamois (q. v.) in habits. The colour is a light brown marked with black, and the horns are short, pointed, and curved inwards.

Gora'my (*Osphromenus olfax*), a peculiar species of Teleostean fishes, included in the family *Anabasidæ* of which the *Anabas* (q. v.) *Scandens* or Climbing-Perch (q. v.) of India is a familiar example. The G. appears to be a native of rivers in China and the Malay Archipelago, and has been acclimatised in the W. Indies. The body is broad, the tail prominent, and the head small. The dorsal and anal fins are spinous, and the ventral fins are peculiar, as the first ray of each is prolonged, and forms a long and slender filament. This fish was introduced into the Mauritius in the 18th c., and is now found native in the streams; while in Java the Dutch have long kept the G. in tanks. The nest is formed of plants, both male and female watching the eggs during their development.

Gor'dian Knot. The tradition regarding this celebrated knot may be briefly stated. When Gordius, a poor Phrygian peasant, was ploughing, an eagle settled on his yoke of oxen, and remained till night. Curious to know the meaning of the prodigy, he went to Telmissus to consult the soothsayers. On his way he met a prophetic girl who told him to offer sacrifice to Zeus Basileus. She directed the rites, and the grateful Gordius married her, and became by her the father of Midas. After a time dissensions arose in Phrygia which an oracle declared would be quelled by a king who should come riding in a car. Gordius arrived in this fashion, was chosen king, and dedicated his car and yoke of oxen to Zeus, at the same time tying the yoke to the pole in such a cunning manner that the ends of the thong could not be detected. An oracle, or at least a rumour, promised the sovereignty of Asia to him who should untie the knot. When Alexander the Great came to Gordium (the city of King Gordius) he cut the G. K. with his sword, and declared the oracle fulfilled. The term G. K. is commonly applied to any apparently inextricable difficulty.

Gordia'nus, the name of three Roman Emperors, father, son, and grandson:—1. **M. Antonius G.**, surnamed **Africanus**, Emperor 238 A.D., descended on his father's side from the Gracchi, and on his mother's from Trajan. He spent his life in study and in the practice of virtue. When quæstor he was famed for his liberality, and when ædile he exhibited the games with unusual splendour. He was twice consul, first in 213 A.D., and afterwards with Alexander Severus. Soon after he was nominated Proconsul of Africa. In his eightieth year, during the tyrannical reign of Maximinus, he was compelled much against his will to accept the purple. His election was ratified by the senate, and G. and his son were proclaimed Augusti. Meanwhile Capelliannus, governor of Numidia, refused to acknowledge G.'s authority; advanced towards Carthage, and defeated and slew the younger G., who had taken the field against him. On hearing of this disaster the elder G. slew himself in despair, after a reign of less than two months.—2. **M. Antonius G.**, son of and joint-emperor with (1), was born 192 A.D., and died as stated above, in his forty-sixth year. G., who was a man of considerable culture and literary taste, was chiefly remarkable for the largeness of his library (60,000 volumes, left him by his tutor), and the number of his mistresses.—3. **M. Antonius G.**, grandson of (1), was raised when very young to the rank of Cæsar, and associated with Balbinus and Pupienus Maximus, who were elected emperors in opposition to Maximinus on the death of the two elder Gordians. In a few months all three were slain, and G. was declared emperor. In 241 A.D. he married Sabinia Tranquillina, daughter of the learned and virtuous Misitheus. Next year he undertook the war against Sapor, King of Persia, whom, chiefly owing to the ability of Misitheus, he defeated, and compelled to evacuate Mesopotamia. Misitheus soon died, and Philip, his successor, having created disaffection in the army, G. was assassinated 244 A.D.

Gor'dius, a genius of *Scolecida* (q. v.), popularly known from their slender form under the name of 'hair-worms,' and erroneously included in some works in the class *Annelida* (q. v.), or that of the true worms. The genus G. forms the type of an order (*Gordiacea*) of Nematoid or 'round' worms (*Nematelmia*). It occurs parasitically in the earlier stages of its existence within the bodies of grasshoppers and beetles, and may be found of a length far exceeding that of the insect in which it is located. When sexually perfect, it escapes from the body of its host, and subsequently breeds; the sexes being situated in distinct individuals. The eggs are deposited in long strings in water, and although the G. parasite has a mouth and digestive system, the alimentary canal of the sexually mature G. becomes obliterated. The young G. appears to have hooklets and a retractile proboscis, and at first leads a free existence in water, but soon enters the body of some insect. *G. Aquaticus* is the familiar species.

Gor'don is the surname of one of the most ancient and illustrious Scottish families. The origin of the name and family is unknown, but the fictions of a certain Duke of G. who was Constable of Charlemagne, and of a family who took their name from Gordunia in Macedonia, and flourished as early as the time of Julius Cæsar, are more than usually absurd; nor are accounts of Gourdons in Normandy or of Gordons in Scotland in the time of Malcolm Canmore much more worthy of belief. There seems, however, no doubt that the family was settled in its original seat of G. in the Merse sometime in the 12th c. The first G. of any note was an Adam de G., who joined the crusade of Louis IX., and died during the expedition in 1270. His grandson, Sir Adam, Lord of G., was one of the most notable men of his time. At first in the service of Edward I., he joined Bruce after the death of John Baliol in 1313. For various services he was rewarded with a grant of the lands of Strathbogie in Aberdeenshire, whither in 1333 he transferred the family seat. His second son, William, was ancestor of the Gordons of Kenmure. A descendant of this Adam, another Sir Adam, fell at Homildon in 1402, leaving an only daughter, who married Alexander Seton of Seton. The latter came in consequence to be styled Lord of G. and Huntly, and is the ancestor of the main branch of the family.

GORDONS OF HUNTLY AND GORDON.—**Alexander**, son of the last-mentioned lord, was created Earl of Huntly in 1449.

The succeeding Earls were noted for their loyalty to the Stuart family and the Roman Catholic Church. George, fourth Earl, was head of the Scots Catholics at the time of the Reformation, and his son, the fifth Earl, was one of Queen Mary's most determined adherents. The sixth Earl, created Marquis of Huntly in 1599, was at first a zealous Catholic, but conformed to the Established Church in 1610; and George, second Marquis and Earl of Enzie, was beheaded in 1649 for his unyielding fidelity to Charles I. George, fourth Marquis, was created Duke of G. in 1684; but the title became extinct on the death of George, fifth Duke, in 1836, being confined to heirs male of the body of the first Duke. It was, however, revived in 1876, and conferred on the Duke of Richmond and Lennox, who, as sister's son of the last Duke, had inherited most of the G. estates, while the second title—Marquis of Huntly—devolved on George, fifth Earl of Aboyne. The Duke of G., as head of the great Clan G., was wont to be called 'Cock of the North,' but the most ancient appellation was 'gudeman of the Bog,' from the Bog of Gight, the site of Gordon Castle.

THE GORDONS OF KENMURE AND LOCHINVAR were descended from William de G., second son of that Sir Adam who was killed at Halidon Hill in 1333. In 1633 Sir John G. of Lochinvar was created Viscount Kenmure and Lord Lochinvar. Alexander, fifth Viscount, the hero of 'Kenmure's on and awa', Willie,' was executed in 1716 for his part in the Rebellion of the previous year, and the title and estates were forfeited. The honours of the family were restored by Act of Parliament in 1784; but since the death in 1847 of Adam, eleventh Viscount in succession, but eighth in possession owing to the attainder, the title has been dormant.

GORDONS OF ABOYNE.—Lord Charles G., fourth son of the second Marquess of Huntly, was in 1660, for his great services to the Royalist cause, raised to the dignity of Earl of Aboyne and Lord of Strathaven and Glenlivet by Charles II. The fifth Earl, George, became Marquis of Huntly, as above mentioned, on the death of the fifth Duke of G. in 1836, and died in 1853 in his ninety-second year. The present Marquess of Huntly is the premier marquess of Scotland. He was born in 1847, and succeeded his father in 1863.

The GORDONS OF METHLIC AND HADDO are said to be descended from Sir William G. of Cowdenknowes in Berwickshire, son of that Sir Adam who took part in the last crusade. The groundless tradition that they, with the other Gordons, are sprung from Bertrand de Gourdon, who killed Richard Cœur de Lion, is an event commemorated by the family arms. The family was ennobled in the person of Sir George G., Lord Chancellor of Scotland (3d baronet, 1642), under the title of Earl of Aberdeen, &c. (Viscount Formantine, and Lord Haddo, Methlic, Tarves, and Kellie). George, fourth Earl (q. v.), was Premier from 1852 till 1855, and his second son, Lieutenant-General Sir Alexander Hamilton G., was elected M.P. for E. Aberdeenshire in 1875.

GORDONS OF SUTHERLAND.—In 1512, Adam, Lord of Aboyne, second son of the second Earl of Huntly, married Elizabeth, Countess of Sutherland, and became in her right Earl of Sutherland. Their descendants long retained the name of G. There are many other families of the name throughout Scotland, all more or less directly sprung from the same stock, among whom may be mentioned the Gordons of Gight, of whom Lord Byron, through his mother, was the last descendant.

Besides two unprinted compilations of the history of the G. family—one by an Italian monk, written at Kinloss in 1545, and the other by Robert G. of Straloch, an eminent antiquary who died in 1661—there have been published *A History of the Ancient, Noble, and Illustrious Family of G.*, by William G. (2 vols. 8vo, Edinb. 1726); *A Concise History of the Ancient and Illustrious House of G.*, by C. A. G. (1 vol. 12mo, Aberd. 1754), both of which are rare; and a *Genealogical History of the Earldom of Sutherland, from its Origin to the year* 1630, by Sir Robert G. of Gordonston, with a continuation to the year 1687, by Gilbert G. of Salloch, published at Edinburgh in 1813.

Gordon, General Patrick, a distinguished general in the Russian service, was born at Easter Auchleuchries, in Aberdeenshire, Scotland, 31st March 1635. He left his native country at an early age, and after spending some time in N. Germany, went to Russia in 1661, where he shortly afterwards entered the army. His talent soon gained him promotion, and he at last became General-in-Chief of the Russian army, and the great favourite of Czar Peter. He subdued the Cossacks of the Ukraine (1670 *et seq.*), repelled the assaults of Turks and Tartars (1677), and crushed the revolt of the Strelitzes (1698). The unwillingness of Peter to part with him, obliged G. to decline several highly-flattering offers of command in the service of his own sovereign. To the great grief of the Czar, G. died at Moscow on the 9th December 1699. For many years before his death, G. had kept a diary (in English), of which the MS., in 4 vols. 4to, is preserved in Moscow. Besides some fragments of it to be found in Müller (*Samml. Russ. Geschichte*) two abridgments have been published—*Tagebuch des General Patrick G.*, edited by Dr. Posselt (Mosc. and St. Petersb. 1849-53); and *Passages from the Diary of General Patrick G.*, printed for the Spalding Club. (1 vol. 4to, 1859).

Gordon, Lord George, whose name is best known from the part he took in the Protestant riots of 1780, was the third son of Cosmo George, third Duke of G., and was born in December 1750. After spending some time in the navy, in which he rose to the rank of lieutenant, he entered Parliament in 1774, and so distinguished himself by his attacks on all parties, that it was usual to say 'that there were three parties in Parliament—the Ministry, the Opposition, and Lord George G.' Having been elected President of the Protestant Association in 1779, he headed a procession of about 100,000 excited citizens to the House of Commons on the 2d June 1780, to present a petition against the Catholic Emancipation Act of 1778. The result was a riot which lasted several days, during which many Catholic chapels and private houses, including the house of Lord Mansfield, were sacked, Newgate destroyed, and many of the prisons burst open and set in flames. Lord George was arrested on a charge of high treason, but was acquitted for lack of evidence. In 1787 he was convicted of libel on Marie Antoinette, and of reflecting on the administration of law and justice in his own country in a petition drawn up and presented by him. He fled to Holland, but in 1788 was committed to Newgate, where he spent the remainder of his life in study. Some time before his apprehension he embraced the Jewish religion, of which he continued to be a firm adherent till his death, which occurred at Newgate, 1st November 1793.

Gordon, Sir John Watson, R.A., an eminent Scottish painter, was born in Edinburgh about 1790, studied at the Art Academy of that city, and devoted himself at first to historical subjects, but afterwards to portrait painting, in which he became highly successful. In 1850 he was elected president of the Royal Scottish Academy, and was shortly afterwards knighted. He died June 1, 1864. G. painted many of the chief members of the Edinburgh society of his time, Scott, De Quincey, Wilson, Chalmers, Principal Lee, Cockburn, &c. But his *chef-d'œuvre* is the 'Provost of Peterhead.' His portraits are very realistic and solidly painted.

Gordon, Lucy, Lady Duff, daughter of Mrs. Austin, was born in 1821, married Sir A. G. in 1840, and became known as an excellent translator of French and German works. She died at Cairo, July 14, 1869. Among her translations are Ranke's *History of Prussia*, Niebuhr's *Greek Legends*, *The Amber Witch*, *The Village Doctor*, &c. Her original works, marked no less by an exquisite feminine lightness and grace than by an almost perplexing freedom of religious sentiment, are *Letters from the Cape* (1864) and *Letters from Egypt* (1865), and *Last Letters from Egypt* (1875), with a *Memoir* by her daughter, Mrs. Ross.

Gore, in heraldry, a charge consisting of a third of the shield marked off by a line from the foot of the escutcheon, and a line from the dexter or sinister chief.

Gore, Mrs. Catherine Frances, an English novelist and dramatist, born at East Retford, Nottinghamshire, in 1799. She married Captain G. in 1823, spent several years on the Continent, and died at Lynwood, Hampshire, October 19, 1861. She wrote about seventy novels, among which are *The Cabinet Minister*; *Preferment*; *Cecil, or the Adventures of a Coxcomb*; *Greville, or a Season in Paris*; *The Banker's Wife*, &c. They consist mostly of shallow, lively pictures of fashionable English life, with almost no feeling, but a good deal of caustic cleverness. Mrs. G. also wrote *The School for Coquettes*, a prize comedy; *Lord*

Dacre of the South, a tragedy, and numerous short tales, sketches, verses, &c.

Gorée', an islet off the W. coast of Africa, 2 miles S.E. of Cape Verd, and 3 miles in circumference. It has a good harbour, and some trade in gold-dust, ivory, wax, &c. Two-thirds of its surface are occupied by a fortified town (pop. 3042) of the same name. Pop. 7000.

Go'rey, a town in the county of Wexford, Ireland, 3 miles from the sea and 11 W.S.W. of Arklow by railway. It consists mainly of a long straggling street, and has a modern Roman Catholic church, which includes a nunnery, and is built in the Pointed style. The trade is in wheat, oats, barley, cattle, pigs, &c. Pop. (1871) 3620. G. received its municipal charter from James I.

Gorge. See FORTIFICATION.

Gorged, in heraldry, having a collar round the neck.

Gor'gei, Arthur, a Hungarian general, descended from a noble Protestant family, was born at Toporcz, in the county of Zips, 5th February 1818, and educated for the army. He forsook the military profession in 1845 for the study of chemistry, and was writing chemical dissertations when the Revolution of 1848 called him back to the army again. After Moga's defeat at Schwechat G. was made commander, and his energy and military talent were signally displayed in his defence of the retreat to the hilly country. Though often defeated by superior forces, he was always able to keep in the field. The suspicion of the Hungarian Government, excited by G.'s famous declaration of loyalty to the constitution promised by Ferdinand V., removed G. from the command; but after Dembinski's failure, G. was replaced at the head of one of the armies, and on April 7th, 1849, began at Godollo that brilliant series of victories which ended on the 28th in Welden's retreat on Pressburg. The Austrians now retained only a few fortresses and a mere strip of Hungarian territory. But the tedious siege of Buda proved fatal. A Russian army was now co-operating with the Austrians; and, despairing of success against their combined forces, G. determined, in spite of his orders, to operate immediately against the Austrians, and sustained repeated repulses. He ventured on a last effort at Komorn, 11th July 1849, and was defeated. On 11th August Kossuth resigned in G.'s favour: G. became dictator, and having certain information of the total defeat of Dembinski's army, he submitted unconditionally to the Russians at Világos on the 13th August. The fact that G. had then under his command 20,000 infantry and 2000 cavalry, and the leniency with which he was personally treated, have provoked charges of treachery. At first interned at Klagenfurt, in Carinthia, G. was permitted in 1866 to return to Hungary. In 1851 G. published an account of his campaigns, *Mein Leben und Wirken in Ungarn in* 1848 *und* 1849.

Gor'get (Fr. *gorge*, 'a throat'), a piece of armour which covered the throat. It was retained in the 17th c. after other body armour was disused.

Gor'gias, a celebrated Greek rhetorician, was born at Leontini, in Sicily, about 480 B.C., and lived to the advanced age of 105 or 109. Of his early life little is known. In 427 B.C. he was sent by his fellow-citizens to Athens to solicit aid against the Syracusans. After his return to Leontini his stay was but short; and he seems to have spent the remainder of his long life for the most part at Athens, and Larissa, in Thessaly. G. was the expounder of an art which he deemed superior to all others, and his aim was to enable his pupils to convince by the spell of eloquence alone. He did not profess to impart virtue; and he is said to have preferred the name of rhetorician to that of sophist. Two works ascribed to him are extant, *The Apology of Palamedes* and the *Encomium on Helena*. Their genuineness is admitted by Reiske and Schönborn, but doubted by Foss and others. G. owes much of his reputation to Plato's dialogue, which bears his name.

Gor'go, or **Gor'gon**, according to Homer, one of the frightful shapes in Hades. Hesiod mentions three Gorgons—Stheno, Euryale, and Medusa, daughters of Phorcys and Ceto (hence called *Phorcides*), and assigns them a dwelling-place in the western ocean, in the vicinity of Night and the Hesperides. Later writers place their haunt near Lake Triton in Libya. They are described as winged forms, having hair entwined with serpents, brazen claws, and enormous teeth. Medusa, to whom the name G. is most frequently applied, was the only one of the three who was mortal. According to Ovid and later mythologists, she was originally a very beautiful maiden with luxuriant hair; and had received her terrific visage and serpent locks from Athena as a punishment for having gratified the passion of Poseidon in one of her temples. So frightful was her aspect, that every one who looked on her was turned into stone. She was at last slain by Perseus (q. v.). Athena placed her head in the centre of her shield.

Gorgo'nia, Sea-Shrub, or **Sea-Fan**, a genus of *Cœlenterata* (q. v.) animals belonging o the class *Actinozoa* (q. v.), and to the order *Alcyonaria*. The G. is closely allied to the red coral of commerce, which is, in fact, included in the family *Gorgonidæ*. In this group the cœnosarc (or connecting medium which unites the various and different animals of these compound organisms) is of branched tree-like form, and is permanently rooted to the sea-bed. Each little polyp has a mouth surrounded by eight pinnate tentacles. The spreading coral substance of G. is of a horny and flexible texture, while the living polyps are spread over the extended branches of the flattened organism. *G. flabellum* is a familiar species, and occurs in the W. Indian Seas. The coral substance is usually blackish in hue, but occasionally exhibits various tints.

Gor'ham Controversy was a remarkable episode in the history of the Tractarian revival in the Church of England. Mr. Gorham being presented (1847) to a living in the diocese of Exeter, the bishop refused to institute him until he should submit to an examination on the subject of Baptism. On receiving Mr. Gorham's answers to the forty-nine questions proposed to him 'on the single subject of baptismal efficacy,' the bishop persisted in his refusal to institute, on the ground of unsoundness in doctrine; the whole question at issue between them being whether the efficacy of baptism, in the case of infants, be conditional or unconditional, the bishop holding that it is unconditional, and Mr. Gorham that it is conditional. The Court of Arches, when appealed to by Mr. Gorham, confirmed the bishop's decision, when the judge said:—'The Church has declared that the thing signified is given at the moment. There is no hindrance in the way when infants are baptized, therefore they receive the benefit, whatever it may be, and it is spiritual regeneration according to the formularies of the Church.' The Judicial Committee of the Privy Council, however, being appealed to by Mr. Gorham, reversed the decision of the Court of Arches, and gave a final decision (1850) in favour of the 'Evangelical' view. At least, it declared that the view that the child in baptism is regenerated only if it be one of the elect, or if it be presented in faith, is not inadmissible.

Gorill'a (*Troglodytes gorilla*), one of the highest of the Catarhine, Old World, or anthropoid ('man-like') apes, inhabiting Lower Guinea and Equatorial Africa, and distinguished, among other characteristics, by its large size, the G. attaining a height of between 5 and 6 feet. The genus *Troglodytes* also includes the Chimpanzee (q. v.) (*T. niger*), to which the G. is most nearly related. The distinctive characteristics of this ape are that the arm is longer than the fore-arm, the foot longer than the hand, and both feet and hands broader than in any other ape. The heel is well developed, and the erect posture can therefore be assumed with comparative ease by the G. The thumbs and great toes have well-developed nails; and the first or basal joints of the three middle toes are united by the integument. The points in which the G. approaches most nearly of all the apes to the human type of structure, are the proportions of the leg to the body, the proportions of the hand to the foot, the size of the heel, and the curves of the spine, together with the form of the pelvis. The 'absolute capacity of the cranium' is also closely related to that of the human subject. As measured from a typical skeleton, the spine of the G. measures 27 inches along its front face; the arm 31½ inches without the hand; the leg without the foot 26½ inches. The foot is 11¼ inches, and the hand 9¾ inches long. Certain peculiarities in the skeleton of the G. may be briefly noticed. It has thirteen pairs of ribs, the first lumbar vertebra bearing a pair of ribs—a development occasionally seen in man, who has nominally only twelve pairs of ribs, borne by the twelve dorsal ver-

tebræ. The last lumbar vertebra of the G. frequently becomes ossified with the *sacrum*—an abnormal feature also seen in man. The frontal sinuses of the G.'s skull are large, and the brow ridges well marked. The jaws are largest in proportion to the size of the brain-case in the G. and in the orang. The nasal bones are convex, and rise above the facial level. In the wrist of the G. eight bones are found, as in man, and the thumb is at least one-third the length of the hand. The female G. has a shorter pelvis than the male. The brain of the G. has recently (December 1876) been fully described by Dr. Pansch of Germany, who dissected along with Dr. Bolau a specimen which lived for some time in the Berlin Zoological Gardens (see *Nature*, No. 372, vol. xv. p. 142). In the G. the brain has a capacity of about 35 cubic inches, that of man being over 60 cubic inches. In external appearance, the G. presents a brute-like aspect. The body is covered with very dark brown hair, which has in some cases been described as of black colour. The hairs from the shoulder to the elbow point downwards, those from the elbow to the fingers are directed upwards, and meet the hairs of the upper arm in a tuft at the elbow. The G. has small ears, the tail is abortive, and a large laryngeal sac giving great resonance to the voice is developed. One male appears to mate with several females. The existence of the animal appears to have been first discovered by Dr. Savage of the United States of America, who in 1847 procured the skull of an ape hitherto unknown to zoologists, and which he named the 'G.' In 1861 M. Paul Du Chaillu published his *Explorations in Africa*, and gave a series of descriptions of the G., the truth and correctness of which have been greatly disputed. Making allowance for some exaggeration, Du Chaillu's accounts present no features which render their acceptance a matter of hesitation. It is curious to note that Hanno, the Carthaginian voyager, dating from about 350 B.C., makes mention of an ape-like animal which he named the 'gorilla,' but which may possibly have been the chimpanzee. Of the immense strength and natural ferocity of the G. no doubt can be entertained. The voice is loud and powerful, and the food consists of fruits and leaves. It is an expert climber, and appears to construct 'nests' amid the boughs of trees or in shady places.

Gor'kum, or **Gorinchem**, a strongly fortified town in the province of S. Holland, Netherlands, on the river Merwede, at the point where it is joined by the Linge, and 12 miles E. of Dort. Except the church and the townhouse, the chief buildings are military. G. has a brisk trade in agricultural produce and fish. Its system of relief for the poor is remarkable. Pop. (1875) 8725.

Görlitz, an old town in Prussian Silesia, on the left bank of the Neisse, and 90 miles W. of Breslau by railway. Its chief ecclesiastical structures are the church of St. Peter and Paul (1423-97), with a splendid organ, and a bell of 12½ tons; the Frauenkirche (1450-90), with a magnificent choir and doorway; and a kreuz-kapelle built on the model of the holy sepulchre. Other notable buildings are the gymnasium (Gothic style), containing a large library; and a town theatre built in 1851. The Neisse is spanned by a bridge 115 feet high and 1500 long. G. is the seat of extensive cotton factories, employing some 2000 men; and among its other manufactures are linens, leather, and tobacco. Pop. (1875) 45,348. G. was strongly fortified till the end of the 12th c.

Görr'es, Jakob Joseph von, a German scholar, journalist, and politician, was born at Coblenz, 25th January 1776. Both by his speeches, and by a journal which he edited, G. directed for years the republican zeal of his native district; but after Napoleon became supreme in France, G. retired from politics in disgust. As a lecturer at Coblenz and at Heidelberg, he discoursed and published on subjects as various as physiology, medieval poetry, and Asiatic mythology. The great national German movement of 1814 reawakened his political energies and patriotic hopefulness, and G. edited the vigorous *Rheinischer Merkur*. The work *Deutschland und die Revolution* (1820) exposed G. to the risk of imprisonment; he fled to France, and busied himself with literature. In 1827 he was invited to occupy the chair of literature in the new university of Munich, and was afterwards known as a zealous Catholic, and defender of Catholic measures. He died 29th January 1848. Among G.'s principal works may be mentioned *Athanasius* (1837); *Die Christliche Mystik* (1836-42); and *Die Japhetiden* (1844). G.'s collected works, 8 vols., appeared in 1854-60. His son, **Guido G.** (born 1805, died 1852), distinguished himself as a poet and as a writer for the young.

Gort'schakoff, a princely Russian family, which claims descent from Rurik, and of which the chief members are:—**Peter**, who held Smolensk against Sigismund of Poland from 1609 to 1611.—**Dmitri**, great grandson of the above, was a popular lyrical poet, who wrote odes, satires, epistles, &c., and died in 1824.—**Alexander**, brother of Dmitri, born in 1764, served against the Turks under Suwarroff, his uncle, became a general in 1798, defeated Marshal Laures at Heilsberg, was made War Minister in 1811, and died in 1825.—**Peter**, son of Dmitri, born about 1790, fought against the French in the campaigns of 1812 and 1813, was made commander of a division in 1826, and in 1829 governor-general of Western Siberia—the condition of which he greatly bettered. He held commands at the battle of the Alma and at Inkermann.—**Michael**, brother of the above, born in 1795, joined the army, commanded at the sieges of Schumla and Silistria in 1829, and distinguished himself at the battle of Ostrolenka and capture of Warsaw in the Polish campaign of 1831. He was made governor of Warsaw in 1846, took part in the Hungarian war of 1849, led the Russian troops in the Danubian Principalities in 1853, and in 1855 took command of the army in the Crimea. His defence of Sebastopol against the French and English was a triumph of military skill, and he conducted his retreat from the fortress with consummate ability. He was made lieutenant-general of Poland on the close of the war, and died May 30, 1861.—**Alexander Michaelovich**, cousin of the above, was born in 1798, became secretary to the Russian embassy in London in 1824, *chargé d'affaires* at Florence in 1830, and a member of the legation to Vienna in 1832. In 1841 he arranged the marriage of the Grand Duchess Olga of Russia with the Prince Royal of Würtemberg. He represented Russia in the Vienna Conference of 1854, and in 1856 became Minister for Foreign Affairs. In 1870 he announced that Russia would no longer submit to the restrictions on her rights in the Black Sea imposed by the treaty of 1856, and gained his demands at the London Conference of 1871. He is still (1877) Russian Foreign Minister.

Goruckpore' (*Gorakhpur*), the chief town of the District of the same name in the N.W. Province, British India, on the left bank of the Rapti, 430 miles N.W. of Calcutta. Pop. (1872) 51,117. It has an old ruined fort with two mosques, and a Hindu temple with a tank much frequented by pilgrims. The military cantonment lies to the E.—The *district* of G., bounded N. by Nepaul, has an area of 4579 sq. miles, and a pop. (1872) of 2,019,361. It is flat, studded with marshy lakes, and watered by the Gogra, Rapti, Gunduck, and their tributaries. Rice is the staple crop, but wheat, barley, opium, and sugar-cane are also grown. A large trade is conducted with Bengal, by means of the rivers, the chief marts being Burhej, Gopalpore, and G. During the first half of 1876, they were valued at £290,000.

Go'ry-Dew, a common name for *Palmella cruenta*, a cellular plant belonging to the order *Palmelleæ* (q. v.), or green-spored Algæ (q. v.). It occurs on damp walls in the form of gelatinous spots resembling blood, hence its name. It is nearly allied to the Red-snow (q. v.) plant.

Görz, or **Göricz** (Slav. 'the town on the hill'), the capital of a district of the same name, in the Kustenland of Austria, on the Isonzo, 25 miles N.N.W. of Trieste by railway. It lies between the Karste and Tarnovane forests, and has a cathedral and an old castle of the former Counts of G. There are large sugar-refineries, and silk, linen, cotton, and leather industries. Pop. (1869) 15,300.—**G.** or **Gorica Velica**, a town of Austria in Croatia, in the valley of the Save, 10 miles S.S.E. of Agram by railway. Pop. (1869) 8000.

Gosain', or **Goswa'mi** (Sansk. lit. 'one who is master of his passions'), is the term used throughout India for a special class of professed religious mendicants. In S. India, they are chiefly the reputed descendants of the religious reformer, Sankara Acharya; they are gathered into *maths* or convents, and profess celibacy. In N. India, they are generally members of the Vaishnav sect, who may marry and follow secular pursuits; but the name is loosely applied to all sorts of disreputable vagrants.

Gos'hawk (*Astur palumbarius*), a species of *Raptorial* birds belonging to the sub-family *Accipitrinæ*, or that of the sparrow-hawks. In the genus *Astur*, to which the G. belongs, the bill is broad at the base, and compressed at the tip; the nostrils are large and oval, and placed in the middle of a *Cere* (q. v.). The wings are very long, and have their third, fourth, and fifth quills longest. The tarsi are long, and are scaled in front and behind. The G. is found in Europe, Asia, and N. Africa. Its length is about 18 inches. The colour is a grey-brown above; white, beneath; the body, and particularly the under part, being marked with black bars. The legs and toes are yellow. The female G. is a more powerful bird than the male, but neither is able to take long flights. When trained, the G. becomes an adept in the capture of hares and rabbits. The nests are placed on the highest branches of trees, and the eggs, numbering three or four, are of a bluish-white. An allied species is the *Astur Novæ Hollandiæ*, or white eagle of New Holland.

Goshawk.

Go'shen (Heb.) was the part of Egypt where the children of Israel dwelt during the period of their residence in that country (Gen. xlv. 10). According to the best authorities it lies between the desert of Arabia and Palestine on the E., the Pelusiac arm of the Nile on the W., and the Mediterranean on the N., corresponding nearly with the modern *Wadi-t-Tumeylat*.

Gos'lar, ('the town or site on the Gose'), an old town of Prussia, in the S.E. of the province of Hanover, at the foot of the Rammelsberg, on the Gose, 25 miles W. of Halberstadt by railway. It has remains of fortifications, and of a cathedral of 1040, part of an old imperial palace, now used as a corn-magazine, and a Gothic church of 1521. There were formerly (from 986) gold, silver, copper, lead, and zinc mines in the vicinity. Pop. (1875) 9823. G., founded by Heinrich I. about 920, and often an imperial residence, was the seat of splendid diets (in 1009 and 1015), and remained a free city till 1801. It was incorporated with Hanover in 1814. See Crusius, *Geschichte von G.* (1814), and *G. am Harz, sonst und jetzt* (1863).

Gos'pels (Old Eng. *god-spell*, 'good news') are the four memoirs of the life of Christ in the New Testament under the names of Matthew, Mark, Luke, and John.

I. *Their Mutual Relation.*—1. *John v. the Synoptics.*—Even the most careless reader of these books cannot fail to be struck with two circumstances: the marked agreement that exists among the first three, and their common difference from the fourth. In the first place, prior to the arrival of Jesus at Bethany six days before the Passover, John relates only two incidents in common with the other three—the feeding of the 5000 people, and the storm on the Sea of Galilee. But this is not the whole of the difference, neither is the difference a mere diversity of style or plan. It affects the fundamental distribution of the events of Christ's public ministry, if not even the whole conception of his person and teaching. The first three describe Jesus as baptized by John, like many of his countrymen, and not beginning his public ministry till that of John was finished (Matt. iv. 12, 17); confining his labours exclusively to Galilee and the N.; appealing to the Messianic expectations of the time, and teaching the common people, and performing countless miracles as he journeyed from place to place; gradually unfolding to a select few his claims and destiny, while warning them not to reveal the same to the common people (Matt. xvi. 20); and only at the very close of his ministry coming to Jerusalem, where he came into collision with the sacerdotal and rabbinical party, who accomplished his death. Further, his teaching, as set forth in the three, is remarkable for its casual and aphoristic nature, and, with the exception of the Sermon on the Mount, for never expanding into any lengthened argumentation. His public ministry is divided into two distinctly-marked periods—that which was passed in Galilee, and that in Jerusalem; the one introduced by the descent of the Holy Ghost upon him at his baptism; the other, by the Transfiguration. Finally, the Last Supper was an ordinary Jewish Passover. In all these particulars the fourth Gospel stands out in decided contrast to the first three, but is in no sense contradictory of them. It differs, but does not disagree. Thus it omits the baptism altogether, and presents the Messiahship of Jesus as a thing distinctly comprehended from the first (ch. i. 29–34, 41, 45), indeed; openly proclaimed by himself (ch. i., ii., iii.). In keeping with this is the position given to the incident of the expulsion of the traders from the temple, namely, at the very beginning of his ministry, instead of the end, as in the three. Instead of the daily miracle-working of the three, the fourth gives what is evidently a selection of (seven) miracles. The time of Christ is also divided almost equally between Galilee and Jerusalem from the first, and he attends two, if not three, Passovers in the Holy City. But in nothing is the difference more marked than in the discourses delivered by Christ. The parables and short aphoristic sayings of the three give place in the fourth to long argumentative discourses. Instead of a varied 'miscellany of history and doctrine, of miracle and parable, there is an almost uninterrupted flow of exhortation and disputation.' Finally, according to this Gospel, Christ was crucified on the day of the Jewish Passover. Regarding the explanation of the difference here briefly sketched, critics are greatly divided. Some maintain that the explanation first broached by Eusebius (*H. E.*, iii. 4), namely, 'that John, writing last, at the close of the 1st c., had seen the other G., and purposely abstained from writing anew what they had sufficiently recorded,' is quite satisfactory. Others maintain that it is impossible to harmonise the two forms of the narrative; and that the theory of Clement of Alexandria (*apud* Eus. *H. E.*, vi. 4), properly understood, is nearer the truth, namely, 'that whereas the three earlier G. contained the *corporeal* side of the history, John . . . produced a *spiritual* Gospel.

2. *The Synoptics, per se.*—Not less remarkable than the variation of the fourth Gospel from the first three is their general harmony among themselves; from which harmony they have received the name of the Synoptics. 'If the synoptic text be divided into 124 sections, 47 are common to the 3; 12 are in Matthew and Mark, 2 in Matthew and Luke, 6 in Mark and Luke; while 17 are in Matthew alone, 2 in Mark, and 38 in Luke alone.' The examples in which all the three verbally coincide are not numerous, and contain generally only from one to three sentences. The examples of verbal agreement between Matthew and Mark are very numerous; between Mark and Luke they are but slight. These verbal coincidences are more numerous in reporting the words of Jesus, or the words of others spoken in connection with his language, than in the narrative parts; being in the proportion in Matthew of about one to two, in Mark of one to four, and in Luke of one to ten. But, notwithstanding this similarity of matter, there is great diversity among them in its arrangement. Exact chronological sequence is not found in any of them. Matthew comes nearest to it. In arrangement Mark agrees more nearly with Luke than Matthew.

II. *Origin of the G.*—In view of the above peculiarities, a great number of theories have been propounded to account for the origin of the G. (1.) The first that may be mentioned is, that the Evangelists made use of each other's work. On this theory many critics (*e.g.*, Grotius, Mill, Wetstein, Griesbach, &c.) have tried to determine which of the three was the first written, which was copied from the first, and which from the other two; it being always understood that the fourth came last of all. Of the six possible combinations, each has found advocates. The difficulty of this theory, whatever the order adopted, is the omission by the second and third of matter inserted by the first, which indicates an arbitrary selection, for which there are no apparent grounds. (2.) The theory of Eichhorn (*Einleitung ins N. T.*), which was followed by Marsh (Edn. of Michaelis) with certain modifications, was that the G. were derived from a common written source or sources: the portions common to the three, from a certain document from which they all drew; that the sections common to Matthew and Mark, but not to Luke, were additions made in the copies used by Matthew and Mark, but not in the copy used by Luke; and that the portions common to Mark and Luke, but not to Matthew, were additions made in the copies used only by Mark and Luke. (3.) Both of the above theories are now to a great extent abandoned; a third, adopted by Gieseler (*Historisch-krit. Versuch*, 1818), is that they were derived from oral tradition, after it had assumed a fixed form. The objection to this theory is, that while accounting for many resemblances and discordances in the G., 'it fails to explain their numerous verbal coincidences.' This objection the Arch-

bishop of York, in his exposition of the theory (Smith's *Dict. of the Bible*), endeavours to meet as follows:—The preaching of the apostles must have been in great part historical, 'of such a kind as to be to the hearers what the reading of lessons from the G. is to us;' their preaching would probably begin to take one settled form during the first years of their ministry; the guidance of the Holy Spirit, 'which consisted not in whispering to them facts which they had not witnessed, but rather in reviving the fading remembrance, and throwing out into their true importance events and sayings that had been esteemed too lightly at the time they took place,' would supply for a time such aid as made a written Gospel unnecessary; 'there is nothing unnatural in the supposition that the apostles intentionally uttered their witness in the same order, and even, for the most part, in the same form of words;' the vernacular language was the Syro-Chaldæan, which was a poor and scanty language, and the Greek, as used by the Jews, partook of the poverty of the speech which it replaced; and while modern taste abhors a repetition of the same phrases as monotonous, the simplicity of the Evangelists, and their language and education, would all keep them from having any such feeling. It is necessary for the completeness and success of this theory to assume that the G. were written by the apostles, or during their lifetime. (4.) A fourth theory, held by more 'advanced' critics, is that earlier G. were used in the composition of the later ones; otherwise, the writers used earlier G., 'with other written documents now lost, some of them preserved only in fragments, others entirely unknown except in name,' not excluding oral tradition, although 'it formed a small element in the composition of each, because it had been incorporated into written collections of the evangelical history when the canonical G. appeared.'

III. *Language.*—The earliest MSS. of the G. we have cannot be dated earlier than the 4th c., but these are understood to be copies of the originals as they first appeared, with the exception, perhaps, of Matthew (q. v.). Consequently as these MSS. are all in Greek, it is assumed that that language was understood by the people of Palestine to whom Jesus and the apostles preached, and for whose instruction the G. were written. Thus Dean Alford says (*Com. Acts* vii. 1) that 'Greek was almost universally understood at Jerusalem;' and Dr. Roberts (*Discussions on the G.*, Lond. 1862) maintains 'that Greek was, in several important respects, the then prevailing language of Palestine, that it was, in particular, the language of literature and commerce, the language generally employed in public intercourse, the language which a religious teacher would have no hesitation in selecting and making use of, for the most part, as the vehicle for conveying his instructions, whether orally or in writing, and the language accordingly which was thus employed both by our Lord and his apostles.' As this is a question which has an important bearing on the origin of the G., it may be well to inquire briefly into the actual facts of the case. If Greek were understood at Jerusalem in the time of Jesus, it must have been still more familiar in the time of Josephus, a generation later. Yet Josephus himself says in the last chapter of his *Antiquities*, 'I am so bold as to say, now I have so completely performed the work I proposed to myself to do, that no other person, whether he were a Jew or a foreigner, had he ever so great an inclination for it, could so accurately deliver these accounts to the Greeks as is done in these books. For . . . I have also taken a great deal of pains to obtain the learning of the Greeks, and understand the elements of the Greek language, although I have so long accustomed myself to speak our own tongue that I cannot pronounce Greek with sufficient exactness. For our nation does not encourage those that learn the languages of many nations.' In his treatise *Contra Apion*, he tells us (i. 9), 'I sold them (the books of the *Wars of the Jews*) also to many of our own men who understood Greek, among whom were Julius Africanus, Herod (of Chalcis), and King Agrippa;' and in the preface to the *Wars of the Jews*, that he had translated those books into Greek which he had formerly composed in the language of his own country. Again, when at the siege of Jerusalem with Titus, he was several times employed as an interpreter. He was the only man who understood the deserters, and was sent several times to parley with the besieged in their native tongue (*Contra Apion*); and in the *Book of the Wars* (bk. vi.) he gives in Greek a long address which he delivered to them, by command of Cæsar, in the Hebrew language. The above information furnished by Josephus, who was the only Jew born in Judea in those times whose testimony we have before us independently of the G., seems to afford evidence that Greek was not generally understood at Jerusalem, even by the higher classes of the people. And although the question of the original language of Matthew has been keenly discussed, this evidence, as an element in the problem of the origin of the G. generally, has not received the attention which it deserves. See MATTHEW, MARK, LUKE, JOHN, GOSPEL OF; Smith's *Dict. of the Bible* (1863); Norton's *Int. Evid. of the Genuineness of the G.* (Bost. 1855); Westcott's *Introd. to the study of the G.* (Camb. 1860); Marsh's Michaelis' *Introd. to N. T.* (1803); Tischendorf's *Wann wurden unsere Evangelien verfasset?* (1867, Eng. trans. 1869.)

Gospel Side of the Altar is the N., on which side the G. was read in the time of St. Augustine, in allusion to Jer. iii. 12. At Rome the deacon turned to the S., because the men sat there (1 Cor. xiv. 35), or rather as defying Satan (Isa. xiv. 13). In some parts of England the G. S. of the A. was the S. side as late as the 15th c.

Gos'port ('God's port'), a fortified seaport of Hampshire, on the W. side of Portsmouth harbour, opposite Portsmouth, and 14 miles S.E. of Southampton, with which it is connected by railway. A steam ferry and floating bridge give it communication with Portsmouth; and the chief public works are the Royal Clarence Victualling Yard, comprising large granaries, a brewery, a steam-bakery capable of making 10 tons of biscuit in an hour, and the Haslar shipyard for the repair of gunboats. The Haslar Hospital (1762), one mile to the S., can accommodate 2000 invalid sailors. G. has some shipbuilding, and manufactures of iron anchors, chain cables, &c. Pop. (1871) 7366.

Goss, Sir John, an eminent composer, was born at Fareham in Hants in 1800. In 1811 he became one of the 'young gentlemen' of St. James' Chapel Royal, and in 1856 was made composer to the Chapels-Royal. He was organist of St. Paul's Cathedral from 1838 to 1872, and till recently Professor of Harmony at the Royal Academy. G. has published an *Introduction to Harmony and Thorough Bass* (1833), a collection of voluntaries (1864), and numerous glees and anthems. He composed the music for the funeral ceremony of the Duke of Wellington in 1852, and for the thanksgiving service for the Prince of Wales' recovery from fever in 1872; on the latter occasion he was knighted.

Goss'amer, the name given to the light and almost invisible filaments which sometimes exist in great quantities in the air, and which are secreted by certain species of Spiders (q. v.). Various explanations were formerly given of the formation of G. threads, which, when loaded with dewdrops and extended from plant to plant, present an appearance which has frequently been alluded to in poetical works as symbolical of an airy, graceful, and ethereal substance. The exact relation of G. threads to the silky secretion of spiders is not well determined. The theory has been advanced that G. represents the secretion of young spiders, but this explanation is not a probable one, as the G.-producing spiders do not appear to be capable of producing any other kind of thread; and insects are not frequently detained by these slight threads. The idea has also been thrown out that possibly the water or dewdrops attracted by the G. threads may be acceptable to the spiders. Altogether the subject is one which requires further elucidation—at any rate, as to the exact functions of the G. threads; while the more exact determination of the species of spiders which secrete this substance will materially aid our understanding of the uses subserved by G.

Gossan'der (*Mergus*), the name of a well-known genus of Natatorial birds, belonging to the family *Anatidæ* or ducks, and to the special sub-family *Merginæ*. It is distinguished by the straight, compressed bill, which has its edges prominently toothed, by the short and rounded tail, and by the front toes being webbed, while the hinder toe has only an edging of membrane. The G. (*Mergus merganser*) arrives in Britain in November, and migrates northwards in March. A few specimens may be found remaining throughout the year in Britain. The northern coasts are the habitat of these birds, which subsist on fishes, and secure their prey by means of the sharp-toothed projections of the bill. These projections are merely prominences of the horny lining of

the bill, and are in no sense to be regarded as physiologically corresponding to teeth. The average length of the G. is 2 feet. Its colour is a deep metallic green on the neck and upper part of the back, the latter region being black, and the tail dark grey. The wing-coverts are white, and the breast and belly of a ruddy buff hue. The bill and legs are scarlet. The female has a reddish-brown head and neck, and a grey back. The nest is constructed in the neighbourhood of water, and the eggs, which number six or seven, are of a pale buff colour.

Gosse'lies, a town of Belgium, province of Hainault, 4 miles N.W. of Charleroi. There are coal-mines in the neighbourhood, and G. has manufactures of woollen cloth, hats, &c., tanneries and bleachfields. Pop. (1870) 7000.

Gossyp'ium, the generic name of the cotton plant. See COTTON.

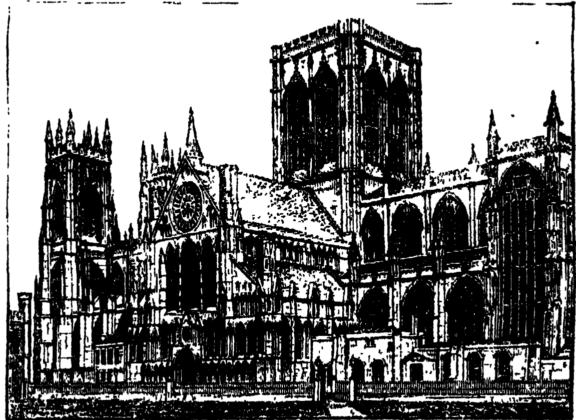
Go'tha, the capital of the duchy of Sachsen-Koburg-Gotha, is situated on the Leine Canal, and about 15 miles W. of Erfurt by rail. It lies just on the northern border of the Thuringian Forest, and besides being the most beautiful town in this region, is also the most prosperous. It is surrounded by pretty avenues, and is handsomely built. The ducal palace Friedenstein was erected in 1643, and contains a fine picture gallery, and other collections of valuables and curiosities, with a library of 200,000 volumes and 3000 MSS. The park is admirably laid out. The five churches and other public buildings are not very remarkable; the observatory has been newly refitted. G. is the seat of Perthes' geographical publishing house, and has considerable manufactures of porcelain, tobacco, sugar, paper, leather, shoes, sausages, and musical instruments. Pop. (1875) 22,928.

Gotha, Almanach de (Ger. *Gothaischer Almanach*), is a universal political and statistical compend, published annually at Gotha since 1764 by the firm of Perthes. It gives the pedigree and dignities of all royal and princely families, the members of the various governments, the diplomatic and other public officials, and a multitude of tables illustrating the constitutional features, the area, population, army, navy, the national finance, and the commerce of all nations. The almanack gives further a chronicle of the chief political events of the past year, and an annual necrology; and within its 1000 small pages, it contains probably more information than any other work of the same size. Originally appearing in German, the A. de G. was issued in French alone from the time of Napoleon I. down to the restoration of the German Empire; now it is published in both languages.

Gö'thaland, or **Gö'taland** (also called **Göta Rike**, 'the Gothic kingdom'), southmost of the three provinces of Sweden, embracing eight läns or districts with the islands Gotland and Oland. Area, 28,126 sq. miles; pop. (1874) 1,991,021. The surface, though in general mountainous, is well watered and wooded, and presents many fertile tracts. The chief river is the Götha or Göta, once unnavigable from cataracts (Trolhättan, &c.), but now so fitted with canals and locks that vessels can reach Lake Venern, from whence the Göta Canal affords free passage to the Baltic. The chief towns are Göteborg, Malmö, Norrköping, Carlskrona, Jönköping, Lund, and Calmar. To Englishmen it possesses a special interest as the native land of the hero Beówulf (q. v.) whose adventures have been celebrated in one of the oldest and greatest of English poems. See SWEDEN.

Go'thard, St., the name of a group of the Helvetian Alps, having an extreme height in Tritthorn of 9852 feet, and of a mountain pass and carriage way 6867 feet, from Altdorf on Lake Lucerne to the Valentino (*Vallis Lepontina*), or valley of the Ticino and the Lago Maggiore. The road was made in 1820-32, and suffered greatly from two terrible storms of 1834 and 1839. The Sasso di San Gottardo (8235 feet) rises above the summit of the pass. Near the summit is a hospice, with fifteen beds, receiving yearly some 10,000 visitors. The 'St. G. Tunnel,' now in process, is to be completed in 1880.

Gö'theborg, or **Gö'teborg** (Ger. and Eng. *Gothenburg*), the chief town of a län of the same name, and the second port in Sweden after Stockholm, from which it is distant 145 miles W.S.W. by railway, stands near the mouth of Göta river. In the last half of the 18th c. it grew rapidly through its great herring fishery, on the decline of which it profited greatly by the 'Continental system,' as it became a depôt for English colonial goods. G. has been steadily increasing, especially since the completion of the Göta Canal and the western railway; and its fine harbour has now an extensive foreign traffic. In 1874 there belonged to the port 240 vessels of 25,000 tons. The town is regularly built, and in the part within the moats intersected with canals crossed by twenty-four iron bridges. Pop. (1874) 63,748. The chief industries are shipbuilding, linen and cotton weaving, and brewing. G. is well provided with educational and benevolent institutions, and its peculiar public-house system has of late years excited attention in England.



Goth'ic Ar'chitecture. The Gothic style of architecture is directly descended from the Romanesque, an adaptation of the classical Roman form to the requirements of Christian worship, and which continued to be the prevailing style of the early churches down to the 6th and 7th centuries. After the destruction of the Roman Empire by successive tribes of barbarians, and during the period of confusion among the Western nations of Europe that followed that event, the practice of the arts was suspended, and the traditions of Romanesque architecture appear to have been partly lost or abandoned. When the practice of elaborating their places of worship by the nations of Western Europe was resumed, the prevailing system of architecture was found to embody what were believed to be 'Barbarian' ideas, and the name 'Gothic' was consequently applied to it by the Italians. G. A., the architecture of the pointed arch and vault, first appeared in the Isle de France (Paris) and its neighbourhood during 1170-1200, and in the 13th c. extended all over the N.W. and some parts of the S. of Europe. It is by no means to be inferred here that the European medieval architects were the discoverers of the arch and vault. Stone arches, perfect in construction, have been discovered in the porches of the pyramids, and belonging to an age between the era of Solomon and that of Cambyses, and Layard discovered both circular and pointed arches forming underground vaults at Nimroud of the 8th or 9th c. before our era. The arch was also thoroughly understood by the Pelasgian Greeks, by the Romans, and, indeed, by all the great building nations of antiquity. The true Gothic Pointed style, however, was invented in the N. of France toward the close of the 12th c. From the N. of France the new architectural method was carried into Normandy and across to England with astonishing rapidity. G. A. was only invented thirty years before the close of the 12th c., yet the choir of Canterbury Cathedral was rebuilt in this style in 1174-85.

The Christian architects of the 12th c. had recourse to the employment of groined vaults, pointed arches, and flying buttresses, which enabled them to dispense with the massive walls of the Norman builders. The introduction of high-pointed arches, in which the weight of superincumbent wall rested upon a single point (the *crown* of the arch), and thus diminished the powerful outward thrust of the round or heavily-loaded arch to the utmost possible extent, gave quite a new character to the architecture of the time. The walls were now light and *lofty*, and the supporting piers were made correspondingly light, there being no longer any necessity for constructing them of the vast Norman proportions. The result was the Gothic cathedral with its spacious nave and choir, its airy spire, its infinite variety of graceful and fanciful decoration.

The name given by the French to the style of architecture under consideration, and which arose in France, is *Ogival.* (See OGEE.) Its essential characteristics are that the arches are always pointed; the pillars are attenuated to a point at which all resemblance to the classic column ends, and they are frequently combined and grouped together into a *sheaf* of columns; the mouldings, cornices, and the capitals are entirely different from those of the Romanesque style; and the rectangular surfaces, the pilasters, and entablature of classic architecture no longer exist. The elements of the design in G. A., or Ogival architecture, are much more slender than in the ancient styles; and instead of the flat surfaces and strongly-marked features of classic construction, there is a constant repetition and multiplication, all but confusion, of details. It may be said that the openings, the doors and windows, are the characteristics of G. A., instead of the solidly-constructed portions—columns, entablatures, &c., of the ancient art. Vertical lines predominate in the later, as horizontal lines

do in the early style. The outline of the pillars is carried up to the vault, which is divided by the prolonged stems into numerous regular compartments; and between these compartments and the windows of the clerestory, the form of the triforium, and the decoration of the nave, a subtle harmony is preserved. Finally, the buttresses have a considerable outward slope, and variety and interest are given to the lines of the roof by the pinnacles and towers which pass through or rise above them. During the three centuries in which G. A. prevailed in France —from the close of the 12th c. to the classic revival of the commencement of the 16th c.—the style underwent continuous development. There are, therefore, several phases in which, at different times, the art manifests itself. Owing to the length of time employed in building a cathedral, it often happens that several of these phases of development may be observable in the same structure. In France, the style named *Ogival Primaire*, or *Gothique à Lancettes*, prevailed from the close of the 12th c. to the end of the 13th c. It owes the latter name to the high-pointed style of its windows, arcades, &c. In this style the doorways, which are deeply recessed into the wall, are often divided into two bays by a central pillar. The arch which surrounds the entrances is enriched with numerous mouldings, and the sides (jambs) are decorated with pillars standing free from the wall. Similar pillars enrich the windows, niches, &c. The windows are usually long and narrow, and they often occur in groups of two, three, and sometimes five together. Above such a group a pointed arch frequently rises, and the space between the apex of the arch and the window-heads is often pierced with a circular, trefoil, or quatrefoil opening. The *Second Ogival style*, or *Style Gothique Rayonnant*, is regarded as the completely developed form, and existed in perfection during the 14th c. Without losing severity and sublimity of form, it shows all the lightness and elegance compatible with the inspiring religious idea of which the churches and cathedrals of the period named were the symbols. The churches of the Rayonnant or Second Ogival do not differ in any essential particulars from those of the Primary Ogival style. They show, however, considerable difference in details. The windows and doorways are much larger, and the mullions that divide them are more slender and more numerous. The tracery of the window becomes more complicated, the forms, which are remarkably varied, being for the most part geometrical. The great circular *rose-windows* of this period were on an immense scale. Strassburg Cathedral is the best example of this perfect style of French Gothic. The *Third Ogival style* inaugurated the period of decline. During the 14th c. immense progress had been made in the *technique* of the art. Stone had become, so to speak, as ductile as wax in the hands of the builders, who had surmounted every difficulty of construction. There was now a constant temptation to attempt *tours de force*, with the view of doing better than, or at least of doing differently from, their predecessors. The consequence was that the architecture of the 15th c. became more remarkable for audacity and fantastic invention than for purity of taste. Feats of construction were attempted in stone that could only suitably be executed in metal, and church architecture now began to lose the gravity of religious art. This period of decadence set in at the same time in France, in Germany, and in England. In France the debased form of the art was known as Flamboyant (q. v.), while in England it became known as Perpendicular (q. v.).

The new era in architecture had already been inaugurated in England in the middle of the 11th c. During the Heptarchy, when the dominant race was Saxon or Danish, the building enterprise of king and noble was inconsiderable. After the Norman conquest in 1066, when a brilliant inventive nobility and a cultivated and wealthy clergy took possession of the country, the rude Saxon churches were superseded by edifices designed by foreign architects in the Norman or late Romanesque style, the distinctive feature of which was its massiveness. But though heavy from the clumsiness of its enormous piers and round arches, it must be stated that the Norman nave in some instances remains to this day unsurpassed for impressiveness. The vivifying influence of Norman culture continued to animate the architectural art of England for about four centuries. From the date of the building of Canterbury Cathedral (q. v.) the national architectural style of the country has been Gothic. Originally foreign, the style soon became naturalised on English soil. From the earliest times the extreme length of the English churches and cathedrals in proportion to their breadth has given to these structures a peculiar and original character. It was customary on the Continent during the middle ages to give to churches the proportion of about 4 in length to 1 in breadth. Canterbury and Winchester Cathedrals, which were built under French supervision, were originally less than 5 in length to 1 in breadth; but the early English architects were so convinced that greater length in proportion to breadth would give greatly increased artistic effect, that they increased the proportions of these great cathedrals to 7 to 1. Again, the English plans, even of the churches of the Norman period, were further peculiar for the great height of the nave, and consequently they vastly excel the Continental cathedrals for pictorial effect. York Minster, mainly of the 13th and 14th centuries, is one of the noblest

York Minster.

cathedrals in the world. Originality of plan and of constructive details was cultivated with great success in Yorkshire, in which there was great activity in church-building during the 12th c., but which, from its remote distance from the S. coast, remained practically unaffected by the influence of foreign architects. Thus it happened that when Lincoln was rebuilt (1200), the English style was distinct from the Norman or French. (See EARLY ENGLISH.) In Salisbury Cathedral (1220–58) the plan and general arrangements are not only thoroughly original, but remarkably beautiful, and in its design the English nation, for the first time, asserted that national scorn and independence of foreign interference, 'which,' says Fergusson, 'eventually led to the reformation,' and he might have added, to the decay, of ecclesiastical art in Britain. But perhaps the most original and the boldest of the great distinctive conceptions of English architects was the vaulted octagon at the intersection of Ely Cathedral, built by Alan of Walsingham in 1322. It is 'the only true Gothic dome in existence,' and is 'surpassingly beautiful' (Fergusson). After the death of Edward III. (see DECORATED STYLE), few really great architectural works were commenced in England. The Decorated style existed from 1272 to 1377, after which the finest age of G. A. in England is at an end. Still, though English middle-age architects appear, after the close of the 14th c., to lose something in wealth of spontaneous invention, and become somewhat formal in their treatment of exteriors (see PERPENDICULAR), the feeling for beauty of ornamental work was not yet to decay till at least the royal chapels of Windsor, Westminster, and Cambridge, and other fascinating fan-roofed buildings, were finished, with which the true G. A. of England went out 'in a blaze of glory' under the Tudors. See FAN TRACERY.

Domestic Architecture.—It is a curious circumstance, that of *lay* buildings, as distinct from cathedrals and churches, England cannot show many *municipal* buildings in Gothic, while in *Castles* (q. v.) or Gothic military structures she is richer than any country in Europe. The mansions, also, manor-houses, granges, &c., of the latest Gothic period, the Tudor, usually called the Elizabethan (see ELIZABETHAN ARCHITECTURE)—the domestic establishments of nobles and gentry after the period of the

Reformation—which, with their spacious halls, heavily mullioned windows rich in stained glass, and their appearance of peaceful, sunny comfort, are specially beautiful examples of Domestic Gothic in England. The universities, colleges, and the Eton, Winchester, and other schools, are noble examples of semi-ecclesiastical foundations in late Perpendicular. Although, with the construction of the churches and cathedrals of the 13th and 14th centuries, the vitality of Gothic as a pure style of construction came to an end, yet many great schools, &c., in which a futile attempt to reproduce the style was made, continued to be built down to the death of Queen Elizabeth (1602). But by this time the great object for which Gothic had been invented—the suitable celebration of a gorgeous religious ceremonial by which an unlettered nation might be instructed, impressed, and governed—had ceased to exist, and after the Reformation, as soon as other means for the instruction of the people were provided, the Gothic cathedral was employed for other purposes, the Gothic style of architecture died out, and even its traditions, its constructive principles and processes were forgotten by English architects. Little wonder, then, that when Horace Walpole attempted to reproduce the glories of Westminster Abbey in a suburban villa near Twickenham, he performed an act which has immortalised him more surely than his cleverest letter or his best story—in the ridicule of posterity. Still the attempt awakened an ignorant interest in Gothic, and since 1750 there has been a sort of Gothic revival throughout the land, until, at the present day, a large class of persons advocate Gothic indiscriminately for churches, cottages, villas, assembly-rooms, law-courts, and houses of parliament.

Gothic Architecture in Scotland.—Among the old churches of Scotland, one of the most characteristic and beautiful is that of Leuchars or Dalmeny, in which the details are at once rich, bold, and elegant, and the ornament most skilfully distributed. The churches of Jedburgh and Kelso are of the end of the 12th or the beginning of the 13th centuries. Much of the decoration is of the Early English period. Kirkwall Cathedral was founded in 1137. The arch of the tower and the vaulting are in the Gothic of the 14th c. Glasgow Cathedral, the best preserved, is also the best Gothic work in the country. Its crypt is unrivalled in Britain, perhaps in Europe, for peculiarity of solid construction, rich vaulting, and variety of perspective. The cathedral of Elgin, in the Decorated or Edwardian style, was probably the most beautiful building in Scotland. Next to it was Melrose, a great Cistercian abbey, originally founded by David I. in 1136. The building erected by the 'sair saunt for the croun' disappeared in the Wars of the Succession, and the present ruins are the remains of a new monastery begun in the reign of Robert Bruce, and not finished for nearly 250 years. It is a specimen of the Perpendicular or Lancastrian style. The tracery and carvings are of unsurpassable excellence. Scott thus speaks of them—

'The moon on the east oriel shone,
Through slender shafts of shapely stone,
By foliaged tracery combined:
Thou would'st have thought some fairy's hand
'Twixt poplars straight the osier wand
In many a freakish knot had twined;
Then framed a spell when the work was done,
And changed the willow wreaths to stone.'

Roslyn Chapel (1446) is believed to owe its structure and ornament to a Spanish source. Holyrood Chapel was originally founded in 1128, but its remains are of the Decorated style of the 13th c. Much of its ornamentation has a rich but foreign look. St. Andrew's Cathedral was probably not inferior to Elgin and Melrose in beauty of ornamentation. Doorways in St. Giles', Edinburgh, and Pluscarden Abbey are beautiful examples of the round arch beautifully enriched. The fine remains on Iona are of Continental design.

Gothic Architecture in France.—The principal French works of the first epoch (corresponding with that of Early English) are the cathedrals of Sens, Amiens, Rheims, St. Denis, Fontenay Abbey, La Chapelle (Paris), the Churches of Pontigny and St. Germain. Of the second epoch (corresponding with our Decorated), are the churches of St. Ouen (Rouen) and parts of the cathedrals of Rouen, Tours, Amiens, Paris, Bayeux, Poictiers, Nevers, Narbonne. Of the third epoch, the Flamboyant (q. v.), are the churches of St. Nisier at Lyon, Pont l'Evêque, Caudebec, Louvois, St. Brieux cathedral.

Gothic Architecture in Germany.—The chief examples of German Gothic are—First epoch, the nave at St. Gereon at Köln, the Madonna church at Treves, St. Elizabeth at Marburg, the choirs of the cathedrals at Magdeburg, Meissen, and Köln, the naves of the minsters at Strassburg and Freiburg, and the cathedrals at Halberstadt and Minden; Second epoch, the nave and aisles of Meissen cathedral, choir of St. Stephen's at Vienna, the church of Lamberti and that of Our Lady at Münster; Third epoch, the church of Our Lady at Esslingen, St. Lorenz, and St. Sebald at Nürnberg, St. Peter, and St. Paul at Görlitz, and Church in the Fields at Soest. See Lubke's *Ecclesiastical Art in Germany*, Fergusson's *History of Architecture*, Ruskin's *Seven Lamps of Architecture*, works of Violet-le-Duc, &c.

Goths. Though the term Gothic is sometimes used as synonymous with Teutonic, the G. were only the chief of the Teutonic tribes who broke up the Roman Empire. According to one derivation, Goth or Yuth signifies 'war;' while Dr. Latham asserts that G. was not the aboriginal name of the race, but was given to them after they came to the mouths of the Danube, the land of the Getal, 'as the Kentings of England took their name from the Celtic Kent.' The Lithuanians, he says, were first called *Gothini* or *Gothones* by the Sclavonic peoples. The G. in all likelihood come originally from Scandinavia, whence Gotha-land, and in the earliest historic times seem to have held the Prussian coast from the Vistula to Braunsberg. In Pliny and Tacitus G. are mentioned as dwelling near the Baltic, and Ptolemy speaks of the Guthones, a tribe living E. of the Vistula. In the 3d c. the G. had spread over the S. of Russia and along the Danube into Hungary. In the reign of Philip (244–249) they seized Dacia, and in 250, being assailed by Decius, almost wholly destroyed a Roman army near Philippopolis. In 251 they routed Decius with terrible carnage near Forum Trebonii, and from about 250 to about 270 made piratical expeditions in the Euxine, and ravaged the Greek and Illyrian coasts. Though they were severely beaten by Claudius in 269, the Romans were forced in 272 to yield them Dacia, where they remained for the next fifty years at peace with the empire. In 332 they crossed the Danube under an Alaric, but were repulsed, and did not again attack the Romans until the latter half of the 4th c., when their dominion stretched from the Black to the Baltic Sea. At that time they were split into two great divisions, the Ostro-G. ('East G.') or Grutungs, who lay between the Volga and the Dniester, the Visi-G. ('West G.') or Thervings or Thuringer, who lay mainly between the Dniester and the Theiss. They were beginning to become Arian Christians, chiefly through the teachings of Bishop Wulfila or Ulfilas, when in 376 the Huns, guided, says the Gothic legend, across the steppes by a magic hind, fell upon them, defeated their great king Ermanaric ('powerful warrior'), and forced most of the Visi-G. to cross the Danube, and with the Roman permission to settle in Mœsia. Being ill-treated by the Romans, who established a slave trade in the Gothic children, they rose against the empire, routed the Roman general Lupicinus, and in 378 overthrew and killed Valens at Adrianople—a crushing disaster from which the Roman power never recovered. Recruited by great bands from the N., the G. now became so powerful that the Romans sought to avert destruction by hiring them as mercenaries, and conferring imperial offices on their leaders, a policy which was partly successful, until, after the death of Theodosius (395), the great chief Alaric (q. v.) led the West G. into Greece and then into Italy, from which, however, he was forced to retire. But in 410 he sacked Rome, and his successor, King Athaulf ('helping father'), having married Placidia, sister of the Emperor Honorius, passed into Spain and here founded a Visi-Gothic kingdom which lasted until the 8th c. (See HISTORY OF SPAIN.) It seemed at this time that the G. might raise a great western empire, but they wasted their strength by dividing into small bands, and their Arian creed was a barrier to their union with the inhabitants of Gaul and Italy. Athaulf was succeeded by Wallia (415-418), who aided the Romans against the Vandals and Alans, and was followed by Theodoric I. (418-451), son of Alaric. When the Huns (q. v.) under Attila swept down on the empire, the Visi-G., under Theodoric, united against them with the Romans and drove them back in the great battle of Chalons—the *Hunnenschlacht*—in 451, a victory which saved European civilisation. The history of the Visi-Gothic kingdom in the West belongs to the history of Spain, on which, notwithstanding its de-

struction by the Mohammedans in the 8th c., it exerted a great influence. The Visi-G., who were at first severed from the original Spaniards by their heresy, afterwards appeared as the deliverers of the country from the Moors, and regained their old position as its rulers. The early Visi-Gothic customs helped greatly to mould the Castilian institutions, and were not displaced by the Justinian law until the 14th c. Another kingdom, more brilliant, but much shorter lived than the Visi-Gothic in Spain, was founded by the Ostro-G. At the end of the 4th c. many of the latter yielded to the Huns, and the Romans refusing to allow them to settle within the imperial boundaries, they again and again ravaged the frontier, but sustained a severe check in 386 when seeking to cross the Danube. They afterwards settled in Asia Minor, and on Attila's invading Southern Europe, joined the Huns in large numbers, and fell fighting against the Visi-G. and Romans at Chalons. Afterwards the majority of them settled in Pannonia, and the Emperor Leo agreed to pay them 300 pounds of gold yearly if they would leave the Eastern Empire in peace. Theodoric (q. v.), who became King of the Ostro-G. in 475, after fighting for and against the Byzantine Emperor Zeno, gathered together his people along with other Teutons, fought his way into Italy, where he overthrew Odoacer at Verona in 488, and established a great Gothic kingdom with a Roman organisation. He ruled with admirable justice and firmness, and restored Italy to peace and prosperity; but after his death in 526, civil war broke out among the G., and Queen Amalasuentha invited Justinian to seize Italy. The Ostro-G. maintained a lingering struggle with Belisarius, but that general's successor, Narses, defeated their king Totila in 542 at Tagina, and after a desperate battle at Vesuvius, where Teia, the last of the Ostro-Gothic kings was slain, the remnant of his people withdrew from Italy, and henceforth disappear as a nation, being absorbed in other Teutonic peoples. Their kingdom fell mainly through their intestine strifes, the enervating effects of a southern climate, and because, holding aloof from the conquered races, they could not, when cut off from their northern kinsmen, sufficiently recruit their numbers in the war with Rome.

The Gothic invasions are often compared to a deluge, as if the G. had swept into the empire by vast united movements, whereas they really destroyed it by endless incursions and battles, by ravaging it in small bands, by breaking off fragments from the imperial dominion. Most of these leaders seem to have been awed by the Roman greatness, and many of them seem to have dreamed of themselves filling the emperor's throne. The G. who seized on Italy, Spain, and part of Gaul were not mere destroyers, but allowed the Romans to keep their own laws and customs, and even portions of the land. As they were, however, smaller in number than the Romanised peoples, they gradually lost their distinct language and manners. (See ROMANCE LANGUAGES.) When they began to stream into the empire, the G. were believers in Wodenism (see NORTHERN MYTHOLOGY), and were ruled by two races of kings, both held to be descended from Woden—the Amalungs ('heavenly race'), and the Balthungs ('bold race'). They were a tall, fair-haired people, said to be the noblest and least cruel of all the Teutons, and were considerably removed from savagery when they first came down to the lower Danube. Their foremost warriors prided themselves on the skill with which they could forge armour and weapons, and the war Geats or Geátas who appear in *Beówulf*, and who were a section of the Gothic race, are described as equipped with chain-mail, helmets with plumes and devices, with dress of linen and hide, and gold and silver ornaments. Their lands were chiefly tilled by slaves, most of whom were probably Sclavs, and according to Dr. Latham, they numbered among their fighting men a large Germanised Sclavic element. They were closely akin to the Low German tribes who conquered Britain, and their language was certainly a Low German speech. The only specimen of it is the translation of the Scriptures executed in the 4th c. by Bishop Ulfilas (q. v.). See Jornandes, *De Getarum Origine et Rebus Gestis*; Procopius, *De Bello Gothico*; and Gibbon, *Decline and Fall of the Roman Empire*.

Gott'fried von Strassburg, one of the leading *minnesingers*, belonged to the second half of the 12th c., and probably was born or lived at Strassburg. His chief work, *Tristan*, written about 1207-1210, surpasses all the productions of his contemporaries in grace and ease of style. He tells the story, moreover, with considerable power, and at times displays an almost Chaucerian vein of bantering pleasantry. G. likewise wrote lyrics, several of which are extant. His works were edited by F. van der Hagen (Bres. 1823), and Bechstein (1869), and modern German translations of *Tristan* have been published by Kurtz (Stuttg. 1844), and Simrock (Leips. 1855).

Gött'ingen, an ancient town in the province of Hanover, Prussia, pleasantly situated in the fertile valley of the Leine, about 50 miles S. of Hanover. G., once a Hanse town, thrives under Prussian rule; the rapidly-multiplying villas that have recently sprung up outside the old city fortifications (now a promenade with beautiful lime-tree avenues) give G. a more lively appearance than of old. G. has some industries, but its wellbeing depends mainly on its famous university, to which the only important buildings of G. save the churches belong. The university was founded in 1734 under George II. of England as Elector, and under the fostering care of the minister Münchhausen speedily became one of the foremost in Germany. Its professors long enjoyed a then unparalleled freedom of research and speech, and had amongst them men such as Heyne, the Eichhorns, Blumenbach, and O. Müller. In 1823 the university had 1547 students, but political troubles, culminating in the expulsion of the well-known seven professors (Dahlmann, Albrecht, Ewald, Gervinus, the brothers Grimm, and Weber), sadly reduced the number of students. But better times soon restored prosperity. In 1874 the university had 81 professors, besides *privatdocenten*, and 1018 students. Its library contains 360,000 volumes and 5000 MSS. Pop. (1875) 17,038.

Gott'sched, Johann Christoph, for a great part of his life the literary dictator of Germany, was born 2d February 1700, at Judithenkirch, near Königsberg, at which latter place he studied. In 1724 he came to Leipsic, and in 1730 was called to a chair in the university, a post he retained till his death, 12th December 1766. G.'s merits were great as well as his defects. He asserted the rights of the German tongue, and did much to purify it from foreign admixture. He brought utter discredit on the turgidity of style then prevalent, and, seeking his models in France, strove in numerous works and in magazines to prove that accuracy of form is the cardinal virtue of poetry. As a necessary result, poetry became in his hands formal to a degree, cold, stiff, and soulless. G.'s fierce controversy with the Swiss school, with Bodmer at its head, prepared the ground for the glorious age of German literature, and meanwhile effectually sapped G.'s influence. His principal works are *Die Deutsche Schaubühne* (6 vols. 1741-45, 2d ed. 1746-50); *Versuch einer kritischen Dichtkunst* (1730, 4th ed. 1751). G.'s example did little to commend his precepts; his *Gedichte* (1736) and his *Der sterbende Cato* (though the latter, imitated from Addison, went through ten editions) are of small interest. See Danzel, *G. und seine Zeit* (Leips. 1848).

Gou'da, or **Ter Gouw**, a Dutch town in the province of S. Holland, on the right bank of the Yssel, at its confluence with the Gouw, 11 miles N.E. of Rotterdam by railway. The chief building is the church of St. John, with its forty-four famous stained windows (two 60 feet high), contributed, after the burning of the old church in 1552, by various European sovereigns and cities, and executed by the brothers Dirk and Walter Crabeth (1560-1603). In the market-place, which is one of the finest and largest in Europe, stands the townhall, with painted roof and pinnacled façade. There is a weekly market for the sale of cattle and of the well-known G. cheese, made of new milk. G. has extensive potteries, brick-fields, clay-pipe factories, cotton-mills, &c. Pop. (1873) 15,174.

Gough, Hugh, Lord, a distinguished English general, born at Woodstown in the county of Limerick, Ireland, 3d November 1779, entered the army in 1794, served at the Cape of Good Hope and in the W. Indies, and was present at most of the battles of the Peninsular war, in which he was more than once severely wounded. He was sent to India in 1837, and to China in 1840, in command of the land forces; for his services in the latter country he was made G.C.B. and a baronet. From 1843 to 1850 he was commander-in-chief in India, and commanded in person throughout the two bloody Sikh campaigns of 1845-46 and 1848-49. On his return to England he was created baron and viscount, and received a pension for three

generations; subsequently also he obtained a field-marshal's staff. He died 3d March 1869. Personally he was regardless of danger, and he was not sparing of the lives of his soldiers, preferring an immediate bayonet-charge to the proper use of artillery.

Gough, Richard, an antiquary, born in London in 1735, studied at Cambridge University, and, after a life of research, died at Enfield in 1809. His works include *Anecdotes of British Topography*, *The Sepulchral Monuments of Great Britain*, *The History of Pleshy in Essex*, *Plates of the Coins of the Seleucidæ*, *Account of the Missal presented to Henry VI. by the Duchess of Bedford*. G. left all his MSS. to Oxford University.

Goul'burn, a town in New South Wales, 128 miles S.W. of Sydney, with which it is connected by railway. It is the centre of an important agricultural district; while gold is found in the vicinity, though not in rich quantities. Copper is also beginning to be worked. G. is a see of the Anglican and Roman Catholic Churches. Pop. of the town (in 1875), 4453; of the district, 13,756.

Gou'nod, Charles-François, a brilliant operatic composer, was born at Paris, June 17, 1818. As a pupil in the Conservatoire he learned composition under Halévy. In 1839 he gained the first prize at the 'Institut,' and, receiving a Government pension, went to Rome to study further. There he was appointed honorary *maestro di capella* for life. He next held in Paris the posts of chapel-master to the church of foreign missions and director of the Orphéonists, an important musical organisation. He resigned the latter in 1860. He wrote operas from 1851, obtaining little favour till 1859, when he produced *Faust*. Of later date are *Mireille* (1864) and *Romeo and Juliet* (1867). In 1866 he was made a member of the French Institute. G.'s recent compositions are principally songs. G.'s music shows 'great depth of sentiment and decided originality of thought,' though in sustained power he falls below his great model, Gluck.

Gou'ra (*Goura Coronata*), a species of *Columbidæ* or Pigeons (q. v.), found in Sava, New Guinea, and the Moluccas, and distinguished by having an expanded crest of light silky feathers. The colour is a slate-blue with dark tints on the wings and tail, and a patch of red and white on each wing. The nostrils exist in a groove in the middle of the bill, and the fourth, fifth, and sixth quills are the longest. The cry of the G. is sonorous and loud.

Gourd, a name commonly given to many species and varieties of *Cucurbita* and other genera belonging to the natural order Cucurbitaceæ (q. v.). They are principally found in Asia, N. America, and Europe. The fruit of some is poisonous, that of others is largely used as a culinary vegetable. The species chiefly grown in British gardens are the white G. or G. pumpkin (*Cucurbita pepo*), the red G. (*C. maxima*), and especially the succade G. or vegetable marrow (*C. ovifera saccada*). Many species of G. are exceedingly ornamental. The orange G. (*C. aurantia*) is sometimes grown in gardens for its beautiful orange-like fruit, but as colocynth is frequently developed, it is unsafe for use. The snake G. of India (*Trichosanthes anguina*) is eaten, and the shell of the fruit of *Lagenaria vulgaris* serves as a vessel to hold fluid, hence it is called 'bottle G.' The name 'sour G.' is given to a tree of a different natural order. (See ADANSONIA). The squash (*C. melopepo*) is largely cultivated in America, and produces an acceptable food for men, cattle, and swine. The bitter G. or colocynth is furnished by *Citrullus colocynthis*, and the round fruits from which the drug is prepared are principally the produce of countries bordering the Mediterranean. The gooseberry G. is the fruit of *Momordica echinata*. The white G. of India is *Benincasa cerifera*, and in its unripe state is universally employed by the natives in their curries. What are known as 'club G.' or 'trumpet G.' are different forms of the 'bottle G.' above mentioned, the fruit of which is at first long and cylindrical, like a cucumber, but swelling as it ripens, ultimately assumes a shape like a Venetian bottle. After being gathered the neck end is cut off, the internal pulp with the seeds carefully removed through the orifice, and the interior repeatedly washed to remove the bitter principle which constitutes the poison. G. are sometimes grown to weigh as much as 200 lbs. each.

Gourd (*Cucurbita*).

Gout (Lat. *gutta*, 'a drop'), or **Pod'agra**, a disease attended with febrile excitement, and a specific form of inflammation, usually associated with disorder of the digestive and other internal organs, and especially with an affection of the joints, as the first joint of the great toe. G. is predisposed to by congenital or hereditary constitution, and generally occurs in paroxysms or 'fits of the G.' at indefinite intervals, and is characterised by nocturnal exacerbations and morning remissions. It has been proved experimentally that the blood, in cases of acute G., contains *lithic acid* in the form of *lithate of soda*, and that, in cases of chronic G., with chalky deposits round the joints, *lithic acid* is *always* present in the blood and deficient in the urine, both absolutely and relatively to the other organic matters. Uric acid is also found to exist in the blood-serum, the fluid effused by blisters, and in the abdominal and pericardial fluids. The gouty inflammations are distinguished from the rheumatic by a tendency of the former to the deposition of urate of soda, a discovery made by the late Dr. Wollaston. The urate of soda is deposited first as a white fluid, and after a time the fluid portion is absorbed, leaving concretions of crystals of urate of soda, which eventually harden and form what have been termed *chalk-stones*. Sometimes these concretions are accompanied with deposits of phosphate and carbonate of lime. A paroxysm of G. is simply an effort of nature to eliminate from the system ingredients which act as blood-poisons. G. is equally common among the plebeian and aristocratic, the degraded and the highly cultivated. It may be acute or chronic, and when the viscera are affected it is termed irregular, retrocedent, or misplaced G. This metastasis may be to the stomach and intestines, or to other parts, as to the testicles, bladder, rectum, or the head, causing death, in the latter case, from apoplexy. The intervals between paroxysms of G. vary, but in general they are shorter the younger the patient. The most common is the biennial or triennial attack for the space of eight or ten years, and then the attacks become more frequent, the tendency of the disease being to acquire a chronic form, terminating in complete lameness, helplessness, and debility, or in death by metastasis to the heart or brain. The treatment of G. is complicated, but as the disease is clearly of constitutional origin, the indications are the administration of remedies to control or subdue the constitutional tendency, and to modify the severity of the paroxysms. This must be done cautiously, as the paroxysm is the means by which nature seeks to relieve itself of the *materies morbi*. Iodide of potassium and alkaline remedies, as the bicarbonate, the citrate, or the acetate of potash, have been recommended, and benefit has been derived from the continuous administration of small doses of salines, in a very dilute form, taken two or three times a day on an empty stomach, shortly before food. See Dr. Adams' *Treatise on Rheumatic Gout* (Lond. 1873).

Gout-Weed, Bishop-Weed, or **Herb-Gerard**, popular names given to *Ægopodium Podagraria*, a common umbelliferous plant.

Gov'an, a borough of Lanarkshire, Scotland, on the left bank of the Clyde, 3 miles W. of Glasgow, of which it is virtually a suburb. It has extensive shipbuilding yards, silk, cotton, and paper mills, blast furnaces, cotton-printing and dye works, &c. Pop. (1871) 19,200. G. was known before the 17th c. as 'meikle Govane.'

Gov'ernment. See CONSTITUTION, PRIVY COUNCIL, MINISTRY.

Government Purchase of Annuities. See ANNUITY, in English law.

Govind', or **Gobind' Singh'**, the tenth and last *guru* of the Sikhs, flourished 1660-1708. It was he who developed what had previously been a mere religious sect into a nationality of disciplined warriors. He gave the name of *khalsa* = 'select or liberated;' and a great part of the *Grunth* or Holy Book is

composed of the elaborate ceremonies and rules of conduct which he imposed on his followers. See Cunningham's *History of the Sikhs* (Lond. 1853).

Gow'die, a name given to the Gemmeous Dragonet (q. v.), a Teleostean fish allied to the Goby (q. v.), and known scientifically as the *Callionymus lyra*. The term 'G.' refers to the golden lustre of the body.

Gower, John, an English poet, born about 1320. He was an esquire of Kent, and held the living of Great Braxted, Essex. Little is known of his life, which was that of a recluse. He died in 1408. G. was probably the greatest English scholar of his day, and his voluminous works are brimful of learning. His *Speculum Meditantis*, a didactic poem in French, is lost, but several French *Balades* are extant. In *Vox Clamantis*, a Latin political poem, he defends Richard II., and satirises the social evils of the time. His chief English work is the *Confessio Amantis*, a dialogue in verse between a penitent and his confessor, a priest of Venus. It contains tales of love, magic, astrology, &c. The work is overburdened with learning, but seldom rises to poetry, and is generally so wearisome as to justify Professor Lowell's remark, that G. has 'positively raised tediousness to the precision of a science.' G.'s English is wanting in the ease and grace of Chaucer, and has a larger Norman element. The best edition of G. is that by Dr. Reinhold Pauli (3 vols. 1857). See Minto's *English Poets* (1874), and Morley's *English Writers* (1864-67).

Gowhat'i (*Gauhati*), the chief town in the district of the Kamrup, province of Assam, British India, on the left bank of the Brahmaputra. Pop. (1872) 11,492. It was the capital of Assam under the early Hindu dynasty, and the fortifications can still be traced for miles on both sides of the river. All buildings have now entirely disappeared, but the soil is mainly composed of decaying brick and mortar, and sculptured stones are continually turned up by the plough. It is by far the most populous town in the province, indeed the only town, and is the seat of a considerable river trade; but owing to its unhealthiness, the headquarters of the Chief Commissioner have been removed to Debrugurh.

Gowrie, Carse of, a fertile reach of land on the N. side of the Tay in Perthshire. It formerly belonged to the Ruthvens, who hence derived their title of Earls of G.

Gowrie Conspiracy, an attempt made by John Ruthven, Earl of Gowrie, his brother Alexander Ruthven, and others to murder, or more likely to seize the person of, James VI., whom they decoyed into Gowrie's house in Perth on August 5, 1584. The King, however, was rescued by his followers, and both the Ruthvens were killed. The conspiracy is still involved in mystery. Gowrie may have been actuated by revenge, his father having been executed in 1584; but the object of the plot seems to have been by keeping the King a prisoner to govern in his name in favour of Presbyterianism. See Burton's *History of Scotland* (vol. v. ed. 1867).

Goyann'a, a city in the province of Pernambuco, Brazil, on a river of the same name, 30 miles S. of Parahyba. It has some trade in hides, rum, dyewoods, &c. Pop. 12,000.

Goy'a y Lucientes, Francisco, a Spanish painter, was born at Fuente de Todos, Aragon, March 31, 1746. Studying at Rome, he returned to Spain, where he soon became famous, and was made court painter by Charles IV. He led a gay, dissipated life, and in his 78th year removed to Paris for his health. G. died at Bordeaux, April 16, 1828. He was a most fertile and original artist, painting numerous portraits, historical pictures, and scenes from everyday Spanish life. He delighted in Rembrandtesque shades and fantastic colour, his style is peculiarly bold and vivid, and he sometimes displays a subtle, lurking satiric purpose. See Théophile Gautier in *Le Cabinet de l'Artiste et de l'Amateur* for 1842.

Goyaz', chief town of an inland province of the same name, Brazil, on the Vermelho, a tributary of the Araguaya. Pop. 8000.—The *province* lies near the centre of the empire, between the Tocatins and Araguaya, two affluents of the Amazon, and is a fertile but neglected region with no exports. It had formerly rich gold-mines; there is now only some insufficient husbandry and cattle-rearing. Area, 263,335 sq. miles; pop. 160,395, most of whom are Indians.

Gozz'i, Count Carlo, an Italian dramatist, born at Venice in 1722. When a youth he joined the army in Dalmatia, and after spending three years there returned to Venice, where he began to write fanciful fairy dramas, one of which, *L'Amore delle tre Melarance*, brought out in 1761, had such a complete success that G. for a time quite eclipsed his rival Goldoni. He produced many other wild romantic pieces, full of spectacle and bustle, and not without humour and pathos amid their lively trivialities. G. died April 6, 1806. His pieces were speedily displaced by Goldoni's. An edition of his works in 10 vols. was published in 1792. See his autobiography, called *Memorie inutili di Carlo G.* (Venice, 1797).

Gozz'o, an island in the Mediterranean, 4 miles N.W. of Malta, belongs to England. Area, 36 sq. miles; pop. 17,000. It has many rare plants, abounds in game, and yields heavy crops of cotton and grain, &c. There is here a fine breed of large asses. G. has two harbours, and the governor resides at Castel del G. In the centre of G. is the chief town, Rabato. The 'Giant's Tower' is an interesting relic of remote antiquity. G. was known to the Romans under the name *Gaulos*.

Gozz'oli, Benozz'o, an Italian fresco painter, born at Florence about 1408. He was a favourite pupil of Fra Angelico, who greatly influenced his style and choice of subject. He painted at Florence, Rome, Volterra, and Pisa, and died in the last city in 1478. His masterpiece is the series of scriptural frescoes in the Campo Santo of Pisa. G.'s colour is rich, and his drawing accurate, though sometimes over formal. He was less sentimental in style than Angelico, and worked in the accessories to his figures with lavish care.

Graaf, Regnier de, a Dutch physician, born at Schoonhaven, 30th July 1641. His fame rests on his investigations on the use of the pancreatic juice, and on the physiology of human generation. The results of these were published in the treatises *De Natura et Usu Succi Pancreatici* (Leyden, 1663), *De Mulierum Organis Generationi Inservientibus* (1672), and other brief works. G. died at Delft, 17th August 1673. His *Opera Omnia* appeared in 1607, and were republished in 1608 and 1705.

Graaff-Rey'net, the chief town of a county of the same name, Cape Colony, on the Zondag, to the S. of the Schnee Berge, and 130 miles N.N.W. of Port Elizabeth. It has some trade in pastoral produce, and a pop. of 9000. The province is intersected from W. to E. by the Koudveld and Schnee Berge, which in Compass Peak attain a height of 8500 feet.

Graaf'ian Ves'icles, are structures found in the ovary, developed for the special purpose of expelling the ovum, and named after Regnier de Graaf (q. v.).

Graal, or **Gréal** (probably from the Old Fr. *gréal*, Prov. *grazal*, Med. Lat. *gradalis*, 'a dish'), a sacred and miraculous cup, which forms the centre of various medieval legends and poems, and which was generally spoken of as the *san graal* ('sacred dish'). The stories of the G. probably arose from the Breton tradition of a marvellous golden chalice studded with diamonds, and concealed in a magic lake or grotto, which endowed its possessor with vast knowledge and the gift of prophecy. In the Christian legend the G. was a chalice, brought by angels to earth, from which Christ drank at the Last Supper. Joseph of Arimathea caught in it the last drops of the blood of Christ, and carried it to Brittany, and afterwards to England, where he left it to his descendants. The G. wrought strange miracles if its possessor were devout and stainless, and became the symbol of holiness and purity. Some time after Joseph of Arimathea died the G. was lost, and Uther Pendragon founded the order of the Round Table to recover it. In Arthur's time many knights set out in search of it, and the quest was achieved by Galahad, according to Walter Mapes (q. v.), who added the legend of the G. to the English Arthurian cycle. According to some French *trouvères* the G. was found by Parcival le Gallois, whose story was begun by Chrétien of Troyes, continued by Gerbert and Gauthier de Denet, and ended by Manessier at the close of the 12th c. Wolfram von Eschenbach (q. v.) introduced the story of the G. into German literature. The legends of the G. were at one time very popular throughout Western Europe, and interest in them has been lately awakened by Tennyson's *Holy Grail* in the *Idylls of the King*.

Grac'chus, the name of a Roman family of the Sempronian gens, which gave to the state many citizens eminent for bravery, magnanimity, and patriotism. **Tiberius Sempronius G.**, the first known to history, was consul 238 B.C., and carried on war in Sardinia and Corsica after the rising of the Carthaginian mercenaries. The next was **T. Sempronius G.**, who achieved renown in the Second Punic War. He was ædile 216 B.C., consul 215 B.C., defeated Hanno 214 B.C. with great loss near Beneventum, was consul a second time 213 B.C., and in 212 B.C., while bravely resisting the Carthaginian arms in Lucania, was slain in the struggle with Mago, or fell into his hands by treachery. Mago sent his body to Hannibal, who gave it distinguished burial. His son, of the same name, augur 203 B.C., died augur 174 B.C. **T. Sempronius G.**, who waged war with the Gauls 196 B.C., and **P. Sempronius G.**, tribune 189 B.C., also deserve mention. But the three most illustrious members of the family are—1. **Tiberius Sempronius G.**, a man whose life was adorned by public and private virtues of the highest order. He was born 210 B.C., was tribune 187 B.C., ædile 182 B.C., prætor 181 B.C., consul 177 B.C., censor 169 B.C., and again consul 163 B.C. His military career in Spain (181–178 B.C.) was a brilliant one; and in the latter year he celebrated a splendid triumph over the Celtiberians and their allies. He afterwards subdued the Sardinians, for which he was again honoured with a triumph, 175 B.C. About 186 B.C. he married Cornelia, youngest daughter of Scipio Africanus, by whom he had twelve children, nine of whom died young. The survivors were Cornelia, wife of Scipio Africanus the younger, and the two famous tribunes T. and C. Sempronius G., known in history as the 'Gracchi.'—2. **Tiberius Sempronius G.**, the elder of the 'Gracchi,' was born, according to Plutarch's statement, about 164 B.C., but probably four years earlier. While still young he lost his father. The education of G. and of his brother, however, was carefully superintended by their mother, and under the best Greek teachers they received a training that enabled them to outstrip all the youths of the time. When G. arrived at manhood, he was elected augur. In 149 B.C. he accompanied his brother-in-law, Scipio Africanus the younger, into Africa, and was present at the siege of Carthage, the walls of which, it is said, he was the first to scale. In 137 B.C. he was appointed quæstor to the army under the consul C. Hostilius Mancinus in Hither Spain. Here he gained the esteem of the soldiery and the confidence of the enemy. Forty years before this the Spaniards had experienced the upright dealing of his father, and now, in their turn victorious, they declined to treat with any other than the son. G. was thus enabled to save the lives of 20,000 men who were entirely at the mercy of the Numantines, and to conclude an equitable peace. The terms, however, were deemed disgraceful at Rome, and Mancinus was sent back to the Numantines naked, with hands bound, that the treaty might be set aside (136 B.C.). Meanwhile G.'s popularity increased. But he was daily becoming more and more impressed with the desert look of the fields of Italy, and the terrible destitution of the poorer classes. These evils he resolved to remedy by checking the avarice of the aristocracy, and by creating an industrious middle class of husbandmen. To this end he stood for and gained the tribuneship, 133 B.C. He then brought in a bill for the renewal of the Agrarian Law (q. v.) of Licinius Stolo, which with certain modifications he carried amid violent opposition. The triumvirs appointed to carry out the law were G., his father-in-law Appius Claudius, and his brother Caius, then with Scipio at Numantia. Though G. still continued the idol of the people, the death of one of his intimate friends by poison warned him of danger. He therefore ceased to appear alone in public. Meanwhile Attalus died leaving his kingdom and wealth to the Roman people. G. wished the money thus left to be divided among the poor, and further entertained the idea of extending the franchise; but fortune turned against him. Rumours were circulated that he aimed at being King of Rome. At every turn his life was in danger, and his heart became filled with fears and misgivings. The people deserted their champion, and at next election for the tribuneship he was slain in a scuffle at the entrance to the temple of Fides. Upwards of 300 men were killed in the tumult by sticks and stones, but none by the sword. G. was a man of amiable nature, noble bearing, and simple, yet dignified demeanour. As a speaker he was temperate, graceful, and persuasive; but in talent, energy, and intensity he was inferior to his younger brother.—3. **Caius Sempronius G.** was, according to Plutarch's account, nine years younger than Tiberius. At his brother's death G. was in Spain, and the aristocracy, jealous of his abilities, were nowise anxious for his return. He came back, however, in the following year, but kept aloof from public affairs. In 126 B.C. he was sent as quæstor to Sardinia under the consul L. Aurelius Orestes, a mission which removed him from the jealous eyes of his enemies for a time. Like his brother, he soon became popular in the camp. After an absence of two years, urged by his brother's shade, which appeared to him in a dream, he returned to Rome. In 123 B.C. he was elected tribune. As such, his first acts were directed against his brother's murderers. He then proceeded to carry out his brother's Agrarian Law, which was being thwarted by the nobles on all hands, and to pursue a policy for the improvement of the poor, the regeneration of his country, and the development of its resources. A law was enacted that corn should be sold every month to the poor at a low and fixed price. He next directed his weapons against the senate, and carried a law by which the *judicia publica* were transferred to a court of 300 equites. G. was re-elected tribune for the following year, when one of his colleagues, M. Livius Drusus, bribed by the nobles, succeeded in outbidding him in the proposal of popular measures. The result was that G. failed next year to obtain the tribuneship, and the consul Opimius began to repeal his laws. In the tumult which followed G. fled to the temple of Diana, and thence to the grove of the Furies, where he was slain at his own request by his slave Philocrates. More than 3000 are said to have perished with him. All his friends who fell into the hands of their enemies were thrown into prison and strangled. After this fearful scene of bloodshed, the senate, in blasphemous mockery, dedicated a temple to Concord! Many specimens and fragments of the oratory of G. may be found in Meyer's *Fragment. Orat. Rom.*, pp. 227–249, 2d ed.

Grace (Gr. *charis*) means a favourable or kind feeling, especially towards an unworthy object. In the New Testament it is represented as the crowning attribute of the divine nature, the manifestation of which was the grand end of the whole scheme of redemption (Eph. i. 3–6, ii. 6, 7). In theology various kinds of G. are distinguished. Common G. is 'that influence of the Holy Spirit which, in a greater or less measure, is granted to all who hear the truth.' Sufficient G. means 'such kind and degree of the Spirit's influence as is sufficient to lead men to repentance, faith, and a holy life.' Effectual G. is 'such an influence of the Spirit as is certainly effectual in producing regeneration and conversion.' Preventing G. 'means that operation of the Spirit on the mind which precedes and excites its efforts to return to God.' Co-operating G. is 'that influence of the Spirit which aids the people of God in all the exercises of the divine life.' Habitual G. is that permanent state of mind which is due to the abiding presence and power of the Holy Spirit. See Hodge's *Systematic Theology* (Edinb. 1872).

Grace, Days of. See BILL OF EXCHANGE, under BILL.

Gra'ces (Lat. *Gratiæ*; Gr. *Charites*), the goddesses of grace, beauty, refinement, and loveliness. Homer in the Iliad (xviii. 382) describes the Grace Charis as the wife of Hephæstus. In the same poem (xiv. 269) he speaks of the G. as an indefinite number, and calls one of them the destined wife of Sleep. In the Homeric poems the G. are elsewhere spoken of in the plural. According to the Odyssey, Aphrodite is the goddess of love and beauty, and the G. are her attendants. Hesiod mentions three G.—Thalia, Aglaia, and Euphrosyne. The G. are generally represented as the daughters of Zeus by Hera, Eurynome, Eurydomene, Eunomia, Harmonia, or Lethe; of Apollo by Ægle or Euanthe; or of Dionysus by Aphrodite. The Spartans and Athenians worshipped only *two* G., though under different names. The worship of the G. was introduced into Bœotia by Eteocles. They are represented as the companions of many divinities besides Aphrodite, *e.g.*, of Hera, Hermes, Eros, Dionysus, and the Muses. They are generally portrayed as slightly draped or nude, and as carrying musical instruments, myrtles, roses, or dice. Among later Roman writers the G. appear as symbols of gratitude and benevolence—a phase unknown to Greek mythology, and springing from the radical meaning of the term *gratia* in the Roman tongue. Apropos of this later meaning of the term may be noted the Feast of the Charities (*Charistia*), an annual family banquet for the adjustment of differences—'the Feast of the Reconciliation'—celebrated on the 19th or 20th of February, and called from

its character the 'Kinsmen's Day'—*Lux Propinquorum.* See Mart., *Epigr.* ix. 56.

Gracio'sa, one of the Azores (q. v.).

Gra'dient (Lat. *gradus*, 'a step'), in heraldry, signifies 'walking,' and is applied to the tortoise.

Gradient, of a railway, road, or canal, is its inclination to the horizontal, and is measured as a rise of 1 foot in so many measured horizontally. The *barometric G.* of any two localities is the geographical distance of the two places in nautical miles, divided by the difference of barometric pressure in inches.

Gradisk', a town in the S. of Russia, province of Poltava, near the left bank of the Dnieper, 65 miles S.W. of Poltava. It has four churches, a monastery, and some grain and cattle trade. Pop. (1870) 7107.

Grad'ual (from Lat. *gradus*, 'a step') was—(1) An anthem or response, originally an entire psalm, varying with the day, sung in the Western Church, between the reading of the Epistle and the Gospel, from the same step of the ambo as the Epistle was read from; hence probably the name G. Strictly the G. was only the first verse of the anthem; the rest, when sung to the end by the chanter alone, was called the Tract; when he was interrupted by the choir, it was called the Verse or Responsory. (2) The book containing the anthems, although the name was also applied to the Antiphonary, containing everything sung antiphonally at the Eucharist.

Gradual Psalms is the liturgical name for the fifteen psalms entitled 'Songs of Degrees,' cxx. to cxxxiv. The term 'degrees' has been variously explained. Some make the psalms to have been songs of the pilgrims returning from Babylom (*cf.* Ezra vii. 9); others refer them to the journeys to Jerusalem at the great feasts. Later Jewish expositors say they got their name from fifteen steps in the Temple. Most probably they got it from the step-like progress of the thoughts and the rhythm (*cf.* cxxi. 1, 2, '. . . from whence cometh my help. My help cometh,' &c.)

Gradua'tion is the art of dividing a given length into a required number of equal parts. The geometry of the straight line and circle supplies a method by which any straight line may be so subdivided, but in practice this method is neither convenient nor accurate. The principle was made use of in constructing the Diagonal Scale (q. v.), which has been, however, in our modern instruments for astronomical, geodesic, and other purposes, wholly superseded by the Vernier (q. v.). The growing necessity for accurate measurements has developed the art into one of great delicacy. Most instruments are graduated by the aid of a *dividing engine*, which has been constructed with the greatest possible care. This of course requires a scale graduated originally with the aid of such a simple form of machine as the beam compasses, and the difficulties of original G. are such as to have rendered the few who have attained to excellence in it as famous as the illustrious investigators who have used their instruments—such men for instance are Graham, Ramsden, Troughton, Simms, and others. The most practically accurate method for original G. is that of successive bisections until the different intervals are so small as to be easily divided, by the process of *stepping*, into the required number. Stepping is accomplished by setting the compass points as near as may be to the needed interval, and then, by stepping over the whole distance to be divided, discovering by how much this interval repeated so many times exceeds or falls short of the true interval taken the same number of times, and adjusting the compass points accordingly. A dividing engine consists essentially of an endless screw, on which a nut works backwards and forwards. If this screw be provided with a graduated circle, by which the number of turns may be fairly estimated, we have a machine by which any given distance not exceeding the screw in length may be divided into any number of equal parts, with a greater or less degree of accuracy depending on the operator. For example, if it is required to divide a length into n equal parts, first count how many turns and fractions of a turn are necessary to make the nut travel the given distance, then work the nut backwards, marking the positions which correspond to $\frac{1}{n}$, $\frac{2}{n}$, $\frac{3}{n}$, &c., of the whole distance, found by calculating the number of turns necessary to make the nut move through each subdivision.

Graduation, the ceremony of conferring an academic degree. See DEGREE, UNIVERSITY.

Græ'cia Mag'na. See MAGNA GRÆCIA.

Graf is the German form of the Old Eng. *gerēfa*, perhaps a variant of *gefēra*, 'a companion or associate' (Mod. Eng. *reeve*, 'a bailiff;' Low. Sc. *grieve*, 'a farm-steward'), and if so, the equivalent in meaning of the Lat. *comes*, and the Fr. *comte*. The name first occurs among the Franks in the *Lex Salica* under the Latinised form of *grafio*, and there it denotes an officer appointed by the king to govern a 'gau' or district. The office grew in importance and dignity with the growth of the kingly power, and various kinds of 'grafs' gradually appear. The chief of these, however, is the district-G., who superseded the older *thunginus* or *centenarius* chosen by the people themselves. His duties were to preside in the justiciary court, to protect the Church and all who deserved help, to proclaim the royal summons to arms, to lift the royal revenues, and to inspect the royal demesnes. His management of Church property ultimately gave rise to abuses, such as the appointment of laymen to the office of abbots, hence the word *comites* or *grafen* sometimes stands for *abbates*. Among the more notable of the other grafs who figure in Frankish history are the *stall-G.* (Lat. *comes stabuli*, Fr. *connétable*, Eng. *constable*) or *marschalk* (Lat. *marescalcus*, Fr. *maréchal*, Eng. *marshal*), who had charge of the horses in the king's stable; the *pfalz-G.* (Lat. *comes palatii*), who assisted the king in his personal administration of justice; the *send-G.*, who was sent as an extraordinary delegate of the king to control or report upon the district-G.; the *mark-G.* ('border earl'), a creation of Karl the Great's, made necessary by his extensive conquests. As early as the 9th c. we see a tendency in these offices to become hereditary, and it gradually increased with the development of feudalism until the family succession to lands and offices was formally recognised and invested with the authority of feudal law. Towards the close of the middle ages many *herren* ('lords') who had never held any office under the Emperor took the title of G.; and in modern times the fundamental changes in the mode of governing a country, exemplified in the separation of the judicial office from territorial possessions, have transformed the G. in Germany, like his counterparts elsewhere in Europe, into a mere titled noble. See COMES, COUNT, EARL.

Gräf'enberg, a village in Austrian Silesia, on the slopes of the Grafenberge, overlooking the Biele, 1250 feet above the sea, and 65 miles S.W. of Oppeln. It has the first hydropathic establishments in Europe, founded by Vincenz Priessnitz in 1828. G. receives annually from 500 to 1000 visitors.

Graffi'ti (from Ital. *graffiare*, 'to scratch') is the name applied to a class of ancient inscriptions rudely scratched by a style or other hard-pointed instrument on walls, door-posts, and the like. They have been found in some of the most famous Roman palaces and in the Catacombs, but chiefly in Pompeii. Though their literary merit is of no account, their value to scholars is nevertheless great; and when we have more knowledge of them than we possess, even after the labours of Wordsworth, Garrucci, and others, we may be in a better position to appreciate the 'slang' and 'street-life' of Rome, and to account for many obscure allusions in the writers of the pre-Augustan and Augustan periods. G. are found written in Greek in a few instances; in Oscan, at a time, moreover, when that language is generally supposed to have passed away; but more frequently in Latin. The subjects, scribbled on door-posts, walls, and pillars, include jokes, caricatures, witty or wicked epigrammatic touches, and simple statements of passing events; those in the Catacombs, again, are symbolical of Christian life and hope. For collections of Pompeian G. see Wordsworth's *Ancient Writings on Walls of Pompeii* (8vo, Lond. 1837); and Garrucci's compilation, a still better one (Par. 1856); while, for an exhaustive essay on the whole subject, the reader may consult the *Edinburgh Review* (vol. cx. pp. 411–437).

Graft'ing. In its broad sense, G. is the operation by which a bud portion of one plant is implanted upon the nourishment-yielding portion of another, and there made to grow. The numerous methods of G. are conveniently divided into three groups—namely, Budding (q. v.), Inarching (q. v.), and G. proper. The part transferred is termed the *graft* or *scion* (*bud* in the case of budding), and that to which transferred, its future

support, the *stock*. Most of our valuable fruit-trees have been produced by long cultivation and selection from comparatively worthless originals, *e.g.*, all the kinds of apple are an accumulated succession of improvements upon the wild austere crab. When patient labour is rewarded with a desirable variety, that variety could not with any certainty be reproduced from its own seed, there being always a tendency to revert to the parent state; moreover, self-fertilisation is not the rule in nature, and cross-fertilisation might quite alter the characteristics of the offspring. The object of the horticulturist is therefore to obtain a method of propagation by division of the special individual he has secured, and one great means to accomplish this is G. In addition to this, G. also accelerates the production of fruit and flowers, and induces fertility. Consequently it is evident that G. is an art of the highest importance in horticulture. The whole system of artificial G. is founded upon the capacity inherent in plants of uniting together under certain circumstances and in a given mode. As to circumstances, it is absolutely necessary that stock and graft bear a near natural affinity to each other; in other words, that G. may be successful, the sap of the stock must contain all that the engrafted bud or shoot requires in every stage of its growth. As to mode, it is essential that those parts of graft and stock which have the power of generating new tissues be brought into juxtaposition. This growing element of the plant is termed its *cambium*, and is the layer of delicate cells between the last formation of new wood and the inner bark. When graft and stock are properly placed, the new tissue produced by their respective cambium meets together, coalesces, and thus institutes a vital connection between the buds of the scion and the roots of the stock. No real union ever takes place between the adjacent surfaces of the *existing* wood. G. is most simple when both stock and scion are equally the same size: in such a case a smooth sloping cut is made in an upward direction on the former, while a corresponding downward cut is made in the latter, the two surfaces are then brought together, secured by matting, and covered with clay or other adhesive material to exclude air, &c. But the multitudinous conditions of plant-life practically render G. so varied in plan of operation that the inquirer must consult special treatises on the subject. In all the methods of procedure the chief point to remember is that the closer the contact between the respective cambium layers the greater the prospect of success. The period of operation is entirely guided by the state of the ascent of the sap: the spring, therefore, is the proper season for the hardy trees in our climate. The vine is best grafted when in leaf. The following are the principal current names in connection with G.—namely, splice-G., whip or tongue G., saddle-G., cleft-G., crown-G., peg-G., shoulder-G., root-G., inarching, and budding. The art of G. is so ancient that anything connected with its origin is lost in the obscurity of ages. Accounts, such as Pliny's, of a tree so grafted as to bear apples, pears, plums, almonds, olives, figs, and grapes, are based simply on ingenious deceptions.

Gragna'no, a town of Italy, province of Naples, 2 miles S.E. of Castellamare di Stabia, on the slope of Mount Gaurano. It is a bishop's see, and is noted for its wines. Pop. 12,278.

Graham, Grahame, or Graeme, the variously-spelled name of an ancient Scottish family, is probably derived from a Celtic root, *grym*, signifying strength (Gael. *grumach*, 'stern'), from which we have also *Grime's*, popularly called *Graham's*, Dyke. The first member of the family known in Scotland was Sir William de Graham (so spelled in a charter witnessed by him at Holyrood), who came from England in the reign of David I. The elder line of his descendants having terminated with Sir John de G. in the 14th c., the younger branch, derived from John, second son of Sir William, became the representative of the family. David, son of this Sir John, obtained from William the Lion a grant of land near Montrose, from which the present ducal title is derived. His elder son (?), Sir Patrick, fell at Dunbar in 1296, while his younger son was the famous Sir John the G., the friend and comrade of Wallace. In 1451 Sir Patrick G. of Kincardine, a cousin of Patrick G., Archbishop of St. Andrews, was created a peer of Parliament by the title of Lord G. William, third Lord G., who fell at Flodden in 1513, was created Earl of Montrose in 1503. Third in descent from him was James, first Marquess of Montrose (q. v.), born 1612. The ducal title was granted in 1707 to James, fourth Marquess. The Grahams of Claverhouse (q. v.) were a branch of the house of Montrose; and the Grahams of Balgowan, of whom General Thomas G., Lord Lynedoch (q. v.), was a representative, were sprung from the same noble family.

Graham, John, of Claverhouse, Viscount Dundee, celebrated as a zealous Royalist and a relentless opponent of the Scottish Covenanters. He was the eldest son of Sir William G. of Claverhouse, near Dundee, a descendant of the noble house of Montrose, and Lady Jane Carnegie, fourth daughter of the first Earl of Northesk. G. was born in 1643; and after completing his education at the University of St. Andrews, entered the French service as a volunteer, but left it in 1672 for that of the Prince of Orange. He received a captain's commission in the Dutch army in 1674, having, it is said, saved the life of the Prince at the battle of Seneff in August of that year. Returning to Scotland in 1677, he was appointed to the command of one of the independent bodies of cavalry raised to suppress the Covenanters, and soon distinguished himself by his merciless ardour in hunting out and persecuting these unhappy people, earning for himself the title by which he is still generally spoken of in the W. of Scotland—'The Bloody Claver'se.' The only regular engagements in which he took part against the Covenanters were those of Drumclog and Bothwell Brig, both in June 1679, in the former of which he was surprised and beaten. In 1682 G. became Sheriff of Wigton. His discipline of his own soldiers was almost as severe as his treatment of the 'hill people,' death being the only punishment he inflicted. For his services he was in 1684 appointed captain of horse, and received as a gift the Castle of Dudhope and the constabulary of Dundee. Under James II. he rose to be major-general, and in 1688 was created Viscount Dundee and Lord G. of Claverhouse. After the Revolution he raised an army in the Highlands in support of King James, and marched to Killiecrankie, where he was met on July 27, 1689, by General Mackay with nearly 4000 men. Dundee's troops amounted to only about 2500; but Mackay could not withstand the furious onset of the Highlanders, and retreated with a loss of over 2000 men. The victory was, however, dearly purchased with the loss of Dundee, who was mortally wounded by a musket-ball. He died shortly after the battle, and was buried in the church of Blair Athole. With him died the hopes of King James' cause in Scotland. See Napier's *Memorials and Letters illustrative of the Life and Times of Dundee* (Edinb. 1859).

Graham, Sir James Robert George, of Netherby, Bart., an English statesman, was the eldest son of Sir James, first baronet, and Lady Catherine Stewart, eldest daughter of the seventh Earl of Galloway. He was born June 1, 1792, and was educated at Westminster and Christ-Church College, Oxford. He afterwards spent two years in foreign travels, during part of which time he acted as private secretary to Lord Montgomery in Sicily; and owing to the illness of his superior, G. had entire charge of the negotiations by which Murat, King of Naples, was detached from his alliance with Napoleon. Returning to England in 1815, he began to take an eager interest in politics, and having declared himself a Whig, was in 1818 elected member for Hull. In 1824 he succeeded to the baronetcy, and in 1830 became First Lord of the Admiralty in Earl Grey's Ministry, and was soon a Privy Councillor. He helped to pass the Reform Bill of 1832, but in 1834, differing from his colleagues, he resigned along with Lord Stanley and the Earl of Ripon. In 1835 his political doctrines underwent a considerable change, in consequence of which he lost his seat for Cumberland in 1837; but he was returned as a Conservative for Pembroke, and in 1841 accepted office as Home Secretary in the Government of Sir Robert Peel. While at the head of the Home Department he incurred much unpopularity from the unyielding attitude by which he precipitated the Disruption of the Scottish Kirk, from opening the letters of Mazzini, and, in Ireland, from the proceedings against O'Connell. The Ministry fell in 1846, and G. remained out of office till 1852, when he again became First Lord of the Admiralty in the Coalition Ministry of Lord Aberdeen, a post which he retained till a few days after Lord Palmerston became Premier in 1855. Having latterly embraced Liberal views, G. generally supported Palmerston during the rest of his parliamentary career till his death, which occurred 25th October 1861; but he refused to take office in his Government. G.'s Life, by Mr. M'Cullagh Torrens, was published in 1863 (2 vols. Lond.).

Graham, Thomas, a celebrated chemist, was born December 20, 1805, in Glasgow, where he studied till 1826, when he removed to Edinburgh. In 1830 he was elected Professor of Chemistry in the Andersonian University, and in 1837 succeeded Dr. Turner in the chemical chair of University College, London. In 1855 he was made Master of the Mint, a post which he held till his death, September 16, 1869. G. was a skilful experimenter, and is especially famous for his researches on the Diffusion (q. v.) of gases and liquids, and his contributions to the atomic theory of matter. His valuable memoirs on this and other physical and chemical subjects are printed in the *Transactions* of the Royal Society of Edinburgh, and in the *Philosophical Transactions*. His *Elements of Chemistry* has gone through several editions. His papers have been collected and printed for private circulation by Mr. James Young and Dr. Angus Smith, under the title of *Chemical and Physical Researches* (1876).

Grahame, Rev. James, a Scottish poet, born at Glasgow, 22d April 1765. After studying law and practising for some years at the bar, he took orders in the English Church, and became curate of Shipton, Gloucestershire, and of Sedgefield, Durham. Ill-health forced him to return to Scotland, and he died at his brother's house near Glasgow, September 14, 1811. G.'s writings include *Mary Queen of Scotland*, a dramatic poem; *The Sabbath*, his best work; *Sabbath Walks*, &c. His verse is tame and monotonous, and his sentiment is mostly a reproduction of Cowper's, somewhat dulled by the lack of genius, yet not without a certain sweet and tender piety. He shows strong sympathy with Scottish life, and his descriptions have an unmistakable Scottish impress.

Grahams, The, of the Border, are descendants from Sir John G. of Kilbride, second son of Malice 'with the bright sword,' first Earl of Strathern, and afterwards Earl of Menteith. The principal families are those of Plomp, Esk, and Netherby.

Graham's Town, the capital of the eastern county of Albany, Cape Colony, South Africa, 25 miles from the sea. It is the see of a Protestant and Roman Catholic bishop, and has a cathedral, hospital, barracks, public library, botanic garden, &c. Its harbour is Port Alfred, next in importance to Port Elizabeth, with £50,000 yearly of custom dues. Pop. 9000.

Grain (Lat. *granum*, probably allied to *gramen*, 'grass,' anything that can be eaten), the name generally applied in botany to the caryopsis or fruit of the cereal grasses.

Grain, the origin of all weights in England, was a G. of dried wheat from the middle of the ear. Thirty-two grains made one pennyweight, twenty pennyweights one ounce, and twelve ounces one pound. Now twenty-four grains make one pennyweight. The G. is the smallest weight in common use.

Grain Coast, also known as **Pepper Coast**, is the name given to the seaboard of Liberia, W. Africa, on account of the Malaguetta pepper, or 'grains of paradise,' formerly exported in large quantity. See GUINEA.

Grain'ing (*Leuciscus Lancastriensis*), a species of *Teleostean* fishes belonging to the family *Cyprinidæ*, or that of the Carps (q. v.), and nearly allied to the Dace (q. v.). It is found on the Continent, but also inhabits a few English rivers. The G. has a single prominent dorsal fin, the tail is forked, and the head short and compressed.

Grains of Paradise and Malaguetta Pepper, the names given to the seeds of two species of *Amomum*—viz., *A. grana-paradisi* and *A. Meleguetta*—belonging to the ginger order. A few tons of the seeds are annually imported into Britain from the Guinea coast, where the plants are indigenous. They are sometimes illegally used to give a fictitious strength to spirits, and a hot, strong flavour to gin. In Africa they are largely used as a spice, and in some parts of Europe as a veterinary medicine. The name Guinea Pepper (q. v.) has also been applied to the seeds.

Grak'le (*Gracula*), a name popularly applied to many Insessorial birds allied to the Starlings (q. v.), but specially limited by zoologists to members of the genus *Gracula* included in the sub-family *Graculinæ* of the *Conirostres*. In this group the bill is broad at the base and compressed, but is also curved above. The nostrils are exposed, and the wings are long, the first quill being short, and the third and fourth longest. The tail and tarsi are short, and the toes long. The genus G. itself has a long bill, with a strong hinder toe, parts of the head being unfeathered. The grakles inhabit India and New Guinea. The crowned G. (*G. coronata*) is of a very dark-green colour, glossed with blue and black. The head and nape of the neck are yellow, and the skin around the eye pink. The tail is short and square-shaped. The Mina bird (*G. musica*), found in India and the E. Archipelago, is of a deep-black colour, with a white mark at the base of the wing-quills. The head bears two prominent yellow wattles. The average size of the G. is about that of the common thrush. This bird, which is a rare visitant in England, seems to possess talking powers, and imitates various sounds in a very perfect manner.

Grakle.

Grallato'res, Grallæ, or **Waders**, an important order of Birds (q. v.) represented by the cranes, herons, ibises, storks, coots, waterhens, rails, woodcocks, plovers, bustards, &c. In this group the legs are for the most part very long, as is also the bill. The legs are destitute of feathers from the lower end of the tibia or shinbone downwards. The toes are long and straight, and a short hinder toe or *hallux* may be developed, but is frequently absent. The wings are long, but the tail is short, and in flight the G. (as is well seen in the herons) fly with the legs extended behind them, the legs supplying the place of the tail in guiding their flight. The neck is long. The food consists of worms, slugs, mollusca, fishes, and small mammalia. The G. inhabit shallow pools and lakes and the estuaries of rivers or the sea-coasts. They are either monogamous or polygamous, and the young run about as soon as they are hatched.

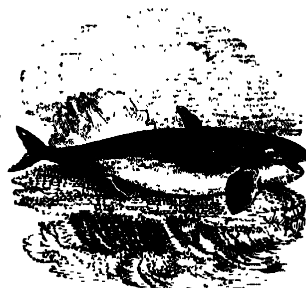
Gram, the Indian name for the Chick-Pea (q. v.).

Gramin'eæ, the natural order of Grasses (q. v.).

Gramm'ar (from Gr. *gramma*, 'a letter'), in its common and restricted sense, is the art of writing and speaking a language with accuracy and elegance. Its object is to investigate, systematise, and apply the component 'parts of speech,' as exhibited in the best writers and speakers of any particular tongue. The four main divisions of the subject are—(1) Orthography, (2) Etymology, (3) Syntax, (4) Prosody. The first treats of the forms and sounds of letters, and the formation of syllables from letters, and of words from syllables; the second, of the derivation, composition, inflection, and classification of words; the third, of their collocation or order in a sentence; and the fourth, of their correct accentuation and pronunciation with special reference to the metrical value of the syllables. G. is not one of the early births of language. To Homer, as an art, it was unknown. In the days of Plato it was still in its infancy. G., in the sense in which we are using the term, was a nursling of the Alexandrine writers; and the analysis and classification of words and other phenomena of language, as exemplified in the early poets, philosophers, and historians, furnished it with nourishment. The earliest Greek G., systematically compiled, for the use of Roman students, was not published till about 80 B.C. This work, the production of one Dionysius Thrax, a pupil of the Alexandrine school, formed the basis of European grammars. Within the present century, in all the countries of Europe, immense advances have been made in the treatment and study of the subject; and now, under the names of comparative G., comparative philology, and science of language, G. possesses an elaborate nomenclature, and takes a foremost place among the sciences. In the essentials all languages agree. Setting out with this dictum, comparative G. undertakes not only the investigation, arrangement, and comparison of the different parts of human speech, but also the classification of the different varieties of language into families and groups according to their affinities and differences. It even seeks to account for the origin, growth, and manifold phenomena of language. For the different terms in G., see under their special heads.

Grammar Schools. This was the name given to schools before the grammar of our language was written or taught, and when all grammatical knowledge was obtained through the study of the ancient languages. Latin, the language of the Church and of the learned, was the chief subject of instruction in the early G. S. The learning of Latin, of course, involved the translation of it into some living language. In England this tongue was French till 1350, when John Cornwall, a schoolmaster, introduced the practice of making his pupils translate Latin into English. In the 16th c. Hebrew, Greek, Latin, French, and Gaelic were allowed to be spoken in the Grammar School of Aberdeen, but not English. In course of time 'Lecture' schools were added, and subsequently schools for arithmetic and writing. In connection with the G. S. in Scotland, the 'Sang' schools deserve mention. These, as their name implies, were originally for music. G. S. have now in great measure lost their distinctive character as colleges for classics alone, and aim at giving a liberal and general education. In most of them mathematics and other sciences are now on an equal footing with the classic tongues. German and French are becoming indispensable; while a critical study of the English language—a powerful instrument of culture far too long neglected or but inadequately recognised—and the historic sequence of English literature, history, geography, &c., are rapidly attaining their rightful place.

Law Regarding Grammar Schools.—Act 3 and 4 Vict. c. 77, was passed for improving and enlarging the sphere of G. S., defined as all endowed schools founded or maintained for the teaching of Latin or Greek. The Act empowers the Court of Chancery, on being properly petitioned, to make decrees extending the system of education in any school, and regulating the system of admission and the application of its revenues. The intention of the founders is to be considered. The teaching of Greek and Latin may be given up if the revenues are insufficient. The Act 23 Vict. c. 11, provides for the secular instruction of children whose parents do not hold the religious doctrine taught under the endowment, unless the deed specially appoints the teaching of the formularies of a specified Church or religious sect.



Gramme (Gr. *gramma*), the standard unit of weight in France, was originally fixed as the weight of a cubic centimètre of distilled water at 0° C., and is equal to 15·43234874 grains Troy. The method of nomenclature of the multiple and submultiple weights is considered under METRIC SYSTEM.

Gram'mont, or **Gramont,** the name of an old French family belonging to the S.W. of France. In the 15th c. it split into two branches, the younger of which found a second home in Dauphiné, while the elder became extinct in the male line in the 16th c. But a daughter, **Claire de G.**, carried on the succession, and on her marriage in 1525 with Menaud d'Aure, Vicomte d'Astre, the latter took the name and arms of G. His great-grandson was the famous courtier, **Philibert, Comte de G.**, born about 1621. He distinguished himself in his youth under Condé and Turenne, but eclipsed his early fame as a soldier by his accomplishments as a courtier. Banished from France for seeking to win the affections of one of the royal mistresses, he betook himself to the court of Charles II. of England, where he became a great favourite from his wit and gallantry. He afterwards returned to France, and died in 1707. His brother-in-law, Anthony Count Hamilton, published memoirs of G., which sparkle with wit, and give a lively and seemingly faithful picture of the licentious Restoration society. See *Memoir of the Comte de G.*, edited by Sir Walter Scott (1811), and reprinted in Bohn's 'extra volumes.' His brother Antoine (born 1604), distinguished as a diplomatist and soldier, was made **Duc de G.** in 1663. He also left *Mémoires* (published by his son in 1716). To this family belongs the present **Antoine Alfred Agenor, Duc de G.**, born at Paris, 14th August 1819. He was educated at the École Polytechnique, entered the army in 1840, allied himself with Louis Napoleon after the Restoration of 1848, was appointed French ambassador at the court of Würtemberg in 1852, at Sardinia in 1853, at Rome in 1857, and Vienna in 1861. In May 1870 he was appointed Foreign Minister, became the leader of the war party, and after the fall of the Napoleonic dynasty fled to England, where he wrote *La France et la Prusse avant la Guerre* (1872).

Gram'mont, an industrial town of Belgium, province of E. Flanders, on the Dender, 25 miles W.S.W. of Brussels by railway. Its chief manufactures are linens, lace, damasks, woollens, leather, tobacco, &c. Pop. (1873) 9362.

Gram'pians, the great mountain system of Scotland, stretching as a principal chain in a W. and S.W. direction from Kincardineshire to near the southern end of the Caledonian Canal. The Cairngorm range is an offset to the N. into Banffshire and Aberdeenshire; and the Southern G. of Argyle and Perthshire, exending as far S. as Loch Lomond, form the southern limit of the system. The strata, which are violently contorted and upturned, belong to the Silurian age, and rest upon granitic rocks. On the S. they touch unconformably upon the Old Red Sandstone of Forfarshire and Perthshire. The chief heights are, in the principal chain, Ben Nevis (4406 feet), Lochnagar (3786); in the Cairngorm range, Ben Macdhui (4296), Cairntoul (4245), Cairngorm (4090), Ben-na-Buird (3860); and in the Southern G., Ben Cruachan (3668), Ben Lawers (3935), Schiehallion (3564), and Ben Lomond (3192).—G. is also the name of a mountain group extending N. and S. in the S.W. of Victoria, Australia. It forms two parallel chains, the Victoria and Serra ranges, in the latter of which is Mount William, 3825 feet high. The name is taken from the *Mons Grampius*, or rather *Graupius*, of Tacitus.

Gram'pus (*Phocæna*), a genus of *Cetacea* (q. v.) or Whales belonging to the family *Delphinidæ* or Dolphins. The characters of the genus are the presence of teeth of compressed form in both jaws, and a triangular dorsal fin, placed near the middle of the back. The common G. (*P. orca*, or *Delphinus G.*) attains a length of from eighteen to thirty feet, and a girth of from ten to twelve feet. The teeth number forty-four. The colour is black on the upper parts, and white on the belly, and there is a patch of white over each eye. The tail is broad and deeply forked, and the body tapers towards the posterior extremity. The food consists of salmon, herrings, and other fishes, and the grampuses are frequently taken in rivers or shallow waters, into which they have pursued their prey. The habitat of the G. is the northern seas, but it often appears in warmer latitudes. The name G. is derived from the French *grand poisson* ('great fish').

Grampus.

Gran (Hung. *Esztergom*), the chief town of a comität of the same name in Hungary, at the mouth of the river G., on the right bank of the Danube, 25 miles N.W. of Pesth, and opposite Párkány, a station on the Vienna and Pesth Railway. It is the seat of the archbishop and primate of Hungary, and has a beautiful cathedral (1821-56) and other fine buildings. Its wine trade is considerable. Pop. (1869) 11,215. G. was the birthplace of St. Stephen, the first King of Hungary.

Grana'da (Span. *Granata*, Arab. *Garnathah*, perhaps a corruption of *Karnathah*, the name of the old Phœnician fortress which stood here, or perhaps from *granatum*, 'a pomegranate,' as the city bore a resemblance to that fruit half opened, and as a pomegranate was part of its arms), once called by the Arabs 'the Damascus of Spain,' the former capital of the kingdom of G., and now the chief place in the province of G., in the S. of Spain, is situated 2445 feet above the sea, and 140 miles E.S.E. of Seville. It overlooks the wide and fertile plain known as the Vega of G., and lies in a deep valley between two hills, one of which is crowned by the Alhambra (q. v.), and the other by the suburb of Albaycin. G. is belted by high ruined walls, once studded with 1030 towers, outside of which are villas embosomed in groves. It lies partly between the Xenil, which flows through it, and the Darro, which joins the Xenil about a mile below G. The city has a picturesque aspect from its neighbouring mountains and Saracenic piles, its white walls, airy minarets, gilded cupolas, and intervening masses of verdure. The streets are crooked and narrow, and the houses mostly flat-roofed, with balconies. G. is enlivened by many fountains, and has several fine squares, of which the chief are La Plaza Mayor,

La Bivirambla, and El Campo. The cathedral is a splendid but irregular building. There are some silk and woollen manufactures. Pop. (1870) 67,326. G. was founded by the Arabs in the 10th c., when it belonged to the caliphate of Cordova. In 1236 it became capital of the Kingdom of G. (q. v.), and became a famous seat of Moorish power, wealth, and luxury. It is said to have had 200,000 inhabitants at the beginning of the 14th c., and in later times to have been able to send out an army of 50,000. After a long resistance it was taken by the Spaniards in 1492.

Granada, a former province in the S. of Spain, bounded N.W. by Andalusia, E. by Murcia, and S. and S.E. by the Mediterranean. Area, 11,063 sq. miles; pop. (1870) 1,351,909. It is a fruitful and picturesque region, traversed by the rugged, snow-capped range of the Sierra Nevada, by the Sierra de Ronda, and the Alpujarras, and watered by the Guadalhorce, Almeria, and Almanzora, which flow into the Mediterranean, and by the Xenil, and other affluents of the Guadalquiver. Its mountains shelter deep and fertile valleys, and descend to the lowland by beautiful, richly cultivated terraces. The plains abound in corn and vines, and there are valuable mines of iron, lead, silver, and copper. G., now subdivided into the provinces of G., Malaga, and Almeria, formed the ancient kingdom of G., which in 1235 was made an independent Moorish dominion, and became a famous seat of culture and wealth, exercising considerable influence on Western Europe by the refinement, chivalrous courtesy, and artistic, literary, and scientific activity of its inhabitants. In 1492 it was seized by Ferdinand and Isabella, and in 1510 the Moors were driven from Spain.

Granada, a town of Nicaragua, Central America, on the N.W. shore of Lake Nicaragua. It was founded by Spaniards in 1522, and was once very prosperous, but has not recovered from its siege in 1854-56 during a civil war. Pop. about 8000.

Granadill'a, the name usually given to the edible fruit of several species of *Passiflora* or Passion-Flower (q. v.). *P. quadrangularis* produces the large G., a well-known W. Indian fruit. The roots of the plant are narcotic. Several species are grown in hothouses in Britain.

Gran'ary Weevil. See CORN WEEVIL.

Grana'ti Rad'icis Cor'tex, or **Pomegranate Root Bark**, the dried bark of the root *Punica granatum*, chiefly imported from the S. of Europe, is used in medicine as an astringent and anthelmintic, and, in the latter case, it is more effective than turpentine in expelling tapeworm. For this purpose two ounces of the bruised bark are macerated in twenty-four ounces of boiling water for twenty-four hours, and then boiled down to eighteen ounces. A dose of castor-oil should be administered on the morning of the day previous to taking the medicine, and solid food should be abstained from during the day. A third part of the decoction should be taken early in the morning, another third in half an hour after, and the remainder in another half-hour. The worm is generally expelled entire within about two hours after.

Gran'by, John Manners, Marquis of, son of the third Duke of Rutland, born 2d January 1721. He had already sat for several Parliaments in the House of Commons, when in 1745 he raised the regiment which he commanded at Culloden. Choosing the military career, he served in Germany under Prince Ferdinand of Brunswick, and gained the battle of Minden by disobeying the orders of his superior officer, Lord George Sackville. He further distinguished himself in the other battles of the campaign, but at the peace in 1763 returned to Parliament. He was soon called to a place in the Cabinet, and was in this capacity one of the most bitterly assailed in the *Letters of Junius*. G. died at Scarborough, 19th October 1770. In his lifetime he was much admired by his countrymen.

Gran Chaco, El (*i.e.*, 'the great hunting-ground'), also called **Chaco Gualamba**, is a wide expanse of llanos in S. America, comprising the N.E. of the Argentine Republic and the S.E. of Bolivia. Area and population uncertain. The surface is very level, in the S. waste, in the N. covered with luxuriant vegetation. It is watered by the Rio Salado, Vermego, Pilcomayo, &c. Little is known of the interior, which is occupied by scattered tribes of nomadic Indians.

Grandchildren. See GRANDFATHER.

Grand Combe, La, a town of France, department of Gard, 9 miles N.N.W. of Alais by railway, has important manufactures of iron, and one of the richest coal-pits in France, yielding annually 15,000 tons of fuel. Pop. (1872) 9367.

Grand Days, in English law, were days solemnly kept in the Inns of Court and Chancery during the terms, and on which the famous revels of the Inns were held. They were Ascension Day, St. John the Baptist's Day, All Saints' Day, All Souls' Day, and Candlemas Day. The benchers now decide what days shall be observed as G. D. See Pearce's *Inns of Court and Chancery*.

Grandees' (Span. *grandes*) was as early as the 13th c. the term for a special class of nobles in the kingdom of Castile. The G. included amongst their number, besides the members of the blood royal, all the most distinguished members of the higher nobility of Spain, and enjoyed many peculiar privileges, both formal and real. Ferdinand and Isabella broke their power, and G. became at last merely a court title. Even this dignity was abolished at the Revolution, though subsequently restored.

Grand'father. By the common law of England a G. is not obliged to maintain his grandchildren, but by 43 Eliz. c. 2, he may, if able, be called on by the parish to help to do so. In Scotland, when the father fails, the G. is bound to support his indigent grandchildren, the burden falling first on the paternal G., failing whom it falls on the maternal. The liability is by common law.

Grand Haven, a town of Michigan, U.S., on Lake Michigan. It is the terminus of the Detroit and Milwaukee Railway, has a public bank, eight churches, and a trade in timber, leather, flour, fish, &c. G. is a favourite summer resort. Pop. (1870) 3147.

Grand Jury. After committal of a prisoner, or after acceptance of Bail (q. v.), the next step is to present an Indictment (q. v.) against him to the G. J. This is summoned by the sheriff, and consists of not fewer than twelve, nor more than twenty-three, of the principal men of the county. Before trial they are instructed by the bench as to the subject of it. They only hear evidence for the prosecution. For expediting the proceedings of the G. J., by 19 and 20 Vict. c. 54, persons attending to give evidence before them may be sworn in the presence of the jurors and examined on oath. After evidence has been led, the jury, if they think the accusation groundless, write on the back of the bill of indictment 'Not a true bill,' or 'Not found.' The prisoner is then discharged. But a new bill may be preferred to a subsequent G. J. If the accusation be held to have good ground, the indorsation is 'A true bill.' The indictment is then said to be *found*. But to effect this at least twelve of the jury must concur. As to convict requires the unanimous verdict of the petty jury of twelve men, it follows that no prisoner can be found guilty except by the votes of twenty-four of his countrymen. (See JURIES; JURY, TRIAL BY.) In Scotland, the duties of the G. J. are discharged by a public prosecutor. See ADVOCATE, LORD; CRIMINAL PROCEDURE; PRECOGNITION; PROCURATOR-FISCAL.

Grand Master (Lat. *magnus magister*, Ger. *hochmeister*), the head of the Templars (q. v.), Hospitallers (q. v.), Teutonic Knights (q. v.), and Dominicans.

Grand Pen'sionary, in the Dutch Republic, was State Secretary for the province of Holland, for which he was also Advocate-General until the time of Olden Barneveldt. Afterwards the G. P. was practically Foreign Minister. The office, which was held for five years, was abolished in 1795.

Grand Rapids, a city of Michigan, U.S., on the Grand River, 30 miles E. of Lake Michigan. It is an important railway centre, stands in a thriving agricultural district, and has a large trade in pine and other wood, and manufactures of furniture, agricultural implements, &c. Grand River is here 900 feet wide, and, falling seventeen feet in two miles, supplies excellent water-power to numerous mills. Pop. of G. (1870) 16,507.

Grand River, a river of Michigan, U.S., enters Lake Michigan, after a course of 270 miles, at Grand Haven. It is navigable for 40 miles, to Grand Rapids.

Grandville, Jean Ignace Isidore Gérard, a French artist, born at Nancy, 3d September 1803, removed to Paris in 1823, where in 1828 he published his *Métamorphoses du Jour,*

and at once found himself famous. This series of designs represents persons with the heads of animals, and in the selection of the heads and their treatment as expressive of the assumed character of the person represented, G. was wonderfully successful. He afterwards designed series of illustrations for the works of Beranger, for *Gulliver's Travels*, La Fontaine, *Robinson Crusoe*, *Don Quixote*. A posthumous work, *Les Étoiles*, was published in Paris in 1856-57. His *Magasin Pittoresque* embraced many curious designs, as the *Scènes de la Vie Privée des Animaux*, and many others of equal humour and peculiarity. The illustrated periodicals for which he produced the majority of his political and other fugitive sketches were *La Caricature*, *Figaro*, and *L'Illustration*. G. died in Paris, 17th March 1847.

Gra'ne, or **Qua'de**, a seaport of Arabia, in the N.W. angle of the Persian Gulf. It has some trade in carpets, fruits, &c. Pop. 8000.

Grani'cus, the ancient name of a river in Mysia, rising in Mount Cotylus, a branch of Ida, and flowing through the Adrastian plain into the Propontis. It is small, and, like the rest of the rivers in the Troad, unnavigable; but, like them also, it is famous in poetry. It is, moreover, celebrated in history for two great victories gained on its banks—one in B.C. 334 by Alexander the Great with 30,000 men over Darius with 600,000 Persians, when 100,000 of the latter were left dead on the field; the other by the Roman general Lucullus over the great Mithridates in 73, 71, or 69 B.C. (The chronology of the events in the Mithridatic war is very confused and perplexing.) Famous as this small stream has been, there is considerable difficulty in identifying it with any modern river. Some travellers consider it to be the *Kodsha-su*, others the *Dimotico*.

Gran'ier de Cassagnac (Adolphe de), born at Aveyron-Bergelle (Gers.) in 1808, reached Paris in 1832, and, introduced by Victor Hugo, became a contributor to the *Journal des Debats* and the *Revue de Paris*. The acerbity of his style gained him a position on the staff of the *Press*. He visited the Antilles in 1840, was elected *délégué* for Guadaloupe, and having married a creole, Madle. de Beauvallon, returned to France. He became editor of the *Pouvoir* in 1850, afterwards joined the staff of the *Constitutionnel*. He eagerly espoused the Government inaugurated by the *coup d'état*, and was elected deputy to the Corps Legislative. He was re-elected deputy in 1857, in 1863, and 1869. In conjunction with others he founded the *Réveil*, later he undertook the editorship of the *Pays*, in which, after 1866, he was assisted by his son, Paul de Cassagnac. He was promoted 'officier' of the Legion of Honour in 1857, and 'commandeur,' 1865. Throughout his career he has signalised himself as a violent partisan of successive conservative Governments, and has used every weapon, fair and unfair, against his adversaries. He has been engaged in many duels, some of them, it is said, not of a strictly honourable character, and has been implicated in numerous affairs which have necessitated his visiting the Palais de Justice. His principal substantive works are *Histoire des Causes de la Revolution Française* (1850), *Histoire de la Chute de Louis-Philippe* (1857), and *Les Girondins et les Massacres de Septembre* (1860)—productions marked by imperfect research and unwarranted conclusions.—**Paul de G. de C.**, son of the preceding, notorious as a literary and political writer and otherwise, was born about 1841. He commenced his career as a journalist in 1866 on the *Pays*, of which he afterwards became *rédacteur en chef*. Early in his career he fought a duel with M. A. Scholl, a satirical journalist; he fought M. Vermorel in 1867, Lieutenant Luiller in 1868, and M. Gustave Flourens (see FLOURENS) in 1869. This last fight, in which G.'s antagonist received many wounds, one of which endangered his life, lasted for twenty-five minutes, and is one of the most determined duels of recent times. G., who has spilt about as much blood as ink, has steadily supported the cause of the Imperialists, and at present (1877) is one of the most audacious and scornful Bonapartists in the National Assembly.

Gran'ite (Ital. *granito*, 'grained,' from Lat. *granum*), a well-known and easily recognised igneous rock, composed of the three minerals felspar, mica, and quartz in varying proportions. The felspar is always an essential ingredient, forming rarely less than a half of the mass, but the mica and quartz may exist in minute almost unrecognisable quantity. The texture of G. also varies greatly, and its colour is red, grey, or white, with intermediate tints depending upon the proportion and colour of the constituent minerals. The felspar is usually orthoclase. Oligoclase, however, is also found, being recognisable by its finely striated surfaces; and, more rarely, albite. The quartz but seldom forms perfect crystals, an interesting and remarkable fact when it is observed that both the felspathic and micaceous ingredients not unfrequently are most distinctly crystallised. This may probably be due to the physical phenomena attending the production of granitic rocks, which are now generally believed to have solidified by cooling. Differences between the fusing-points of the various minerals easily account for the more perfect crystallisation of the felspar and mica, which may have solidified while the quartz was still viscous. As proved by Hutton towards the close of last century, G. is, in certain circumstances, an igneous rock. It forms the heart of all the great primitive mountain chains, and is regarded as the original source of all the felspathic or highly silicated traps and lavas. It is also conceivable that it may have given rise to the more basic traps, if the circumstances in which it was fused admitted of the admixture of some fusible bases. In many cases, however, undoubted metamorphic rocks have been observed undistinguishable in character from a true igneous G. It is, in such instances, the ultimate metamorphosis of gneiss, mica-schist, or other schistose rock, losing in the process all trace of stratified structure. Syenite may be regarded as a variety of G. in which hornblende replaces the mica. *Graphic G.* is distinguished by the peculiar regularity of the crystallisation of the quartz in the felspar, presenting on a cross section an appearance somewhat resembling Hebrew writing. *Prologine* has the felspar replaced by talc, and occurs in the metamorphic rocks of the Alps. G. is important from an industrial point of view, since in it are found ores of tin, copper, zinc, iron, antimony, nickel, cobalt, bismuth, silver, &c., and also the emerald, topaz, fluorspar, garnet, tourmaline, and other precious and useful minerals. As a building material G. is very valuable, especially the finer in texture and more quartzose varieties, which, if free from pyrites or other iron ore, are very durable.

Gran Sass'o d' Ital'ia ('great rock of Italy'), or **Monte Corno** ('horn mountain'), the highest peak of the Apennines, in Abruzzo, province of Teramo. It is a towering, snow-capped mass of calcareous rock, nearly 10,000 feet high, rising in a sublime series of wild mural slopes and vast overhanging cliffs.

Grant, in English law, formerly signified a conveyance of incorporeal things, as reversions, tithes, &c. But by 8 and 9 Vict. c. 106, it is enacted that incorporeal as well as corporeal estate may pass by G.

Grant, a name of several distinguished Scotchmen and Scotchwomen of different families, of whom the following are the most notable:—1. **Mrs. Anne G.**, a Scottish authoress, born at Glasgow, February 21, 1755. In 1779 she married the Rev. Mr. G. of Laggan, on whose death in 1801 she was forced to support herself and family by literature, and produced, among other works, *The Highlanders* (1803), a volume of verse, which was well received; *Letters from the Mountains* (1806), a collection of her own letters; *Memoirs of an American Lady* (1808); *On the Superstitions of the Highlanders* (1811); *Eighteen Hundred and Thirteen* (1814), a poem of very little worth. She received a pension in 1825, and died at Edinburgh, November 7, 1838. See her Life by her son, J. G. (1844).—2. **Mrs. G. of Carron** (born 1745, died 1814), authoress of *Roy's Wife of Aldivalloch*, a song of exquisite humour and vivacity.—3. **Charles G., Lord Glenelg**, born of a Highland family at Kidderpore, Bengal, in 1799. He studied at Cambridge University, was called to the bar in 1807, and in 1811 was elected M.P. for the Inverness burghs. After being for five years a Lord of the Treasury, he was in 1819 made Secretary for Ireland, and in this office showed great impartiality, and strove to carry out a policy of conciliation. He was made Vice-President of the Board of Trade in 1823, President of the Board of Control in 1830, and Secretary of State to the Colonies in 1834. After 1839 he took little part in politics. G. died at Cannes in 1866. He was a Liberal in politics, an eloquent speaker, and a pure-spirited statesman.—4. **Sir Robert G.**, brother of the preceding, born in 1788, studied at Cambridge, was called to the bar in 1807, sat for several years in Parliament, was knighted and made Governor of Bombay in 1834. He died at Dapoorie in 1838. G. wrote two treatises on Indian affairs, and some hymns

inspired by an evangelical devotion, which were collected and published by his brother in 1839.—5. **Sir Francis G., P.R.A.**, fourth son of Francis G. of Kilgraston, Perthshire, was born at Edinburgh in 1803. He was intended for the bar, but abandoned law for painting; was elected an Associate in 1842, a R.A. in 1851, and President of the Royal Academy in 1866, shortly after which he was knighted. He was made D.C.L. of Oxford in 1870. Among his portraits are those of Macaulay, Landseer, Sir J. H. Grant, Disraeli, Lords Palmerston, and Russell.—6. **Sir James Hope G., G.C.B.**, brother of the preceding, was born in 1808, distinguished himself as brigade-major in China; was commander in the battles of Chillianwallah and Gujerat; was made brevet-colonel in 1854; showed great ability at the siege of Delhi and relief of Lucknow; and was appointed major-general and K.C.B. in 1858; led the army which took Pekin in 1860; was made lieutenant-general in 1861, and general in 1872. He died March 7, 1875. He wrote *Incidents of the Chinese War of* 1860 (Lond. 1874). —7. **Sir William G.**, born at Elchies, Morayshire, in 1754. He went out in 1775 to Canada, where he was made attorney-general, and in 1787 he was called to the English bar. In 1790 he was returned to Parliament, and in 1793 was made a judge by Pitt, of whom he had been a firm supporter. In 1801 he became Master of the Rolls, retired from Parliament in 1812, and died in 1832. He was a strict Conservative in politics, an admirable debater, and a learned and sagacious lawyer.

Grant, Ulysses Simpson, late President of the United States, was the son of a leather merchant of Scottish descent, and was born at Point Pleasant, Ohio, April 27, 1822. He entered the Military Academy at West Point in 1839, received a commission as second lieutenant in 1842, took part in all the battles, save Buena Vista, of the Mexican war, and in 1848 married the daughter of a St. Louis merchant. In 1854 he was made captain, when he resigned his commission, and after engaging in farming near St. Louis, went into business with his father. Until the civil war G. was quite unknown; but shortly after its outbreak he was made brigadier-general of volunteers, and after the battle of Belmont and the capture of Fort Donelson became commander of W. Tennessee. He drove back Beauregard at Shiloh (April 7, 1862), repulsed the Confederates at Corinth (October 4, 1862), took Vicksburg (July 4, 1863), and (November 23, 24, 25) defeated General Bragg at Chattanooga, a victory which opened up Georgia to the Federals. In February 1864 G. was made lieutenant-general, and on 17th March took command of all the Northern forces. He now set out against the army of N. Virginia under Lee, which he drove back after several desperate battles, while Sherman fought his way through Georgia. G. then held Lee shut up at Richmond, the siege of which he pushed on with unflinching energy, notwithstanding the impatient murmurs of the Northern States, while Sherman, Schofield, and Sheridan routed the other Confederate leaders. After he was joined by Sheridan, G. captured Richmond, April 3, 1865, and on April 9 surrounded Lee at Appomatox, where the Confederate general surrendered with 27,000 men, G. granting him very generous terms. This ended the civil war, and immediately after Abraham Lincoln was assassinated and Andrew Johnson became President. G., who was hailed throughout the North with boundless enthusiasm, and loaded with honours, was now placed in opposition to Johnson, interposing in behalf of the South, and averting the prosecution of Lee. Johnson afterwards in a measure severed himself from the Federals, and in 1868 G. was elected President. During his administration the enmities engendered by the war were greatly allayed, the national debt largely reduced, and the Alabama question settled. In 1872 G. was re-elected President over Horace Greeley (q. v.), the candidate of the Democrats and 'Liberal Republicans.' His second presidentship was marked by financial difficulties and troubles in the South, which culminated (1876–77) in the contest regarding his successor. G. is the greatest general that America has produced, and may even rank among the foremost generals in modern times. Without undervaluing the brilliant military genius of Sherman and Sheridan on the one side, or of Stonewall Jackson and Lee on the other, a comparison of the work done by the host of able soldiers that the civil war brought to the front distinctly shows G. to be the man who most thoroughly grasped the whole situation, and who saw most clearly how the end could be attained.

Gran'tham, a town of Lincolnshire, England, on the Witham, 26 miles S. of Lincoln by railway. It has a beautiful parish church (St. Wolfran's) of the 13th c. (restored by Sir G. G. Scott, 1865–68), with pointed windows and a spire 273 feet high; a free grammar-school (with an endowment of £800 yearly), where Sir Isaac Newton received part of his early training; two large corn-exchanges, a new townhall, hospital (1876), and institute. G. is connected with the Trent by a canal, and carries on a trade in malt, coal, corn, &c. Here are Messrs. Hornsby's agricultural implement factory and iron foundry. G. returns two members to Parliament. Pop. (1871) 5028.

Gran'ton, a port of Midlothian, on the S. shore of the Firth of Forth, opposite Burntisland, and 3 miles N.W. of Edinburgh by railway. It has a good harbour of 130 acres, a pier 1700 feet long and 200 broad, an eastern breakwater 3170 feet long, and a western breakwater 3100 feet, the greater part of which is converted into wharfage, with steam-cranes and special appliances for shipping coal (in 1876, 230,000 tons). The trade is in grain, timber, iron, oil, tobacco, &c. G. is the ferry port of the North British Railway, and has regular steam traffic with London, Aberdeen, Shetland, Norway, and Sweden, &c. In 1876 there entered and cleared the port 1924 vessels of 670,956 tons. The customs revenue (1876) was £73,762. G. has one of the finest tobacco bonding warehouses in the country, with an area of 14,000 feet; also large sawmills, foundries, engineering, ink, and chemical works. Pop. (1871) 976. The docks are the property of the Duke of Buccleuch.

Granula'tion is one of the modes by which a wound or sore, or part previously acutely inflamed, heals. G. is always a reparative process, which may occur with or without suppuration, and is associated with an exudation of inflammatory lymph, into which old vessels extend, and in which new ones are formed. See INFLAMMATION, ULCER, WOUND.

Granvell'a, Antoine Perrenot, Cardinal de, the accomplished but unscrupulous Minister of the Emperor Karl V. and of Philip II., was born at Ornans, in Burgundy, 20th August 1517. In 1540 he became Bishop of Arras, and soon entered the diplomatic service of Karl V., under whom G.'s father had kept the great seal. G.'s sagacity and linguistic attainments—so great that he had perfect command of seven languages—soon raised him to high favour, and his influence over the great political negotiations of his time renders him one of the most prominent men of the 16th c. G. was present at the Diets of Worms and Ratisbon, and at the Council of Trent. He negotiated the marriage of Philip II. with Mary of England, and, as Minister of Margaret of Parma, he conducted the affairs of the Netherlands from 1559 till his unpopularity compelled him to retire in 1564. In 1570 he concluded the alliance of Spain and the Pope against the Turks, was for a time vice-king of Naples, and died at Madrid, 21st September 1586. For his services to Church and State, G. was successively rewarded with the archbishoprics of Mechlin and Besançon, and in 1561 he was raised to the cardinalate. The papers left by G. illustrate all the negotiations in which he was engaged, and extend to eighty folio volumes of MS. In 1842 the publication of them was begun. See Gerlache's *Philippe II. et G.* (Bruss. 1843).

Gran'ville, a fortified seaport in the department of La Manche, France, on a rocky peninsula 60 miles S.W. of Caen, and 12 N.W. of Avranches. It has a Flamboyant church of grey granite, and a new pier and floating-dock. The harbour is dry at ebb tide. Many English people resort hither for sea-bathing, and there are shipbuilding industries and oyster fisheries. Pop. (1872) 14,747. G. was burned by the English in 1695, and was besieged by the Vendeans in 1793.

Grape-Shot is a combination of a number of small balls to be fired from a cannon, and contained in a strong canvas bag firmly bound with a network of cord, the whole being attached to a circular iron plate, the diameter of which is adapted to the gun. This species of shot is very destructive.

Graph'ic Representa'tion is the practical application of the principles of co-ordinate geometry to the construction of curves, which show readily to the eye the relations existing between a series of numbers which refer to some one physical phenomenon. The construction of maps by means of meridians and parallels is a very perfect example of the nature of the methods commonly employed, except that in this par-

ticular case the co-ordinates are not referred to *rectangular axes*. In the elucidation of the laws by which a continually and regularly varying phenomenon is governed, the method of G. R. is of singular power. As an example, take the variation of barometric pressure throughout the day. Measure along a horizontal line twenty-four equal spaces to represent hours, and at each point raise a perpendicular representing by its length the height of the mercury at the corresponding hour. The result will be a series of points, the curve through which will indicate on mere inspection the general variation of barometric pressure from hour to hour. In our best observations the barometer is made to record its variation in this way for every instant. A strong electric or lime light is thrown through the barometer tube upon a strip of sensitive photographic paper, which is moved slowly and equally along by clockwork. The column of mercury of course shuts off the light from the lower part of the paper, which is therefore not acted upon, and by this means a sharp line of demarcation is obtained upon the paper, which gives at once the law of variation. When there are three variables involved in the progression of any phenomenon, G. R. on a plane surface becomes more difficult. For instance, in mapping a country, we must take account of vertical elevation, as well as of latitude and longitude. The usual method of representing mountains on maps is not only inaccurate, but, as a rule, misleading. The true scientific method is by *contour lines*. A glance at an Ordnance Survey map will show at once the nature of this representation, which consists in drawing through points at the same elevation a line, which must be ultimately a closed curve. The principle is the same as in the drawing of Isotherms (q. v.) or equipotential lines (see POTENTIAL). The closer two different contour lines are, the steeper is the slope at that place; and if they touch, they indicate a perpendicular precipice.

In all branches of science graphical methods are coming into greater favour, and in practical science the Continental engineers have developed a kind of applied geometry which they call graphical statics. By its methods the engineer can solve numerous statical problems by simple construction more easily and with as much accuracy as by calculations founded on analytical investigations. The leading treatise on this subject is the *Graphische Statik* of Professor Culman of Zürich (2d ed. 1875). See also Professor Dubois' *Elements of Graphical Statics* (New York, 1875).

Graph'is, a genus of Lichens (q. v.) which have their fructification resembling Oriental writing, hence they have been called 'scripture worts.' There are several species in Britain which grow on the bark of trees.

Graph'ite. See BLACKLEAD and CARBON.

Graph'otype, a cheap and rapid process of engraving, which, it was expected, would before this have supplanted wood-engraving. But while it is well adapted for the rougher work of maps and diagrams, it would prove a poor substitute for highly finished wood-engravings. In 1860 Mr. De Witt C. Hitchcock, a draughtsman on wood, had occasion to remove the white enamel from a visiting card, and discovered that the printed portion resisted the action of his brush, and stood out in relief. This circumstance suggested to him the idea of the G., and after a series of experiments the following process was perfected:—A metallic plate is coated under hydraulic pressure with French chalk, finely pulverised and sifted. The surface is then sized, and a drawing made upon it with ink composed of lamp-black and glue. The chalk not drawn upon is next brushed off with silk velvet, and the drawing left in relief is hardened by soaking the block in water-glass. Finally a stereotype cast is taken, which is used for printing the impressions.

Grap'nel, Grap'line, or **Grapp'ling Iron**, an anchor-shaped iron instrument with four or six bent and pointed claws springing from a stem, at the end of which is a ring to which a rope is attached. Made on a small scale, it is used as an anchor for boats or small craft. Formerly grapnels of a large size were frequently used in naval engagements, to draw ships closer, and facilitate the attack of boarders.

Grapp'le-Plant, the common name for *Uncaria* (Harpagophytum) *procumbens*, an African plant belonging to the order Pedaliaceæ. It has received the name G.-P. from its fruits being furnished with very strong, sharp, branching hooks, which lay hold of animals and travellers' garments, and with difficulty can be removed.

Grap'tolites, an important fossil genus of *Cœlenterata*, allied to the existing *Sertularidæ*, or 'sea-firs,' which belong to the class *Hydrozoa*, or that including the zoophytes, jellyfishes, &c. The G. occur as fossils in a very distinct and limited series of rocks—the Upper Cambrian and Silurian, attaining the maximum of their development in the former. The best-known genera of G. are *Graptolites*, *Rastrites*, *Didymograpsus*, *Dichograpsus*, *Diplograpsus*, &c. These fossils were probably not rooted and attached like our existing zoophytes, but were free-floating bodies; at least no disc or attaching part has yet been discovered in any specimen. The outer portion of the organism was protected by a horny covering, and the polypites or distinct animals of each graptolite were enclosed in horny cups or *cellules*, a conformation also seen in living 'sea-firs,' in which the cups are named *hydrothecæ*. Further, the interior of each graptolite was strengthened by a central solid rod or axis, this latter structure being unrepresented in living zoophytes. Certain bodies supposed to represent the *ovarian bodies* or *egg-capsules* of the G. have also been discovered in a fossil state. The G. are divided into the *Monoprionidia* and *Diprionidia*, the former (*e.g.*, *G. priodon*) having only a single row of cellules, and the latter (*e.g.*, *Diplograpsus*) a row of cellules on each side of the axis. About sixteen genera of G. are known.

Gras'litz, an industrial town of Bohemia, on the Zwoda, 88 miles N.W. of Prague. The manufactures are cottons, paper, machinery, scientific instruments, &c. Pop. (1869) 5786.

Gras'mere ('the lake of swine'), one of the smallest, but also one of the finest, of the Westmoreland lakes, a mile long and half a mile broad, and situated about three miles N.W. of Ambleside. The vale, lake, and mountain girdle of G. exhibit a rare harmony of natural forms, and their beauty, once seen, can never be forgotten. Wordsworth, who for many years lived on a rising ground overlooking the lake, and whose plain grave, worn by the feet of pilgrims, is in the village churchyard, has sung the praises of every striking feature of the scene.

Grass, Law Regarding. Growing grass belongs to the owner of the soil, and is real estate. In Scotland, the landlord's Hypothec (q. v.) extends over the grass-mail of fields let for pasture.

Grass Cloth, a popular name for a fine soft fabric made from the fibre of *Bœhmeria nivea*, extensively and carefully cultivated in China and other Eastern countries. As the plant belongs to the nettleworts, G. C. is a misnomer.

Grasse', a town of France, department of Alpes-Maritimes, on steep southern slopes 20 miles W. of Nice. It is embowered amid rich flower gardens and citron groves, looks out over the sea to the blue hills of Corsica, and has an old cathedral and hospital with many good pictures. There are extensive manufactures of perfumes (exports 11,000,000 francs' worth yearly), soap, silks, &c. Pop. (1872) 8382. G. was founded by Sardinian Jews in the 6th c.

Grass'es (Old Eng. *gaers* and *graes*, 'that which grows;' comp. Lat. *cresco*, 'I grow,' Gr. *graō*, 'I gnaw,' and Sansk. *gras*, 'to devour') belong to the class Monocotyledons (q. v.), subclass Glumiferæ, and natural order Gramineæ. They constitute a well-marked order, which is characterised by round, generally hollow, jointed stems. Their leaves are furnished with a projecting membrane called a ligule. The flowers, usually produced in spikelets with outer scales called glumes, have two styles and three stamens. The plants of the order are generally low, tufted herbs, but some species, such as the sugar-cane and bamboo, attain a considerable height. They have all slender stems strengthened by a deposit of silica in the epidermis. G. are one of the most useful and widely distributed families of plants known. As furnishing the chief article of food, they are cultivated in all parts of the civilised world, man and beast being alike dependent on them. Among the more useful G. may be enumerated the various cereals. Barley (*Hordeum vulgare*) and oats (*Avena sativa*) extend to the northern parts of Scandinavia and Siberia. Rye (*Secale cereale*) is grown along the shores of the Baltic, Russia, and N. Germany. Wheat (*Triticum vulgare*) is cultivated in Great Britain, the middle of Europe, Hungary, and in the southern parts of the Russian empire. In Southern Europe, America, and in the tropics, as

Central Africa, maize (*Zea mais*) appears. Rice (*Oryza sativa*), the staple article of food for the greater part of mankind, is met with throughout all the warmer parts of Asia and the Old World, as well as in the Southern States of N. America. The seeds of *Sorghum vulgare* and *Panicum miliaceum* are known as Guinea corn and millet. All these grains have been cultivated from time immemorial, and no trace of their origin remains. Sugar-cane is chiefly grown in the E. and W. Indies, in Hong-Kong, Java, Jamaica, and Demerara. The bamboos rival the palms in usefulness. Various G. are grown as fodder, as the rye-grass (Lolium); others (*Andropogon*) yield aromatic oils; while many G. fulfil a most important purpose by binding together loose sand shores with their long creeping roots, and thus form a natural bulwark against the inroads of the sea. There are no poisonous plants in this order.

Grass'hopper, a name given to the various genera of insects belonging to the order *Orthoptera* (q. v.), and nearly allied to the locusts, crickets, &c. The genus *Acrida*, represented by the *A. viridissima*, or great green G., is one of the best-known groups. The wings are long, the wing-covers (formed by the front wings) form a slanting roof, and the ovipositor is flat and sword-shaped. The abdomen bears four straight spines. This G. attains a length of from two to two and a half inches. Its colour is a delicate green. The ovipositor is used to bore holes in the earth, for the purpose of burying the eggs. The young are like the adult, and the pupa does not pass through any quiescent stage (as in butterflies); the *Metamorphosis* (q. v.) is therefore said to be *incomplete* or *hemimetabolic*. The characteristic 'chirp' of the G. is produced, as in the crickets, by a peculiar arrangement of the anterior wings or *elytra*. The tarsi are four-jointed, and the ocelli or simple eyes are usually wanting. The food consists of leaves and the soft parts of plants.

Grass of Parnass'us, the common name for *Parnassia palustris*, a beautiful bog plant, placed by some authors in the natural order *Hypericaceæ*; by others, in *Saxifragaceæ*. It is not uncommon in Northern Britain and other parts of Europe, and has been named from Mount Parnassus, to which, however, it is not peculiar. Dioscorides called it *Agrostis en to Parnasso*; in France it is the *fleur du Parnassus*, and in Germany the *Einblatt*.

Grass Tree, the common name for the species of *Xanthorrhœa*, a remarkable genus of Australian Liliaceous plants resembling small palms. Two kinds of fragrant resin, one yellow and the other red, are obtained from them, and their foliage affords fodder for cattle. *X. arborea* and *X. hastilis* are the most conspicuous.

Grass'um, in Scotch law, is an immediate payment in consideration of a lease for a term of years. When the title of an heir in possession prohibits alienation, the general rule seems to be that he must administer the estate *secundum bonum et æquum*, taking no more of the profits than he leaves to his successor. The equivalent terms of English law are *premium* and *fine*. A freeholder may let his land at any rent and for any premium or fine which he can get.

Grass Wrack, or **Sea Wrack**, the popular name for *Zostera marina*, a salt-water plant belonging to the natural order *Zosteraceæ*. It has a wide distribution, and is common on the shores of Britain. It is largely used for packing glass and earthenware. In Russia it has been found in old tombs among pottery. In the N. of Europe beds are frequently stuffed with it, and it is sold in this country for similar purposes under the name of *Alva* (*Ulva* or *Alga*) *marina*.

Grate (Ital. *grata*, 'a lattice:' from Lat. *crates*, 'a hurdle'), a contrivance consisting essentially of an iron sparred basket for burning fuel placed in an open fireplace. The sides and back are commonly lined with firebrick to conserve and radiate the heat. By placing a thin metal plate in the bottom in place of bars, which cause an excessive draught, a great saving of fuel is effected. As five-sixths of the heat produced in an open fireplace passes up the chimney, it should be contracted at the throat. 'Register grates' are provided with movable plates for this purpose. Many kinds of 'smokeless grates' have been designed on Franklin's idea of a reversible box-G., in which the coal is ignited at the top and burns downwards. When the charge is nearly exhausted but still red hot, the G. is replenished, then closed with a lid, and turned upside down. In Dr. Arnott's smokeless G. a large box for holding a large supply of coal is placed beneath the fire-bars, at the level of which the burning coal is maintained by raising a false bottom in the box. In this way the coal beneath is subjected to a crude process of distillation, and the carbon vapours emitted are consumed as they pass through the burning layer.

Grate, in mining, signifies a perforated metal plate used for riddling disintegrated ores.

Gra'tian, or **Grazia'no**, the collector of a great body of ecclesiastical acts and decrees, commonly called the 'Decretum Gratiani,' was born at Chiusi in Tuscany in the beginning of the 12th c. Nothing is known of the personal history of this celebrated canonist except that he passed a considerable portion of his life in the monastery of St. Felice at Bologna. The 'Decretum' was probably compiled between the years 1130 and 1151. How far it is the work of G. himself cannot now be ascertained. Historical criticism has shown much of it—for instance, the so-called 'Isodorian Decretals'—to be apocryphal. In addition to decrees of councils and popes, the Decretum contains numerous quotations from the Scriptures, the fathers, and the Roman law. The first part of the work treats of the hierarchical constitution of the Church, with special reference to doctrine and morals; the second is occupied with external jurisdiction; and the third and last with the Church's inner life, ritual, and ordinances. G. died at Bologna, but the date of his death is unknown.

Gratia'nus, Augustus, son of Valentinian I. by his first wife Severa, was born at Sirmium in Pannonia, 19th April A.D. 359. In A.D. 366 he was made consul, and on 24th August 367 he was raised to the rank of Augustus. In 368 A.D. he accompanied his father against the Alemanni, more that he might learn the art of war than experience its hardships. The poet Ausonius was his tutor, and it is to the credit of G. that he afterwards raised him to the consulship in token of his gratitude (379 A.D.). On the death of Valentinian at Bregenz A.D. 375, the troops declared G.'s half-brother, Valentinian II., a child of four years, his partner in the empire. As the eastern provinces were subject to Valens, brother and colleague of Valentinian I., the western provinces fell to be divided between the young emperors. The part allotted to G. included Gaul, Spain, and Britain. G. fixed his residence at Treviri (*Trèves*). In the early part of his reign Illyricum and the Danubian provinces were the scenes of ceaseless strife, and G. was on the eve of starting for Thrace to assist his uncle, when the Lentienses, a German tribe, to the number of 40,000, invaded his dominions. They were cut to pieces by the imperial army in May 378 A.D. G. now pressed towards the eastern portion of the empire, where he heard of the defeat and death of Valens near Adrianople, August 378 A.D. The eastern empire now fell to G.; but feeling himself unequal to the task of the undivided sovereignty, he recalled Theodosius from Spain, and assumed him as his colleague, 19th January 379. After this we hear but little of G.'s warlike or other transactions. He seems to have persecuted with great severity both the pagans and heretic Christians, and thereby to have alienated the affections of many of his subjects. The frivolous amusements and low company with which he occupied his time increased his unpopularity with the army. At this crisis Maximus, being chosen by the legions in Britain, crossed into Gaul and defeated G. near Paris. Deserted by his troops, he was pursued and slain by Andragathius, 25th August 383 A.D.

Grati'ola, a genus of herbaceous plants of the natural order *Scrophulariaceæ*, found in Europe, N. and S. America, and Australia. *G. officinalis* is the hedge hyssop of Europe, which was formerly held in great esteem as a medicine. It is very bitter, and acts as a purgative and an emetic. Cattle have been poisoned by it in Switzerland.

Gratt'an, The Right Honourable Henry, a great Irish statesman and orator, was born in Dublin, July 3, 1746. After studying at Trinity College, Dublin, he entered at the Temple, London, and in 1772 was called to the Irish bar. He won no success as a lawyer, soon devoted himself wholly to politics, and in 1775 was returned to the Irish Parliament by the borough of Charlemont. He now vindicated the constitutional rights of Ireland with such effective fervour of eloquence that in 1782 the Irish House won the privilege of conducting its business without the control of the English Parliament or Privy Council. For

this service the Irish Parliament proposed to make him a grant of £100,000, which was at his request reduced to £50,000. G.'s popularity now greatly waned, and he was ably opposed by Henry Flood (q. v.); but his successful resistance in 1785 to the unjust restrictions which it was sought to lay on Irish commerce made him again the idol of his countrymen. In 1790 he was returned for Dublin, and in 1805, after the Union—of which he had been a determined foe—was elected to the Imperial Parliament for the English borough of Malton. In 1806 he was again elected by Dublin, which he thenceforth represented until 1820. He continued to labour in the interests of his country until his death, June 4, 1820, in London, whither he had gone, against the advice of his physicians, to contend for Catholic emancipation. He was buried in Westminster Abbey. G.'s character seems to have been unimpeachable, and his fiery patriotism was unstained by revolutionary sentiment. His oratory was admirably varied; his speeches abound in pathos and sarcasm, in stormy invective, close reasoning, felicitous epigram, and terse antithesis. G.'s *Speeches* (4 vols. Dub. 1821) were collected by his son, who also wrote *Life and Times of Henry G.* (5 vols. Lond. 1839-45). See also Lecky's *Leaders of Public Opinion in Ireland* (1871-72).

Gratu'itous Deed, in Scotch law, means a deed granted without value given for it. A person cannot dispose of his property to the injury of his creditors, or of those to whom he is under legal obligation. The granter of a G. D. with a future obligation in favour of children or grandchildren who falls into poverty before the date of fulfilment may draw back so far as to provide for his own subsistence. The rule does not, as in Roman law, extend to a Donation (q. v.) to a stranger. In England a G. D. is usually called a Gift (q. v.).

Gratz, formerly **Grätz** (Slav. 'the fortified place'), the capital of Styria, Austro-Hungary, on the Mur, 1047 feet above the sea, and 140 miles S.S.W. of Vienna by the Vienna and Trieste Railway. The old part of the city, on the left bank, is girt with walls and shady promenades, and has a cathedral of St. Agidi of 1462, the church of St. Leonhard of 1283, the old 'burg' of the Styrian dukes, the arsenal, many fine palaces, a university (founded 1585, and rebuilt in 1863) with a library of 55,000 volumes, a museum, picture gallery, &c. The river is crossed by two chain and two wooden bridges. G. has manufactures of steel and iron wares, saltpetre, cottons, woollens, paper, &c. It is a bishop's see. Pop. (1869) 81,119, of whom many are Italians and Jews.

Grau'denz (Slav. 'the fortified place'), a fortified town of W. Prussia, on the Vistula, 20 miles S.S.W. of Marienwerder. It has a Catholic seminary (formerly a Jesuit college), a convent of 1635, a Protestant seminary for female teachers, extensive barracks, woollen and cotton industries, and a trade in cattle, corn, tobacco, &c. The Vistula is here crossed by a bridge of boats. One mile to the N. is the bombproof fort of G., built by Friedrich II. in 1770-76, and bravely defended by Courbière against the French in 1807. Pop. (1871) 14,844.

Grauw'acke, or **Grey'wacke**, a name given to certain metamorphosed sandstones, consisting of rounded or angular grains of quartz, felspar, mica, or slate, cemented together by an altered arenaceous or argillaceous base. Its colour is usually grey, but may be brown, red, or blue. The name is of German origin, and was applied by Werner and his disciples to what was deemed a highly important unfossiliferous rock, which was supposed to occupy a certain geological position. G., however, belongs to all periods, and in most cases contains fossils.

Grav'el. See Calculus.

Gravel, in geology, is any accumulation of rounded pebbles and sand. Beds of G. occur of all ages, but the most extensive belong to the Tertiary formations. The Glacial Period is especially rich in such deposits, and along the slopes of the valleys through which certain rivers—notably the Somme in France—flow, terraces of G. are found indicating the much greater extension in former times of the river's channel. All gravels have been deposited by running streams or water currents, or through the wearing action of the sea along the coast-line; and the more ancient accumulations have almost always consolidated, by the infiltration of some cementing material, into conglomerate or pudding-stone.

Grave'lines (Flem. *Gravelinghe*, 'count's ditch,' so named because Count Theoderic of Flanders here constructed a canal), a fortified seaport of France, in the department Du Nord, at the mouth of the Aa, 10 miles S.W. of Dunkirk. It is defended by Fort Philippe, and has a church of the 16th c., a fine market-place, a trade in timber from the Baltic, and in butter, eggs, cheese, &c., to London, several salt-refineries and linen-factories, &c. The harbour is left dry at ebb tide. Pop. (1872) 7723. G. was founded by Count Theoderic in 1066, taken by the English under the Bishop of Norwich in 1383, and ravaged by the Duke of Burgundy in 1405. The Spanish, under Count Egmont, gained here a famous victory over the French, under Marshal Thomes, 13th July 1558. By the peace of the Pyrenees, G. was finally ceded to Louis XIV.

Grave'lotte, a village in the German province of Elsass-Lothringen, 7 miles W. of Metz and 35 E. of Verdun, was the scene of one of the fiercest battles in the late Franco-German war. Prevented by the first and second armies of Germany under King Wilhelm from marching W. to Verdun, the French army under Bazaine was placed in a strong defensive position on the elevation marked by St. Privat, Amanvillers, Rozerieulles, and Verneville. At 10 o'clock on the morning of August 18, 1870, the French centre was vigorously attacked, the 9th German corps by noon gaining the height of Verneville, and pouring a terrific fire into the batteries of Ste. Marie, St. Privat, and Amanvillers. By seven o'clock St. Privat was taken, but it was quite dark when the contest was finally decided by the failure of an attempt to break through the German lines at G. The French had then to fall back on Metz. The Germans, numbering 211,000, lost 904 officers and 19,658 men; the French, 140,000 in number, lost 609 officers and 11,605 men. St. Privat and Rezonville have also given name to the battle.

Graves, Robbing. It appears to be the doctrine of the common law of England that a human body, living or dead, is not the subject of theft. (See Larceny or Theft. See, however, Abduction.) Thus stealing a dead body is not felony, unless some of the grave-clothes be taken. But it is an offence not to bury a dead body; and in Rex *v.* Young the master of a workhouse and a surgeon were convicted of a conspiracy to prevent the burial of a person who died in a workhouse; and in Rex *v.* Cundick the defendant was found guilty of a misdemeanour for not having buried the body of an executed felon intrusted to him by the gaoler for that purpose (Surrey Spring Assizes, 1822). See Anatomy, in Law; Churchyards.

Graves'end ('the town at the end of the *graf* or moat'), a parliamentary and municipal borough in the county of Kent, England, and a thriving port on the Thames, opposite Tilbury Fort, and 24 miles E. of London by rail. Its townhall is a handsome classical edifice, and there are a number of interesting churches, old and new. From Windmill Hill a fine view may be obtained of the river and the constantly passing craft, the flat banks of the Thames, and the wooded hills inland. G. is the outport of London, at which emigrant and other outward-bound ships stop to take passengers on board, and inward-bound ships are inspected by revenue officers. G. is the headquarters of the Royal Thames Yacht Club, and of various other boating clubs. It is customary for royal and other distinguished visitors from foreign shores to land here and proceed to London by rail or road; and G. has consequently been the scene of many splendid pageants and welcomes conducted with festive ceremonial, among the last of which was the reception given to the Duchess of Edinburgh on her arrival in England in March 1874. Coal and timber are imported, and the shrimp and turbot fisheries are important. Rosherville Gardens, on the outskirts, is one of the principal resorts of Londoners for 'a happy day.' Steamers ply regularly from Rosherville and G. pier on the S. to Tilbury pier, in connection with Tilbury Railway, on the N. bank of the Thames. Asparagus and rhubarb are raised in great quantity for the London market. G. returns one member to Parliament. Pop. (1871) 21,265. G., the Gravesham of Doomsday Book, was sacked, and many of its inhabitants carried off, by French galleys, in the reign of Richard II. Its early history is meagre. It was fortified by Henry VIII., and in 1861-66 £148,000 were spent upon its defensive works.

Gravestones. In England, the ordinary, who is usually the bishop, has the power of granting or refusing permission to erect G. or monuments in the church or churchyard. In Scotland, this power belongs to the *heritors, i.e.*, the proprietors of the lands in the parish. As to the admissibility of G. as evidence in questions of pedigree, see *Dickson on Evidence*, 591, 592.

Gravi'na, an Italian town in the province of Terra di' Bari, 37 miles S.W. of Bari. It stands in a district famed for its pastures, on a hill above the river G., an affluent of the Bradano, is girt by a wall with towers, and has a cathedral and several churches. It is a bishop's see, and has a yearly cattle fair. Pop. 10,849.

Gravita'tion is the great law which regulates all the motions of the planets, satellites, and comets of our system. It was discovered by Newton, who was led to its enunciation by a brilliant train of inductive reasoning perhaps never equalled in the history of science. Assuming the truth of Kepler's Laws (q. v.), he showed that the planets would so move under the action of an attraction force directed to the centre of the sun and varying inversely as the square of the distance from it. The motion of the moon round the earth strongly resembled in its general characters the motion of the earth round the sun, and therefore was presumably due to a similar force. The possibility of this force being the same which made a body fall at the surface of the earth soon suggested itself to Newton's mind; and to test this he compared the distance through which the moon falls *towards* the earth in a given time with the space traversed by a falling body at the earth's surface in the same time. The calculations brought out that the force which drew the moon towards the earth was less than that which made a body fall in the ratio of 3600 : 1 or of 60^2 : 1. Now the moon's distance from the earth's centre is about sixty times the earth's radius, and consequently the earth's attraction, or force of gravity, as it is termed, varies inversely as the square of the distance from the earth's centre—the same relation which Kepler's laws necessarily involve. This governing principle, viewed in the light of his own laws of motion (see MOTION, LAWS OF), was generalised by Newton into the law of universal G., which is that 'every particle in the universe attracts every other particle with a force which acts in the straight line joining them, and is proportional to the square of the distance inversely and to the product of the masses directly.' This law proves that Kepler's laws, to a first approximation, are true, but when applied in all its strictness to such a system as our own solar system, it shows that the path described by any planet deviates from the exact ellipse, and that the area swept out by its radius vector in a given time is not constant, on account of the perturbing effects due to the attraction of the other planets, and also that the planet does not move round the sun, but that both move round the common centre of gravity. Almost all the lunar inequalities are due to the secondary effects of this principle, which seems to rule throughout the whole visible universe.

To regard G. as merely an action at a distance is unscientific in the extreme. In mathematics it may be treated as such, but in physics we are bound in the light of analogy to inquire into the direct cause of the attraction, for *force* in itself has no existence. It must be due to a transmission of energy, and for transmission a medium is necessary. The only plausible theory which has ever been advanced is that of Le Sage, who supposes this medium to consist of an infinite number of particles, minuter far than even the ultimate particles of matter, darting about in all directions with great velocities. One material particle, placed in the heart of such a conflicting crowd, would be equally battered all round, and would remain stationary. Two particles, however, would, so to speak, shield each other, and the better the nearer they were, and accordingly they would approach each other with ever-increasing velocity. The exact law of the inverse square also would hold; but when large masses are considered, a difficulty is encountered as regards the effect of density—a difficulty which is overcome only by supposing the molecules of matter to be separated by a distance large in comparison to their diameter, or by supposing the molecules or atoms themselves to be cage-like in their construction. Sir William Thomson's vortex atoms are essentially such, and his theory has of late years brought Le Sage's hypothesis much into notice. See VORTEX.

Gravity is the force of attraction which the earth exerts upon a mass of its substance, and is measured by the acceleration it produces on a falling body in unit time. It varies from point to point of the earth's surface, thus indicating that our world is not a true sphere. Its maximum value is at the poles, and its minimum at the equator, while in any given locality it diminishes as the height above the sea-level increases. At Greenwich the acceleration due to gravity is 32·1912 feet per second; at Edinburgh, 32·2; at Paris, 32·1819; at Stockholm, 32·2122; at Spitzbergen, 32·2528; at New York, 32·1594; at Rawak, 32·088; and at Ascension, 32·0956. The most accurate method for finding the force of gravity at any locality is by pendulum experiments. See PENDULUM.

Gravity, Specific. See SPECIFIC GRAVITY.

Gray, a town of France in the department of Haute-Saône, on the left bank of the Saône, 26 miles W.N.W. of Besançon. It has a townhouse with a fine façade, a church built in the Renaissance style, and other interesting buildings. It is a thriving place, with manufactures of haircloth, starch, &c., boatbuilding, ironworks, and trade in corn, wine, timber, &c. Pop. (1872) 6965.

Gray, Asa, a distinguished savant, born at Paris, New York, U.S., November 18, 1810, studied medicine, was made in 1842 Professor of Natural History in Harvard University, and has become widely known as a botanist. Among his many works are *Elements of Botany* (1836), *Manual of Botany* (1848), *Botany of the U.S. Pacific Exploring Expedition* (1844), &c. He is a part author with Dr. Torrey of the *Flora of N. America*, a book begun in 1838.

Gray, David, was born at Merkland, Dumbartonshire, 29th January 1838, studied at Glasgow University, and in May 1860 removed to London, where symptoms of consumption showed themselves. Sent by his friends (chief among them, Lord Houghton) to Italy, he derived no benefit from the change of climate, and returning to his father's house at Merkland, January 1861, died there, 3d December of the same year. His work, *The Luggie and Other Poems*, abounds in delicate and subtle descriptions of natural scenery, and in melodious and suggestive lines. Had he lived he might have won fame. See *Life and Works of D. G.* (Lond. 1862), and *Poems of D. G.*, edited by Henry Glassford Bell (Glasg. 1874).

Gray, John Edward, naturalist, was born at Walsall in 1800, studied medicine, was made assistant in the natural history department of the British Museum in 1824, and in 1840 keeper of the zoological collections. G. wrote many works on zoology, among which are *Illustrations of Indian Zoology*, *The Knowsley Menagerie*, *Spicilegia Zoologica*, &c. He died 7th March 1875.

Gray, Thomas, a familiar English poet, was born at London, December 26, 1716. He was the son of a money-scrivener, and was educated at Eton and at Cambridge. After travelling through France and Italy with Horace Walpole, he fixed his abode at Cambridge, where he led a secluded, scholarly life, acquiring great stores of learning, slowly polishing and maturing his verses, and corresponding with accomplished friends. He published his *Ode to Eton College* in 1747, his *Elegy Written in a Country Churchyard*—which became at once popular—in 1751, and his *Pindaric Odes* in 1757. He was offered but declined the situation of poet-laureate, and was in 1768 made Professor of Modern History at Cambridge, with a yearly income of £400. G. died at Cambridge, July 30, 1771. His poems, of which the best-known is the *Elegy*, are elaborated with infinite painstaking, and each of them may, as a whole, be considered an original work, though their diction is in a large degree a mosaic of the 'curious felicities' of other poets. They are sometimes overloaded by personification, and are not free from a false glitter and an obvious artificiality, but they glow with splendid epithets and images, and their verse has a peculiar richness and stateliness of rhythm. G.'s letters are among the finest in English literature, models of scholarly grace, refined humour, and exquisite description. See Mason's memoir in his edition of G.'s works (4th ed. 2 vols. 1807), and Mitford's, prefixed to the Aldine edition of G.'s poems.

Gray'ling (*Thymallus vulgaris*), a genus of Teleostean fishes belonging to the family of the salmons (*Salmonidæ*). The mouth and teeth are small, but the dorsal fin is of great length. The

scales are also large. The G. is very local in its distribution, but occurs in many English and some Scotch rivers. It lives in clear water and seems to prefer a gravelly bottom. It attains a weight of 4 to 5 lbs., and its general colour is a silvery grey, the body being distinctly marked by longitudinal streaks of dark colour. The dorsal fin is marked by transverse rows of dark spots, and the abdominal or lateral line is straight. The flesh is very palatable, and is finest in the autumn. The breeding season is in April or May. The G. is caught with trout bait, and rises readily to the fly. An allied species is *T. signifer* of N. American streams.

Grayling.

Gray's Inn is one of the four Inns of Court (q. v.).

Grazale'ma, a town of Spain in the province and 60 miles E.N.E. of the city of Cadiz, and 50 miles N. of Gibraltar. It lies to the E. of the Cerro de S. Cristobal at a height of 3130 feet, and is only approached by a narrow ledge. It has considerable smuggling trade. Pop. 6000. G. has withstood severe sieges.

Grazio'so (Ital.), a term in music meaning 'with graceful expression.'

Grease (Fr. *graisse* from *gras*, 'fat;' Lat. *crassus*, 'gross,' 'fat'), any soft thick unctuous matter of a refuse kind, more especially animal fats which are variable in consistence. G. is extensively used as a lubricant, and in certain processes, as currying leather, is in great demand. Curriers' G. is composed of tallow and cod oil. Cart-wheel G. is a mixture of equal parts of tallow or train oil and common tar. Railway-axle G. is a compound of tallow, palm oil, common soda, and water, the ingredients are mixed by heat and agitated while cooling. The proportions of tallow and palm oil vary in summer and in winter. G. is also the name of a disease which attacks badly cared-for horses in the heels and surrounding parts. See Dick's *Manual of Vet. Science*.

Great Bear Lake. See BEAR LAKE, GREAT.

Great Britain and Ireland, United Kingdom of, the official name given to the British Isles, of which the principal members are Great Britain (comprising England, Wales, and Scotland) and Ireland, and also including 1127 smaller islands. They lie within lat. 49° 13′–60° 49′ N., and long. 1° 45′ E. and 10° 32′ W., are separated from the Continent by the North Sea, the Strait of Dover, and the English Channel, and are bounded N. and W. by the Atlantic. The extreme length of Great Britain, from Dunnet Head to Lizard Point, is 610 miles; of Ireland, from Fair Head to Crow in Kerry, 306 miles; while the entire coast-line has a length of 4300 miles. The archipelago occupies 11½° of lat. and 12¼° of long., and the trapezium formed by the meridians and parallels that pass through its extreme points is 800 miles long and 490 broad, enclosing an area of about 392,000 sq. miles, of which, however, over two-thirds are covered with water. The actual area of the land (exclusive of 2662 sq. miles of lakes and rivers) is 118,946 sq. miles, or rather more than one-thirtieth of the area of Continental Europe. Of the 1127 islands along the coasts, only 224 are inhabited. The chief groups are the Orkneys (320 sq. miles), the Shetlands (615), the Hebrides (3141), Isle of Man (227), Anglesey (192), Scilly Islands (6), the Isle of Wight (156), and the Channel Islands (112). According to the census of April 3, 1871, the populations and areas of the British Isles are as follows:—

	Area in sq. miles.	Pop. (1871).
England and Wales	58,311	22,712,266
Scotland (including islands)	30,463	3,360,018
Ireland (do.)	32,531	5,411,416
The Isle of Man and the Channel Isles	303	144,638
	121,608	31,628,338

The details of areas and populations, of physical geography, climate, geology and mineralogy, botany and agriculture, zoology, and industries of the British Isles are given in separate articles on England and Wales, Scotland, Ireland, Isle of Man, Jersey, Guernsey, &c. The present article confines itself to a sketch of the physical geography, to statistical details for the United Kingdom, and to the history of England and Scotland from the Union in 1707, and of Ireland from the Union in 1801.

Physical Aspect.—The British Isles are based on a submarine plateau issuing from the coasts of Denmark, Germany, the Netherlands, and France. A fall of the sea-level of 180 feet would convert almost the entire southern half of the German Ocean into dry land, while a fall of 240 feet would unite Ireland to Britain. From 20 to 50 miles N. and W. of Ireland, the Shetland Islands, and Hebrides, the depth of the sea increases rapidly. In Great Britain no point is distant more than 75 miles from the sea, in Ireland no point more than 50 miles. The E. coast of Great Britain is only indented by the sand-choked Wash, the Moray Firth, and by the estuaries of a few rivers, as the Thames, Humber, Forth, and Tay. The great inlets in the W. are the Firth of Clyde, the Irish Sea, and Bristol Channel, while Wales and the Scottish Highlands present bold and broken coast-lines. Ireland, almost unindented in the E., has also a wild, rugged western coast, in which the chief openings are the Donegal, Sligo, Clew, Galway, Dingle, and Bantry Bays, and the estuaries of the Shannon and Kenmare. The British Isles, with a mean height of little more than 700 feet, have a great variety of surface. England and Ireland are comparatively flat, the former, however, rising in the Pennine chain and in the Cumbrian and Cambrian groups into veritable mountain heights. Scotland is far more mountainous than either, having a mean height of 800 feet. The Grampians (q. v.) form its chief range, and in the W. culminate in Ben Nevis, the highest point in Britain, with an altitude of 4406 feet. The chief rivers of Great Britain are the Thames (201 miles long), Severn (186), Humber (185), Shannon (160), Ouse (143), Suir (114), Tay (103), and Tweed (96). The rivers of Great Britain, though small compared with those of the Continent, are all abundantly supplied with water throughout the year, and are of great industrial and commercial importance.

Commerce.—Great Britain holds the first rank among the commercial nations of the world for both home and foreign trade. It possesses some 57 per cent. of all steam-vessels, 37 per cent. of all sailing vessels, and not only carries out the exchange of its own immense industrial products for the raw material of other countries, but acts extensively as foreign agent and carrier for the Continental markets. An analysis of the imports shows them to consist of over 40 per cent. of breadstuffs, condiments, and stimulants, about an equal amount of raw material for industrial purposes, and only 9 per cent. of manufactured goods. Of the exports, on the other hand, manufactured goods constitute 82 per cent. of the whole. The following returns are exclusive of the movement of bullion and specie, and also of the merchandise trans-shipped in British ports (amounting in 1875 to £12,137,064):—

	Imports.	Exports.
1854	£152,389,053	£115,821,092
1860	210,530,873	164,521,351
1865	271,072,285	165,835,725
1870	303,257,493	199,586,822
1873	371,287,372	255,164,603
1874	370,082,701	239,558,121
1875	373,939,577	223,465,963

The imports are, in order of importance, mainly from the United States, France, India, Russia, Germany, Egypt, Australasia, Belgium, Holland, the Dominion of Canada, Sweden, and Norway, China, and Spain; the exports of home produce are chiefly to the United States, Germany, India, Australasia, France, and the Netherlands. In 1874 the value of several of the principal imports was as follows:—Raw cotton, £50,696,496; corn and flour, £51,070,202; sugar (raw and refined), £20,009,730; wool, £21,116,184; timber, £21,968,138; tea, £11,532,896; coffee, £7,103,000; silk, £15,713,000; metal ores, £11,109,000; spirits, £2,612,000; wines, £6,868,000. The exports (1874) comprise—Cotton manufactures and yarn, £74,247,615; woollens and worsted goods, £28,359,512; linens, £8,832,533; silks, £3,130,000; haberdashery and millinery wares, £9,328,000; earthenware

and glass, £3,152,000; iron and steel, £31,190,256; coals, £11,954; hardware, £4,413,000; machinery, £9,790,914; leather and leather wares, £3,547,000; beer and ale, £2,451,000; soda, £2,602,000; books and stationery, £1,587,000, &c. The declared value of gold bullion and specie imported, mainly from Australia, Mexico, S. America, the W. Indies, and the United States, in 1875, was £23,140,834; of silver, £10,123,955; of gold exported, £18,648,296; of silver, £8,979,746. There are neither export nor protective duties; customs levied on imports from abroad are balanced by articles manufactured within the kingdom being made to bear corresponding excise or stamp duties. The tariff, which is exceedingly simple, includes (since the expiry of the sugar-duties in 1874) but four great articles of customs' produce, namely, spirits, tea, wine, and tobacco. In 1874 the gross receipts of customs amounted in England and Wales to £15,475,043, in Scotland to £1,666,215, and in Ireland to £1,752,736.

The British *mercantile marine* in the home and foreign trade in 1800 comprised 15,724 vessels, of 1,698,515 tons; in 1845, 23,472 vessels, of 3,004,398 tons; in 1860, 27,663 vessels, of 5,758,687 tons; and in 1876, 25,461 vessels, of 6,152,000 tons. There has been a decrease in the number of sailing vessels, and no great increase in the tonnage since 1860, but the number of steamers has risen from 997 to 2970; while their tonnage has advanced from 441,184 to 1,847,188. In 1876 the equipment extended to 199,667 men. The total tonnage of the vessels in the foreign trade that entered British ports was, in 1875, 22,693,163, of which 7,502,172 was foreign; cleared, 23,583,675, of which 7,829,922 was foreign. The coast trade is represented by 22,944,265 tons, all but 138,541 tons being in British ships. Adding to the registered fleet of Great Britain its colonial marine (in 1876, 11,675 vessels, of 1,592,000 tons), there is under the British flag a total of over 37,136 vessels, of 7,744,000 tons. In 1875 there were 923 vessels of 420,551 tons (357 steamers of 178,905 tons) built in the United Kingdom. The British Isles are encircled by a ring of 360 shore-lights and 50 lightships, under the direction of the Trinity Board, and of Scottish and Irish boards. There are also 250 lifeboat stations supported by public charity and managed by a private association.

Railways, &c.—From 1825, the date of the opening of the first railway, to 1850, Great Britain constructed 6621 miles of line; at the end of 1860 there were 10,433 miles open for traffic; in 1876, 16,664. The railways are entirely the property of private companies. In 1875 the total amount of paid-up capital was £630,226,942; of traffic receipts, £58,977,518; and the number of passengers 507,532,187. The amount invested (1874) in railway stock in England and Wales was £508,720,097; in Scotland, £71,327,140; and in Ireland, £29,902,682; while of traffic receipts (1875), England and Wales contributed £49,766,684; Scotland, £6,577,731; and Ireland, £2,633,103. The railway lines in the British colonies have a total length (1875) of 12,158 miles. In 1870 the telegraph lines were taken over by the State, and in 1874 the total length of wires was 107,000 miles, of which 5487 were rented by private persons. The revenue has increased from £697,933 in 1871 to £1,120,000 in 1875; the expenditure was £1,083,275 in the latter year. The post-office in 1875 transmitted 1,009,000,000 letters, 280,000,000 newspapers and book-packets, and 16,485,661 money orders to the aggregate value of £26,493,090. The savings' banks of the post-office, with a capital of £25,187,345, received £9,355,436, of an average deposit of £2, 14s. 10d. The life insurance and annuity department granted 278 insurance policies, amounting to £21,622; 1,814 immediate annuities of £12,259 value, and 53 deferred annuities of £992. The gross revenue of the post-office (1874) was £5,751,600, and the expenditure £3,009,588. Since the introduction of penny postage in 1840 the revenue has quintupled, while there is more than a tenfold increase of the correspondence.

Finance.—The actual revenue of Great Britain for the year ending 31st March 1876 was £77,131,693, and the expenditure £76,621,773. The yearly returns have varied little for upwards of twenty years. In 1876 the sources of revenue were—Customs £20,196,691, excise £27,569,323, stamps £11,023,374, land-tax and house duty £2,440,000, property and income tax £4,306,000, post-office £5,670,000, telegraph service £1,120,000, &c. The items of expenditure were—Interest on and 'management' of national debt £27,094,479, civil list and civil charges £1,583,589, army £14,519,433, army purchase commission £579,114, navy £10,680,404, civil service £11,974,127, customs and inland revenue £2,694,908, post-office £2,911,917, telegraph service £1,193,065, packet service £972,000, localisation of the military forces £200,000, purchase of Suez Canal shares £76,566. The annual value of property and profits on which the income-tax is assessed amounts (1874) to £543,025,761. At 31st March 1876 the national debt (see DEBT, NATIONAL) was £776,970,544, of which £713,657,517 was consolidated, and £10,701,800 unconsolidated, and £51,911,227 of terminable annuities. The balance in the Exchequer (1875) was £6,265,322. By an Act of 1875 the national debt is to be reduced by a new permanent Sinking Fund (q. v.) maintained by annual votes of the Legislature. The charge of the sinking fund, to be entered under the consolidated fund, was fixed for 1875-76 at £27,400,000, for 1876-77 at £27,700,000, and for every subsequent year at £28,000,000. In 1875 there was coined at the Royal Mint £243,264 of gold, £594,000 of silver, £69,813 of copper. See BANKING.

Army and Navy.—See BRITISH ARMY and BRITISH NAVY.

Constitution and Government.—The government of Great Britain is a constitutional monarchy, in which the sovereign alone represents the supreme executive, and the sovereign jointly with Parliament (q. v.) the supreme legislative power. There are three estates of the realm—the Lords Temporal, the Lords Spiritual, and the Commons. The Act of Settlement secures the succession in either male or female line of the family of Brunswick. Since the time of Edward I. the heir-apparent has borne the title of Prince of Wales. The civil list granted to the Queen amounts to £363,760 a year, in addition to the revenue of the Duchy of Lancaster (£37,000); the various members of the royal family receive separate revenues and annuities. Parliament comprises the sovereign, the House of Lords, and the House of Commons. An Act, to obtain the force of law, requires to be passed by all three. The customary session of Parliament extends over six months of the year. (See CONSTITUTION, PRIVY COUNCIL, CABINET MINISTRY.) The sovereign nominates to the orders of chivalry, chief of which are those of the Garter, Thistle, St. Patrick, Star of India, the Bath, St. Michael, and St. George (the Maltese cross). Valorous conduct in the field is rewarded by the Victoria cross.

Administration of Justice.—The judicial system of Britain comprises Courts of Common Law (q. v.) and Courts of Equity (q. v.). The former include the Courts of Queen's Bench, of Common Pleas, of Exchequer, of Probate and Divorce and Matrimonial Causes; the latter those of the Lord Chancellor, of the Lords Justices of Appeal, of the Master of the Rolls, of the three Vice-Chancellors, and of Appeal in Chancery of the County Palatine of Lancaster. The new Court of Judicature (q. v.) of 1873-75 combines these in a 'High Court of Justice,' from which an appeal lies to the newly constituted 'Court of Appeal.' The House of Lords and Judicial Committee of the Privy Council retain their appellate jurisdiction in Scotch, Irish, colonial, ecclesiastical, and admiralty cases. There are also Courts of Bankruptcy, three Ecclesiastical Courts, the Lord Mayor's Court, the Sheriffs' Courts, and sixty County Courts. Inferior jurisdiction is in the hands of justices of the peace in petty and quarter sessions, and of stipendiary magistrates in larger towns. Together with the Lord Chancellor and Lord Chief-Justice there are forty-six superior judges in England. In Great Britain the number of salaried judges is 450, and their joint salaries £550,000. (See JUDGES.) In Scotland the Court of Session (q. v.) is supreme in civil cases, the Court of Justiciary in criminal cases. In Ireland the system resembles that of England, with the special feature of a Landed Estates Court. The sessions of justices of peace are presided over by a salaried barrister. In 1874 the number of offenders convicted in England and Wales was 10,954, in Scotland 2143, in Ireland 2484. The police (in England and Wales 28,550, Scotland 3200, Ireland 12,000) are maintained by local rates. But in the metropolis the police (except those of the city) depend on the Home Secretary.

Education.—Great Britain possesses a national system of primary education. By the Public Elementary Education Act of 1870 the various 'educational districts' of England are provided with schools supported by local rates, fees, and parliamentary grants, and are placed under the control of popularly elected 'school boards,' invested with the power of compelling the attendance of all children between the age of five and thirteen. Children may be admitted free, and the schools are open to

Government inspection at all times. In England and Wales the number of day-schools inspected (1874) was 12,167; of pupils in average attendance, 1,678,759; of teachers, 51,216. The Government grants amounted to £1,050,259, In Scotland the number of day-schools inspected (1875) was 2329; of pupils in average attendance, 233,130; of teachers, 7606. The Government grants amounted to £134,053. In Ireland the primary schools have been under the management of the Commissioners of National Education since 1833, and are professedly based on the principle of the separation of religious from secular instruction. In 1871 the number of schools was 6914, and of pupils 1,021,700, while the grant amounted to £408,388. According to the returns of 1871, 15·7 of the whole population attend school, namely, 16·3 in England, 17·1 in Scotland, and 12·1 in Ireland. In England the most famous schools for higher-class education are Eton, Rugby, Westminster, Harrow, Charterhouse, Winchester, Cheltenham, Marlborough, and Clifton; in Scotland, the High School of Edinburgh, the Edinburgh Academy, and the Aberdeen Grammar-School. The great universities are those of Oxford (q. v.) and Cambridge (q. v.) for England; Edinburgh (q. v.), Glasgow (q. v.), Aberdeen (q. v.), and St. Andrews for Scotland; and the Trinity College or Dublin University (q. v.) and Queen's University for Ireland. The last of these, like the London University, is strictly a mere examining board, and has three affiliated colleges—Belfast, Cork, and Galway. There are many medical schools in connection with the leading hospitals. Besides the great national institutions above mentioned, the Nonconformist communions have important colleges of their own. There are colleges of physical science, as Owen's College, Manchester (to which, however, a literary faculty is attached), and Bristol College (1876); military schools, as Sandhurst, Woolwich, &c.; various Dissenting Church colleges; schools of art and design. Other of the higher educational institutions are the Royal Society, Royal Geographical Society, the Royal Academy, the British Museum (q. v.), South Kensington Museum, the National Art Gallery, the Royal Academy of Music, the recently established National School of Music, &c.

Religion.—The Established Church of England and Wales is Episcopal, of Scotland Presbyterian; that of Ireland was a branch of the English Episcopal Church till its disestablishment in 1871. It is impossible to obtain trustworthy statistics regarding the numbers belonging to the different ecclesiastical communions. The *Almanach de Gotha* (1877), from calculations based on those of Ravenstein (*Denominational Statistics of England and Wales*, Lond. 1870), arrives at the following result; but as regards the Church of England it seems a gross exaggeration, 13,000,000 being probably nearer the mark, leaving 4,780,000 more to be distributed among the other Nonconformist communions:—

ENGLAND.	
Church of England	17,781,000
Protestant Dissenters	3,971,000
Roman Catholics	1,058,000
Jews	39,000
SCOTLAND.	
Church of Scotland	1,473,000
Presbyterian Dissenters (Free, U.P., &c.)	1,486,000
Anglicans	73,200
Roman Catholics	320,000
Jews	6,400
IRELAND (Census 1871).	
Roman Catholics	4,150,867
Anglicans	667,079
Presbyterians	497,648
Methodists	43,441

The Established Churches of England and Scotland are in possession of valuable endowments; the others, several of which have accumulated large funds, depend on voluntary contributions. According to the census of 1871, the number of Protestant ministers in England and Wales was 29,958, in Scotland 4105, in Ireland 3243; of missionaries, scripture readers, &c., in England and Wales 3261, in Scotland 252, in Ireland 24; of Roman Catholic priests and monks in England 1620, in Scotland 224, in Ireland 3505; of nuns in England and Wales 2474, in Scotland 243, in Ireland 3719.

Colonies.—The colonies and dependencies of Great Britain embrace nearly a seventh of the land surface of the earth, and fully a seventh of its inhabitants. In 1875 the various colonial possessions were grouped into thirty-nine administrative divisions, of which several embraced formerly separate colonies. The following table gives the colonies and possessions with areas and populations, according to the *Almanach de Gotha* for 1877:—

	Area in sq. miles.	Pop. 1869–76.
British India	905,046	190,840,848
Ceylon	24,454	2,418,741
Straits Settlement	1,206	308,097
Keeling Islands, Aden, Perim Labuan, Hong-Kong	96	156,996
Australia	2,967,500	1,117,929
Tasmania	26,215	104,176
New Zealand	104,272	211,146
Chatham and Norfolk Islands	630	661
Fiji Islands	8,033	142,150
Dominion of Canada	3,483,952	3,602,321
Newfoundland	40,200	161,386
Bermuda	40	15,309
W. India Islands	13,754	1,063,886
Honduras	13,500	24,710
British Guiana	85,425	215,200
Falkland Islands	4,741	933
Cape Colony (including Kaffraria since June 1876)	214,914	746,461
Bassuto Land	8,450	75,000
Griqua Land (West)	16,632	25,477
Natal	18,750	307,241
West African Settlements	17,115	633,417
Mauritius (and dependencies)	1,088	352,762
St. Helena	47	6,241
Ascension	34	27
Tristan da Cunha	45	85
Gibraltar	2	25,143
Malta	142	145,604
Nicobar Islands	725	5,000
Andaman Islands	2,551	13,500
Laccadives	744	6,800
Kuria Muria Islands	21	
Kamaran	64	500
Auckland Isle	196	
Lord Howe Isle	3	37
Fanning Malden Starbuck and Caroline	46	150
New Amsterdam	25	
	7,960,658	202,727,934

The cost of the colonies, which has long been gradually declining, scarcely now amounts to two millions sterling, of which more than one half goes to maintain nine of the possessions, classed as general military and naval stations—Gibraltar, Malta, Cape Colony, Mauritius, Bermuda, St. Helena, Heligoland, Falkland Islands, and Hong-Kong. In 1875 the total effective strength of the British army in the colonies, exclusive of India (q. v.), was 23,063 rank and file.

History.—After the union of the English and Scottish Parliaments was effected, May 1, 1707, the two nations were together designated the United Kingdom of Great Britain. Discontent with the Act of Union lingered for some time in Scotland, but the measure, fruitful as it has been in good results, did not lead to an immediate change in the home or foreign policy. During the latter part of Anne's reign Bolingbroke and Harley, the leaders of the Tories, who were then in power, schemed incessantly to secure the succession for the Pretender, but these intrigues were ruined by the Queen's sudden death in 1714, when the Elector George of Hanover, a descendant through his mother of Elizabeth, daughter of James I., became king as George I. (1714–17). The two chief consequences of the Guelphic accession were, first, that the power of the crown was reduced in the reigns of George I. and George II. to sheer insignificance, the country being then ruled by a Whig oligarchy, who advocated constitutional principles, and jealously narrowed the royal power, now divorced from its old allies the Tories; second, that the Tories through their Jacobite leanings became alienated from the mass of the nation, hostile to the new dynasty, and identified with rebelliousness and disorder. The most notable events of George I.'s reign were the overthrow of a Jacobite revolt in 1715, the forming of the Quadruple Alliance in 1718, the collapse of the South Sea scheme in 1720, and the beginning of Walpole's Ministry in 1721. During the reign of George II. (1727–60) the government was prudently administered by Walpole, who controlled Parliament by a system of general bribery, and skilfully fostered commerce and averted war until 1739, when he was forced into an inglorious struggle with Spain. In 1742 Walpole was ousted from office because he opposed

England's engaging in the Austrian War of Succession (q. v.). In that struggle the English won the battle of Dettingen (1743), but were beaten at Fontenoy (1745), and at the close of the contest in 1748 Great Britain and France remained on the same political footing as before the war. The revolt of the Highland clans to restore Prince Charles Edward Stuart, which broke out in 1745, was completely crushed at Culloden in 1746. During the Seven Years' War (q. v.) Great Britain took part with Prussia, and though the British arms were unsuccessful on the Continent, the Duke of Cumberland surrendering in Hanover with 40,000 men, in the progress of the struggle Wolfe added Canada to the British Empire, and Clive swept the French almost out of India. The war was still going on at the accession of George III. (1760–1820). A great change now affected British politics. The Whigs, after their triumphant defence of the Revolution settlement against Jacobites at home and Louis XIV. abroad, had lost their old patriotism and unity, and were mainly occupied in scuffling for places; the Tories, formerly the opponents of the Guelphs, now flung aside their Jacobitism and allied themselves against the Whigs with the King, who was obstinately bent on winning a despotic control over the nation. Instead of politics being a mere strife of factions and aristocratic cabals, weighty differences began to distinguish the rival parties, and the questions whether the King or Parliament should be the chief seat of government, whether the popular or despotic theory of the constitution should prevail, whether the Ministry should be a united body, plastic to the nation's will and pursuing a harmonious line of policy, or whether each Minister should be merely a royal official responsible only to the King, were first seen in this reign to underlie the chronic faction fights, combinations, and squabbles of the country's rulers. Outside of politics and foreign wars, the reign of George III. was marked by a great Christian revival—notably by the Wesleyan movement—by great scientific and speculative progress, by great industrial inventions and improvements, Brindley beginning the Grand Trunk Canal, Wedgewood establishing his potteries, Hargreaves inventing the spinning-jenny, Watt the steam-engine, and Crompton the 'mule' between 1761 and 1776. George III., in his efforts after fresh monarchical power, placed himself in serious opposition to the country. Bute, his first Minister, by shameless bribery and 'borough-jobbing,' made Parliament for a time the tool of the royal will, but was forced by popular indignation to resign in 1763. His successor, Grenville, kindled a violent excitement by his arbitrary prosecution of Wilkes (q. v.); and the Ministry of Lord North, by seeking to impose unjust duties on the American colonies, stirred up the war of American Independence (1774–83), which led to the formation of the United States. On the break-up of the Coalition Ministry—which was formed by a union of Fox's with North's followers—Pitt became Prime Minister in 1783. Supported by a great Tory majority, and backed by the royal favour, Pitt at first devoted himself to economical and financial measures, but in 1793 he declared a groundless war against the French Republic, which plunged his country in debt and disaster. Napoleon was at first universally victorious by land, and Great Britain was left without an ally to face a powerful European coalition, with her trade crippled by the exclusion of her merchandise from Continental ports, though she remained irresistible by sea. At length fortune changed, Napoleon (q. v.) failed in his Russian expedition; various states began to join against him, and he was finally crushed at Waterloo (1815). These long wars were a terrible source of suffering to the English poor, and at the end of the struggle the popular discontent was embittered by a series of bad harvests and the stagnation of trade, while the corn laws kept the price of corn up to the war rates. The democratic movement that arose at the end of the War of Independence, that gained new force at the beginning of the French outbreak against feudalism, and that was almost extinguished in England through the reaction caused by the excesses of the French revolutionaries, burst forth irresistibly shortly after 1815. In France the reaction against democracy was aided by the association of French democracy with atheism; while in England the democratic cause was strengthened by the great Evangelical movement, which was mainly confined to the Dissenters, who were mostly Radicals in politics. In the reign of George IV. (1820–30) reform slowly began. Canning and Huskisson introduced excellent commercial measures, trade revived, and in 1829 Catholic Emancipation was passed. Under William IV. (1830–37) the Whigs were restored to office, from which they had been excluded for above fifty years. They carried the Reform Bill in 1832 (see REFORM), enacted the abolition of slavery in 1833, improved the state of the poor-laws, and in 1834 founded a system of national education in Ireland. Queen Victoria ascended the throne in 1837, and the Whigs were displaced by the Ministry of Sir Robert Peel in 1841. But the principles of free trade advocated by numerous speakers throughout the country, and especially by Cobden and Bright, produced such excitement that in 1846 the corn laws were repealed. Numbers of the working classes about this time banded together as Chartists (q. v.), but the Chartist agitation, which brought Great Britain to the brink of revolution, was suppressed in 1848. In 1852 the Tories regained office but had to retire within a year, and the next Ministry, Lord Aberdeen's, gave way to Lord Palmerston's in 1855. In 1854 Great Britain entered into an alliance with France in defence of Turkey against Russia, and the Crimean war, which began in the same year, was ended by the taking of Sebastopol in 1855. The Indian Mutiny which burst forth in 1857 was stringently and heroically suppressed, and in 1858 the government of India was transferred from the East India Company to the Queen, who in 1876 took the title of Empress of India. Except for a short interval in 1858 when Lord Derby was Prime Minister, Lord Palmerston held office from 1855 to 1865, pursuing a policy of inaction at home and non-intervention abroad. His successor, Lord Russell, resigned office in 1866 on his Reform Bill being flung out, but the Tory Government which followed with Lord Derby as Prime Minister passed a more sweeping measure. The new constituencies returning a Liberal majority of over 100, the Tories retired and Mr. Gladstone became head of the Government. A succession of measures, some great, and all drastic, followed—the disestablishment and disendowment of the Protestant Church of Ireland in 1869, and the legalising of tenant-right in Ireland by the Land Bill of 1870, the abolition of compulsory church rates in 1868, and of religious tests for admission to offices and degrees in the English universities in 1871. A bill for securing national education was also passed in 1870. Purchase was abolished in the army and the Ballot Bill was passed in 1871. But incessant changes created a deep feeling of distrust; and in 1874, when Mr. Gladstone dissolved Parliament, a Tory majority of fifty was returned, and Mr. Disraeli again became Prime Minister. But the foreign policy pursued by the Tory Government, more especially its support of the Turkish despotism in Europe, brought about a revulsion of public sentiment, to which the eloquence of Mr. Gladstone immensely contributed, and in 1880 the Liberals were returned to power by a larger majority than they had ever obtained since the Great Reform Bill of 1832. Mr. Gladstone was again called to fill the office of Prime Minister. See Stanhope's *History of England from the Peace of Utrecht to the Peace of Versailles*, Macaulay's *Essays*, Massey's *History of England from the Accession of George III.*, Alison's *History of Europe*, Napier's *History of the Peninsular War*, Molesworth's *History of England*, &c.

Great Britain, Royal Arms of. The royal heraldry of England dates from about the middle of the 12th c.; the arms ascribed to kings of an earlier date, whether English or Norman, are not authentic. The shields of the Plantagenets (1154–1340)

bore gules, three lions passant gardant, in pale, or. In 1340 the royal arms of the French kings were introduced into the English shield by Edward III. Henry VI., Edward IV., Richard III., and the Tudor sovereigns Henry VII., Henry VIII., Edward VI., Mary, and Elizabeth all bore the same arms, viz., quarterly 1 and 4 *France, modern* (*i.e.*, bearing three fleurs-de-lis only);

2 and 3 *England*. Elizabeth, however, sometimes bore *Ireland*. James I. incorporated the arms of Scotland (*or, a lion rampant gu.*), and those of Ireland (*azure*, a harp *or*, stringed *argent*). William III. introduced in pretence his paternal arms of Nassau; Mary his queen bore the Stuart shield with the royal arms impaled. After the accession of George I., the royal shield was blazoned—quarterly—1 England impaling Scotland, 2 France, 3 Ireland, 4 Hanover. The French fleur-de-lis were removed from the arms of England 1st January 1801. The kingdom of Hanover passed from the sovereign of Great Britain on the accession of her Majesty Queen Victoria, when the Hanoverian escutcheon was removed from the royal shield, which now bears only the insignia of the realms of the United Kingdom—England 1 and 4, Scotland 2, and Ireland 3.

Great Circle Sailing. The shortest distance between any two points on a sphere lies along the great circle which passes through these points, *i.e.*, the circle whose centre coincides with the centre of the sphere. In the art of navigation, therefore, it becomes a question of practical value to be able to sail along a great circle in passing from one position to another. The difficulty in doing this will be evident when it is considered that any great circle (excluding the equator and the meridians) cuts successive parallels and meridians at varying angles, so that a vessel in pursuing the theoretically shortest course must be continually altering its direction of motion. In practice G. C. S. can only be effected by approximation. The great circle connecting the two stations is first laid down on the chart; and along this line convenient points are chosen, sufficiently near so as to render the straight line joining any successive two nowhere much deviating from the corresponding portion of the great circle. The vessel then makes for each point in succession, following the direction represented on the map. See NAVIGATION.

Great Fish River, an unnavigable stream in British America, has a course of about 500 miles, and flows into Cockburn Bay, an inlet of the Arctic Ocean, its mouth being in lat. 67° 8′ N., long. 94° 40′ W.—**G. F. R.** is also the name of a river of Cape Colony, which rises in the Snowy Mountains, and enters the Indian Ocean after a course of 231 miles.

Great Kanawha River, a river of W. Virginia, U.S., formed by the confluence of the Gauley and the New rivers, which, after a course of 100 miles through a picturesque and fertile region, joins the Ohio at Point Pleasant. It is a narrow rapid stream, navigable for small vessels for 98 miles to the Falls, which are of about 50 feet.

Great Marlow (orig. *Merelow*, 'the hill by the marsh'), a market-town of Buckinghamshire, England, 29 miles N.W. of London by rail. It stands in a hollow near the Thames, which is here crossed by a suspension bridge of 225 feet span. G. has paper, copper, rope, and wire works, and a trade in corn, timber, and hops. The parish church had a fine chancel added in 1875. G. M. sends one member to Parliament. Pop. (1871) 6627.

Great Salt Lake, a sheet of water in the N. of Utah, U.S., 70 miles long, 45 broad, 4250 feet above the sea, with an average depth of 12 and a maximum of 66 feet. Its coasts are wild and rugged, and it is studded with many rocky islands, of which Antelope Island, 15 miles long, is the largest. It receives the Blue River, Weber, Jordan, and other streams, but has no outlet. It contains 20·196 per cent. of common salt, and a slight percentage of other salts. Its specific gravity, 1·170, is almost that of the Dead Sea. Steamers ply upon it between Corinne and Black Rock. The G. S. L. was first explored by Colonel Fremont in 1843, and first thoroughly surveyed by Captain Stansbury, U.S. Navy, in 1849-50.

Great Seal. The office of Lord Chancellor is conferred by the sovereign delivering the G. S. to him who is to hold the office, the sovereign addressing him by the title which he is to bear. The G. S. is held to be the emblem of sovereignty—the *clavis regni*—the only instrument by which, on solemn occasions, the will of the sovereign can be expressed. Faith is universally given to every document purporting to be under the G. S., as having been duly sealed with it by the authority of the sovereign. When in a new reign, or on a change of the royal arms or style, an order is made by the sovereign in council for using a new G. S., the old one is publicly broken. The ceremony of publicly breaking the seal consists in the sovereign giving it a gentle blow with a hammer, after which it is supposed to be broken, when, according to Lord Campbell (*Lives of the Lord Chancellors*, vol. i. p. 261), it has lost its virtue, and becomes the perquisite of the Lord Chancellor for the time being. At the union of England and Scotland a G. S. for the United Kingdom became necessary for public Acts and instruments. But this G. S. not being appropriate for those private grants which had formerly passed the G. S. of Scotland, by article 24 of the Treaty of Union a G. S. for sealing private grants in Scotland was ordered to be made, and declared to have the same effect with the ancient G. S. of Scotland.

Great Slave Lake, one of the largest of that chain of lakes which extend in a N.W. direction through the Dominion of Canada from the United States frontier almost to the shores of the Arctic Ocean. It is, next to the Great Bear Lake, the most northernly of the chain; lies in lat. 60° 40′-63° N., long. 109° 30′-117° 30′ W.; is irregular in shape, about 300 miles in length, with a breadth, at its greatest, of 50 miles. It has numerous islands, some of which are covered with wood; its northern shores are steep, and it is frozen for half the year. G. S. L. receives the waters of Lake Athabasca by the Great Slave River, and discharges its own by the Mackenzie.

Great Wall of China. See CHINESE EMPIRE.

Greaves (Old Fr. *grèves*, Span. and Port. *grevas*, from Lat. *gravis*, 'heavy;' Low Lat. name *bainbergæ*, from Ger. *beinbergen*, 'leg-coverers'), armour for the legs, made of metal in classical times. Homer's Greeks are always 'well-greaved,' and examples of G. found at Pompeii are in metal richly ornamented. In the middle ages they were frequently made of leather.

Grebe (*Podiceps*), a genus of Natatorial or swimming birds, having the toes provided with very broad flaps or lobes of skin, the hinder toe being rudimentary. The nostrils are in a short groove, the tail is very short, and the first quill is the longest. The feet are not webbed; the lobed appearance is produced by the web being divided into a portion for each toe. In swimming, and during the forward or ineffective stroke of the foot, the lobes allow the water to pass freely between them, but during the backward stroke they expand and oppose a firm surface to the water. When at rest, the G. sits in an erect position like the penguins and puffins, the legs being extremely short. The great crested G. (*P. cristatus*) is a familiar example of the genus. It occurs in the fen districts of England, and swims and dives with great ease. Its food consists of fish. The head is brown, and the cheeks, which are provided with expanded feathers, are of reddish-chestnut colour. The neck and upper parts are dark brown, and the under surface is white, glossed with a peculiar satin-like lustre. The average length is 22 inches. The eared G. (*P. auritus*) possesses tufts of golden feathers behind each eye, and attains a length of 12 inches. The head and neck are black, the back dark brown, and the under parts white. The horned G. (*P. cornutus*) has a tuft of dark-brown feathers, and is noted for its habit of diving when alarmed, with the young borne on its back. The dabchick or little G. (*P. minor*) is the most common British species, and measures about 9 inches in length. Its colour is dark brown above, and greyish white below. The nest is made of water-plants, and is scarcely raised above the surface of the ground. The eggs are white, and number six. The skin of the G. is much used for making muffs, and for bordering cloaks and fur garments.

Crested Grebe.

Grecian Architecture, universally recognised as the highest, most complete form of structural invention and expression as yet developed, was itself, in a measure, a development out of the earlier architectural systems of Egypt and Assyria. It is now generally acknowledged that nearly every idea and every architectural feature of the renowned works that crowned the Acropolis were derived from already ancient structures in Asia Minor and on the banks of the Nile. Yet the Greek temple was as distinctively a *creation* as is a Shakespearian play, and owed no more to the Egyptian temples or Assyrian palaces than did *Romeo and Juliet* to the old Italian tales. Wherever the original types of the various architectural elements of the Par-

thenon were gathered, that work, as one complete and perfect whole—a distinctive conception faultlessly realised—was essentially the creation of native Hellenic genius. The earliest architectural remains of Greece are ascribed to the 'Pelasgians'—a name that expresses nothing beyond vague tradition or pure ignorance. Among these are the Treasury or tomb of Atreus at Mycenæ, a city of Homeric times. The tomb is an immense horizontal pointed arch, enclosing a chamber 48 feet 6 inches in diameter. At the doorway of the tomb were the fragments of two pillars richly covered with sculptured ornamentation, purely *Asiatic*, or rather Persepolitan in character. Other so-called 'Pelasgic' remains are a pointed arched gateway at Thoricus in Attica, an exact counterpart of which exists at Assos in Asia Minor; an arched roof at Delos formed by placing two large stones together at a certain angle; a wall in the Peloponnesus, the lower courses of which are in excellent *ashlar* work, while above the masonry is irregular or 'Cyclopean;' and the Gate of Lions, the principal gate of the Acropolis of Mycenæ, which has been said to stand to the art of Greece somewhat in the same relation as the *Iliad* to her literature. These remains, the antiquity of which ranges beyond the historic into the heroic age, clearly attest the intimate connection which subsisted between Greece and Asia long before the age of Homer.

But though so ancient, these extraordinary ruins, especially the tomb and gateway of Mycenæ, show wonderful knowledge and constructional skill, and like all Asiatic art are remarkable for elegance of form and rich ornamentation. But a new influence which had long been at work in the ancient country, and which was now to become paramount, completely altered the character of the primitive architecture of Greece. When the supremacy of the pre-Hellenic tribes came to a close, and the Hellenes began to appear as the dominant element in Greece late in the 8th c. B.C., then the ingenious and ornate Asiatic art gave way before the graver genius of the Hellenic nation. The earliest known example of this new G. A. is the Doric temple of Corinth, of about the middle of the 7th c. B.C., in the construction of which anterior tradition seems to have been abandoned, and the Hellenes sought their model in the massive temples of Egypt. It is asserted by Falkener (*Museum of Classical Antiquities*) that already twenty-seven proto-Doric columns are enumerated as still existing in eight different buildings, ranging from the Third Cataract to Lower Egypt. It is hardly questioned now, however, that the Greeks borrowed their idea of the Doric order from the rock-cut temple of Beni-Hassan (Lower Egypt), which is known to have been in existence a thousand years before the erection of the temple at Corinth. The 'Proto-Doric pillar of Beni-Hassan,' as it has been called, was a very short, massive, fluted column. Those of the Doric temple at Corinth were equally primitive and massive. Their diameter was 5 feet 10 inches, and their height was less than four diameters, or under 23 feet. The architrave—the only part of the superstructure still existing—was proportionately heavy. The next known and notable work of G. A. was the small temple of Ægina (94 feet by 45), supposed to have been erected in the middle of the 6th c. B.C. Other contemporary temples, of which, however, little is known, are supposed to have existed in all the considerable cities of Greece. These were all destroyed during or immediately after the Persian war, and in the exultation of the Greeks after the famous victories of Salamis and Platæa, new temples were erected to the gods that had fought with them against the Persian. The consequence was that a great building era set in in Greece, so that within forty or fifty years after the defeat of Xerxes and the destruction of his thousand ships, nearly all the great temples now found in Greece were built, including the Parthenon, the most beautiful building of its class in the world.

The character of G. A., however subtle in its refinements and minute and complex from the technical point of view, is simple in itself. Its essential element is the pillar and beam—the column and entablature. (See COLUMN, ENTABLATURE, ARCHITRAVE, CORNICE, FRIEZE, CAPITAL, PEDIMENT, &c.) The column and entablature taken together form what is called the order of an architectural style. There are three styles in G. A., the Doric, Ionic, and Corinthian, the difference of the orders of which consists in the different proportional relations between the column and the superincumbent entablature. Before noting the special features of the three orders, a few words may be said about the character and the forms of temples. In the earliest ages of Greece trees were often selected by devotees as the dwelling-places of their gods, and mountains, as Parnassus, Olympus, &c., were regarded as their favourite seats. The simplest Grecian temples were small square *cells*, in which the image was placed. The name cell remained, for however large and splendid the temple might become, the interior enclosure in which stood the image of the divinity was still called the cell or cella. Afterwards the square apartment was divided into two—the cell and the porch or doorway. The fronts of these small temples were *distyle in antis*, that is, they consisted of two pillars between *antæ* or square piers, which terminated the flat side-walls. As the temple was enlarged, the number of the pillars of the front increased, and the step from the picturesque hexastyle (six-pillar) front to a peristyle temple (one surrounded by pillars on all its four sides) was an easy and natural one. As the Greek temple was usually twice as long as it was wide, the number of pillars extending along each side of a hexastyle structure was usually either thirteen or fifteen. In such a temple an inner range of pillars usually surrounded the *cella*, which was thus a temple in itself, and which, curiously enough, occupied a position near the back of the temple similar to that occupied by the altar in Christian churches. The plan of the Parthenon was somewhat peculiar. Its porticoes were octostyle (eight-pillared), with seventeen pillars in all down each side, but there was an inner hexastyle portico at each end of the cell. These temples were lighted from the roof by an ingenious contrivance which, while admitting light, excluded rain.

The Doric order is readily recognised by the short, massive, fluted column, without base, and with a plain capital composed merely of the echinus and Abacus (q. v.), and by the simple ornamentation of the frieze, in which the joints of the primitive wooden structure which preceded the classic temple are represented by tablets carved with two vertical grooves or glyphs in the centre and two half grooves at the sides. These tablets are called *triglyphs*. The plain spaces between them are named *metopes*. The distinguishing mark of the Ionic order is a longer and more slender column, the capital of which is ornamented with volutes or scrolls. The Corinthian order is remarkable for its very slender column, with capital richly carved in acanthus and honeysuckle foliage and blossom.

The Greek temple being rectilinear, all its horizontal and perpendicular lines are nominally straight. But were they perfectly straight, they would not appear so; for by a law of perspective all perfectly straight lines projected far above the spectator appear to have a slight inclination upwards, while those extending on either side of him appear to be also slightly deflected. The Greeks discovered this law, and by giving every straight line a very slight curve they counteracted the optical illusion and made every line appear to the eye to be mathematically straight. There are no really straight lines in any temple of the best age of G. A., though all appear so, and hence the perfect satisfaction with which the eye rests upon these marvellous structures. The steps of their temples have a convex curve of 3 inches in 100 feet. Even the pillars have a scarcely perceptible convex curve near the middle, the swelling which causes the curve being named *entasis* ('a stretching or distension'). In all the orders sculpture and painting, and in some cases gilding, were employed. The Doric order, the first, severest, but grandest and most beautiful, may be understood as expressive of power, the Ionic of decoration, the Corinthian of luxury and incipient decline. The main characteristics of the three orders are given under COLUMN. Compare also ACROPOLIS, AMPHITHEATRE, BATHS, CARYATIDES, &c. See Sharpe's *History of Egypt*; Guhl and Koner's *Life of the Greeks and Romans* (Lond. 1875), and Fergusson's *History of Architecture* (2d ed. 1874).

Greece, or the modern **Kingdom of the Hellenes**, is the southern portion of the most eastern of the three European peninsulas that project into the Mediterranean Sea, lat. 37° 30′–39° N., long. 21° 10′–24° 5′ E. The name G. (*Græcia*) was first given to the country by the Romans, who probably derived it from the *Graikoi*, a tribe in Epirus near Dodona, with whom, from proximity, they must early have come into contact. *Hellas*, however, was the name by which the ancient Greeks themselves knew their own land; and in a separate article under this heading the ancient geography, history, and culture of G. are treated. Modern G. is bounded N. by Turkish Albania and Thessaly, W. by the Ionian Sea, S. by the Cretan Sea, and

E. by the Ægean Sea. It excludes not only Epirus and Macedonia, but Hellenic Thessaly and part of Acarnania, while of the islands of ancient G. it embraces the Ionian Islands (q. v.)—Corfu, Cephallenia, Zante, Santa Maura, Ithaki, Cerigo, &c.—Eubœa (q. v.), Salamis (q. v.), and the Cyclades (see ARCHIPELAGO)—Delos, Naxos, Tinos, Andros, Thermia, Serpho, Syra, Paros, Milos, Scyro, Sciatho, Scopelo, &c. The mainland has an extreme length from N. to S. of some 200 miles, and a breadth of 180 miles. G. is now divided into thirteen nomarchies, which correspond in name, and often in extent, with the old Hellenic states. The nomarchies are subdivided into fifty-nine eparchies. The areas, populations, and chief towns of the nomarchies are as follows:—

Nomarchies.	Area in sq. miles.	Pop. 1870.	Chief towns.
Attica and Bœotia	2,481	136,804	Athens.
Evripo (*Eubœa*)	1,574	82,541	Chalcis.
Phthiotis and Phocis	2,053	108,421	Lamia.
Acarnania and Ætolia	3,025	121,693	Missolonghi.
Achaia and Elis	1,908	149,561	Patras.
Arcadia	2,028	131,740	Tripolitza.
Laconia	1,678	105,851	Sparta.
Messenia	1,226	130,417	Kalamæ.
Argolis and Corinthia	1,448	127,820	Nauplia.
Cyclades	926	123,299	Syra.
Corfu (*Corcyra*)	427	96,940	Corfu.
Cephallenia (*Cephalonia*)	302	77,382	Argostoli.
Zante (*Zacynthos*)	278	44,557	Zante.
	19,354	1,437,026	
Soldiers and sailors		20,868	
		1,457,894	

Physical Aspect.—G. has a singularly diversified surface, and a very irregular coast-line. It is almost encircled by the sea, and is somewhat triangular in shape, having a northerly base. Near the middle it is all but intersected by the Gulf of Corinth (*Lepanto*) on the W., and the Saronic Gulf on the E., which approach each other to within 3½ miles. Thus G. is generally regarded as consisting of three great divisions—(1) The northern portion (7500 sq. miles) between the Gulf of Corinth in the S., and the range of Mount Othrys in the N., indented in the N.W. angle by the Gulf of Arta (q. v.), and running out in the promontory of Attica in the S.E. parallel to Eubœa, from which it is separated by the narrow channels of Evripo, Talanti, and Orei; (2) the Morea (anc. *Peloponnesus*), or southerly portion (8500 sq. miles), connected with N. Greece by the Isthmus of Corinth, and sending out to the S. three promontories, which enclose the Gulfs of Koron (*Messene*) and Marathonisi (*Laconia*); and (3) insular G., including the Cyclades and the Northern Sporades in the Ægean, having a total area of 3300 sq. miles. G. is distinguished among European countries, as Europe is among continents, for the great extent of its coast-line. Little larger than Portugal, its coast-line is longer than that of 'the whole Pyrenean peninsula,' having a length of 2700 miles. The Morea is indented on the W. by the Gulf of Arcadia, on the E. by the Gulf of Nauplia (*Argolis*), and on the N.E. by Megara Bay. No point in G. is further than 46 miles from the sea. *Mountains.*—The mountain-ranges of G. are irregular, extensive, and often boldly precipitous, but are of no great altitude. The lofty Pindus chain, which separates Thessaly from Epirus, enters G. in the N.E. of Ætolia, at 39° N. lat., and sends off to the E. the Mount Othrys range (highest point Geracovuni, 6110 feet), which forms the N. boundary of G. to the Gulf of Volo, and to the S.E. the Mount Katavothra (*Œta*) range, which, again, in the N.W. of Phocis, separates into several diverging ranges. Of these, the most easterly (in Mount Saromata, 5780 feet) runs close to Gulf of Zituni, contains the famous pass of Thermopylæ (q. v.), and after separating Phocis from Locris, enters Bœotia. From Mount Katavothra (6310), in a westerly direction, trend several minor ranges, while the great irregular central chain, comprising Liakura (*Parnassus*) (8068), Palæovúni (*Helicon*) (4963), Elaté (*Cithæron*) (4630), and Telo-Vuni (*Hymettus*) (5366), extends S.E. as far as Cape Sunium or Colonna in Attica. The great system of the N. is connected with that of the Morea by the Geranean Mountains, which stretch over the Isthmus of Corinth. Covered with a maze of lesser mountain ranges, the Morea is traversed in a southerly direction from Mounts Zyria (*Cyllene*) (7778 feet) and Olonos (*Erymanthus* (7297) in Arcadia, by the chains Pentedactylon (*Taÿgetus* (7902) and Malevó (*Parnon*) (6355), which terminate in Capes Matapan and Malia. The islands, almost without exception, are mountainous and irregular in shape. The mountains of G. are all below the line of perpetual snow. They enclose innumerable narrow valleys, and are parted here and there along the coast by fertile plains. Most notable are the plains of Bœotia, Marathon, Argos, and Messenia. *Rivers, &c.*—Few of the rivers of G. are perennial, and none are navigable. The most important is the Aspropotamo (*Achelous*), which rises in Mount Pindus, flows in a southerly direction through Epirus, Ætolia, and Acarnania, and enters the Ionian Sea near the Gulf of Corinth, after a course of 130 miles. On the E. side of the Pindus range rises the Ellada (*Spercheus*) (60 miles long), which flows E. through a wide vale between the Othrys and Œta ranges to the Malic Gulf. Liakura sends forth the Mavronero (*Cephissus*) (55 miles) over the Bœotian plain to Lake Topolias (*Copais*). The Evenus (70 miles) waters the E. of Ætolia, and flows into the Gulf of Corinth. Several meagre streams in Bœotia, Attica, and Phocis appear in the rainy seasons. Almost the only notable rivers in the Morea are the Vasilipotamo (*Eurotas*) in Laconia, and the Alpheus (*Rufêa*) in Arcadia and Elis. The Rufêa (*Alpheus*, q. v.) is consecrated by the memory of the great Olympic games. The largest of the permanent lakes are Topolias in Bœotia, Phonia (*Stymphalus*) in Arcadia, and Arta (*Ambracia*) in Acarnania. Many lakelets are formed in the valleys during spring-time, but in summer these evaporate and give place to malarious swamps.

Climate.—G. has every diversity of climate, from the winter severity of Arcadia and of the northern highlands, where snow lies for many months in the year, to the sultry heat of the marshy plains. Attica is pre-eminent for its pure atmosphere and clear blue sky. Bœotia is proverbially notable as the land of fogs. The lively Athenians supposed that their neighbours over the hills had got fog on the brain. The chill winds of the N. and N.W. prevail even in summer, while the temperature of the S. is often raised by the sudden visits of the parching sirocco. The rains of spring and autumn come with the mild S.E. winds. The climate of G. is said to be affected to a greater extent than in ancient times by malaria, and this is ascribed to the diminution of tillage and the destruction of forests. The mean temperature in the N. is 59° F., in the S. 64° F.; at Athens it is 60°-41° in winter, 77° in summer.

Agriculture and Botany.—One-half of the land consists of mountain and marsh, and only a fifth of the remainder is under cultivation, although nearly half of the male inhabitants are employed in agriculture. The soil is rich but thin, the implements and resources are exceedingly primitive; oxen for ploughing are scarce, and the country people are for the most part lodged in miserable huts. Upwards of three-fourths of the land belongs to the State. The *metayer* or tenant is in many cases supplied by the proprietor with oxen and seed, holds his farm by the year, and pays rent in kind to the extent of one-third of the net produce. Wheat, barley, and maize are the chief crops, but grain has to be imported, chiefly from the S. of Russia, for the subsistence of the population. The currant (Ital. *papolina*) or small Corinthian grape is successfully cultivated along the shore of the Gulf of Corinth, between Corinth and Patras, and on the islands of Cephalonia and Zante. The marshy regions and plains (especially those of Argos and Marathon) produce rice, cotton, madder, and tobacco. Among the fruits are the vine, olive, almond, orange, lemon, and fig. The island of Santorin exports (mainly to Russia) in considerable quantity a fine wine to which it gives name. Many of the mountains have been stripped of their forests, but the ancient Taÿgetus, Parnassus, Helicon, &c., are still richly clad with foliage. The pine is the common tree; others are the beech, chestnut, oak, and cypress.

Zoology.—The principal wild animals still left in the mountains are the bear, wolf, boar, lynx, jackal, deer, and wild-cat. Game abounds in great variety, and of typical birds there are eagles, vultures, hawks, and owls. G. is more a pastoral than an agricultural country, and its great sources of wealth are its flocks of sheep and herds of goats. Arcadia is still, as of old, the land of shepherds.

Geology and Mineralogy.—G. has no volcanoes, but is marked by volcanic action in its wild, contorted mountains, mineral springs (as those of Thermopylæ and Delphi), deep caverns, &c.

The prevailing rock is hard, grey limestone, often assuming the form of finest marble. Other rocks of G. are granite, mica schist, and serpentine. Among the minerals are gold, silver, copper, iron, lead, sulphur, salt, cobalt, manganese, and antimony. The quarries of Mount Mendeli (*Pentelicus*) produce beautiful white marble, those of the Morea and the islands, rare green and red marbles. At Laurium in Attica are the once valuable silver mines. There are many quarries of gypsum and porphyry.

Industries and Commerce.—G. is of little industrial importance. The chief manufactures are cottons, woollens, silks, gauze stuffs, cutlery, carpets (in Andros), gold and silver embroidery, straw-hats (at Epakto), earthenware, &c. Shipbuilding, dyeing, and marble-cutting are special occupations. In 1874 the exports amounted to £2,678,000, the imports to £4,763,000. The principal exports are currants (£1,319,000), lead, skins, olive-oil, figs, wine, silk, and tobacco. The imports include grain from Russia, and manufactured goods from Great Britain and France. G. trades chiefly with Great Britain, Turkey, Austria, France, and Russia. In 1874 the total number of vessels that entered and cleared the ports was 142,503, of 7,945,000 tons. The trading ports are Syra, Piræus, Patras, and Nauplia; and the mercantile marine numbers (1874) 5202 vessels, with an equipment of 25,838 men. Greek vessels are much engaged in the carrying trade of the Mediterranean and Black Seas. In the almost total absence of carriage roads, internal communication is wretchedly defective. The only line of railway is that from Athens to Piræus (7 miles). In 1875 there were 1156 miles of telegraph wires, while the post, with 136 offices, transmitted 2,573,481 letters, 1,300,019 papers and journals, and 670,914 official despatches.

Government.—The constitution of G., of date 1863-64, vests the whole legislative power in a chamber of representatives, the Boulé, of not less than 150 members, which is balloted for by universal suffrage, for a term of four years. The constitution guarantees religious liberty, the establishment of the Greek Church, inviolate personal liberty, the non-existence of slavery and of titles of nobility, trial by jury, the freedom of the press, &c. The Boulé meets for not less than three nor more than six months in the year; a sitting is only valid when one-half of the members are present, and no measure can become law without the vote of an absolute majority. A council of state examines all bills, and may propose amendments. The assembly has no power to alter the constitution. Executive power is vested in a hereditary king, and in Ministers of the interior, of finance, of justice, of education, of ecclesiastical affairs, of war, of marine, and of foreign affairs. The king must belong to the Greek Church. Since 1863 ministerial changes have occurred on an average three times a year.

Army and Navy.—In 1867 military service for three years in the 'active army' and nine in the reserve was made obligatory. G. has a national guard for home defence. In 1876 the effective comprised 12,188 men (754 officers) and 636 horses. In time of war the army can be raised to a force of 29,584 men, besides volunteers. In 1875 the fleet consisted of 1 ironclad, 6 screw steamers, 4 schooners, 2 cutters, and a royal yacht. In 1876 it had 76 officers and 581 men. The cost of the army was (1875) £279,600; of the navy £64,298.

Finance.—In 1875 the revenue was £1,415,857, and the expenditure £1,421,125. The public debt, foreign and internal, amounted in 1875 to £15,360,000, on only a small portion of which is the interest paid. Starting on a borrowed capital, G. has had few financial terms without a deficit. The constant excess of expenditure is in great part due to the employment of so many public officials (18,860 or one-twelfth of the population) at salaries amounting to about one-half of the total revenue. G. has, in addition to her funded debt, a floating one estimated at about £6,000,000 sterling. The unit of the monetary system is the *drachma* = 8½d.; of weight, the *oke* = 2 lbs. 11 oz. avoirdupois; of lineal measure, the *pique* = 27 inches. A *stremma* is about one-third of an English acre.

Justice.—G. is divided into four judicial districts each having a royal court of appeal. The supreme court is the Areopagus. There are 13 courts of appeal and 120 of justices of the peace. The laws are mainly based on the Code Napoleon; the judges, appointed by the King, are reputed for integrity. Cases of brigandage and murder are common, but there are not many of drunkenness and immorality. Besides passing a special examination, advocates must hold the degree of LL.D. from the University of Athens or from some other university of Europe.

Education and Religion.—In 1834 education was made compulsory and free, but according to the census of 1870 only 33 per cent. of men and but 17 of women were able to read or write. There are 370 communal schools, 180 schools where ancient Greek is taught, some fifty gymnasia, four medical schools, one theological, one military, one agricultural, one school of arts, and universities at Athens and Corfu. The professors and teachers number about 500, and the pupils 64,061; the state estimate of grants for education and religion was (1875) £75,825. Nearly all the inhabitants belong to the Greek Church (q. v.). Only 12,555 are members of other Christian churches, and 2582 are Jews. The monks are numerous, ignorant, and degraded. The press is free, and there are 120 political, literary, and religious newspapers. In the Neo-Hellenic literature that is slowly developing, perhaps the most illustrious names are those of the historians Tricoupis (q. v.) and Perrævos; of the dramatists, Soustos, Neroulos, Rangavis, and Charmouzis. Barnvas, Gennadios, and Byzantino are authors of works on the language.

Nationality.—In 1870 there were in G., besides the Greek-speaking inhabitants, 37,598 Albanians, 1217 Macedo-Wallachians, and 29,216 others. The number of resident Turks was 15,051, of English 2099, of Italians 1539, of Germans 526, of French 415, of Russians 141.

History.—After the fall of the Comnenian dynasty (see BYZANTINE EMPIRE) in 1203, a dukedom of Athens was one of the divisions into which the empire was split. The dukedom remained in the hands of various families till after the final siege of Constantinople in 1453, when G. passed under the Moslem yoke. On the signal defeat of the Turks at Vienna (1684), the Venetians invaded and took possession of Athens and the Peloponnesus, but were forced to withdraw in 1718. G. had to endure for a century longer the cruel despotism of Turkey. At last, in 1821, broke forth the rebellion in which Greek nationality worked out its independence, aided by the allied fleets of England, France, and Russia. The chief events of the war of independence were the Turkish massacre in Scio (q. v.); the brilliant midnight attack of Marcos Bozzaris (q. v.) on the Turkish camp at Carpenesia (1823); the capture of Missolonghi (1825), and of Athens (1826), by the Turks; the rejection by the Porte of all diplomatic interference; and the destruction of Ibrahim Pasha's fleet in the harbour of Navarino (1827). The Count Capo d'Istria, who had assumed the presidency of G. in 1828, was assassinated in 1831. Otho, second son of Ludwig of Bavaria, was chosen king, and began to reign in February 1833. G. compelled Otho to grant a constitution in 1843, and eventually banished him in 1863. The crown was then almost unanimously offered to Prince Alfred of England, but its acceptance was prevented by standing conditions between the protecting powers. Prince Georg, son of Christian IX. of Denmark, and brother of the Princess of Wales, was crowned as Georgios I. (see GEORG) in October 1863. He married the Princess Olga, niece of the Emperor of Russia (1867), and has several sons. See Bernardaki, *Le Présent et l'Avenir de la G.* (Par. 1870); Brockhaus, *Griechenland, geographisch, geschichtlich und kultur-historisch von den ältesten Zeiten bis auf die Gegenwart dargestellt* (Leips. 1870); Edward Strickland, *G., its Condition and Resources* (Lond. 1863); Tuckerman, *The Greeks of To-day* (Lond. 1873); and Dr. R. Nicolai, *Geschichte der neu-griechischen Literatur* (Leips. 1876).

Greece, Ancient. See HELLAS.

Greek Church, which assumes to itself the name of 'Orthodox,' and might most properly be called the Eastern Church, comprises in its wider sense three main groups of churches. 1. Those fragments of the Christian Church in Asia and Africa, all of which, with the exception of the last, rendered themselves heretical by protesting against the innovations of the see of Constantinople. (1) The Chaldean Christians of Kurdistan, who trace their origin to the mission of Thaddæus to Abgarus, King of Edessa, their sacred city. They only recognise the first two general councils of the Church, rejecting the third (of Ephesus), which condemned Nestorius, and receive the epithet of Nestorians. (2) The Armenians (q. v.), inhabiting the mountainous tract around Ararat, converted by Gregory the Illuminator in the 4th c., who have been called the 'Quakers' of the East, the 'Jews' of the Oriental Church; their sacred city and seat of the patriarch is Etschmiadzin (q. v.). (3) The Church of Syria, with its capital Antioch, which is the oldest of

the Gentile churches, and to whose chief pastor 'alone in the world by right belongs the title of patriarch.' It comprises two different communities—(*a*) The Jacobite or Monophysite (q. v.) Church, with its patriarch at Diarbekr (q. v.); and (*b*) the Maronites of Mount Lebanon, founded by Maro in the 5th c., the only relic of the Monothelite (q. v.) heretics. (4) The Coptic Church (q. v.) of Egypt, with its patriarch formerly at Alexandria, now at Cairo, which, like the Syrian, is Monophysite, rejects all but the first three general councils, and protests against the heterodoxy not only of the whole West, but of the whole East beside themselves. A daughter of the last is the Church of Abyssinia, founded by the Church of Alexandria in the 4th c. In the usages of this Church 'whatever there is of Jewish or of old Egyptian ritual in the Coptic Church, whatever of extravagant ritualism, of excessive dogmatism, of the fatal division between religion and morality, that disfigures to so large an extent the rest of Oriental Christianity, is carried to excess.' (5) The Church of Georgia. The king of this country was converted nearly at the same time as Constantine (312). The allegiance of the Church, which at first belonged to Antioch, was afterwards transferred to Constantinople. 2. The G. C. proper, the Orthodox Imperial Church, or 'the great Church,' which includes the whole Greek-speaking race, has its centre in Greece and Constantinople, and the sanctuary of which is the 'Holy Mountain' of Athos. The main characteristic of this Church is its lineal descent from the first Christian empire (the Byzantine), and of that Church at new Rome which was for a period more truly the centre of Christendom than that at old Rome. 3. The barbarian tribes of the North who were converted by the Byzantine Church—(1) The tribes on the Lower Danube. Bulgaria was first converted to Christianity by Cyril (q. v.) and Methodius in the 9th c., and communicated the new religion to Servia, Moldavia, and Wallachia. There is besides a colony of Greek Christians, called 'Raitzen,' who occupy large districts in Hungary. (2) The Church of Russia, which is the present representative of the Imperial Church of Constantine, the Czar being the personal head of the whole G. C.

II. The history of the G. C. has been divided into three periods. 1. The first period is that of the first seven general councils, which were as peculiarly councils of the Eastern Church as those of Constance and Trent were of the Western. Of these, the Council of Nice (325), the confession of which has been received by the whole of Christendom as the earliest, the most solemn, and the most universal expression of Christian theology, may be considered both as the most significant and also as the most enduring monument of the Oriental Church. 2. The second epoch is the birth and growth of Mohammedanism, which is essentially interwoven with the G. C. There are points which Mohammedanism owes to its Oriental origin in common with the G. C.; in other points it is a reaction against that Church. The history of the Slavonic races has been continually affected by their conflict with Arabs, Tartars, and Turks. 3. The third epoch is the establishment of the Russian Church, and through it of the Russian Empire.

III. The characteristics which are common more or less to all parts of the G. C., and which distinguish it from the Western Church. The final external separation between the Eastern and the Western Church, which took place in the 12th c., was directly due to a multitude of concurrent external causes: (1) Political—the jealousy between the two rival capitals of Rome and Constantinople, specially represented by their bishops; the rival claims of the Eastern and the Western Crusaders, &c. (2) Religious—as the doctrine regarding the procession of the Holy Spirit (see FILIOQUE); the use of leavened or unleavened bread, &c. But the real elements of discord between these two great divisions of the Christian Church were more deep-seated than any of the above-mentioned pretexts. 1. Perhaps the most prominent distinction between the two is that of the speculative tendency of the G. C. and the practical tendency of the Western which is manifested in the theology of the two. 'The East,' it has been said, 'enacted creeds, the West discipline;' the truth of which is seen from the fact that the first decree of an Eastern council was to settle the relations of the Godhead, the first decree of the Pope of Rome was to interdict the marriage of the clergy. 'Latin Christianity contemplated with almost equal indifference Nestorianism and all its prolific race, Eutychianism, Monophysitism, Monothelitism. While in this great contest the two great patriarchates of the East, Constantinople and Alexandria, strove to establish their right to ascendancy, . . . in the West there was not a Nestorian or Eutychian sect.' 2. This contrast 'appears not only in the theology but in the ecclesiastical, and especially in the monastic, system of the East.' Monasticism was not only born in the East, but has thriven there with an unrivalled intensity. The active life generally exhibited by Western monachism—*e.g.*, by the Benedictines and the Sisters of Mercy—is regarded in the East as an abuse of the system. So, too, fasting, which in the West is chiefly confined to the special season of Lent, is liable to wide dispensations, and amounts for the most part only to abstinence from particular kinds of food, in the East extends over long periods of the year, and means abstinence from all food. 3. Another important difference is that the G. C., like the East generally, has remained stationary and unchanged, while the Western has been progressive. This conservatism in the G. C. is exhibited, *e.g.*, (1) in the rite of baptism, in which the original, primitive practice of immersion is kept up, and in the following practices also descending from primitive times:—(2) the laying on of hands immediately after baptism, in the case of infants as well as adults, that they might receive 'the gifts of the Spirit,' which in the Western Church has been made into a separate rite of Confirmation; (3) the administration of the Eucharist to infants; and (4) calling in the elders of the Church (James v. 14) *for the recovery of the sick*, a rite which in the Western Church has developed into extreme unction for those not expected to recover. Minor points in which the same spirit is exhibited are, keeping up the primitive posture of standing at public prayer, excluding musical instruments of every kind from public worship, and refusing to adopt the 'new style' of reckoning time. 4. Another point of difference is that in general the G. C. has never shown either a missionary or a persecuting spirit; the conversion of the Russian nation, what would appear to be a great missionary effort, was effected, not by the preaching of the Byzantine clergy, but by the marriage of a Byzantine princess. 5. Another difference, which is a marked indication of the stagnant spirit of the G. C., is that its theology has not been systematically developed, as in the Western Church. Its doctrines remain very much in the rigid, undefined state in which they were in the beginning of the 4th c. 6. The organisation of the hierarchy of the G. C. shows a marked contrast to that of the Western Church. (1) The ordination of a priest in the G. C. is not indelible. (2) The monastic orders in the East are to a great extent lay institutions. (3) The centralisation displayed in the Papacy is unknown in the G. C. Its place is taken by the Patriarchate, so that the constitution of the one Church is monarchic; of the other, aristocratic. (4) The whole body of the parochial clergy of the G. C. must always be married before they enter on their office, except the bishops, who, being selected from the monasteries, are single. In the Western Church the enforcement of celibacy was one of the first steps for the organisation of the clergy. See Stanley's *Lectures on the Eastern Church* (4th ed. Lond. 1869); Neale's *Hist. of the Holy Eastern Church* (2 vols. 1850); Palmer's *Diss. on the Eastern Communion* (1853); Gibbon's *Decline and Fall of the Rom. Empire.*

Greek Fire, an inflammable compound very extensively employed in warfare for causing conflagrations during the middle ages. It was well known in the East in the 7th c., and its invention has been ascribed to the Arabs. The definite composition of G. F. is not known; its ingredients are supposed to have been naphtha, bitumen, sulphur, resins, and numerous fatty substances. The fire was thrown in fragile pots or other vessels from catapults or other warlike engines. Through the Crusaders it came to be known in Western Europe, and it was one of the many incendiary compositions in use at the time gunpowder was discovered. A modern instance of the employment of a kind of G. F. occurred in the siege of Charleston, U.S., by the Federals in 1863.

Greek Music is a very obscure subject. The Greek name for music was *harmonikē*, and the Greek instrument was the lyre. The Greeks understood the nature of *intervals*, and Pythagoras is said to have discovered the law on which the construction of stringed instruments depends. Terpander (flourished probably about 670 B.C.) added three to the four strings of the lyre, and successive additions were made to the number corresponding to successive extensions of the scale. The centre of the Greek system is the *tetrachord* (four notes—*e.g.*, B, C, D, E), and by adding and 'fitting' together tetrachords, they reached a 'sys-

tem' of two octaves, which they called 'perfect.' Two tetrachords were 'fitted' together when they had a note in common, and this was usually, but not always, the case. The above 'system,' corresponding to our minor scale with minor seventh, was called the 'diatonic genus;' besides, the Greeks had the chromatic and the enharmonic genera, in which the notes proceeded by different degrees. G. M. was used almost exclusively to accompany poetry.

Gree'ley, Horace, an important American writer and politician, was born at Amherst, New Hampshire, February 3, 1811. He was the son of a poor farmer, and spent his youth in rural labours until he was apprenticed to a printer. In 1831 he went to seek his fortune in New York, and worked there as a journalist on various papers, one of which, the *Log Cabin*, rose to a circulation of 80,000, and in 1841 was merged in the *New York Tribune*, of which G. was the founder, and with which he was henceforth always associated. He was elected to Congress in 1848, visited Europe in 1851, and was chairman of one of the juries in the Great Exhibition. He travelled again to Europe in 1855, and to California in 1859. On the close of the civil war he earnestly advocated a universal amnesty, and in 1867 was a member of the New York State Constitutional Convention. In 1872 he was brought forward against General Grant (q. v.) as a candidate for the presidentship, but was defeated, and shortly afterwards died near Chappaqua, November 29, 1872. G. was not only a singularly able writer and speaker, but a man of so unique a character that he may be said to have approached the confines of genius. Impetuous yet generous, broadly tolerant yet keenly opinionative, he was perhaps one of the best representatives of American vigour and enthusiasm, and was held in honour both in England and on the Continent of Europe. Among his works are *Hints towards Reforms* (1850), *Glances at Europe* (1851), *History of the Struggle for Slavery Extension* (1856), *Overland Journey to San Francisco* (1860), *The American Conflict* (1864), *Recollections of a Busy Life* (1869). See G.'s *Life* by J. Parton (new ed. Bost. 1868).

Green is one of the constituent colours of white light, and occupies a position in the solar spectrum intermediate between yellow and blue. It is regarded by Clerk Maxwell as one of the three primary colour sensations, deep red and violet being the others; and this theory is supported by the now well-known fact that from a pure yellow and a pure blue (such as are present in the spectrum) it is impossible by mixture to form a G. The reason why yellow and blue pigments, when mixed, produce G. is simply because they do not severally produce upon the retina the same simple sensations which the pure spectrum colours do, and the consequence is a blurred resultant sensation, which, though apparently the same as the pure spectrum G., is as different as a mixed sound from a pure note. The production of a G. by the combination of blue and yellow is very common both in oil and water-colour painting and in dyeing. There are, however, certain greens which are formed directly by a chemical process, such as *Scheele's G.*, *Brunswick G.*, *Emerald G.*, *Schweinfurth G.*, *Mineral G.*, which are all salts of copper, and *Sap G.*, formed from the fermented juice of buckthorn berries. An allied species gives also *Chinese G. Indigo*, which is used for dyeing silk. The copper greens are all highly poisonous. *G. Vitriol* is the sulphate of Iron (q. v.), having the composition $FeSO_4 7H_2O$. It crystallises in rhombic prisms, is soluble in water, and is employed in dyeing and in the manufacture of ink and Prussian blue.

Green'backs, the popular name for the paper money of the United States, first issued by the Government in 1862.

Green Earth, a mineral consisting of the silicate of ferric oxide with potash, alumina, magnesia, water, and other ingredients, usually found occupying cavities in amygdaloid. In the arts it is used as a pigment under the name of *mountain green*.

Green Eb'ony, the wood of the *Jacaranda ovalifolia* (see JACARANDA), a tree of S. America belonging to the natural order Bignoniaceæ (q. v.). It is imported into Britain as a dyewood.

Greene, Nathan'iel, an American general, born of Quaker parents at Powtowhommet, Rhode Island, May 27, 1742. He became a member of Rhode Island Assembly in 1770, and in 1774 enlisted in the American army. He was made brigadier-general in 1775, and major-general in 1776; and after distinguishing himself in the battles of Trenton and Princeton, by a rapid march saved the American army at Brandywine. In 1780 he presided at the trial of Major André, and was made commander of the army of the S., which he found in great want and disorganisation. Having restored his troops to efficiency, he was attacked by Cornwallis, who, though he defeated G. at Guildford, was shortly forced to retreat before him. In 1781 he gained the battle of Eutaw Springs, one of the most fiercely contested in the whole war, for which a medal was struck in his honour by Congress, while Georgia and N. and S. Carolina gave him large grants of land. At the end of the war he returned to Rhode Island, and in 1785 retired to his estate of Savannah, Georgia, where he died, June 19, 1786. G. is one of the foremost heroes of the War of Independence, and in the eyes of his countrymen ranks second only to Washington himself. No more energetic, skilful, or intrepid leader figured in the strife.

Greene, Robert, an Elizabethan dramatist, lyrist, and writer of fiction, was born at Norwich about 1560, became B.A. of Cambridge in 1578, travelled in Spain and Italy, and, after hesitating whether to be a clergyman or a physician, 'became an author of plays and a penner of love pamphlets.' His first work, *Mamilia*, a prose tale (1583), was followed by other euphuistic stories which became at once popular. Henceforth his career was one of incessant literary work and reckless debauchery until his death, September 3, 1592. His *Repentance of Robert G.*, published after his death, gives a frank, touching account of his wild life. Only six of his plays are preserved, *Orlando Furioso*, *Looking-Glass for London and England*, *Friar Bacon and Friar Bungay*, *James the Fourth*, *Alphonsus*, and *George-a-Greene*. These show slender dramatic art, but are often graceful, natural, and pathetic. *Friar Bacon* and *George-a-Greene* are delightfully English in descriptive colouring, and combine a sweet and simple pastoralism with a vein of rich classical allusion peculiarly characteristic of the Renaissance spirit. Many of G.'s lyrics are exquisitely musical, and full of a glowing voluptuousness of imagery. See Dyce's *Works of G. and Peele* (new ed. 1874).

Green'finch (*Fringilla chloris*), a well-known species of *Fringillidæ* of Finches (q. v.), and one of the commonest hedge-birds of Britain. The colour is yellow on the upper parts in the adult male, the yellow being tinted with green, and the wings edged with yellow. The quill feathers are greyish black, and the under parts yellowish fading into grey. The female is similarly coloured, but the tints are less bright than in the male. The average length is 6 inches. The song is sweet, but not powerful. The nest is not completed till May, and the eggs, which number from three to five, are a bluish white spotted with grey and brown. In winter the G. frequents farmyards and barns.

Greengage', the common name given to a cultivated variety of *Prunus domestica* or common plum, from the green appearance of its round fruit. It is regarded from its delicate flavour when ripe as one of the best dessert plums. In France it is called *Reine Claude*.

Green'heart, Bibiri, or **Bebeeru**, names given to *Nectandra Rodiæi*, a valuable timber tree of British Guiana belonging to the natural order *Lauraceæ* (q. v.). The wood is hard and durable, and so heavy as to sink in water. It is employed in ship-building, and for a variety of purposes where strength and durability are requisite. Its bark is valued in medicine as a tonic and febrifuge. It owes its properties to an alkaloid called Bebeerine (q. v.).

Green'house, in horticulture, a structure glazed on the sides and roof, for rearing tender plants, such as *Pelargonium*, *Fuchsia*, *Camellia*, *Azalea*, *Calceolaria*, *Cineraria*, &c., and for protecting during winter hardier kinds that in summer are grown out of doors. In cold weather heat is maintained by artificial means, and in order to admit air the sashes of the roof are made movable. The plants are placed in pots—a G. differing only in this respect from a Conservatory (q. v.), and are arranged on benches or shelves so as to reap the full benefit of the sun's rays. A G. is usually in direct communication with the dwelling-house, for convenience of being resorted to in inclement weather.

Green'land, a polar region belonging to Denmark, being a large island or cluster of islands of unknown size N.E. of the N. American continent, bounded on the N. by the Arctic Ocean,

E. and S. by the Arctic and Atlantic Oceans, and W. by Davis Strait, Baffin's Bay, Smith Sound, Kennedy Channel, &c. The E. coast is quite desolate and almost inaccessible, being beset by immense icefields, from which great floes constantly pass round Cape Farewell to the W. coast, the only part of G. hitherto at all explored. For about 1000 miles this W. part presents first an outer seaboard strip from 15 to 150 miles broad, cut with bays 45 to 90 miles deep, and skirted with large and small islands. Its area, about 35,000 sq. miles in extent, is in general rocky, having a lower formation of gneiss and granite covered with sandstone and coal-layers, and in the N. with an extensive trap formation. Its shores are steep, with many cliffs of from 3000 to 5000 feet, some even from 5000 to 6000 feet, and plateaux from 2000 to 3000 feet high, with edges scarped to the sea. Seen from Davis Strait and Baffin's Bay, it offers the same features from S. to N.—high, naked, black mountains towering above a white sheet of ice and snow, which on closer approach proves to be the ice-clad highland of the coast, hiding an 'underland' less bleak, yet well-nigh barren of plant-life, owing to the fog and sea-wind from Baffin's Bay. Farther inland the vegetation becomes less stinted, though still restricted to the valleys and lower slopes. Beyond this the interior of G. is a monotonous wilderness of ice, about 2000 feet high at its western part, but slowly rising to nearly 4000 feet, whence the eye sees to a great distance eastward one level unvarying desert, destitute of every sign of life. This inland ice has a constant tendency to compensate its yearly increase by pushing its edge westward over the outer borderland into the sea. The descent of the 'ice-streams' is very gradual, but river-like; they slide down into the fjords, and their edges, often 1000 feet thick, are lifted up by the sea, and form icebergs. There are thirty-two such 'ice-fjords' on the W. coast of G. In some places where the inland ice extends to the cliffs of the shore itself, it falls down into the fjords in smaller pieces, called 'calf-ice.' The presence of these masses, as well as the neighbourhood of the Arctic Ocean, renders the cold in G. exceptionally severe. In North G. the ground is always frozen to a depth of 8-12 inches. The average temperature is 3·22° F. South G., having a moister and more uncertain though generally warmer climate than North G., and therefore a more uneven surface, is less favourable for communication by dog-sledges. At Godhavn the sun is six, at Upernavik eleven and a half weeks below the horizon; but there always remain two or three hours clear enough for reading the smallest print. The dry atmosphere of G. keeps wood long sound and food long fresh. The islands only produce lichens and carices, but on the mainland are found grass and shrubby plants yielding 'ling-fuel,' chiefly willows and dwarf-birches, and also whortleberries, bilberries, and crake-berries, which are universally used as food. Further inland grow the birch, willow, alder, and juniper, but nowhere higher than 5 feet from the ground. Corn cannot be ripened. For fuel, turf, drift-timber, and train-oil are chiefly used. Of animals, the natives have only the dog. The hunting of reindeer, once very extensive, has now nearly ceased, and is succeeded by that of hares, foxes, bears, and sea-birds. But it is the capture of seals (90,000 to 100,000 are taken yearly) that supports the life of the Greenlanders, and makes G. of any importance. The few minerals are chiefly graphite, alum, lime, vitriol, cryolite (of which 9147 tons, valued at £21,660, were exported to Philadelphia in 1869), and coal. The chief imports are wheat, coffee, sugar, brandy, tobacco, and firewood. The pop. (10,000) is composed of native Eskimos (q. v.), and some Danes. Taxes are unknown. Judicially, the country is divided into two 'inspectorates' subdivided into thirteen districts. G., discovered by an Icelander named Gunbjörn, at the beginning of the 10th c., was first colonised by Erik the Red about 982. Gradually two settlements arose, called the 'East Parish' and the 'West Parish.' While the 'Black Death' raged in Norway (from 1349), all communication with that country, from which the Scandinavians in G. had drawn their supplies, was cut off, and the distressed settlers gradually dwindled away under the attacks of the 'Skrællinger' (*lit.* 'parings,' *i.e.*, 'puny wretches'), as they were wont to call the Eskimos. In 1721 Hans Egede (q. v.) went to G. to Christianise the natives. In 1874 the first native pastor was ordained. The people are now well educated, and have a journal of their own, published in the Eskimo tongue (*Scotsman*, 23d August 1877). Some attempts had been made in the 17th c. by the Danes to found a trade with G., but a century elapsed before any success was attained. See Rink's *Tales and Traditions of the Eskimo* (1875), and Brown's *Danish Greenland* (1877).

Green Mountains. See APPALACHIANS and VERMONT.

Green'ock (Gael. 'the sunny knoll'), a thriving seaport of Scotland, in Renfrewshire, on the left shore of the Firth of Clyde, opposite Helensburgh (q. v.), the Gare Loch, and peninsula of Roseneath, 4 miles N.W. of Port Glasgow, and 21 W.N.W. of Glasgow by railway. Stretching along the shore for about 5 miles, and climbing the slopes of a range of hills 800 feet high, it looks N. to the rugged peaks of the Highlands, across the Clyde, which has here a breadth of 2¼ miles. It is a bonding port, and its fine custom-house was erected in 1818 at a cost of £30,000. Other public buildings are the courthouse, townhall, Wood's Mariners' Asylum (1851), the sugar exchange, the academy, a mechanics' institute, a hospital, temperance institute, Watt Institute (with bust of Watt by Chantrey), museum, and library of 100,000 vols. G. has been supplied with water from large reservoirs behind the neighbouring hills since 1825, at a total cost till the present time of over £300,000. On the line of falls in the water system there have been erected fifteen sugar refineries, woollen, flour, and saw mills, yielding a revenue for water supply of £10,000 yearly. The harbours stretch about 3 miles, cost over £1,000,000 sterling, and include four tidal docks, three graving docks, a large wet dock in course of construction (1877), and the Princess Pier, opened in 1870. The Gavel Park graving dock (1870-74) is one of the finest in Britain; the harbour cranes (two of which are 70 and 50 tons respectively) are worked by hydraulics. The harbour revenue in 1876 was £69,212; in the foreign trade 667 vessels of 307,957 tons entered, and 516 of 299,015 tons cleared, while there was an active coasting trade. The trade is chiefly in sugar, timber, coal, and iron. The sugar imported in 1876 amounted to 237,799 tons; the timber to 98,740 loads; the coal exported to 36,713 tons; the iron to 8950 tons. The chief industries are shipbuilding, engineering, spinning, distilling, and sugar refining. In 1876 the fifteen sugar refineries sent out 239,410 tons, being 31 to every 100 tons refined in the British Isles (772,700 tons) in the same year. The valuation of the burgh in 1876 was £337,085, while 429 vessels of 200,374 tons belonged to the port. The corporation revenue was £119,197 in 1876. G. is the great starting-point for tourists to the W. Highlands, and as many as fifty steamers call at its quays in a day. It returns one member to Parliament. Pop. (1871) 57,821; estimated in 1876, 70,192. Prior to the Union (1707) G. was a mere fishing village, though a burgh of barony from 1635.

Green River, a river of Kentucky, U.S., which, after a course of over 300 miles, joins the Ohio 6 miles above Evansville, Indiana. It is navigable for small vessels for about 20 miles. The river in the Mammoth Cave is a subterranean offshoot from the G. R.

Greens, a familiar name for all the open-hearted varieties of cabbage, but more especially applied to the curled leaves of German G. or kale. *Brassica oleracea*, a cruciferous plant, is the origin of G. See CABBAGE.

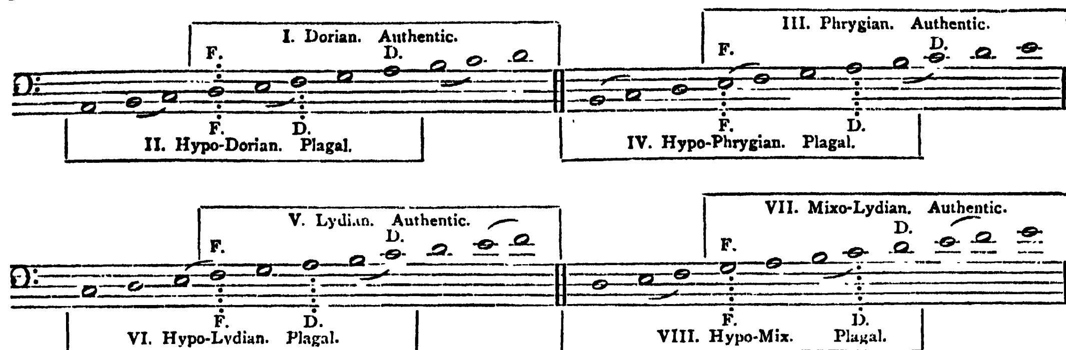
Green'sand, the name given to two formations belonging to the Cretaceous Period (q. v.). They are known as the *Upper* and *Lower G.*, and are separated by the Gault (q. v.). The former is of comparatively little importance, and is probably a shore deposit formed while the Chalk (q. v.) was being laid down in deeper water. By a subsidence of the land, it was removed to a greater depth, and there became covered with the chalk. It attains a maximum thickness of 100 feet in the Isle of Wight. The *Lower G.* is the upper member of the Lower Cretaceous, overlying the Wealden Beds, and corresponding in position to the Neocomian of the Continental geologists, which is specially developed at Neuchâtel in Switzerland. It is a marine formation, abounding in Lamellibranch fossils and other molluscs and invertebrata. Reptiles characteristic of the Wealden formations are also found, indicating the proximity of land, and suggesting that these formations were formed after a depression of the fresh-water Wealden, which brought it under the waters of a sea. The name G. arises in both cases from the frequent presence of dark-green specks of silicate of iron in the sand, but this is not a constant character, and the name must be taken, as in every other similar case, to refer merely to a certain period of geological time.

Green'stone, an old and generic name for a numerous class of trappean rocks (see TRAP), which consist essentially of oligoclase felspar with hornblende or augite. They are highly crystalline, and sometimes become porphyritic. Their colour is generally greenish, and on the weathered surfaces dark brown. Diorite, diallage rock, hypersthene rock, &c., are well-known species belonging to the G. group.

Green'weed, the common name generally applied to *Genista tinctoria*, a British plant at one time largely used as a yellow dye for wool. See GENISTA.

Greenwich, a borough of Kent, on the Thames, and 5 miles S.E. of London by rail. The old town, which was low and irregular, has all but disappeared, and new and pleasant garden-bordered streets, with handsome lines of villas erected, give to the town a cheerful, holiday appearance. Quite a feature of G. are its taverns, which occupy a whole street leading from the river to the Royal Observatory, and which are daily patronised during the season by thousands of Londoners. From the Observatory (see OBSERVATORIES), a grassy hill in the middle of the fine Park, a noble view is obtained of the winding reaches of the Thames, studded with sails, and the rich low country on its banks. Engineering, steamboat-building, and the industries that feed these, are the chief employments. The manufactures comprise electric telegraph cables, ship-rockets, wire ropes, india-rubber, soap, and artificial stone. Pop. (1871) 40,412. G., together with Deptford, returns two members to Parliament.

Greenwich Hospital, a former home for disabled sailors, on the right bank of the Thames at Greenwich, was founded by William and Mary in 1694. The grand building, originally a palace, in which were born Henry VIII. and his daughters Mary and Elizabeth, was extended and adapted to hospital service by Wren (1694–1705), and in the latter year received 100 sailors. By 1708 the royal grant had been increased by bequests and contributions exacted from sailors to a sum of £12,000 a year. In 1735, under George II., the estates of the attainted Earl of Derwentwater (beheaded in 1716) were bestowed on the hospital, amounting yearly to £6000. An annual grant of £20 000 from the Consolidated Fund was substituted (1797) for the sailors' compulsory contributions. The hospital had reached the highest point of its prosperity in 1853, when it was lodging 2710 seamen, and drawing a revenue of £150,000. The staff comprised a governor (salary £1500), a lieutenant-governor (£800), four captains, four commanders, eight lieutenants, two masters, two chaplains, and a large body of medical officers and nurses. After much public discussion on the merits of the splendid charity and its administration, an Act of Parliament (28 and 29 Vict. c. 89) of 1865 converted the hospital into an infirmary, and dismissed 900 seamen with addition to their pensions. By 1869 all but thirty-one bedridden inmates had left the place, and the patients of the *Dreadnought* hospital were removed hither in the following year. The G. H. out-pensions or 'naval pension,' regulated by Acts of 1869–72, provide for a far greater number than the hospital could ever accommodate. These pensions, varying from £3 to £57 a year, are distributed by district staff-officers of military pensions. The hospital buildings have been occupied by a royal naval college and a free school for 800 sailors' sons since 1873.



Greg, William Rathbone, was born at Manchester in 1809, was made a Commissioner of Customs in 1856, and Controller of the Stationery Office in 1864. He has become well known as the author of *Essays on Political and Social Science*, *Enigmas of Life* (1872, 5th ed. 1873), *Literary and Social Judgments*, *Political Problems*, *The Creed of Christendom* (3d ed. 1873), *Rocks Ahead, or the Warnings of Cassandra* (1874). He is a singularly lucid and graceful writer, and a clear and original thinker, but his teachings are somewhat narrow, cold, and dogmatic. In his fidelity to fact, in his earnest attachment to what truth he knows, no less than in his rigid attitude of hostility to convictions which he does not share, we can recognise both the good and the evil of his Puritan training.

Gregari'na, a genus of lower *Protozoa* (q.v.), forming the type of the class *Gregarinida*. The gregarinæ exemplify some of the lowest animal forms known to the naturalist. They are defined as Protozoa destitute of a mouth, and not having the power of emitting *pseudopodia*, or processes of the body substance. All gregarinæ are parasitic in habits, and exist chiefly in the digestive system of *Annulose* animals, such as worms, insects, lobsters, &c. A very common form is *G. lumbricis*, found in the alimentary canal of the earthworm, whilst *G. gigantea* inhabits the digestive system of the lobster. The latter attains a length of one-third of an inch, but the other species are of microscopic size. The G. of the earthworm, which may be selected as a typical form, consists of a little speck of protoplasm of granular nature. When magnified, it is seen to be long and oval in shape, and to have a *nucleus* and *nucleolus*. Living in the digestive canal of its host, the G. absorbs nourishment by imbibition, and thus, like a true parasite, lives at the expense of its host. No distinct body-wall exists, but in some cases (as in *G. gigantea*) one extremity of the body may be provided with hooked processes for attachment to the tissues of its host. Occasionally the interior of the body has been described as divided into two or more portions, but this appearance has probably some connection with the process of reproduction and development. The latter begins by two gregarinæ uniting, although changes may be observed in single gregarinæ; and the interior or central protoplasm of the body next divides into small portions, the outer part of the body having become thickened to form a cyst-like wall, whilst the body itself assumes a globular form. The cyst-like body sooner or later ruptures, and the small contained particles (*pseudonavicellæ*) escape as young gregarinæ. Some of the particles may exhibit *amœboid* movements, or those observed in the nearly allied *Amœba* (q. v.); hence some naturalists have maintained that gregarinæ are simply Amœba degraded by parasitism. The process of development in G. and the internal division of the body bear a strong analogy to the segmentation of the yolk seen in the eggs of higher animals. (See DEVELOPMENT OF THE EMBRYO.) Certain little bodies known as *Psorospermiæ* (q. v.) found as parasites on fishes are regarded as peculiar forms of G.

Gré'goire, Henri, a French priest and revolutionist, was the son of humble parents, and was born in the village of Vého near Lunéville, 4th December 1750. Educated by the Jesuits, he taught for a time in their seminary at Pont-à-Mousson, and was subsequently for years the zealous pastor of Embermésnil in Lorraine. In 1789 he gained a prize for an essay on the regeneration of the Jews. That same year G. was sent as a deputy to the States-General, and was soon known as a thorough-going democrat. He had no hesitation in accepting the new constitution of the clergy, decreed by the National Assembly in 1790, and under that constitution G. was next year elected Bishop of Mans. He sat also in the National Convention, yet never forgot the bishop in the statesman; and when it was demanded of him by the Convention that he should abjure Christianity, he rejected the notion with horror, and remained then and to the end faithful to his Christian profession in spite of scorn, hatred, and solitariness. In the Council of the Five Hundred G. used his influence indefatigably for the restoration of the Christian faith; and he presided over two national assemblies of the clergy held for that end. But as G. favoured Gallicanism, and in theology approached Jansenism, he was never in favour at Rome, and was compelled to demit his bishopric in 1801, and Bonaparte, though he made him a senator, preferred the friendship of the Pope to a reformed French Church. The Restoration regarded G. with the utmost disfavour. He devoted himself to study, declined to withdraw his oath to the revolutionary constitution, and, in spite of the hierarchy, had the last rites of the Church administered to him on his deathbed, 28th May 1831. G. wrote a *Histoire des Sectes Religieuses* (1810, 2d ed. 5 vols. 1828); *Essai Historique sur les Libertés de l'Église Gallicane* (1818, 2d ed. 1826); *De l'Influence du Christianisme sur la Condition des Femmes* (1821). See Carnot, *Mémoires de G.* (1837); Krüger, *Heinrich G.* (1838).

Gregorian Chant or **Tones**, the choral melodies introduced into the Roman Catholic liturgy by Gregory the Great (q. v.), and still used by the Roman, and, to some extent, by the Protestant Church. Gregory was the author of a musical system, as well as the organiser and composer of actual church song. He carried on the work of St. Ambrose (q. v.), Bishop of Milan in the 4th c., inventor of the 'Ambrosian chant.' The latter was founded on what was thought to be the Greek system of scales, and that again is thought by some to be identical with 'the tonality of the Hebrew music.' G. retained from the Ambrosian system four scales, called the Dorian, Phrygian, Lydian, and Mixolydian, under the name of 'authentic modes,' and added to each of these another called 'plagal.' (See diagram.)

It should be noticed that each authentic mode has the same keynote or 'final' (F) as its 'plagal' companion, and that they have a perfect fifth in common; also that every scale is made up of a perfect fifth added to a perfect fourth, and has a note called the 'dominant' (D), which was next in importance to the 'final' in the liturgical recitation. The notes are all 'naturals;' to speak more strictly, they are all *in one key, in the modern sense of that word.* The semitones thus occur in a different place in each scale.

Three more couples are required to give us seven 'finals,' an octave of finals. One (couple) was rejected for reasons of harmony, and the other two were the subject of dispute on the ground of alleged 'superfluity.' A decree of Karl the Great said, 'Octo toni sufficere videntur' (*tonus* = scale). The rhythm of Gregorian music follows the irregular accentuation of spoken language. See Coussemaker's *Histoire de l'Harmonie au Moyen Age*, and Stainer's *Dictionary of Musical Terms.*

Greg'ory I., surnamed **The Great,** the son of a Roman senator, and the grandson of Pope Felix, was born in Rome about 540. He was very carefully educated, and early held offices under the Roman Government. In 574 the Emperor Justin the Younger appointed him Prefect of Rome, but in 576 he resigned the post and entered a monastery on the Cælian Hill, and lived with the strictest austerity. Benedict I. made him a deacon, and in 579 Pelagius II. sent him as Nuncio to seek aid at Constantinople against the Lombards. He discharged his mission with great firmness and dexterity, resumed the rule of his monastery in 584, and in 590 was chosen as Pope. He devoted himself to the double task of spreading Christianity, and of reforming the monks and clergy. He aided Queen Theodolinda in converting the Lombards, sent missionaries to Sardinia, checked Nestorianism, repressed simony, and is linked to English history by his efforts to win over our forefathers from paganism. According to a beautiful story in Bede, G., when a young deacon, noticed several fair-haired slaves in the Roman market, and asked from what land they came. Being told they were Angles, he answered they would be, not Angles, but Angels if they were Christians, and thenceforth resolved to labour for the conversion of that people. Accordingly, in 597, he sent Augustine (q. v.) to Kent, and Christianity was planted in England. G. died at Rome in 604. He was zealous, mild, and strongly averse to persecution. He did more, it has been said, than any other Pope to extend the ecclesiastical power of Rome. Besides bringing about the conversion of the English, he won over Spain to orthodoxy, spread his influence throughout the West, and even into Greece, successfully withstanding the Patriarch of Constantinople, who claimed the title 'Universal Bishop.' He reorganised the Church funds, regulated the calendar, and instituted a new and solemn ritual. Unfortunately he had an illiberal dislike of classical literature and art, and, more than any other pontiff, fostered that excessive veneration of saints, martyrs, and relics, which afterwards sapped the strength of the Church. Among his works are letters, dialogues, homilies, and a treatise on the duties of bishops. The best edition of G.'s works is that published by the Benedictines of St. Maur (4 vols. Par. 1705), which contains the lives of G. written by Paulus Diaconus and Joannes Diaconus. See Gibbon's *Decline and Fall of the Rom. Empire;* Milman's *History of Lat. Christianity;* Lau's *Gregor I. nach Leben und Lehre* (Leips. 1845); Pfahler's *Gregor der Gr. und seine Zeit.* (Frankf. 1853).—**G. II.**, afterwards **Saint**, was born at Rome, and bred a Benedictine. He held the see of Rome from 715 till 731, at a time when Italy was distracted by the advance of the Lombards, and when the unity of the Church in the East and West was seriously threatened by the controversy about image-worship. Both circumstances served to loosen the hold of the Eastern Emperors on Italy, and to compel the Popes to independent negotiations with the Franks, so that the pontificate of G. is justly regarded as having greatly promoted the independence and the supremacy of the see of Rome.—**G. III.**, a Syrian by birth, was consecrated Bishop of Rome in 731, and, so long as he guided the Church of the West, carried out in all respects the policy of his predecessor, G. II. The latter had defended image-worship, and had treated the Emperor Leo the Isaurian like a disobedient child; G. III. formally sanctioned, at a council, the Western usage, and excommunicated the Emperor along with all enemies of the images. G. II. had given his support to the mission of Boniface, the English apostle of Germany; G. III. made Boniface archbishop. And, like his predecessor, G. III. invoked the help of the Franks against the Lombards. He is said to have written a work in favour of the use of images, and died 28th November 741.—**G. VII.**, the type of papalism in its loftiest aims as well as in its proudest spirit, was Pope from 1073 to 1085, but his influence on the affairs of the Roman Church had been decisive for nearly twenty years before he assumed the tiara. His own name was Hildebrand, and he was born about 1020, of humble parentage. Whether or not he was a native of Rome, he spent there most of his childhood, and was chaplain to Pope G. VI. For a time a monk at Cluny, he returned to Rome under Leo IX. and was raised to the cardinalate. Hildebrand's first great work for the reformation of the Church, begun in 1058, was to destroy the influence of the Roman nobility on the papal elections. This he accomplished, not without violence and bloodshed, by the help of the Norman dukes of S. Italy, who were content to become vassals to the successor of St. Peter. A still more arduous and ambitious venture was the attempt to make the papal election itself entirely independent of the Emperor. But circumstances favoured Hildebrand. Pope Nicolas was deposed in 1061; without waiting for the advice or initiative of the German court, Hildebrand and the other cardinals elected Alexander II. The mother of Heinrich IV., the young King of the Germans, had nominated another Pope, but soon after died; and the new regent saw it to be for his advantage to recognise the cardinals' choice. But that which completed Hildebrand's triumph in this matter, was when, on the very day of Alexander's death, he was chosen his successor by clergy and people, and took the name of G. VII. A rebellion of the Saxon princes constrained the king (afterwards emperor), Heinrich IV., to sanction the election, and even to submit to a penance imposed by the new Pope for having held intercourse with counsellors who had been excommunicated by Pope Alexander. The third of the great aims promoted by G. was finally and completely to impose celibacy on all clergy. Since the time of Leo IX. several synods had forbidden the married state to priests, but ineffectually. Taking advantage of the prejudices of the populace of Milan, G. in 1074 forbade the laity to receive the sacrament at the hand of a married priest, and commanded them to compel all such to separate

from their wives. The sufferings of the parochial clergy in consequence of this were indescribable, and lower clergy and bishops were alike bitterly incensed against a Pope who conferred such powers on the rabble. G.'s fourth and greatest undertaking was that of securing the freedom of the Church in the matter of the investiture of bishops and abbots. He regarded it as profanation and invasion of the Church's rights that bishops, selected by the Emperor for the most part arbitrarily, should receive purely spiritual appointments from the temporal power, and in the 'abominable usage' that had hitherto permitted this G. saw an open door for simony. His contention was that people and clergy should freely select the bishop, solely with regard to his fitness for office. So the monks, their abbot; and the thus elected bishop should receive investiture from his archbishop, the abbot from the bishop of the diocese. But G. was content that bishop and abbot should do homage to the king in respect of the temporalities of their offices. G.'s famous decree was first drawn up in 1075, though formally published only in 1078, and was to the effect that henceforth no clergyman should receive any spiritual office from the hand of a laic, and that no prince or other temporal potentate should hereafter confer any appointment in the Church. G.'s great contest with Heinrich IV. began in 1076. In 1073 the King had appointed a new Archbishop of Milan. The common people, enthusiastic for the Pope, chose another. Neither obtained general recognition, and in 1075 the nobility and higher citizens, determined to put an end to the perpetual tumults, petitioned the King to name a new and worthy archbishop. So that, when Heinrich had nominated Tedald, there were three archbishops of Milan, of whom two had been appointed by the King. G. was enraged, and when, in the course of the same year, an embassy came requesting him to crown Heinrich Emperor of the Romans, G.'s reply was substantially a threat to deprive Heinrich of his kingdom now and of salvation hereafter. On receipt of this, in January 1076, Heinrich was imprudent enough to decree the deposition of the Pope. G. replied by excommunication. The unlucky ruler's enemies at home insisted on his submission to the Pope, and compelled him to consent that G. should be invited to take part in a diet of the empire. G., delighted at the prospect of sitting as mediator between the King of the Germans and his princes, immediately hastened north. But when he reached the Po he learned to his dismay that Heinrich was in Italy. G. fled to Canossa, whither he was followed by Heinrich. And here the Pope was persuaded to absolve Heinrich, who did penance for three days. The German princes, enraged that the Pope had in so far yielded, chose in 1077 an anti-king, but in 1080 the rebels were crushed. The Pope, disappointed in his hope of securing power over the King, put him a second time under excommunication, while Heinrich again appointed an anti-pope, Clemens III. In spring 1081 the indefatigable soldier was marching southward through Italy against Rome; but his army was small, and twice he had encamped before the city ere in 1083 he took a part of it, and established his anti-pope in the Lateran. But on the approach of Robert Guiscard, who at last listened to G.'s entreaties for help, Heinrich retired; and Robert, entering the city, carried G. off with him to Salerno, where, after eleven months, G. died, 25th May 1085. He did not live to see the issue of his work, and many of his schemes—such as those for making the several European states fiefs of the apostolic see, and his design of a crusade—were entirely absorbed in the struggle with the imperial power. But he lived long enough to set a movement going which turned the course of European history into new channels, and of which we still feel the effects. G. was a great man, and was inspired by an ambition that was at least as noble as it was perilous to liberty. Nothing mean or selfish urged him to advance his portentous claims. If he desired to be the Vicar of Christ on earth, it was to do the work of Christ, to confront and overcome evil-doers, and to lift up the down-trodden and the oppressed. See Milman's *History of Lat. Christianity;* Voigt's *Hildibrandt als Papst Gregor VII.* (2d ed. 1846); Floto's *Kaiser Heinrich IV.* (1855-57); Gfrörer's *Gregor der Siebente* (7 vols. 1859-64).—**G. XIII.** was born at Bologna, January 7, 1502, and educated in his native city. He had for eight years taught canon law with success at Bologna, when the learning and activity displayed by him at the Council of Trent recommended him to the dignity of cardinal. He was chosen Pope chiefly at the instance of Cardinal Granvella. Though formerly far from an ascetic in his life, he entered with zeal and self-devotion into the great work of Catholic restoration, and was indefatigable in the struggle against Protestantism. He celebrated the massacre of St. Bartholomew by processions and medals, and did his best to suppress the Gallican liberties, as well as the Huguenots. No less than twenty-two Jesuit colleges owe to him their origin. He was zealous in the cause of foreign missions. The new edition of the *Corpus Juris* was due to G., and he has the credit of having succeeded in carrying out the reform of the Julian calendar. But his many undertakings involved the papal treasury deep in debt. He died in 1585. See Ranke's *History of the Popes* (Eng. trans. Lond. 1843 and 1847).—**G. XVI.** was born at Belluno, 18th September 1765. He entered the order of the Camaldulites, and became a profound student of theology and the Oriental languages. Called to Rome as general of his order in 1814, he held the offices of Consultor of the Inquisition, of the Propaganda College, Examiner of Bishops, &c., was made a cardinal in 1826, and at the same time Prefect of the Propaganda. In 1831 he was elected Pope. Alarmed by the outbreaks which in Italy followed the French revolution of July 1832, he made liberal promises, which on the suppression of the insurrections he failed to keep, and for some years after 1836 his rule was marked in an unseemly way by proscriptions and punishments of the severest kind. The shameful treatment of the Roman Catholics of Poland by the Russian Czar did not evoke from G. the stern denunciations that became his exalted office. He died 1st June 1846. See La Farina's *Storia d'Italia dal* 1815 *al* 1850.

Gregory Thaumatur'gus ('the wonder-worker') belonged to a wealthy heathen family at New Cæsarea in Pontus. Even after his conversion to Christianity at the age of fourteen, he was resolved to devote himself to the study of law. But circumstances having in A.D. 231 led him to Cæsarea, he there came under the powerful influence of Origen, whose conception of Christianity G. was ever after zealous in defending and disseminating. Leaving Origen at Alexandria in 239, he went homewards with the design of leading a hermit's life, but was induced to become bishop of his native city, where, it is said, there were then only seventeen Christians, while at G.'s death in 270 there were only seventeen heathens. G. was strong in word and in deed; and to his miracles, especially in casting out devils, he owes his name. He escaped the Decian persecution by flight, and survived to ward off a fearful pestilence from all good Christians or converts. G. was zealous against heretics, but was himself accused of a leaning towards Sabellianism. His extant works, including the Panegyric on Origen, were published by Vossius at Mainz in 1604 (Par. 1622); his life, at least the miraculous part of it, was descanted on by Gregory of Nyssa.—**G.**, surnamed **the Illuminator**, because he enlightened his country with a knowledge of the gospel, was born at Vagarchabad in 257, escaped from a massacre of his family at the court of Armenia, and was carried to Cæsarea by his nurse, who brought him up in the Christian faith. Returning to Armenia in the train of Tiridates II., he was soon thrown into prison for his attachment to his religion; but having cured the king of a deadly malady, he was not only liberated from his dungeon, but converted his royal patient. Christianity rapidly spread. To persuasion G. added violence. The idols were shattered, the pagan temples destroyed, and churches erected in their stead. G. was now consecrated Bishop of Armenia, and in his turn made numerous priests. He founded monasteries, hospitals, schools, and libraries, and fixed his episcopal residence at Vagarchabad, the ruins of which may still be seen in the neighbourhood of the monastery of Etschmiadzin (q. v.). He was invited to attend the Council of Nice in 325, but sent a deputy instead. After discharging the duty of patriarch for many years, G. withdrew from all human society to a cave in Mount Sebu, where his lifeless frame was afterwards discovered, about 332. His relics are now scattered over Western Asia and Europe. The homilies, orisons, and prayers ascribed to G. are collected in the work entitled *Le Celèbre Omelie e Preci del Nostro S. Padre Gregorio Illuminatore* (Ven. 1838). The legend of G.'s life, given in the *Acta Sanctorum* of the Bollandists, is taken from the Greek text of Agathangelos.—**G. of Nazian'zus**, one of the famous 'three Cappadocians,' combined the highest culture of Greek theology and sacred eloquence with Nicene orthodoxy, and was in his time one of the most influential apostles of Trinitarianism. Born about 330 in or near Nazianus, in the S.W. of Cappadocia

he was early dedicated to the clerical life by his father, who was afterwards Bishop of Nazianzus. The young theologian visited Cæsarea and Alexandria, and at Athens devoted years to the study of grammar, mathematics, rhetoric, and philosophy, in the company of his countryman Basil. At the age of thirty he returned home, and in 361 was ordained a presbyter in his native city, but withdrew into retirement. The bishopric of Sosima was forced on him, but he soon fled from its responsibilities, and in 374 became the vicar of his aged father. His life passed between official activity and monkish seclusion till he was called to a charge in the Eastern capital, where the orthodox party was still in a depressed minority. G.'s success as apologist and pulpit orator was marked; and in 381 he was compelled to accept the metropolitan bishopric, which, however, he soon abdicated. He returned to Cappadocia, and till his death in 389 or 390 devoted himself to private studies. Neither so powerful a churchman as Basil, nor so original a thinker as his own namesake and friend of Nyssa, G. was distinguished by rhetorical power, versatility, and general culture. His intensity of feeling often passed into bitterness, and his repeated resignations of influential position are not to be wholly attributed to commendable humility. Some of G.'s hymns are good, but his most important works are his discourses on various subjects, especially the five dedicated to the exposition and defence of the Nicene doctrine, which earned for him the title of 'the theologian.' The best edition of G.'s works is the Benedictine (not finished till 1840); and the most valuable memoir is the monograph of Ullmann, *Gregorius von Nazianz der Theologe* (1825).—**G. of Nyss'a**, the brother of Basil the Great, was born about 331 of a family distinguished in Cappadocia both for piety and social standing, but he does not seem to have enjoyed the very unusual opportunities of study, both at home and in Greece, that were permitted to his brother. After he had held for a time the ecclesiastical function of lector, he, to the great grief of his friends, forsook the Church for the profession of orator. But he was soon persuaded to return to pastoral office, and in 371 or 372 was, against his will, and in spite of his being a married man, consecrated Bishop of Nyssa by his brother Basil. It was probably less his energy of character that commended him to the post than his power of oratory and his dogmatic subtlety—gifts of great value while Antitrinitarian heresy was still in the ascendant. In 375 G. was condemned and banished by a court of synod; and he remained in exile, and subject to persecution, till the death of the Emperor Valens permitted him to return to Nyssa with enthusiastic welcome. In 381 G. was present at the second Œcumenical Council, and it is doubtful whether or not the additions then made to the Nicene Creed are from G.'s pen. He visited Jerusalem, made various public appearances in Constantinople, and is last heard of at a council held there in 394. G.'s importance depended on his zeal and ability in defence of the mystery of the Trinity. On this head he is one of the great pillars of orthodoxy, though here and there he shows traces of Origen's theology. His sermons, orations, homilies, and letters first appeared in 2 vols. at Paris in 1615. There are several good monographs on G., especially that of Möller (1854).—**G. of Tours**, born about 540 at Clermont in Auvergne, belonged to one of the most distinguished Roman families in Gaul, and was originally named Florentius. Coming on a pilgrimage to the grave of St. Martin at Tours, he secured the favour of King Siegbert and the goodwill of the clergy, and in 573 was made Bishop of Tours. With self-denying zeal, resolution, and prudence, he watched in troublous times over both the spiritual well-being of his diocese and the temporal interests of the city. G. died 17th November 594. His earlier works on the miracles of St. Martin, and on the lives of other saints and confessors, are of small importance, but his ten books on the history of the Franks remain a valuable treasury of the contemporary history of the 6th c. First printed in 1511-12, and critically edited in 1699, G.'s chronicle has been repeatedly translated. See Löbell's *Gregorius von Tours und seine Zeit* (1839). The best edition is that given by Pertz in the *Monumenta Germaniæ Historica.*

Gregory, a Scottish family, many members of which have been eminent in science, and of which sixteen members have held professorships in England and Scotland.—**James G.**, son of David G., a landed proprietor, was born at Aberdeen in 1638, studied at Aberdeen University, devoted himself to science, and in 1674 was made Professor of Mathematics in Edinburgh University. In October 1675, while showing his pupils Jupiter's satellites through a telescope, he was struck blind, and died in a few days. G. wrote *Optica Promota* (1663), which describes his great invention of the 'Gregorian' reflecting telescope; *Vera Circuli et Hyperbolæ Quadratura* (1667); *Geometriæ Pars Universalis* (1668); *Exercitationes Geometricæ* (1668); *The Great and New Art of Weighing Vanity*, an attack on a Glasgow professor.—His son, **James G.**, born in 1674, founded the School of Medicine in Aberdeen, where he was Professor of Medicine. —**John G.**, son of the last, born at Aberdeen, June 3, 1724, studied at Aberdeen and Leyden, held chairs of medicine at Aberdeen and Edinburgh, becoming in the latter place highly famous as a teacher and as a member of the brilliant literary society of the time. G. died February 9, 1773. Among his works are *Elements of the Practice of Physic* (1772); *A Comparative View of the State and Faculties of Man with those of the Animal World* (1765); *A Father's Legacy to his Daughters* (1793).—**James G.**, son of the above, born at Aberdeen in 1753, became in 1776 Professor of Medicine in Edinburgh, and died April 2, 1820. He was a fine classical scholar, as well as a thorough scientist. His chief works are *Conspectus Medicinæ Theoreticæ* (1778), and *Literary and Philosophical Essays* (1792). —His son, **William G.**, born in Edinburgh, December 25, 1803, held the chair of chemistry in Aberdeen and in Edinburgh, and died April 24, 1858. He made several important contributions to chemistry, and was one of the first exponents of Liebig's theory. He translated Liebig's *Principles of Agricultural Chemistry* (1855), and edited part of Turner's *Elements of Chemistry.*— Another branch of the G. family descended from **David G. of Kinardie**, who was a brother of James G. the inventor of the 'Gregorian' telescope, and whose son, **David G.**, born at Aberdeen in 1661, was mathematical professor in Edinburgh, and in 1691 was made Professor of Astronomy in Oxford, chiefly through the influence of Newton, whose *Principia* he had introduced into Edinburgh University. He died at Maidenhead, Berkshire, in 1710. Among his works are *Exercitatio Geometrica de Dimensione Figurarum* (1684), *Catoptricæ et Dioptricæ Sphæricæ Elementa* (1695), *Astronomiæ Physicæ et Geometricæ Elementa* (1782).—**James G.**, brother of the above, succeeded him as Professor of Mathematics in Edinburgh University; and his brother, **Charles G.**, was Professor of Mathematics in St. Andrews University from 1707 to 1739, when he was succeeded by his son, **David G.**

Greif'enberg, a walled town of Pommern, Prussia, on the Rega, 20 miles from its mouth and 40 N.E. of Stettin. It has a garrison, and is noted for its linens. Pop. (1871) 5619. G. is also the name of a small town (pop. 1485) in the Ukermark, province of Brandenburg, and of another (pop. 2496) in Prussian Silesia.

Greif'enhagen, a town of Pommern, Prussia, on the Reglitz, 12 miles S. of Stettin, has cloth factories and distilleries. Pop. (1871) 6611.

Greifs'wald, a town of Pommern, Prussia, on the Rick, about 3 miles from its mouth, and 22 miles S.E. of Stralsund by railway. G. has a saltwork, manufactures some paper and tobacco, does a little weaving, and carries on a coasting trade (G. had fifty-five ships in 1872). The University of G., founded in 1456, has forty-six professors besides ten *privat-docents*, and over 460 students. In April 1878 the university received a grant of £19,050 for a new library, and £10,000 for a new physiological laboratory. The Agricultural Science Academy at Eldena, about 2 miles off, is associated with the university. Pop. (1871) 17,238.

Greiz, capital of the principality of Reuss G., Germany, on the White Elster, and 50 miles S.S.W. of Leipsic, with which it is connected by rail. It has three palaces, and manufactures of woollen, half-woollen, cotton stuffs, &c. Pop. (1871) 11,582.

Grena'da, one of the most beautiful of the Windward Islands, in the British W. Indies, lies in lat. 11° 58′-12° 30′ N., and long. 61° 20′-61° 35 W. Area, 133 sq. miles; pop. (1871) 37,684, of whom 1344 were Asiatic coolies, and 1135 Africans. G. is of volcanic origin, is traversed by a mountain range attaining, in Mount St. Catherine, a height of 3000 feet, and exports sugar, cotton, rum, tobacco, and cocoa. The capital is St. George, and other towns with good harbours are St. Mark,

Charlotte-Town, St. Patrick, and St. Andrew. G. was discovered by Columbus in 1498, occupied by the French in the 17th c., and taken by the English in 1783.

Grenade' (Prov. *granada*, from Lat. *granata*, 'pomegranate'). The hand-G., so called from its resemblance in shape to a pomegranate, is a hollow ball of iron or glass 2½ inches in diameter, charged with powder, and having a tube and fuse attached. When the fuse burns sufficiently low, the powder is fired and explosion takes place. These missiles, which are no longer used in ordinary warfare, were invented in 1594, and were long found useful in field and siege operations. The Bomb (q. v.) is practically a G. fired from a mortar or howitzer.

Gren'adier Guards, the first of the three regiments of foot guards in the British army, numbering, in 1876–77, 2543 officers and men. The Scots Greys form a regiment of horse-grenadiers. In both of these regiments the men wear high bearskin caps. See *The Grenadier Guards, their Origin and History*, by Lieut.-General Sir F. W. Hamilton, K.C.B. (Lond. 1875).

Gren'adiers were first employed (1667) in the French army to throw grenades into the covered way of a fortress, remove the obstacles to the advance of the troops, lead in the assault, &c. The G., who, as they were exposed to special dangers, enjoyed special privileges, were the select men of their corps. In the armies of the present day, the tallest and stoutest men of every regiment of infantry are selected to form a company of G. This company usually leads in the attack, and occupies the place of honour (the right) when the regiment is in line. They are clothed and accoutred like the men of the other companies, with the exception of slight peculiarities in the ornaments of the coat and hat.

Gren'adines, or **Gren'adilles**, a southerly group of the Windward Islands, in the West Indies, belonging to Great Britain, and stretching between St. Vincent and Grenada. They number 23 islets, have a total area of 7000 acres, and a pop. of 3000. The largest are Carriacou and Begnia.

Gren'oble, the chief town in the department of Isère, France, on both banks of the Isère, at the foot of Mont-Rachais, 58 miles S.E. of Lyon. It has many fine streets and boulevards with numerous fountains. The river is lined with spacious quays and spanned by two handsome bridges. Among the chief buildings are the church of Notre-Dame, partly Gothic, partly Romanesque, and said to have been founded by Karl the Great; St. Laurent, belonging to the 11th c., and St. André, which contains Bayard's tomb, and the Palais de Justice, built in the styles of the 15th and 16th centuries. G. has several literary and scientific societies, and a library of 80,000 volumes. The town is very strongly fortified, has large manufactures of gloves, and some trade in wine, liqueurs, wood, grain, &c. Pop. (1872) 42,660. G., originally a town of the Allobroges, when it was called Eularo, was walled anew by the Romans in 288, and in 379 enlarged by the Emperor Gratian, who gave it the name of *Gratianopolis*, of which G. is a corruption. It was the see of a bishop as early as the 4th c.

Gren'ville, an important English family connected with the county of Buckingham since the reign of Henry I., became conspicuous in the 18th c., when **Richard G.**, by his marriage with Hester, daughter of Sir Richard Temple, afterwards the Countess Temple, acquired great wealth and influence. Their son, **Richard G.**, succeeded through his mother to the title and estates of the Temple family. In 1757 he was made Keeper of the Great Seal, and in the political strifes of the time was first the friend and afterwards the foe of Chatham, who had married his sister Hester. It is a compliment to his powers that some have attributed to him the authorship of the *Letters of Junius*. He died childless, 11th September 1779. His brother, **George G.**, was born October 14, 1712. He studied at Oxford, entered Parliament in 1741, was made Lord of the Treasury in 1747, and Treasurer of the Navy in 1754. He became Secretary of State in 1761, and in 1763 succeeded Bute, of whom he was a supporter, as Prime Minister. While holding this office, in which he was merely a tool of Bute, he urged on the prosecution of Wilkes (q. v.), and introduced the Stamp Act (q. v.), which led to the war with the American colonies. His Ministry was thrown out by the Regency Bill in 1765, and G. died 13th November 1770.—**William Wyndham, Lord G.**, third son of the preceding, was born 25th October 1759. He entered Parliament in 1782, and in 1789 was made Speaker of the House of Commons despite the opposition of Fox and Burke. Shortly afterwards he was chosen Secretary of State for Home Affairs, was Pitt's chief supporter, and in 1790 was raised to the peerage as Baron G. He became Foreign Secretary in 1791, quitted office in 1801, and shortly joined Fox in opposition to the Addington Administration. He was Premier in 1806–7, and acted in unison with Lord Grey until 1815, when G. advocated the prosecution of war with Napoleon. He afterwards supported Canning, being a zealous advocate for the removal of the Catholic disabilities. G. died at Dropmore, Buckingham, January 12, 1834. See the *Grenville Papers* (4 vols. Lond. 1852–53), a collection of G.'s family documents.

Gresh'am, Sir Thomas, son of Sir Richard G., was born in 1519, studied at Cambridge University, became a member of the Mercers' Company in 1543, and in 1552 was sent as 'king's agent' to Antwerp, where he skilfully negotiated for loans with the Flemish merchants. From this post he was dismissed by Queen Mary, but was soon reinstated through his successor's incapacity, and in 1559 was knighted by Elizabeth, and sent as ambassador to Antwerp. In 1564 he gave a large sum to raise an Exchange for the London merchants, the building being opened in 1570 by Elizabeth, who named it the Royal Exchange. In 1569 he persuaded the crown to borrow from the London instead of from the foreign merchants, a change which produced much financial good. G. died November 21, 1579, having by his will set aside large sums for charitable institutions, and arranged that his house in Bishopsgate Street should be converted into a college. This building was pulled down in 1768, but 'Gresham College' still exists, the lectures being given in a hall in Gresham Street.

Gret'na Green Marriages. Prior to the passing of the Marriage Act (England) of the 27th March 1754, persons in England desirous of marrying secretly could effect their purpose by repairing to the Fleet Prison (q. v.). After the passing of that Act, which provided that every marriage celebrated in England should be public or in presence of witnesses, English persons wishing to marry secretly required to get away out of England, to which alone the Act referred. Thus the practice arose of posting to the Border and crossing into Scotland, where every facility was afforded for the consummation of the act. The nearest and most convenient spot across the Border was Gretna Green. In Scotland the law was that mutual declaration of acceptance as husband and wife before witnesses constituted a legal marriage; and as the rule is that marriage contracted according to the law extending to the spot in which the contract is made shall be legal all the world over, the G. G. M. were indisputable. Such marriages are still legal, under the condition of the residence of one of the parties in Scotland for twenty-one days; but as the English law now recognises marriages before the superintendent registrar as legal, there is little or no occasion now to have recourse to the once-famous 'blacksmith.'

Gré'try, André Erneste Modeste, a musical composer, was born at Liége, Belgium, February 11, 1741, became a choir boy in the Collegiate Church at the age of six, and in 1759 went to Rome to study counterpoint under Casali. He studied little, but he brought out an 'Intermezzo' in 1765 at a Roman theatre. In 1767 he went to Paris. Between this and 1803 he wrote fifty—chiefly comic—operas, *e.g.*, *Le Huron* (1768), *Le Tableau Parlant* (1769), *L'Amant Jaloux* (1778), *Richard Cœur de Lion* (1785), *Guillaume Tell* (1791), *Delphis et Mopsa* (1803). G. acquired great renown, had a street named after him, was made member of many learned bodies, and received substantial benefits from Napoleon to compensate him for the loss of his wealth during the Revolution. He died at Montmorency, near Paris, 24th September 1813. G.'s works suffered neglect at the time that Méhul and Cherubini began to compose, but they were afterwards revived with new honours. He lived among a circle of admirers, and is said to have disdained all music but his own. Strong in graceful and original melody and dramatic expression, he was extremely ignorant of the principles of his art, as his works abundantly show.

Greuze, Jean Baptiste, a famous French genre painter, was born at Tournus, Burgundy, in 1726. He studied at Lyon, Paris, and Rome, and for a time misdirected his powers through

ambition to be an historical painter, but afterwards limited his efforts to genre and portraits, and achieved a remarkable success. He was long an Associate of the French Academy of Painting, and died at Paris, March 21, 1805. Among his chief works are 'La Petite Fille au Chien,' perhaps his masterpiece, 'La Bonne Mère,' 'Le Gâteau des Rois,' 'La Fille Confuse,' 'Une Jeune Fille tenant une Colombe,' &c. G.'s treatment is sometimes meretricious, and his modelling defective. He was especially successful in subjects from common life, and above all in roguish or languorous female faces, which he executed with peculiar softness and grace, with combined delicacy and richness of colour.

Grew'ia, a genus of small trees and shrubs belonging to the order Tiliaceæ found in warm regions, but absent from America. The wood of *G. elastica* and *G. occidentalis* is used for making bows and carriage shafts. The inner bark of many of the species yields a strong fibre.

Grey, Charles, first Earl, belonged to the old Northumberland house of G., of which the Barons G. of Werk and the Earls of Tankerville were branches. He was born in 1728, was at first Sir Charles G. of Howick, commanded in the wars with the American colonies and the French Republic, was made for his services Baron G. de Howick in 1804, and Earl G. in 1806. He died 14th November 1807.—**Charles G., K.G.**, second Earl, son of the above, was born at Fallowden, Northumberland, March 13, 1764. He was educated at Eton and King's College, Cambridge, and in 1786 entered Parliament as a Whig, and soon became so distinguished for forcible and graceful oratory, that he was chosen at the age of twenty-four, along with Burke, Fox, Sheridan, and Windham, to conduct the impeachment of Warren Hastings. During the times of the Revolution he adhered to Fox, and always strove to end the war between France and England. He early stood forth as the advocate of parliamentary reform, exposing the abuses of the Government, and resisting its arbitrary measures. In 1797 his proposal to extend the suffrage was thrown out; in 1799 he opposed the union with Ireland; and in 1806, when the Grenville Ministry was formed, became, as Lord Howick, First Lord of the Admiralty; shortly after succeeded Fox as Foreign Secretary and leader of the Commons, and carried a bill to abolish the slave trade. In 1807, after the dissolution of the Grenville Ministry, he became Earl G., and thenceforth for several years led the Opposition in the Lords, though his adhesion to the Government was repeatedly sought for. He defended Queen Caroline with remarkable power; attacked Canning with deadly point in 1827; and at length, in 1830, when the stubborn resistance to reform had brought the country to the brink of revolution, became Premier of a Whig Administration. A Reform Bill was introduced, and, after its rejection by the Lords had almost kindled a rebellion, was carried, June 4, 1832. The first reformed Parliament carried several weighty measures, freeing the slaves in the colonies, destroying the monopoly of the East India Company, passing the bill for National Education in Ireland, the Irish Church Temporalities Bill, &c. The Irish Coercion Bill breaking up the Ministry in 1834, G. resigned the office of Premier, and retired with an unsullied character and with general admiration and respect. He died at Howick House, Northumberland, July 17, 1845. See *Life and Opinions of the Second Earl G.* (Lond. 1861), edited by his son.—**Henry George G.**, third Earl, was born 28th December 1802, studied at Cambridge, entered Parliament as Lord Howick in 1829 for Winchelsea, was Under Secretary for the Colonies in his father's Administration (1830–33). When the Whigs re-entered office in 1835 he became War Secretary with a seat in the Cabinet, but resigned in 1839. In 1842 he supported the motion of Villiers for the repeal of the corn laws. Called to the House of Lords by the death of his father, he was appointed Secretary for the Colonies in the Ministry of Russell. In this position he displayed great powers both as a debater and orator, but overweening pride and egotism made him intensely unpopular. Since the fall of the Russell Ministry (1852) he has occupied an isolated position, with a disposition to criticise in a hostile spirit the policy of his former associates. He is the author of *Colonial Policy of Lord J. Russell's Administration* (2 vols. Lond. 1853), and *Parliamentary Government considered in Reference to Reform* (new ed. 1864).

Grey, Lady Jane, famous for her accomplishments and misfortunes, was born at Broadgate, Leicestershire, in 1537. She was the eldest daughter of Henry Grey, Duke of Suffolk, and Lady Frances Brandon, niece of Henry VIII., was educated with the utmost care, and early displayed a singular scholarly aptitude, becoming thoroughly versed in Greek, Latin, French, and Italian, and even dipping into Hebrew and Arabic. A well-known passage in Ascham tells how he found her reading Plato's *Phædon* in the original, while the family were out hunting. In 1553 the Duke of Northumberland (q. v.), bent on altering the succession, dictated a 'plan' to Edward VI. (q. v.), by which that king set aside his sisters Mary and Elizabeth, and named as his successor Lady Jane G., whom Northumberland had married to his son Guildford Dudley. On Edward's death (1553), Lady Jane G. was, against her will, proclaimed queen, but the people, especially in the eastern counties, supported Mary. Northumberland was defeated and beheaded, and Lady Jane imprisoned in the Tower after being queen for ten days. On February 8, Mary pronounced sentence of death against her hapless rival, who was executed on February 12, 1553. Lady Jane G. has left in her letters to Bullinger, says Mr. Froude, a portrait of herself drawn by her own hand—a portrait of piety, purity, and free noble innocence, uncoloured even to a fault with the emotional weaknesses of humanity. See Harris Nicholas' *Memoirs and Remains of Lady Jane G.* (new ed. Lond. 1832), and Froude's *History of England* (vols. v. and vi.).

Grey, Sir George, K.C.B., an explorer and colonial governor, born in Ireland, after the death of his father, who fell at the storming of Badajos, 7th April 1812, entered the army in 1829, and in 1837–39 led a number of expeditions into the interior of Western Australia, displaying great courage and skill. He was governor of South Australia from 1841 to 1846, when he was made governor of New Zealand, and in that office showed rare administrative powers. He was made a K.C.B. in 1848, governor of the Cape of Good Hope in 1854, and in 1861 was replaced in the governorship of New Zealand, where the Maories and English were at war. Through his address and firmness, and the ability of General Cameron, the strife was satisfactorily ended, and in 1867 G. returned to England. He is the author of *Journals of Two Expeditions in N.W. and W. Australia* (1841); *Polynesian Mythology* (1855); and *Proverbial Sayings of the Ancestors of the New Zealand Race* (1858).

Grey'hound, a variety of Dogs (q. v.) distinguished by the lithe, slender body, the shapely and delicate limbs, the length of the muzzle, and the thin, long tail. The chest is deep, allowing free play for the lungs in an extended chase, whilst the hinder quarters are somewhat sloped and narrow. The G. is used for hunting hares, or in 'coursing,' as the sport is named, and a great deal of attention is paid to its breeding and training. In order to give to the breed the powers of endurance necessary for the chase, breeders have been accustomed to unite the bulldog with the G.—the coarser features of the former being toned down after the lapse of time, and by the effects of interbreeding. In the chase of the hare, the latter evades the G. by 'doubling,' or suddenly turning in a direction opposite to that in which it was running, the G. being carried far past its prey before it can recover itself, and start on the fresh line of pursuit. The original habitat of the G. is difficult to trace. The best-known varieties are the *Irish G.*, noted for its strong build, its somewhat coarse hair, and pale fawn colour. The average length is 62 inches. The *Scotch G.* has also a rough coat, and is nearly related to the Deerhound (q. v.). The latter is smaller than the Irish G. The *Russian G.* is thick, and rough at the extremities of the body, while the tail is tolerably bushy. The *Persian* variety, used for hunting the antelope and wild ass, is of light colour. The *Italian G.* is a small breed, kept as a mere pet, and noted for the general delicacy of its frame, the weight of a highly-bred specimen being about 8 lbs., and the height 14¼ inches. The Italian G. is singularly liable in Britain to affections of the lungs. See *Stonehenge on the G.* (new ed. Lond. 1875).

Grey'ness of the Hair, or **Canit'ies**, may be congenital, accidental, or senile. Congenital greyness is usually partial, occurring in the form of round patches; but cases have been met with in which the hair on one side of the head was brilliantly white, while on the other side it was jetty black. Accidental and senile greyness present varieties in extent. When white hair falls off it is not reproduced. Blanching of the hair commences

at the root, and the coloured part is gradually carried onwards, further and further from the integument. Black and brown hair is most liable to greyness, but blonde and auburn hair is more liable to fall off. When the hair is 'snowy,' of an opaque white, and of the thickness of ordinary hair, it contains abundance of calcareous salts; but when it is clear and transparent, assuming a yellowish tint on exposure to the atmosphere, it contains little or no calcareous salts. Senile greyness depends on diminished powers of the nervous system, resulting in the alteration of pigmentary deposits in the formative cells of the hair. In most cases the effects are gradual; but there are numerous instances on record in which the change took place within a few hours, owing to violent mental emotions. The hair of Marie Antoinette, the wife of Louis XVI., became grey in a short period, from grief. So also with Mary Queen of Scots, Sir Thomas More, and others. Rayer mentions a case in which several of the cilia became blanched within a short time in consequence of mental agitation, and the writer had at one time under his care a young lady suffering from acute mania, whose eyelashes became white within ten hours, the hair of the scalp not being affected.

Grey'wacke. See GRAUWACKE.

Gries'bach, Johann Jakob, an illustrious biblical critic, was born at Butzbach in Hessen, 4th January 1745, and early in life resolved to devote himself entirely to the critical study of the New Testament text. After studying at Tübingen, Halle (where he came under the influence of Semler), and Leipsic (where he formed a friendship with Ernesti), he visited the great scholastic libraries of Germany, Holland, France, and England. In 1771 he attached himself to the University of Halle, and in 1776 was called to Jena, where he laboured for more than thirty years, dying 24th March 1812. G.'s edition is generally regarded as the earliest really critical edition of the New Testament Scriptures. It appeared in 1775-77 in two volumes, a third edition being begun in 1827 under the superintendence of D. Schulz. The *Populäre Dogmatik* was issued in 1719 (4th ed. 1789), the *Symbolæ Criticæ* in 1785-93, and the *Commentarius Criticus in Textum N. T.* in 1798-1811. G.'s name is associated with a threefold classification of the New Testament MSS. into—(1) the Alexandrine recensions, (2) the Latin or Western recensions, (3) the Byzantine recensions. Although this classification varies in some respects from that of other scholars, it is in the main a sound division. See *Outlines of Textual Criticism applied to the New Testament* (Oxf. Clar. Pr. 1872). G.'s life has been written by Köthe (1812), Augusti (1812), and Eichstädt (1815).

Griff'ard (*Spizaetus bellicosus*), a species of Eagle (q. v.) sometimes known as the martial eagle, occurring in S. Africa. The colour is dark brown, the feathers bordered by paler brown, and the quill feathers black. The tarsi are long and slender, the inner toe exceeding the outer in length. The nostrils are large and oblique. The bird is powerful and rapacious, and its cry is shrill and disagreeable.

Griff'in (Gr. *gryps*, 'the hook-beaked'), a fabulous animal in Greek mythology, with the body of a lion and head and wings of an eagle. It seems to have been the offspring of Eastern, not of Hellenic fancy. The earliest Greek writer who mentions the G. is Hesiod, and Philostratus includes it among the creatures which were set over the gold of India. The figure of the G. was sometimes included in Greek works of art. It is, however, more often met with in romantic than in classical fiction, and in the medieval romance is the most common custodier of treasures and captive princesses. Its existence was believed in even during the 16th c. The G. is a prominent bearing in heraldry.

Griffin, Gerald, an Irish poet and novelist, was born at Limerick, December 12, 1803. After several years of literary work in London, he joined the monastic order of the Christian Brothers of Cork, and died there, June 12, 1840. Several of his lyrics are tender and musical. Of his novels, the best is the *Collegians* (1828), a powerful tragic story, which won considerable popularity, and which is the groundwork of Boucicault's *Colleen Bawn.*

Griffin, or **Griffon Vulture**, a name given to the Fulvous Vulture (*Gyps fulvus*), a bird distributed very generally throughout the Old World. Its colour is a dirty yellowish brown above, the wings and tail are black, and the head and neck covered with white down. The average length is 4 feet. The G. is remarkable for its keen scent and sight, which enable it to ascertain the presence of carrion and prey at a considerable distance.

Grigoriop'ol, a fortified town of Russia, government of Kherson, on the left bank of the Dniester, 78 miles N.W. of Odessa. Founded by Armenian settlers in 1793, it was named after the national saint, Gregory the Illuminator (q. v.). It has some manufactures of silks and cottons. Pop. 6477.

Grill'parzer, Franz, an Austrian dramatist, was born at Vienna, 15th January 1790. After studying law, he entered the Austrian public service, in which he attained the rank of Reichsrath. He died 21st January 1872. G. first attracted public notice by his 'fate-tragedy,' *Die Ahnfrau* (1816, 6th ed. 1844), in which the fatalistic element was carried to an extreme. His later works are characterised by melodious language and sentimentality. G. wrote, besides minor pieces, *Das Goldene Vlies* (1822); *König Ottokar's Glück und Ende* (1825), generally thought his best piece; *Melusine*, an opera (1833); *Der Traum, ein Leben* (1834); *Weh dem, der lügt* (1840); and *Esther* (1863). An edition of G.'s *Sämmtliche Werke* began to be published in 1872. See the sketch of G. by K. von Wurzbach (1871), and Carlyle's *Essay on German Playwrights.*

Grilse. See SALMON.

Grimm, Friedrich Melchior, a distinguished French critic of German birth, was born at Regensberg, 25th December 1723. While still a mere youth, he accompanied a young nobleman to Paris as his tutor, and there settled permanently. He made Rousseau's acquaintance about 1749, and was by him introduced to Diderot, Holbach, and others of that brilliant circle in which he was himself to shine; and as secretary to the nephew of Marshal Saxe, G. early found his way into the most select society of Paris. In 1776 he was made a baron, and was appointed Minister at the French capital of the Duke of Gotha. Long ere this G. had begun with several German princes that extensive literary correspondence which he preserved to our day—a complete review of all that is noteworthy in French literature from 1753 to 1790. At the Revolution G. retired to Gotha; was made Russian Minister at Hamburg by the Empress Catherine in 1795; and died at Gotha, 19th December 1807. The 16 volumes of his *Correspondance Littéraire, Philosophique et Critique*, were published in 1812 at Paris; a new and complete edition appeared in 1829-31 (15 vols.).

Grimm, Jacob Ludwig, one of the greatest of philologists, may be said to have given the scientific foundation to all subsequent investigations as to the origin, history, character, and relations of the Germanic language. He was born at Hanau in Hessen, studied law at Marburg, and while holding the office of War Secretary, found time to explain the literature of the middle ages. He held various offices of responsibility under the Elector, and from 1816 till 1829 was librarian at Kassel. In 1830 he accepted a call to a chair in Göttingen, and lectured on the German language and literature and on legal antiquities. G. was one of the seven professors who, in 1837, formally protested against the suspension by the King of the national constitution, and was therefore deposed and banished. He was called to Berlin in 1841, where he died, 20th September 1863. G.'s powerful mind and deep poetic insight were mainly devoted to the successful task of tracing the growth and character of the spirit of the German race, as displayed in its language and its poetry, its religion, laws, and customs. The chief monuments of his labours are the well-known *Deutsche Grammatik* (1819-37, new ed. 1869), *Deutsche Rechts-Alterthümer* (1835, 3d ed. 1854), *Geschichte der Deutschen Sprache* (1848, 3d ed. 1868). Along with his brother he edited *Kinder- und Hausmärchen* (1812-1813, 9th ed. 1870), and began the great unfinished dictionary, *Deutsches Wörterbuch* (1854, continued from vol. iv. by Hildebrand, Heyne, and Weigand).—**Wilhelm Karl G.**, brother of the preceding, and closely associated with him all his life, was born 24th February 1786 at Hanau, and went to Marburg University to study law. In 1814 he was librarian at Kassel; in 1830 went with his brother to Göttingen, where, in 1835, he became professor. Like his elder brother, he protested in 1837 against the abolition of the constitution, and was deposed for the same cause. To him also a chair in Berlin was offered in 1841;

and there on the 16th December 1859 he died. Besides work done by the brothers in conjunction, G. edited numerous ancient German poems, *e.g.*, *Grave Ruodolf* (Gött. 1828, 2d. ed. 1844), *Hildebrandslied* (Gött. 1830), *Freidank* (Gött. 1834, 2d ed. 1860), *Rosengarten* (Gött. 1836), *Rolandslied* (Gött. 1838), *Wernher vom Nieder-Rhein* (Gött. 1839), the *Silvester* of Konrad of Würzburg (Gott. 1841), *Alt-Deutsche Gespräche* (Berl. 1851), &c. His great work is *Die Deutsche Heldensage* (Gött. 1829), a collection made with a fine critical taste, and accompanied with a treatise on the origin and development of the sagas. See Denhard's *Die Gebrüder G.* (1860).

Grimm'a, a town in the kingdom of Saxony, on the Mulde, 18 miles S.E. of Leipsic by railway. It was a flourishing place of trade in the middle ages, and has still some cotton and woollen manufactures. G. is the seat of a famous classical school. Pop. (1871) 6476.

Grimm'ia, a genus of Mosses (q. v.) found on walls and rocks, growing in cushion-like tufts, throughout the world. In Britain there are over a dozen species, found in Alpine and sub-Alpine districts. *G. pulvinata* is the commonest. G. is named in honour of Grimm, a German botanist.

Grimm's Law, the principle, discovered by Jakob Ludwig Grimm, which regulates the interchange of mute consonants in the Aryan tongues. Thus *p*, *b*, and *f* in Latin, Greek, and Sanskrit become respectively *f*, *p*, and *b* in Gothic, and *b*, *f*, and *p* in Old High German, as in the Sansk. *purna*, 'full,' Lat. *plenus*, which becomes in Goth. *fulls*; and in Sansk. *upari*, 'over,' Lat. *super*, which becomes in Goth. *ufar*, and in O. H. Ger. *ubar* (Ger. *über*). The Sansk. *bh* becomes the Gr. *ph*, the Lat. *f*, the Goth. *b*, and O. H. Ger. *p*, *e.g.*, Sansk. *bhrati*, Gr. *phratēr*, Lat. *frater*, Goth. *brôthar*, O. H. Ger. *pruoder* (Ger. *bruder*), Eng. *brother*; the Sansk. *dh* becomes the Gr. *th*, Lat. *f*, Goth. *d*, O. H. Ger. *t*, *e.g.*, Sansk. *dvâra*, Gr. *thura*, Lat. *fores*, Goth. *daur*, O. H. Ger. *tor*, Eng. *door*; the Sansk. *gh* becomes the Gr. *h*, Lat. *h*, Goth. *g*, O. H. Ger. *k*; *b* in Sansk., Gr., and Lat. becomes *p* in Goth. and *f* in O. H. Ger.; *d* in Sansk, Gr., and Lat. becomes *t* in Goth. and *z* in O. H. Ger.; *h* in Sansk., Gr., and Lat. becomes *f* in Goth. and O. H. Ger., *e.g.*, Sansk. *panchan* becomes Goth. *fimf*, Eng. *five*; *t* in Sansk., Gr., and Lat. becomes Goth. *th* and *d*, *e.g.*, Sansk. *tvam*, Gr. and Lat. *tu* becomes in Goth. *thu*, in O. H. Ger. *du*, Eng. *thou*; *k* in Sansk., Gr., and Lat. becomes Goth. *h* (*g*), O. H. Ger. *h* (*g*), *e.g.*, Lat. *caput*, Goth. *haubith*, O. H. Ger. *houpit*, Eng. *head*; Sansk. *j* (*g*), Lat. *g*, becomes in Goth. *k*, O. H. Ger. *ch*, *e.g.*, Sansk. *jnâ*, Gr. *gnômi*, Lat. *gnosco*, Goth. *kunnan*, Eng. *ken*, *con*, *know*. There are, however, numerous exceptions to G. L.

Grims'by, Great, a seaport of Lincolnshire, England, on the right shore of the Humber, opposite Spurn Head, 7 miles from the sea, and 15 N. of Louth by railway. It is an old shipping town, and has docks covering an area of 150 acres, capable of accommodating ships of war. Its chief buildings are a fine old church, St. James' (1365), with a tower and peal of bells, a new townhall, custom-house, mechanics' institute, free grammar school, &c. The industries include fishing, shipbuilding, iron and brass founding, tanning, and timber-sawing. In 1875 there entered the port 2543 vessels of 438,520 tons, and cleared 2071 of 508,898. Pop. (1871) 20,244.

Grim'sel, a mountain pass in the Bernese Alps, Switzerland, 7103 feet high. It connects the valleys of the Aar and Rhone, which have just emerged from their respective glaciers, and on its ridge lies the Todtensee ('lake of death'), where the Austrians and French buried their dead in the summer campaign of 1799. At the N. entrance of the pass is the G. Hospice (6148 feet above the sea-level), a few miles W. of which the Aar glacier terminates.

Grin'delwald, a beautiful Swiss valley in the S.E. of the canton of Bern, 7 miles S.S.E. of Thun Lake. It is 15 miles long, 2 broad, and 3852 feet above the sea. It is hemmed in to the S. by the giants of the Bernese Alps, the Eiger (13,041 feet), Mettenberg (10,197), forming the base of the Schreckhorn, and the Wetterhorn (12,165). On its S. side it is entered by two fine glaciers, which rise in a splendid *eismeer* ('ice-sea'), and form the course of the Black Lütschine. The village of G. or Gydisdorf consists of wooden houses scattered over the valley, and has a pop. of 3135.

Grind'ing, in the industrial arts, is the operation by which form is given to a body by abrasion with hard substances. For example, cutlery and edge-tools are shaped by pressing them against grindstones revolving towards the article to be ground; in this way the particles rubbed off are more easily carried away, and the progress of the work better seen. In producing a cutting edge with a stone revolving in the opposite direction, it is not easy to tell when the edge is fully ground in consequence of the formation of a 'feather-edge.' Plate-glass, stones, and metals are ground by rubbing them with hard, coarse powders, such as emery. The term G. is also applied to the act of disintegrating or pulverising ores, &c., between two stone or metal rollers, with their peripheries nearly touching, and again to the reduction of pigments to an impalpable powder with a *muller*, a conoid stone with a perfectly flat base, and a *slab* of close-grained porphyry.

Grind'stones are cylindrical pieces of sandstone or gritstone used for shaping and sharpening cutlery, tools, &c. They are secured to an axle which is turned round by means of a winch handle, or an endless belt moved by steam power. They vary in diameter and thickness, in solidity and granular texture. The famed Newcastle G. are obtained from the coal measures abounding in that district. Bilston in Staffordshire, and Wickersley and Haderley near Sheffield, also furnish good G. Artificial G., formed by binding together grains of sand with silicate of lime (Rawsome's method), are now largely superseding natural G.

Grip'ing, or **Gripes**. See COLIC.

Gri'qua Land, West, better known as the S. African Diamond Field, the western portion of the land formerly occupied solely by the Griquas (*i.e.*, 'bastards'), a mixed Dutch and Hottentot race, lies to the N.E. of Cape Colony, and to the W. of the Transvaal Republic and the Orange River Free State. It is a pastoral country, confined on the S. and E. by the Orange and Vaal rivers, and intersected from N.E. to S.W. by low ranges, as the Asbesto, Mosib, Lange, and Schurve hills. Area, 16,632 sq. miles; pop. (1873) 25,477. In the W. the surface descends in terraces towards a wide region of sandy plains. The diamond 'rush' took place between 1868 and 1870, when the country was in the possession of a 'Captain' Waterboer and his people. Unable to hold his own, Waterboer offered his territory to Britain; it was accepted by proclamation of October 27, 1871, and subsequently a lieutenant-governor and a Government staff were appointed, the territory being vested by commission in the Governor of Cape Colony. This led to considerable dispute between the English and Dutch colonies. In 1875 the revenue was £70,000. The 'farm' on which has sprung up the town of Kimberley, was recently purchased by the local government for £100,000, a sum already far more than realised by mines and building sites. The Government has raised a large sum by selling farms, and retaining the mineral rights. Till the beginning of 1876 the total value of the diamonds found was £12,000,000. The stones are mostly small and of inferior colour, but the famous 'Star of S. Africa,' found in 1869, weighed 83½ carats, and was valued at £20,000. Another of 147 carats was found in 1873, and a valuable blue one in 1876.—*East* Griqua Land is now included in Kaffraria.

Gri'si, Giu'lia, or **Guliett'a**, 'the most distinguished singer of our time,' was born at Milan, 28th July 1812. She was educated in a convent at Girizia, and afterwards took singing-lessons at Bologna. In 1828 and 1829 she sang in the opera at Bologna and Milan. Then becoming the pupil of Marliani, she followed him to Paris in 1832, and became, by Rossini's influence, Prima Donna at the Italian Opera there. From 1834 to 1861 she sang continuously in London, missing only one opera season. G. died at Berlin, November 28, 1869. Her principal parts were in *Norma*, *I Puritani* (written for her), and *Don Pasquale.* See Fétis, *Biographie des Musiciens* (Par. 1862).

Gris-Nez ('grey nose or ness'), a cape on the W. coast of France, department of Pas-de-Calais, 10 miles N. of Boulogne. It supports a lighthouse, and is the point nearest to England, being distant from Dover only 21 miles.

Gri'sons (Ger. *Graubünden*, 'the grey league'), a canton in the S.E. of Switzerland, is bounded N. by Glarus, St. Gall,

and the Vorarlberg, S. by Lombardy, W. by Uri and Ticino, and E. by Tyrol. Area, 2774 sq. miles; pop. (1870) 91,782. It lies among the Rhætian Alps, which here reach a height of 11,208 feet in Piz Linard, and of 13,294 in Piz Bernina, and is intersected by the valleys of the Lower Rhine and the Inn. (See ENGADINE.) Several tributaries flow S. to the Adda and Ticino. The climate varies; the productions are rye, barley, maize, the vine, almond, and fig. There is much cattle-breeding, and a large transit trade. G. has a constitution of 1853. The people are three-fifths Protestant and one-third German. Two Romanic dialects are spoken, *Ladin* in the Engadine, Albula, and Münster valleys, and Romanic in the valleys of Disentis, Ilanz, &c. In the latter there is a slight literature, chiefly of religious and educational works. (See grammars and dictionaries by Conrad, Carisch, and Palioppi.) Coire (anc. *Curia*) is the capital, with a pop. (1870) of 7552. G., the country of the ancient Rhætii, was conquered by the Romans in the 4th c., passed to the German empire in the 9th c., and remained under the Suabian dukes till 1268. It then became an independent province of the empire, and the residence of many nobles, against whom the people were subsequently driven to form leagues. The 'Grey League' dates from 1396. The heroism shown by the confederates in the Suabian war in 1499 gave them great celebrity. The Reformation found an entrance into the canton in 1521, but it was not till quite recently (1803) that G. joined the Swiss Confederation.

Gris'wold, Rufus Wilmot, born at Boston, U.S., February 15, 1815, travelled in Europe and America, became a printer, a Baptist preacher, and finally a journalist, edited *Graham's Magazine* (1842-43), the *New York International Magazine* (1850-54), and died in New York, August 27, 1857. He was the author of *Poets and Poetry of America*, *Washington and the Generals of the Revolution*, *Curiosities of American Literature*, *Prose Writers of America*, *The Republican Court*, &c. His attack on Edgar Poe has called forth very severe strictures.

Grit, a term vaguely given to coarse-grained silicious sandstones. See SANDSTONE.

Grivegn'ée, a town of Belgium, province of Liége, on the Ourthe, near the height of Espérance, 2 miles S.E. of Liége. It has large machine-works, fulling-mills, and coal-mines. Pop. (1873) 6234.

Groat (Dutch *groot*, from the same root as the French *gros* and the English *great*), originally used as a qualifying word to distinguish the thick from the thin coins, but long current in England since the time of Henry III. (1351) as a definite silver coin valued at 4d. In 1835 the coin was revived when the mint issued *fourpenny-pieces*.

Groats, or **Grits** (Old Eng. *greót*, Dutch *grut*, Ger. *grutze*, 'husked and bruised grain'), oats shelled, or deprived of their husks; when ground they constitute *Embden G.*

Gro'cyn, William, one of the great scholars who brought the Renaissance learning into England, was born at Bristol in 1442. He was educated at Winchester and New College, Oxford, became divinity reader in Magdalen College, and in 1479 rector of Newton Longville in Buckinghamshire, and afterwards prebendary of Lincoln. From 1488 to 1491 he studied Greek under Chalcondylas in Italy. On returning to England, he taught the new language in Exeter College, Oxford, where its introduction, and especially G.'s new mode of pronunciation, were strongly opposed—the University being divided into two factions of Greeks and Trojans. G.'s lectures, however, were highly successful, and Oxford became a centre of Hellenic culture. Erasmus, who studied under G., spoke with admiration of his wide knowledge. In 1506 G. was made Master of Allhallows College, at Maidstone, Kent, where he died in 1519. A Latin epistle to Aldus Manutius is his only extant work.

Grod'no, a government of W. Russia, formerly a part of Lithuania, lies along the N.W. boundary of Poland. Area, 14,700 sq. miles; pop. 958,852. It is a flat sylvan country, thickly wooded with beech and pine in the N., where it is watered by the Niemen, and covered in the S. with 500 sq. miles of morass, in which rise the head waters of the Pripet, a tributary of the Dnieper. There is extensive cultivation of rye, barley, flax, and hops, much cattle-rearing, timber-hewing, and iron-smelting. The forests are still a refuge of the bear, wolf, lynx, and buffalo. Of the inhabitants, 225,000 are Poles and 95,000 Jews.—G., the capital of the government of G., lies on the right bank of the Niemen, 160 miles N.E. of Warsaw by railway. It has several decayed Lithuanian palaces, a grand modern palace erected by Augustus III., a medical academy, botanic garden, considerable scientific collections, and a large library. There are manufactures of silks, woollens, and weapons. Pop. 31,000, of whom some three-fourths are Jews. The name is Slavonic, and denotes 'a fortified town.'

Grog is a mixture of rum and cold water, allowances of which were first regularly served in the navy about the middle of the 18th c. under Admiral Vernon. It is said to have been christened from a nickname—'Old G.'—given by the sailors to Vernon on account of his wearing a *grogram* (Fr. *grosgrain*) cloak on deck in foul weather.

Groined Vaulting. See VAULTING and GOTHIC ARCHITECTURE.

Gron'ingen, or **Grön'ingen**. 1. A province of the kingdom of Holland, surrounded by the North Sea, Hanover, and the provinces Drenthe and Friesland. Area, 915 sq. miles; pop. (1875) 238,662. The northern part is marshy, but fruitful, intersected with canals, and fenced with dykes; in the E. there are extensive moors yielding abundance of turf; and the S. has several wide stretches of heath. The streams, though small, are, with the help of canals, skilfully made available for communication, and the largest river, the Hunse, is navigable inland as far as the town of G. The main occupation of the people is the rearing of cattle, sheep, and horses; butter, cheese, and wool, as well as live-stock, being the chief exports. Chief towns, G. and Winschoten. G. in early times was under bailiffs of the Holy Roman Empire, who assumed the title of Burgh Counts (Burcgravii, Præfectii, Comites Urbis or Civitatis) in the 11th c. Afterwards the Bishop of Lüttich (Liége) exercised a sort of supremacy over the country. After much contention it yielded to the Emperor Karl V. in 1536, and in 1580 became one of the Seven United Provinces, with William of Orange as stadtholder. —2. A well-built and fortified town in the province of G., on the river Hunse, 94 miles N.E. of Amsterdam. Pop. (1875) 40,165. It has a beautifully built university (founded in 1614), an imposing townhall, a church of St. Martin with a lofty tower and magnificent organ, a picture gallery, a botanic garden, shipbuilding yards, extensive quays, tobacco and linen factories, gold and silver workshops, and a large trade in cattle, wool, cheese, butter, and corn. G. belonged to the Hanse League. In 1874 there entered the port 190 vessels of 16,157 tons; cleared, 179, of 17,002 tons.

Groo'te Ey'landt (Dut. 'great island'), the largest island in the Gulf of Carpentaria, on the N. coast of Australia. Its shape is very irregular, but the maximum length and breadth of the island are about 40 miles each. The shores are sandy and barren, but the interior, which is still unexplored, appears to be mountainous and well wooded.

Gros, Antoine Jean, Baron, a French painter, the son of an excellent miniaturist, was born in Paris, 16th March 1771. A pupil of David, he gained the patronage of Napoleon by a picture of the 'Victor of Arcola,' and subsequently painted, by commission of the Government, the chief events of Bonaparte's career—the battles of Aboukir, of the Pyramids, of Wagram, and of Eylau, &c. The 'Peste de Jaffa' (1804) was received with immense enthusiasm, and was publicly crowned in the Louvre. G.'s historical pictures exhibit great dramatic power and rapid vigour of execution. His miniature portraits are full of rich refined beauty. The celebrated cupola of St. Geneviève, in Paris, a work of great decorative skill, procured him (1824) the rank of baron. Later his fame was diminished and his life embittered by the attacks of the rising Romantic school. G. was drowned in the Seine, whence, near Meudon, his body was taken, 26th June 1835, and interred in Père-la-Chaise. See Rouget's *Notes*, and J. B. Delestre's *G. et ses Ouvrages* (Par. 1845).

Gros'beak, or **Haw'finch**, the popular name of a group of *Conirostral Insessores* (q. v.) or perching birds belonging to the sub-family *Coccothraustinæ*, in which the bill is large and somewhat clumsy, broad at the base and curved towards the tip.

The tail is short, the wings long and pointed. The common G. or H. (*Coccothraustes vulgaris*) is a familiar British bird. Its bill has angular or sharp edges at the base; the nostrils are oval, and hidden by feathers. The second and third quills are longest, and the tail is short and forked. The G. is found in large flocks, especially at the middle of April, this being the breeding season; the young are hatched about the end of May. In the male the head and neck are fawn-coloured, the back being brown, and the chin and throat black. The wing coverts are white, black, and fawn; the tail black and white; and the under parts of a lighter brown than the back. The average length of the bird is 7 inches. Its food consists chiefly of berries and seeds. The black and yellow G. (*C. melanoxanthus*) of India, is an exotic species, coloured black above and yellow below, the female being mottled with yellow alone. The cardinal G. (*Cardinalis Virginianus*) or scarlet G. is a well-known American species, also termed the 'Virginian nightingale' from its pleasing song. The colour is a dusky red above, and the other parts are a brilliant scarlet, with the exception of the feathers of the chin and forehead, which are black. The bill is also scarlet. The female is of a brownish olive on the upper parts. The eggs, numbering five, are greyish white marked with brown.

Grosbeak.

Gross'enhain (Ger. 'thick grove'), a town in the kingdom of Saxony, on the Röder, 20 miles N.N.W. of Dresden by railway. It has a fine church of date 1748, and is the seat of important woollen and cotton industries. Pop. (1875) 10,686. G. was already a town in the 10th c., and belonged successively to Bohemia, Meissen, and Brandenburg. It suffered severely in the Thirty Years' War and Seven Years' War.

Grosseteste, Robert, one of the great ecclesiastical statesmen of England during the middle ages, was born at Stradbrook, Suffolk, about 1180, studied at the Universities of Oxford and Paris, was made lecturer in the Franciscan school at Oxford, and in 1235 Bishop of Lincoln. He immediately entered on an earnest career as a clerical reformer and champion of political freedom, striving to check the worldliness of the churchmen, and consistently opposing at once the royal tyranny and the papal ambition and venality. In 1244 he took a leading part among the prelates and nobles who demanded that Henry III. should rule through a ministry, and in 1253 he boldly and eloquently combated Innocent IV., who had appointed his nephew, a young Italian, to the first canonry vacant in Lincoln cathedral. Throughout his life he resisted the papal efforts to intrude foreigners on English benefices, was several times the leader of the constitutional party in Parliament, and was the intimate friend of Simon de Montfort. G. died October 9, 1253. Mr. Stubbs calls him 'the most learned, the most acute, and the most holy man of his time,' and adds that he represented 'a school, part of whose teaching descended through the Franciscans to Ockham and the Nominalists, and through them to Wycliffe.' See Sward's *Roberti G. Episcopi Quondam Lincolnsis Epistolæ* (1862), and Stubbs's *Constitutional History of England*, vol. ii. (1876).

Grosse'to, the fortified capital of a province of the same name, Central Italy, on the Ombrone, 8 miles from the sea, and 65 S. of Florence by railway. The seat of a bishop, it has a beautiful cathedral, a *Compagnia di Misericordia*, several sugar refineries, a trade in coals, chemicals, wine-casks, &c. Pop. (1871) 4151. The huge ruins of the Etruscan *Rusellæ* lie 5 miles N.E., where are also the Bagni di Roselle (*Aquæ Rusellarum*), copious springs with a temperature of 28° 5' R., rich in various salts.

Grossularia'ceæ, or **Ribesia'ceæ**, a natural order of Calycifloral dicotyledonous shrubs found in Europe, Asia, and America. The order includes three or four genera, and about sixty species—many of which yield edible fruits. The different kinds of Gooseberry (q. v.) (*Ribes grossularia*) and Currant (q. v.) (*R. rubrum* and *R. nigrum*) belong to this order.

Grosswar'dein (Magyar *Nagy-Várad*), a town of Hungary, capital of the comitát of Bihar, on the Sebes ('rapid') Körös, 38 miles S.S.E. of Debreczin, and 135 of Pesth by railway. It is the seat of a Roman Catholic and of a Greek Catholic bishop, has a beautiful cathedral, is enclosed by walls and girt by eight suburbs. There is an active wine and cattle trade. Pop. (1869) 22,443. G. was occupied by the Turks from 1660 to 1692.

Grote, George, one of the greatest of English historians, was the son of a London banker, and was born at Clay Hill, Beckenham, Kent, November 17, 1794. He entered his father's bank when sixteen years old, and early devoted his leisure to study. A friend of James Mill, and a 'philosophical Radical,' he had resolved as far back as 1823 to write a history of Greece vindicating Greek democracy. He took part keenly in the Reform struggle, publishing a pamphlet, *Essentials of Reform*, in 1831, and in 1832 was chosen at the top of the poll as member for the city of London. He annually brought forward a motion for the ballot, and repeatedly advocated his Radical views with great force and ingenuity. He retired into private life in 1843, and issued the first volume of his *History of Greece* in 1846, the twelfth and last appearing in 1856. In 1865 he produced a work on Plato, and was largely occupied during his last years on a book on Aristotle, which, however, he left unfinished. He became President of University College, London, in 1869, and died in London, June 18, 1871. His *Aristotle* (3 vols.) was published in 1872, and his *Minor Works, Essays, and Reviews*, in 1873. G.'s *History of Greece* is the standard history of that country. It is marked by solid research, strong and penetrative criticism, the keen insight of a practical politician, and especially by an ardent, original, and masterly championship of the Athenian democracy, most of the charges against which G. has in the opinion of many successfully rebutted. The book overthrew the conventional ideas of Greek history, shed a fresh light on very many questions previously misunderstood, and inspired the subject with a novel, varied, and living interest. G.'s style is full, clear, and vigorous, though sometimes wordy, heavy, and tediously parenthetical. See Mrs. G.'s *Memoirs of G. G.* (Lond. 1873), and *Character and Writings of G. G.*, prefixed to G.'s *Minor Works*.

Grotesque', a term applied from the 13th c. onwards to a fanciful and picturesquely unnatural style of ornament, because the first specimens of it were found in old Roman subterranean chambers, called in Italian *grottos*. In G. decorations, which became popular at the end of the middle ages, animals, leaves, flowers, fruits, &c., are fantastically but often gracefully mingled. At the Renaissance, however, the G. style sank into uncouth and unmeaning capriciousness.

Gro'tius, Hugo, the Latinised form of the Dutch **De Groot**, a great jurist and theologian, was born April 10, 1583, at Delft, where his father was burgomaster. He studied at Leyden University under Joseph Scaliger, and in 1598 accompanied the Dutch embassy to Paris, where he won the favour of Henri IV. by his talents and manners. He returned to Holland in 1599, published editions of *Martianus Capella*, and the *Phænomena* of Aratus, three original Latin tragedies, &c., and practised with success as an advocate. In 1613 he was chosen councilpensionary of Rotterdam, but becoming involved in the controversy between the Dutch Calvinists and Arminians, he was, on the triumph of the former, sentenced to lifelong imprisonment. In 1621 he escaped from Lowenstein castle in a book-chest, while his wife remained in his stead, and fled to France, where Louis XIII. pensioned him, and where he wrote his chief work *De Jure Belli et Pacis*. Richelieu's displeasure causing him to quit France, he betook himself to Sweden, and was appointed by Queen Christina, in 1635, ambassador to the French court, an office which he filled with rare ability for ten years. When travelling to Sweden in 1645 he met with a most flattering ovation at Amsterdam, and afterwards received an equally honourable welcome at Stockholm. Disliking the Swedish court and climate, however, he resigned his post, and left Sweden for Holland. Stress of weather drove the ship in which he sailed to the Pomeranian coast, and G. while journeying by road fell ill and died at Rostock, August 28, 1645. His character is untarnished, and he was, notwithstanding his active forensic and diplomatic life, perhaps the widest scholar of his age. His fame is highest as a writer on law, his masterly treatise *De Jure Belli* (1625) being the origin of the modern system of inter-

national law, and generally remarkable for its solid learning and its humane and philosophic spirit. Of his other works the chief are *Mare Liberum* (1609), *Florum Sparsio ad Jus Justinianeum* (1642), *De Imperio Summarum Potestatum circa sacra* (1646), &c., which discuss legal questions; *Defensio Fidei Catholicæ* (1617), *De Veritate Religionis Christianæ* (1627), *Via ad Pacem Ecclesiasticam*, *Annotationes in Vetus et Novum Testamentum* (1641–51), &c., which treat of theology; and various historical and miscellaneous writings, as *De Antiquitate Reipublicæ Batavicæ* (1610), *De Origine Gentium Americanarum* (1642), *Annales et Historiæ Belgicæ* (1657); poems in Dutch, Greek, and Latin, &c. As a theologian G. is distinguished by moderation and clear, sound judgment, and displays both a wealth of philological learning remarkable for his times, and a singularly apt command of illustrations from the ancient classics. His editions of Lucan and Tacitus, and his translations from the Greek poets into choice Latin verse, show him to have been an elegant as well as a profound scholar, and his Latin prose style was admirably terse and vigorous. See Butler's *Life of G.* (Lond. 1826); Creuzer's *Luther und Hugo G.* (Heidel. 1846).

Grott'a del Ca'ne (Ital. 'dog's grotto'), a well-known mephitic cave, 2 miles W. of Naples, near the Lago d' Agnano, is 10 feet by 4, and 9 feet high. The carbonic acid gas which it exhales is known to extinguish lights and even to kill dogs. It is described by Pliny (*Hist. Nat.* ii. 93).

Grottagl'ie, a town in the province of Lecce, S. Italy, 12 miles N.E. of Taranto. It lies at the base of a hill, from the caves (*grotte*) in which it takes its name, and has several cotton factories. G. was founded in the 10th c. by the refugees from neighbouring villages ravaged by the Saracens. Pop. (1871) 8747.

Grou'chy, Emmanuel, Marquis de, a noted French marshal, belonged to an ancient family of Normandy, was born at Paris, 23d October 1766. He entered the army at the age of fourteen, was a sub-lieutenant in the king's bodyguard in 1789, but eagerly embraced the cause of the Revolution. In 1792 he was made a brigadier-general, received the command of the cavalry in the army of the Alps, and took part in the conquest of Savoy. In 1793 he was engaged in the suppression of the Vendean revolt. The decree of the National Convention ordering the expulsion from the army of all aristocrats induced him to throw aside his title and re-enter the ranks as a private. In 1795 he was reappointed a general of division, served under Hoche in the army of the West, under Joubert in the army of Italy (1798), when he induced the Sardinian king to abdicate and deliver up his fortresses to France. He was with Moreau in his memorable Piedmontese campaign against the Austrians, commanded a division of the army of the Rhine, contributed to the success of Hohenlinden, and was made inspector-general of cavalry. In 1805 he commanded one of the divisions of the camp at Brest, distinguished himself (1806–7) in the war against Prussia, his corps being the first to enter Berlin after Jena. His brilliant cavalry charges at Eylau helped to decide the day. For his services at Friedland (1807) he obtained the grand cordon of the Legion of Honour; at Wagram (1809) the title of colonel-general of chasseurs and commander of the Iron Crown, which made him a grand officer of the empire. In the Russian campaign of 1812 he fought at Wilna, Krasnoï, Smolensk, Moskow, and commanded the *escadron sacré* which guarded Napoleon on the retreat. A quarrel with the Emperor prevented him from taking part in the Leipsic campaign, but he fought against the allies when they invaded France. On the return of Napoleon from Elba, G. received the command of four divisions, forced the Duc d'Angoulême to surrender at Lyon, was made marshal, cleared the royalists out of the south, defeated Blucher at Ligny, 16th June 1815, but was unable to give the Emperor any help on the decisive day of Waterloo, owing to a rigid adherence to the orders he had received. Exiled after the second restoration of the Bourbons, G. went to live in America, but was permitted to return in 1821. The revolution of 1830 restored him his military honours, and two years later he was called to the House of Peers. He died at St. Étienne, 29th May 1847. G.'s conduct at Waterloo has been severely censured, and a whole library of acrimonious literature has been written on the subject, but no one now believes the base insinuation of his opponents that he betrayed his master or his country. See Thiers' *Histoire du Consulat et de l'Empire.*

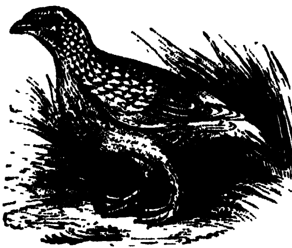
Ground, the term used in painting to denote the whole of the surface unoccupied by the figures, &c., and which is of level uniform colour. The richness and harmony of the design depend to a great extent upon the degree of tonic sympathy which exists between the G. and the colours of the objects of the design. In Indian and Japanese designs the grounds are always in the truest tonic accord with the figured work.

Ground Ann'ual, a term of Scotch law denoting the perpetual annuity which is sometimes given as the price of land instead of an immediate sum. When a sub-feu (see FEU) is prohibited, those who speculate in building-ground with the intention of disposing of it in small portions to builders attain their end by the creation of a G. A. The disposition is granted to be held public (see PUBLIC RIGHT) in compliance with the condition of the feu-charter, but the subject is charged with an annual payment to the disponer and his heirs and assignees; and either a burden or annuity is reserved, which is declared a real burden, or a bond and disposition in security of the annuity is granted by the purchaser, on which Infeftment (q. v.) is taken. The similar term in the law of England is Ground Rent (q. v.).

Ground Dove or **Pigeon**, a name given to various species of *Columbidæ* or pigeons, belonging to the family *Gouridæ*, of which the genus *Goura* (q. v.) is the type. The bill is of moderate size, and arched at its apex. The G. D. seems to approach most nearly of all the pigeons to the ordinary Rasorial birds (such as the fowl, grouse, &c.), which are thoroughly terrestrial in their habits. The G. D. does not, as a rule, perch upon trees, and the food consists of seeds, &c., which it picks up on the ground. Besides the genus *Goura*, the genus *Calænas*, represented by the *C. Nicobarica*, or Nicobar pigeon (a native of India), may be selected as a good example of the G. D.

Ground Ivy, the popular name of *Glechoma hederacea*, a pretty little trailing herbaceous plant common in open woods and on hedge banks throughout Britain. It was formerly used medicinally, and for flavouring ale; hence it was called ale-hoof. Country herbalists still use it in England. It belongs to the natural order *Labiatæ* (q. v.).

Groundling (*Botia tænia*), a small Teleostean fish belonging to the Carp family (*Cyprinidæ*), and attaining a length of 3 or 4 inches. It inhabits the bottom of rivers, and hence its name. It resembles the Loach (q. v.), and has a spinous process below each eye. The G. is found here and there in English rivers.



Ground Nut, a name generally applied to the pods of *Arachis hypogæa*. See ARACHIS.

Ground Rent, in the law of England, is the rent which the person who builds on a piece of ground pays to the landlord. In letting the house the builder includes in the rent the G. R., or a proportionate part of it. The landlord, if the G. R. is in arrear, is entitled to distrain all goods and chattels on the premises, even though the tenant has paid the whole rent to his immediate landlord; but in this case he may deduct the twice-paid G. R. from the payment at next term. The usual duration of a building lease in England is ninety-nine years. On its expiry the building becomes the property of the landlord.

Ground'sel, the popular name for *Senecio vulgaris*, a very common weed throughout Europe.

Ground Squirrel (*Tamias*), a genus of Squirrels (*Sciuridæ*) represented in Europe, Asia, and America, and allied in some respects to the Marmot (q. v.) or prairie dog. They have cheek-pouches, but their feet are shorter than those of the true squirrels, and the tail is shorter than the body. The most familiar example of the G. S. is the *Tamias Lysteri*, the Hackee or chipping squirrel of N. America. Its colour is a brownish grey above, passing into orange brown on the head and the quarters. The sides and back are marked by longitudinal stripes of black and yellowish white, giving the animal a somewhat piebald appearance. The under parts are white. Its food consists of wheat, buckwheat, and corn. The G. S. inhabits burrows, which it excavates for a considerable distance below ground. Its average length is 11 inches, the tail measuring 4 inches. From four to five young are produced in May, and a second brood appears in August.

Grouse (*Tetrao*), a genus of *Rasorial* or Gallinaceous birds, forming the type of a large family (*Tetraonidæ*), which includes a number of sub-families, such as those of the partridges, quails, &c. The sub-family *Tetraoninæ* includes the genus *Tetrao* itself, and is distinguished by the feathered nostrils and the short, broad bill, the wings being rounded, the tarsi feathered, and the toes long. The third and fourth quills are the longest; the eyebrows are bare, and covered with a reddish warty skin. To the genus *Tetrao* belong the Capercailzie (q. v.) (*T. urogallus*), the Cock of the Plains (q. v.) (*T. urophasianus*), and the Blackcock (q. v.) (*T.*) or Black G. (*T. tetrix*). The pinnated G. (*T. cupido*) is a N. American form, attaining a length of 19 inches, and distinguished by the males having two wing-like appendages to the neck, composed each of about eighteen feathers, and a slight crest on the head. The neck is provided with brilliantly-coloured *wattles*. The colour is brown, marked with white and black, the brown being lightest below. The ruffed G. (*Tetrao umbellus*) derives its name from the curious tufts of feathers on the shoulders. These are of a velvet-black colour, and have a bare patch of skin under each. The colour is a rich chestnut brown above, marked with darker brown and grey, and the tail is grey marked with blackish bars. The average length is 18 inches. The genus *Lagopus* is nearly allied to the genus *Tetrao*, but is distinguished by the tarsi and toes being fully feathered—the latter even to their tips. The common or red G. (*Lagopus Scoticus*) is the best-known member of the G. sub-family. It appears to be peculiar to the northern parts of Britain, and inhabits moors, feeding on the tips of heather. The colour is a reddish brown speckled and marked with black, although lighter-tinted varieties are not uncommon. The average length is from 12 to 14 inches. This bird is subject to various grave forms of disease (see G. DISEASE), and in particular seasons large numbers die off. The Ptarmigan (q. v.) (*L. vulgaris*) is an allied species of the G. The sand-G. of the East is represented by the *Pterocles bicinctus*, and inhabits the sandy tracts of Africa, Asia, and S. Europe. The tarsi have their front and inner sides feathered. The bill is small, and the nostrils are partly hidden by membrane. The toes are short, and united at their bases by membrane, the hinder toe being especially small. In colour it approaches very nearly to that of the sandy tracts amid which it dwells.

Grouse.

Grouse Disease, the name given to a peculiar epidemic disorder affecting Grouse (q. v.) in certain seasons, and causing a great mortality in the moors. The disorder has received various explanations, some authorities, *e.g.*, Dr. Cobbold of London, ascribing the disease to the presence of parasites of various kinds, while others, *e.g.*, Dr. Farquharson of London and Dr. Andrew Wilson of Edinburgh, favour the theory of an infectious disorder of an epidemic and febrile type. That the latter view is correct is supported by the fact that even so-called healthy grouse are almost invariably infested with parasites (such as the *Tænia calva* and a species of *Strongylus*), whilst mere parasitism will not explain the sudden spread and extension of the disorder. Dr. Wilson, from his researches (see *Edinburgh Medical Journal*, April 1875), inclines to the belief that the respiratory mucous membrane is specially affected, and that the disease, in some cases at any rate, assumes the form of an acute inflammatory affection. A paper by Dr. Farquharson of London on the G. D. will also be found in the vol. of the *Edinburgh Medical Journal* for 1875, and Dr. Cobbold's contributions to this subject are contained chiefly in the British Association Reports.

Growing Corn, on land let to a tenant, is in England subject to Distress (q. v.) for rent in arrear. In Scotland G. C. is subject to Poinding (q. v.), but procedure is not competent till the corn is cut down and measured. The landlord in virtue of his Hypothec (q. v.) has a claim preferable to that of a poinding creditor. A symbolical delivery of G. C. has in Scotland been held to exclude creditors.

Growl'er (*Grystes salmoides*), a Teleostean fish belonging to the *Percidæ* or Perch family, and found in N. American rivers, an allied species occurring in Australian streams. It attains a length of 2 feet, and has small scales and teeth of minute kind. The flesh is very palatable. The name G. is given to the fish from the grunting sound it emits.

Growth. During early life the tissues of the body increase in size by taking up materials from the blood which they convert into substances similar to themselves. For example, muscle grows by matters obtained from the blood, which are assimilated by the substance of the muscle. This increase in size constitutes G., as regards the individual tissues. Up to a certain period of life the body generally increases in size and weight. It may then remain nearly stationary in these respects for many years, in consequence of the amount of waste of tissue being nearly equal to the amount of repair. During this middle period of life, in one sense the body may have ceased growing, but still G. may be taking place in one or more of the tissues, as, for instance, in muscular tissue in consequence of being habitually exercised, or in fatty tissue. In the later years of life, the waste is in excess of the repair, and consequently the body decreases in size and weight. The general conditions regulating G. may be briefly stated as follows:—(1) A healthy quality of the blood; (2) a proper quantity of blood; (3) a proper influence of the nervous system; and (4) a healthy state of the various tissues of the body. See NUTRITION.

Grub (lit. 'the digger,' because of its picking its way into plants), a general term applied to the larval or caterpillar stage of most insects. It is spoken of frequently by agriculturists in connection with injury done to crops, the larvæ of the Beetle (q. v.) being specially pernicious.

Grubb'er (lit. 'the digger'), an agricultural implement for tearing up and loosening the soil without turning it over like the plough, and for cleaning land of roots of plants, &c. It consists of a handled and wheeled iron frame with cross bars, from which depend iron tines with cutting edges capable of being closed or widened. The most approved forms of the G. have three wheels, one in front and two behind, and have an arrangement for regulating the depth of penetration of the soil, and for withdrawing the tines when requisite. In Scotland, Kirkwood's and Scoular's three-wheeled implements, and Tennant's and Scoular's one-wheeled are principally used. In England, Coleman's and Johnston's cultivators, Biddell's scarifiers, and other machines all designed on the principle of the G., are much esteemed.

Gru'gru, the name given by negroes to the Grub (q. v.) or larva of a W. Indian insect (*Calandra palmarum*) belonging to the *Coleoptera* or beetles, and popularly known as the palm weevil. The weevil itself attains a length of 2 inches, and the larva is even larger. It burrows in the canes and cabbage palms (*Euterpe oleracea*), and is esteemed as a luxury in diet by the negroes, who eat the G. after roasting it.

Grün'berg ('green mount'), a town of Prussian Silesia, on the Golden Lunse, amid vine-clad hills, 54 miles S.E. of Frankfurt-on-the-Oder by railway. The old town is surrounded by a wall with three gates. G. produces 667,000 gallons of sparkling wine yearly, and has manufactures of woollens, silks, tobacco, &c. Pop. (1875) 12,248.

Grundt'vig, Nikolai Frederik Severin, a distinguished Danish theologian, born 8th September 1783 near Vordingborg in Zealand, was educated at Aarhus 'Latin school,' and Copenhagen University, and early chose as his favourite studies religion and mythology. In 1805, after a period of strong spiritual excitement, he caught an enthusiasm for Scandinavian antiquity from the poetry of Oehlenschläger, and for a poetic Christianity from the study of Schelling and Steffens. G.'s remarkable literary activity for the popular enforcement of his gradually developed views dates from 1807. A course of sermons delivered at Copenhagen in 1810 awoke great interest, and led to his rebuke by the University 'Consistorium.' In 1811 he became curate of his father's parish, and the next year published the first of a number of able and characteristic works on the history of the world, quickly followed by the first struggles of the many-sided literary warfare that stimulated most years of G.'s long life, whether he opposed Molbech, Oersted, Heiberg,

Clausen, Rudelbach, or Martensen. After living at Copenhagen from 1813, in 1821 he became minister of Prœstö, and the year after curate of St. Saviour's at Christianshavn, but resigned in 1825 under a censure, which was only removed in 1838. In 1839 he was appointed chaplain of Vartou Hospital, and in 1861 was made a bishop. He died in 1872. G.'s chief writings are *Nordens Mythologi* (1808), *Nordens Kæmpeliv* (1810), *Nytaarsnat* (1811), *Bibelske Prædikener* (1816), *Bjovulfs Drapa* (1820), *Nytaarsmorgen* (1824), *Nordens Mythologi og Sindbilledsprog* (1832), *Verdenshistorien* (1833-36), *Christenhedens Syvstjerne* (1860).

Grunth (Sansk. *grantha*, 'a book'), the holy book of the Sikhs, divided into the *adi* or first G., which contains chiefly the sayings of Nanuk, the founder of the sect; and the tenth G., compiled by Govind Singh, the tenth and last *guru*. Both are in verse, and the language used is Hindi rather than Punjaubi; but the written character is that known as Punjaubi or Gurumukhi, from its having been adopted by the Sikh *gurus*. The earliest writer is Arjun, the fifth *guru* (1581-1606). The contents are chiefly prayers addressed to the One Great God, with some mythological stories. See Cunningham's *History of the Sikhs* (Lond. 1853).

Gruyères (Ger. *Greierz*), a Swiss town in the canton and 16 miles S.S.W. of Freiburg. It has an old castle, and a trade in the famous G. cheese made in the district. Pop. (1870) 973.

Gryll'us, a genus of *Orthopterous* insects, represented by the grasshoppers, crickets, &c., but occasionally subdivided into other genera. See GRASSHOPPER, LOCUST, &c.

Grys'boc (*Calotragus melanotis*), a species of antelopes inhabiting S. Africa, and attaining an average height at the shoulder of from 19 to 20 inches. The colour is a deep or reddish chestnut interspersed with white, the greyish tint thus produced giving origin to the Dutch name of G. or 'grey buck.' The ears are prominent, and have black tips; the tail is short; and the horns (which only the males possess) are erect and tapering.

Gua'charo, or **Trinidad Goat-Sucker** (*Steatornis Caripensis*), also known as the 'fat bird,' a genus of *Insessorial* birds belonging to the *Fissirostral* section of the order, and to the family *Caprimulgidæ* or goat-suckers. The bill has a hooked tip, and its base is provided with feathers and bristles. The wings are long and pointed, the tail broad and graduated, and the outer toe longer than the inner. The G. is found in Guadeloupe, Trinidad, and Colombia, and inhabits caves. The fat of the young is melted down by the Indians in clay pots, and yields a soft limpid oil, which keeps for a long period without becoming rancid. The colour of the G. is a reddish fawn mottled with brown, the plumage being varied by the presence of square white marks.

Gua'chos, or **Gau'chos**, a kind of Mestizo (Fr. *mestis*, from Lat. *mixtus*) descending from the early Spanish colonists and native Indians, and inhabiting, as nomad hunters and cattle-rearers, the Pampas of S. America, especially those of the Argentine Republic.

Guadalajara, the capital of the state of Jalisco, Mexico, near the Rio Grande de Santiago, in the fruitful valley of Atemaxac, 150 miles from the Pacific. It is a bishop's see since 1863, has fourteen public squares, a poorly endowed university with 750 students, an art academy, the great hospital Belén or San-Miguel, a fine cathedral, the appearance of which was impaired by the destruction of its cupolas by the earthquake of 1818. Its *alameda* (promenade) is beautiful, and there are twelve large fountains supplied with water from the Cerro del Col by an aqueduct 3 miles long. The manufactures are gold and silver wares, leather, shawls, earthenware, &c. Pop. (1873) 70,947. G. was founded in 1543. In the vicinity are many silver-mines.

Guadalaviar', or **Tu'ria**, a Spanish river, 130 miles long, rises in the S.W. of Aragon, near the source of the Tagus, flows S.S.E. to the Mediterranean at Grao, 1½ miles E. of Valencia. It is employed in irrigating the fine gardens along its banks, but its mouth is silting.

Guadalja'ra, the capital of the Spanish province of the same name, on the left bank of the Henares, 35 miles N.E. of Madrid by railway. It lies in the fine pastoral district of Alcaria; has ten churches, seven nunneries, and six monasteries, a royal cloth factory, an academy of military engineering, the great palace of the Dukes of Infantado, the Panteon, containing the tombs of the dukes, and erected on the model of the Escorial (1696-1728), at a cost of £225,000. The Henares is here crossed by a new stone bridge, and its valley is malarious. Pop. 6500. G. is the ancient *Arriaca*, and was taken from the Visigoths in 714 by the Arabs, who called it *Wadi-l-Hadjarra*, and eventually lost it to Alfonso I. of Castile in 1081.

Guadalquivir' (Arab. *Wad-al-Kebir*, 'the great river'), the chief river in the S. of Spain, rises in the Sierra de Cazorla, flows S.W. through Andalusia, passing Andujar, Montoro, Cordova, and Sevilla, receiving on the right the Guadalimar and Guadiato, on the left the Xenil and Guadajos, and entering the Atlantic at San Lucar de Barrameda, 20 miles N.W. of Cadiz, after a course of 260 miles. It is navigable to Sevilla (80 miles), below which it encloses the Isla Menor ('lesser isle') and Isla Mayor ('larger isle'). The stream is loaded with alluvium, while its lower course lies in a luxuriant but malarious half-deserted country. G. is the ancient *Bætis*.

Guadalupe', the name (1) of a long spur of the Rocky Mountains between the Rio Grande and the Pecos; (2) of a beautiful grain-growing and sylvan county in the S.W. of Texas, U.S.; and (3) of a river rising in the S. of Texas, which flows S.E. through a fair, fertile region, and, after a course of 200 miles, joins the San Antonio, 13 miles from its mouth, in Esperitu Santo Bay.

Guadalupe-y-Calvo, a town of Mexico, state of Chihuahua, in a hilly region, has a pop. of 10,000, and several rich silver-mines worked by an English company.

Guadeloupe', the chief W. Indian possession of France among the Windward Islands, in lat. 16° N. and long. 61°. Area, along with the islet dependencies La Désirade, Marie Galante, and Les Saintes, 534 sq. miles; pop. (1872) 163,657, including 15,210 coolies. It consists of two islands, G. proper on the W. and Grand Terre on the E., separated by a strait 40 yards wide, called the Rivière Salée ('salt river'). G. proper is traversed by a mountain chain, rising in the volcanic La Soufirière ('sulphur-mine') to a height of 5018 feet; Grand Terre, which is of coral formation, is for the most part low and fertile. The hot climate is tempered by the regular sea breeze, but there are frequent hurricanes, high tides, and earthquakes. Basse-Terre, the capital, is on the W. island, and Pointe-à-Pitre, the only other port, is on the E. The exports (amounting yearly to some 18,000,000 francs) are sugar, rum, coffee, dye-stuffs, cabinet-woods, and tobacco. In 1874, 138 vessels of 37,300 tons entered and cleared the ports from France. G., discovered by Columbus in 1493, was colonised by the French in 1635, passed several times into the hands of the English, and was finally ceded to France in 1816.

Guadia'na (anc. *Anas*), a river of Spain, rises in the Sierra Alcarez, Murcia, 8 miles N.W. of Alcaraz. After 30 miles of its course, it flows for a similar distance underground, throwing up lakelets (*ojos*, 'eyes') here and there. It emerges at Daymiel, and continues W. through Lamancha and Estremadura, passes Badajoz, and then turns S. to form for 35 miles the E. boundary of Spain. It makes an incursion into Portuguese Alemtejo, again becomes the boundary for 30 miles, and finally enters the Atlantic after a course of 420 miles, only 35 of which are navigable. The chief affluent on the right is the Javalon; on the left, the Ardila. The G., though one of the longest rivers of Spain, has a comparatively small volume of water.

Guaia'cum, a genus of S. American and W. Indian trees belonging to the natural order *Zygophyllaceæ*. *G. officinalis* is a beautiful tree with hard wood, called lignum-vitæ, which sinks in water. It yields a resinous substance known as resin of guaiac, or gum-guaiac. Both the wood and the resin are used medicinally, on account of their stimulating diaphoretic properties. *G. sanctum* also yields G. resin, while its leaves are used in the W. Indies for soap.

Guan' (*Penelope*), a genus of Rasorial or Gallinaceous birds belonging to the family *Cracidæ*, or Curassows (q. v.). The crested G. (*P. cristata*), inhabiting the forests of tropical America, attains a length of 30 inches. The throat of the G. is naked, and has a dilatable skin. The bird is solitary in its

habits, and appears to feed on fruits. Its flesh is highly esteemed. It can be domesticated with difficulty.

Guana'co, a variety or sub-species of Llama (q. v.) inhabiting Patagonia, and distinguished by its long neck and its ruddy brown colour. The height at the shoulder is about 3½ feet. The G. lives in herds of from ten to thirty or forty in number, and is kept for the sake of its wool, skin, flesh, and milk. It is wonderfully sure-footed, and in its native state is quiet and timid, but when domesticated shows fight on being irritated, and discharges saliva over its assailant.

Guanaha'ni, or Cat Island, a small island of the Bahamas, W. Indies, has a pop. of 2378. Till recently it was supposed to be the island first discovered by Columbus, and called by him San Salvador. Watling's Island is, however, now regarded as the island in question, and has therefore received the official name San Salvador.

Guanajuato, Sante Fé de, the capital of an inland state of the same name, Mexico, lies at an elevation of 6017 feet above the sea, and on steep, broken slopes. It has a cathedral, eight monasteries, a college, a theatre, and manufactures of soap, linen, tobacco, &c. The vicinity is rich in silver-mines. Pop. (1873) 63,000.—The *state* of G. is partly a plateau 6000 feet above the sea, traversed by mountains 11,000 feet high. It is very rich in silver, and yields maize, red pepper, wine, and olives.

Guana're, a city of Venezuela, S. America, in Barinas, near the river from which it takes its name, 220 miles S.W. of Caracas. It exports hides, coffee, cocoa, &c. Pop. 12,000. The river G. is the upper water of the Apure.

Guanine is a basic nitrogenous substance, first obtained from guano, but it also occurs in the pancreatic juice of the mammalia and in the excrement of certain insects. It may be prepared from guano by boiling with slaked lime and water till the solution is only slightly coloured, filtering, and precipitating with acetic acid. The G. is precipitated in a somewhat impure condition, but may be purified by solution in hydrochloric acid, and precipitation by ammonia. G. is a colourless crystalline powder, insoluble in ether, alcohol, and water, but soluble in acids and solution of potash. Its composition is represented by the formula $C_5H_5N_5O$. It unites with acids to form salts.

Guano (Per. *huano*, 'dung') consists of the excrement deposits of animals, chiefly of sea-birds, which, owing to peculiar conditions, has been allowed to accumulate in extraordinary masses in various regions of the earth. It is used as manure, and is by far the most important and valuable of all imported manures in any agricultural country. The preservation of G. deposits is dependent on the freedom of the locality in which the fæcal matter is dropped from rain or other forms of moisture which would wash away the important fertilising constituents for which it is valued. As observed by Professor Johnston, 'a single day of English rain would dissolve out and carry into the sea a considerable portion of one of the largest accumulations; a single year of English weather would cause many of them entirely to disappear.' It is on this account found that the most valuable deposits of G. occur in hot, arid regions on or near sea-coasts, where little or no rain falls, and these conditions prevail chiefly on certain parts of the Peruvian and Bolivian coasts of S. America, and on islands lying off these coasts. According to the amount of rain or dew which may have operated upon G. deposits, they are roughly separated into three classes as follows:—(1) Nitrogenous G., consisting of droppings which have been little affected by moisture, and which consequently retain the greater part of the soluble constituents of bird-dung, as urea, uric acid with other ammoniacal salts, and soluble phosphates. These guanos contain from 16 to 21 per cent. of ammonia. (2) G. which has lost a large proportion of its nitrogenous matter through the solvent action of rain, but in which from 2 to 4 per cent. of ammonia is still present. (3) Phosphatic G., from which all the soluble nitrogenous compounds are washed away, and which are valuable almost entirely on account of the earthy phosphates remaining in them. These varieties contain also some organic compounds which have resisted the action of water with sulphates and carbonates of lime, and they are frequently mixed with a considerable proportion of sand. The phosphatic varieties are generally treated with sulphuric acid to render the phosphates they contain more soluble, or they are used similarly to bones, coprolites, &c., as a source of 'superphosphates.' Although it is convenient thus to classify the varieties of G., there is no distinct line of demarcation between the three classes, and some kinds may be considered as much phosphatic as nitrogenous. The freshest, most recent, and least altered G. imported into Great Britain consists of Angamos G., obtained from a rocky promontory in Bolivia. It is obtained only in small quantities, and though the most valuable of all, it is practically interesting only as the extreme type of nitrogenous G. Next to it comes the ordinary Peruvian G., of which the now exhausted deposits of Chincha Island were the most characteristic and valuable, containing from 16 to 17 per cent. of ammonia. The Falkland Islands on the Patagonian coast, Ichaboe, Saldanha Bay, certain parts of Bolivia, and Upper Peru, Chili, and California are the sources of the varieties generally containing less than 5 per cent. of ammonia. The phosphatic guanos are obtained from S. America, S. Africa, certain of the W. Indian Islands, and some uninhabited islands in the S. Pacific. The chief commercial varieties are Mejillones, Patagonian, Californian, Curaçoa, Birds' Island, Malden Island, and Starbuck Island. The following analyses by Dr. Voelcker of two extreme varieties indicate the effect of weather on the deposits and their variation in fertilising influence:—

	Angamos Guano.
Moisture	7·24
Organic matter and ammoniacal salts	69·01
Phosphates of lime and magnesia (bone phosphates)	12·06
Alkaline salts (potash and soda salts)	9·02
Insoluble siliceous matter	2·67
	100·00

	Starbuck Island Crust Guano.
Moisture and organic matter	8·75
Phosphoric acid	45·57
Lime	40·94
Magnesia	·64
Sulphuric acid	3·56
Alkaline matter and silica	·54
	100·00

Nitrogenous guanos have a brownish-yellow appearance, and so very pungent an ammoniacal odour that they produce watering of the eyes. Frequent masses of comparatively pure carbonate of ammonia are obtained from them, and they also sometimes enclose remains of birds, &c. They exercise a powerful stimulating and forcing influence on the crops on lands to which they are applied; and containing a large proportion of soluble matter, their valuable principles are communicated to the soil with great rapidity. Phosphatic guanos have a yellow or chocolate colour, and a fine powdery texture, with much less odour than the nitrogenous kinds. They produce a very beneficial effect on root crops when applied in their native condition; but as already stated, they should be washed with sulphuric acid to render their phosphates readily soluble.

The earliest known mention of G. is in the *Commentaries of the Incas* by Garcilaso de la Vega in 1568. Attention was called to its fertilising qualities by Humboldt, who sent samples analysed by Fourcroy and Vauquelin to France in 1805. Regular importations began about 1842 and rapidly rose in amount to 500,000 tons a year, at the rate of £20 a ton. In 1875, 114,454 tons were imported into Great Britain, the value being £1,293,436. The import of France (1870) was 100,186 tons; of Belgium, 68,837; of Germany, 36,412; of Spain, 34,366; of the United States, 30,798.

Guapey', a tributary of the Mamore, a branch of the Amazon, rises in Bolivia, and has a length of 550 miles.

Guapo're, a head water of the Amazon, flows through the Mamore and Madera in Brazil, and has a course of 400 miles.

Guara'na, a native Brazilian name for a valuable food preparation of the seeds of *Paullinia sorbilis* (natural order *Sapin-*

dacea), a low, wide-spreading tree abounding along the banks of the Amazon and its tributaries. The fruit, about the size of a walnut, contains five or six seeds. These are roasted, powdered, mixed with water, and shaped into rolls which are dried in the sun. For use a quantity is grated off a roll and boiled with water. The decoction acts as a stimulant and nervous restorative, owing to the alkaloid theine which is present, to the extent of 5·07 per cent., more than twice the quantity contained in good black tea.

Guar'antee, or **Guar'anty**, in law, is a contract by which one person binds himself to do some act, in the event of the person primarily liable failing to do it, or some other specified act. G. is either continuous or limited. It is continuous when one pledges himself for another to a certain amount in any dealing. It is limited when restricted to a particular transaction, person, or time. The Statute of Frauds provides that no person shall be liable on any special promise to answer for the debts or default of another, unless the G. can be proved by writing, and that the surety shall not be bound beyond the express words of the engagement. 19 and 20 Vict. c. 60 enacts that the G. to or for a firm shall cease on a change in its members, unless it appears to have been otherwise meant by the parties to the contract. By the same Act every surety who discharges his liability to a creditor is entitled to any security held by that creditor. If a creditor discharges or gives indulgence to his debtor, the surety is released. A letter of recommendation, though spontaneously given, is not held to be a G. unless it refers to a particular transaction, and contains assurances of its being a safe one.

Guardafui', **Cape**, or **Ras Asser**, the most easterly point of Africa, in the Somali territory, and running E.N.E. between the Indian Ocean and the Gulf of Aden. It was the *Aromatum Promontorium* of the ancients.

Guar'dian, in English law, is the legal custodier and representative of a boy or girl who is under Age (q. v.). If an estate be left to an infant, the father is by common law the G. and must account to his child for the profits. A father may by deed or will appoint a G. of his child till the twenty-first anniversary of its birthday. A G. so appointed is called *G. by statute*, or *testamentary G.* The reciprocal duties of G. and ward are the same as those of Parent and Child (q. v.), but that on the ward coming of age, the G. must account to him for all transactions on his behalf, and the G. is answerable for loss by his wilful default or negligence. To marry a ward of Chancery without consent of that division, is a contempt for which the offender may be committed or indicted, though he was ignorant of the wardship. A proper settlement made on the ward is sometimes, but not always, held to counteract the contempt.

Guardian ad Litem is a person, usually the father, appointed by the Chancery division to carry on a suit for an infant.

Guardian of the Poor.—This is, by 4 and 5 Will. IV. c. 76, any qualified person elected to the office by the ratepayers and owners in the parish or union. The qualification is not to exceed a rental of £40 a year. County magistrates are guardians *ex officio*.

For *Guardian* in Scotch law, see CURATOR, MINOR, TUTOR, JUDICIAL FACTOR.

Guards, in the British army, are during peace the garrison of London, and guard of the monarch at Windsor. The G. include, in cavalry, the 1st and 2d, and the Royal Horse G. (Blue); in infantry, the Grenadier G., Coldstream G., and Scots Fusilier G. Formerly an ensign in the Foot G. ranked with a lieutenant in another regiment, and a lieutenant with a captain; but this distinction between the G. and other troops vanished on the abolition of purchase in 1871.

Guardship, a war-ship placed to guard a port, and generally used to receive seamen before they are appointed to other vessels.

Guar'ea, a genus of trees belonging to the natural order *Meliaceæ*, having purgative and emetic properties, found in N. America. The wood of *G. trichilioides* and other species has been used as a perfume owing to its strong musk odour.

Guari'ni of Verona, generally called **Guari'no** (Latinised *Varinus*), one of the first scholars of the 15th c., was born at Verona in 1370. He went to Constantinople in 1390 to study Greek under Chrysoloras, and returning to Italy after five years, became Professor of Greek successively at Florence, Venice, Verona, and Ferrara, where he died in 1460. G. did much to revive learning in the West. His principal works are Latin translations of Plutarch and Strabo, and several grammatical treatises, of which the most important are *Grammaticæ Institutiones* (Verona, 1487), and *Chrysoloræ Erotemata Linguæ Græcæ*. See Rosmini's *Vita e Disciplina di G.* (Brescia, 1805).

Guari'ni, Giovanni Battista, an Italian poet, was born at Ferrara, 10th December 1537. After studying at Pisa and Padua, he entered the service of the Duke of Ferrara, who sent him as ambassador to Venice, Rome, Germany, &c. After quitting and returning to the Ferrarese court and engaging in diplomatic labours for various Italian rulers, he died at Venice, 4th October 1612. G.'s brilliant gifts were greatly neutralised by his vanity, irritability, and puerile craving for court favour. His chief work, the *Pastor Fido*, a tragi-comic pastoral written in imitation of Tasso's *Aminta*, was once immensely popular, and is musically versified, pure in diction, and full of colour, but its characters are artificial, and its language often affected and licentious. An edition of G.'s works was issued at Ferrara (4 vols. 1737).

Guatema'la, a republic of Central America, bounded N. by Yucatan, W. by Mexico, S. by the Pacific, and E. by St. Salvador, Honduras, and the Caribbean Sea. Area, 41,830 sq. miles; pop. 1,190,800, of whom about 90,000 are Indians, 20,000 whites, and the rest mestizoes. The country is traversed by mountains which may be regarded as a continuation of the Andes. From these, spurs branch off, with deep valleys between, to the Caribbean Sea. There are several active volcanoes, the highest being Sapoetlan (13,050 feet) and Atitlan (12,500 feet), and the country is subject to earthquakes. The soil is fertile, and wheat, rice, maize, sugar, cotton, vanilla, indigo, tobacco, and cochineal are grown. The revenue for 1874 amounted to £520,200, and the expenditure to £508,520. The national debt in 1875 was £872,645. The value of the imports for 1874 was £610,801, and of the exports for the same year £657,744. The trade, which is chiefly with Great Britain and the United States, is mostly in cochineal, indigo, and coffee. G. was from 1804 to 1839 included in the confederation of Central America. In 1839 it was formed into a separate republic, and was ruled by an oligarchy of dissolute priests and nobles until 1871, when the priestly party was stripped of power. The executive is vested in the president, who is chosen for four years. General Rufino Barrios now (1877) holds the office. —**New G.**, or **Santiago de G.**, capital of the republic of G., stands on a wide fertile plateau 4961 feet above the sea. It is spacious and well built, the houses being generally, for fear of earthquakes, only one story high. It is an archbishop's see, and has manufactures of muslin, cotton yarn, silver-ware, &c., and a brisk trade in agricultural produce. Pop. (1874) 45,000, about a tenth of whom are of European descent.—**Old G.**, or **La Antigua G.**, former capital of G., is beautifully situated at the foot of Volcan d'Agua, 30 miles W. of New G. It was founded in 1524 by the Spaniards, was destroyed in 1541 by an eruption, and in 1773 by an earthquake. Pop. (1874) 20,000.

Gua'va, the common name given to the species of a genus (Psidium) of tropical American and W. Indian trees and shrubs, belonging to the natural order Myrtaceæ (q. v.). Their fruits are edible. The common G., sometimes called white G., is the *P. guaiava*, a well-known tropical fruit. The red G. (*P. pomiferum*) is an agreeable but more acid fruit than the common G. The China or purple G. (*P. Cattleianum*) is cultivated in British hothouses, where it fruits freely. Large quantities of G. jelly and G. cheese are imported annually into Britain from the W. Indies.

Guayaquil', the name of a department, city, and river of Ecuador, S. America. The *department* of G. is a belt of fertile lowland between the Pacific and the Andes. Area, 14,401; pop. 92,696.—The *city* of G., capital of the above department, stands at the mouth of the river G., and has the best port on the W. coast of S. America. It is, however, very unhealthy, lying amid swamps, and is mostly built of wood. It has a considerable trade, the chief exports being cocoa, timber, india-rubber, and tobacco; the chief imports, cotton, wine, and hard-

ware. Pop. 20,000.—The *river* G., the only navigable stream on the W. coast of S. America; rises in the Andes, receives the Daule and Babo, and flows through a marshy plain into the Gulf of G. Vessels of considerable size can ascend it for about 100 miles.

Guay'ra, La, a town of Venezuela, S. America, 6 miles from Caraccas, of which it is the port, stands on a narrow strip of plain between the sea and the mountains, which here rise with an almost sheer ascent of 3000 feet. The climate is very hot and unhealthy, and earthquakes are frequent. G. is the chief port of Venezuela, but has no harbour, and the roadstead is very exposed. Coffee, cocoa, sugar, cotton, indigo, and hides are largely exported. In 1875 its exports amounted to £814,886, and its imports to £1,022,975. Pop. 8000.

Gubb'io (anc. *Eugubium* or *Iguvium*), a town in the province of Perugia, Central Italy, 27 miles S. of the town of Urbino, lies in a valley circled by mountains. It has a quaint medieval aspect, and among its chief buildings are the Palazzo del Comune, begun in 1332, the ducal palace, and the cathedral. Outside G. are the ruins of a theatre, supposed to belong to the age of the Roman republic, and of the temple of Jupiter Apenninus. The Eugubine Tables (q. v.) were found here in 1444. Pop. (1871) 5343. G. was the *Iguvium* mentioned by Cicero, was destroyed by the Goths, afterwards rebuilt, and became an independent state at the end of the 12th c.

Gu'ben, a thriving town of Prussia, province of Brandenburg, at the confluence of the Lubst and Neisse, 28 miles S.S.E. of Frankfurt-on-the-Oder. It has an active river trade, woollen and tobacco industries, and produces much excellent red wine. The gymnasium is its chief building. Pop. (1875) 23,738.

Gud'geon (*Gobio*), a genus of fresh-water Teleostean fishes included in the carp family (*Cyprinidæ*), and distinguished by large scales, small dorsal and anal fins, a forked tail, and a mouth pointed with *barbules*, or tentacular filaments. The G. (*G. fluviatilis*) is a common fresh-water fish in most English ponds and rivers. The average length is 8 inches, and the colour an olive brown with black spots; the under parts are white. The G. appears to be gregarious in habits. Its food consists of worms, &c., and it is readily caught with this bait by juvenile anglers whose only equipment is a piece of string and a bent pin. The flesh is very palatable and delicate.

Gueb'res, a small sect in the E. of Persia, nearly confined to the two cities of Yezd and Kirman and the villages in their neighbourhood, and in 1858 numbering about 7000, are the only known representatives, besides the Parsees of India, of the Zoroastrian religion. When the Sassanian dynasty fell before the advance of the Arabs, and Zoroastrianism had to give place to Mohammedanism, a persecuted remnant fled to the mountainous district of Khorassan; part of whom found their way to India, and became the ancestors of the Parsees there, the G. being the descendants of those who remained behind. The great majority of the latter are in extreme poverty, owing to the harsh persecution to which they have all along been subjected. Their condition, however, is so far ameliorated by the kind assistance of their co-religionists in India, who, for one thing, have established schools for the gratuitous education of their children. They have been able, on the other hand, to repay the kindness of the Parsees with copies of their sacred books. The copies originally brought to India were no longer in existence in the 14th c., the originals of the present Indian MSS. being brought from Yezd between the 14th c. and 18th c. See PARSEES, SUN-WORSHIP, and ZOROASTER.

Guebwill'er, a German town in the province of Elsass-Lothringen, on the Lauch, 15 miles S.S.W. of Kolmar. Its church of Saint Leger is a very interesting edifice of the 12th c., and it has also a Dominican church of the 14th c. There is considerable trade in white wine; and ribbons, cottons and woollens, &c., are made. Pop. (1871) 11,338.

Guelderland. See GELDERLAND.

Guelder Rose, or more properly **Gueldres Rose**, a common name given to the cultivated form of *Viburnum opulus*, a shrub native in Britain. It is also sometimes called snow-ball tree, from the round form of its clusters of flowers. It belongs to the natural order Caprifoliaceæ (q. v.).

Guelphs, Order of, often incorrectly styled the **Guelphic Order**, a military and civil order of knights founded in 1815 by George IV. of England for his Hanoverian subjects, but into which many Englishmen have been admitted. The badge is a gold cross, with a lion passant in its divisions, surmounted by the Hanoverian crown. The Prussian Government does not recognise the order, and its members are not considered as knights in Great Britain.

Guelphs and Ghib'ellines, the names of the two great rival parties in the political history of medieval Italy, the Guelphs being the advocates of the Papal, the Ghibellines of the Imperial power. The names are Italianised forms of the German *Welf* and *Waiblingen*, the *Welfs* being a Saxon house hostile to the Hohenstaufens or *Waiblingen*. According to the most probable tradition of the rise of the names, when Konrad III.'s forces were besieging the revolted town of Weinsberg, in 1140, the rebels used *Welf*, the name of their leader, the brother of the Duke of Saxony, as a war-cry, while the King's troops in reply shouted *Waiblingen*, the name of their commander Friedrich of Suabia's native village, and these war-cries were adopted as distinctive titles by the two hostile German parties. Afterwards, it is said, the foes of the Hohenstaufens in Italy took the name of that family's German rivals. At the beginning of the struggle between the emperors and popes, however, the Italian Guelphic party had not arisen, and it was not until the reign of Friedrich Barbarossa that the true Guelphic faction appeared, when the Pope allied with the republics of Northern Italy against the Emperor. Friedrich then invaded Italy, but not as a mere foreign aggressor. The Ghibellines viewed him as the assertor of strictly legal claims, as the lawful successor to the dominion of the Roman emperors, nor did even the republican Guelphs deny his supremacy over Italy—they merely questioned its nature and extent. His predecessors, Otto and Heinrich III., had been invited into Italy by the Italians to repress papal wrong-doing and feudal anarchy, but after Heinrich's time the imperial rights had fallen into disuse, and free commonwealths had arisen in Lombardy and Tuscany, jealous of a foreign ruler's supremacy. The quarrels of the Italian cities favoured the imperial pretensions. Milan refused to pay tribute to Friedrich, and strove to subdue Como, Lodi, and other cities which sought help from the Emperor. Friedrich then entered Italy, while the Northern Guelphic cities united against him in the Lombard League (q. v.), and finally defeated him at Legnano, after which the Emperor was left only a titular supremacy. This was the greatest struggle between the two parties, and during it both may be said to have been truly warring for principles. Afterwards the names were merely used to give colour to aggression and kindle discord. In 1334 Pope Benedict XII. forbade their use, and at the end of the 14th c. they ceased to have any true meaning. The rivalry of the two great parties, even when their followers were the earnest advocates of two antagonistic theories of government, and when there was true nobility of purpose on either side, was most baneful to Italy. They carried discord into every section of Italian society, and led to ceaseless revolutions in the cities, each of which, whether it were Guelph or Ghibelline, included among its citizens many of the opposite party, the nobles being in general Ghibellines. Our sympathy, says Mr. Bryce, must go with the Guelphic cities, 'in whose victory we recognise the triumph of freedom and civilisation' (Bryce's *Holy Roman Empire*). But the Guelphs never fancied they were fighting for Italy against Germany, and had no stronger national feeling than the Italian Ghibellines who were by no means traitors, though supporters of the less noble cause. In the S. of Italy the names Guelph and Ghibelline never represented rival principles, but were merely used in a contest between the house of Hohenstaufen and the house of Anjou, which grew into a struggle between France and Spain. The Guelphic badge was an eagle tearing a dragon crowned with a lily, that flower as well as a red rose being the symbol of the Ghibellines. See Freeman's essays on the *Holy Roman Empire*, and on *Frederick I., King of Italy* (*Essays*, 1st series), and Bryce's *Holy Roman Empire* (5th ed. 1875).

Guerci'no ('the squint-eyed'), the name given to Gián Francesco Barbieri, a famous painter, born at Cento, between Bologna and Ferrara, February 2, 1590. He early showed strong artistic genius, became a follower first of the Caracci, and after

wards of Guido, won great fame at Rome, where he was patronised by Gregory XV., and settled in 1642 at Bologna, where he acquired large wealth. He died at Bologna, December 22, 1666. Among his works are 'Æneas carrying his Father,' 'Endymion Asleep,' 'St. Antony of Padua,' 'St. Paul,' 'St. Francis,' 'Circe,' 'St. John in the Desert,' 'Persian Sibyl,' 'St. Petronilla,' and 'Aurora,' the three last being probably his masterpieces. His style was nobly facile and vigorous, and at first characterised by the preponderance of sombre shadows, but afterwards, as he came under the influence of Guido, became much more refined and delicate. He was far more successful in colour than in design.

Guer'icke, Otto von, a celebrated natural philosopher, was born at Magdeburg in Prussian Saxony, November 20, 1602. After studying at Leipsic, Helmstedt, Jena, and Leyden, and travelling for some time in France and England, he settled in his native town, where he became a member of the senate in 1627, and burgomaster in 1646. Here he made his famous discoveries in science, inventing the air-pump in 1650. By it he emptied spherical vessels, and proved that air had weight, and exhibited the great pressure exerted by the atmosphere by means of the well-known *Magdeburg hemispheres*. He was the constructor of the first frictional electrical machine, and was the earliest to hint at the periodicity of comets. His most important researches are found in his *Experimenta Nova, ut vocant, Magdeburgica de Vacuo Spatio* (Amsterdam, 1672). In 1681 G. followed his son to Hamburg, where he died, May 11, 1686.

Guerill'a (Sp. 'petty war,' derived from Sp. *guerra*, 'war'), the name given to the war carried on in Spain by irregular bands of peasants, &c., during the French invasion of 1810–14. These bands, of which the most famous was Mina's, that afterwards did good service under Wellington, were at first called *partidas*, but were afterwards spoken of as guerillas, a name now applied to irregular troops carrying on a desultory struggle.

Guér'in, Pierre Narcisse, Baron, a French painter, born at Paris, May 13, 1774. He served in his youth in the army, and first became known in 1796 by his 'Corps de Brutus rapporté à Rome.' He gained great popularity, was successful as a teacher, was made a baron in 1829, and died at Rome, July 16, 1833. Among his chief works are 'Phèdre et Hippolyte' (1802), 'Orphée au Tombeau d'Eurydice' (1802), 'Andromaque' (1810), 'Didon et Énée' (1817), 'Clytemnestre' (1817). G. belonged to the French Classical school. His style was cold and often theatrical, but his colour is pure and harmonious, and his designs are marked by great taste in the details and skill in the grouping.

Guern'sey, the most westerly, and, next to Jersey, the largest of the Channel Islands (q. v.), is 69 miles S.E. of Start Point, in Devonshire, and 46 S.W. of Cherbourg. Area, 25 sq. miles; pop. (1871) 30,667. It is 9 miles long and 6 broad, and is difficult of approach for rocks and currents. The surface is flat and fertile in the N., but rises in the S. to rocky eminences overhanging the sea. Though subject to Britain, G. has its own legislature. Its climate is singularly fine, and its inhabitants, who speak a Norman-French dialect, are intelligent and thrifty. St. Peter's, the only town, is in the S.E.

Guerra'ra, El, or **Gerra'ra,** a town S. of Algeria, on the river Zegerin, in the oasis of Wady-Nizab, 40 miles N.E. of Ghardaia. It is encircled with walls, and has a large trade in gold-dust, ivory, cotton, ostrich feathers, horses, cattle, &c. Pop. 14,000.

Guerrazz'i, Francesco Domenico, an Italian statesman and lawyer, was born at Leghorn in 1805. He studied law at Pisa, but early engaged in literature, and produced a number of patriotic tales bearing on Italian politics. After suffering imprisonment for his republican opinions, he was elected deputy in 1848, and on the flight of the Grand Duke of Tuscany was appointed triumvir with Montanelli and Mazoni. Soon after he was proclaimed dictator, but on the restoration of the ducal power was, in spite of his masterly defence, *Apologia della Vita Politica di G.* (1851), imprisoned for three years, and condemned to banishment for life. He then betook himself to Corsica, but was enabled by the results of the Franco-Sardinian war with Austria to renew his political career, and after the establishment of the Italian kingdom was repeatedly elected to Parliament. G. died September 25, 1873. Among his works are *Battaglio di Benevento, L'Assedio di Firenze, Isabella Orsini, Veronica Cybo, Nuovi Tartufi, Beatrice Cenci, Torre di Nonza, Fides, Il Bucanel Muro,* and *Il Secolo che Muove.* His works are full of noble imagination, ardour, and eloquence, often shot through with satire and humour in a manner that greatly resembles Byron.

Gues'clin, Bertrand du, Comte de Longueville, and Constable of France, a famous French soldier, was the son of a poor Breton gentleman, and born at Rennes about 1320. He was distinguished in his youth for skill in the tilt-yard, and early became known as a fearless and able captain of free-lances. He supported Charles Comte de Blois against Jean de Montfort in a struggle for the dukedom of Brittany, but in 1364 was beaten and captured at Auray by an inferior English force under Sir John Chandos. Ransomed by Charles V., he drove Pedro the Cruel from Aragon, but was utterly routed and captured by the Black Prince at Najara in 1367. Again ransomed, he defeated Pedro in 1369, and raised Henry of Trastamare to the throne, being in return made Duke of Molina and Constable of Castile. In 1369 he was appointed Constable of France, and began to clear the country of the English, whom he never beat in a great battle, but whom he adroitly harassed and out-manœuvred until their strength was utterly broken. G. died while besieging Château-Neuf de Randor in Languedoc, July 3, 1380. He was one of the chief instruments in building up France, but his character has been generally misrepresented. He was not a high-souled chivalrous warrior; on the contrary, more than any other man he helped to destroy chivalry in France, and make war a mercenary pursuit. He was rude and ignorant, insolent to the nobles, but kind and generous to the poor and to his free-lances; a marvel of strength and ferocious courage, and a singularly wily and dexterous tactician. See Cuvelier's *La Vie du vaillant Bertrand du G.*, a metrical chronicle published by M. Charrière (Par. 1839); De Berville's *Histoire de G.* (2 vols. Par. 1767); and Kitchin's *History of France* (1873).

Gueux ('beggars'), the name given in scorn to the confederate nobles of the Low Countries on the occasion (5th April 1566) of their presenting a remonstrance to the Regent Margaret, Duchess of Parma, against the despotic policy of their sovereign, Philip II. of Spain, and particularly against the proposed introduction of the Inquisition into the country. A great gathering was held three nights after, under the presidency of Henry Count Brederode. 'They call us beggars,' said the Count; 'let us accept the name. We will contend with the Inquisition, but remain loyal to the King, even till compelled to wear the beggar's sack.' This was enthusiastically agreed to, and an appropriate costume was fixed on, the G. soon appearing in the streets with common felt hats on their heads, and beggars' pouches and bowls at their sides. After a long and strenuous opposition to the policy of Philip, they were finally crushed and destroyed by the overpowering force of Alva. See Motley's *Rise of the Dutch Republic* (Lond. 1856).

Gugliel'mi, Pietro, an Italian composer, was born at Massa-Carrara in May 1727. Instructed first by his father, and then by Durante of Naples, he wrote operas from 1755, making a successful beginning in the Italian towns. After spending some time in Vienna, Dresden, &c., he went in 1767 to London, where he remained till 1772. Five years later he returned to Naples. From 1793 to his death, 19th November 1804, he was maestro-di-capella of St. Peter's at Rome. Fétis (*Biographical Dictionary of Musicians*) enumerates seventy-eight operas, sacred and secular, written by G.

Guian'a (Fr. *Guyane*, Span. *Guayana*, Port. *Guianna*), the name of an extensive tract of country in the N.E. of S. America, extending along the coast of the Atlantic from the mouth of the Amazon to that of the Orinoco, in lat. 8° 40′ N.–3° 30′ S., and long. 50°–68° W. It is divided politically between Brazil, Venezuela, Great Britain, France, and the Netherlands. Brazil and Venezuela have incorporated their portions in provinces. Its extreme length is 1090 miles, its breadth 710, and its distribution between the three European Powers is as follows:—

	Area in sq. miles.	Population.	Chief towns.
Great Britain, 1874 . .	85,425	215,200	Georgetown.
Netherlands, 1875 . .	46,049	69,834	Paramaribo.
France, 1872 . . .	46,856	24,171	Cayenne.
	178,330	309,205	

There is little geographical diversity between the various divisions. Along the seaboard stretches a belt of low land, from 10 to 40 miles in width, with a soil of bluish clay enriched by vegetable matter and impregnated by marine salts. When drained this soil sinks for nearly a foot, and requires to be protected against the inroads of the sea by dykes. Much alluvium is brought down by the numerous rivers, of which the most important are Essequibo (q. v.), Demerara (q. v.), Berbice (q. v.), Corentyn (q. v.), the boundary between British and Dutch G., the Maroni, that between French and Dutch G., and the Gyapok, forming a boundary of French G. on the E. The rivers are greatly impeded by rapids and cataracts; the Kaiateur waterfall, first described by Barrington Brown, has a drop of 822 feet and a width of 269, and is splendidly set off by all the leafy wealth of the tropics. Advancing inland, the alluvial coast flats give place to sandy uplands, stretching away in the S.W. to the little-known mountain ranges of the Sierra Pacaraima and Sierra Parime. The chief rocks of this rugged region are granite, gneiss, and white quartz. The abundant presence of mica in the quartz gives to the hills in sunshine a glittering appearance, and to this peculiarity has been ascribed the belief in the mythical El Dorado (q. v.), or 'golden land,' that was here sought by Francisco Orellana and the ill-fated Raleigh. According to the report of Schomburgk, published in Leipsic in 1848, the region is somewhat barren of minerals. In British G. is the unique rock plateau of Roraima, which is inaccessible, resembles a vast fortification surrounded by glacis, and is crowned by forests and drained by cataracts. The sculptured rocks in the interior of G. are supposed to relate to the history of an ancient people. G. has a hot, moist climate, the mean temperature being 81° F. The two rainy seasons cover the months of June, July, and August, and December, January, and February. The climatic changes are sudden, and are generally accompanied by violent hurricanes and thunderstorms. G. is only cultivated along the coast flats and for a short distance up several of the rivers. The chief products are sugar, timber, cacao, rum, gums, balsams, drugs, cloves, pepper, rice, and maize; cotton and coffee, formerly grown to a considerable extent, have been abandoned for sugar since the introduction of improved machinery. In French and Dutch G. gold is found in some quantity, and of late years its pursuit has been taking the place of agriculture. The various kinds of woods exported are among the most valuable in commerce; the timber of the gigantic mira tree, which attains a height of 150 feet, is said to be as durable as teak. Among the fruits of G. are the banana, pine-apple, guava, &c. Chief of its gorgeous flowers is the *Victoria regia*, one of the largest of water-lilies. The most notable of the animals are the 'Warra caba' tiger, tapir, ant-eaters, and various turtles, besides anacondas, alligators, iguanas, and several poisonous snakes. There is a great variety of excellent fish, and birds of splendid plumage abound, including the parrots, humming-birds, flamingoes.

It is not known whether Columbus ever landed on the shores of G., but the Spaniards had certainly settled in the region as early as the 16th c., for they opposed the entrance of the Dutch in 1580. The Dutch, however, effected a settlement on the Essequibo in 1602, and the French near the Gyapok in 1633. After much internal disturbance, and frequent raids of the French, part of the Dutch possessions, at the desire of the colonists, was transferred to Britain in 1796. At the peace of Amiens (1802) the colonies were handed over to the Batavian Republic, only to be restored to Britain in 1803.

British Guiana, the most westerly of the three colonies, lies between Venezuela on the W. and Dutch G. on the E. It is divided into the counties Essequibo, Demerara, and Berbice, and its chief towns are Georgetown (q. v.) and New Amsterdam (q. v.). Of its inhabitants (1871), 113,570 were born in British G.; 13,385 in the West India Islands; 7925 in Madeira, Azores, &c.; 1444 in Europe; 7541 are immigrant coolies from Africa; 2535 from Madras; 40,146 from Calcutta; and 6295 from China. The aboriginal Indians, who are not included in the census returns, are variously estimated at from 7000 to 20,000. The colony, which has been making steady progress under British sovereignty, in 1871 had a revenue of £379,647, an expenditure of £338,053, and a public debt, in process of reduction, of £512,865. In 1875 the value of the exports to Great Britain alone amounted to £1,911,981, and of the imports from Great Britain to £852,977. The value of (unrefined) sugar exported was £1,430,861 (1,210,193 cwt.); of rum, £394,044 (3,624,294 proof gallons); of woods, £55,024. Of the imports, the value of cotton was £106,993; of iron, £52,695; of machinery, £63,964, and of manure, £57,477. The total exports (1871) amounted to £2,748,720, the imports to £1,897,184. A submarine cable is (1877) being laid down between Pará in Brazil and Demerara, with stations at Cayenne and Paramaribo, thus connecting the colonies by telegraph with Europe. The political constitution of the colony is little altered since the time of the Dutch. The governor presides over the legislative body, and over the 'combined court,' which meets annually to pass the tax ordinance, and which includes the 'college of financial representatives.' The latter body, comprising six members, is popularly elected; of the legislative body, five members are nominated by the crown, and five by the 'college of electors,' which again is returned by electoral franchise. The judicial system is still partially based on the Roman code, but English criminal law was introduced in 1846. The churches maintained by public funds are Presbyterian, Episcopalian, Roman Catholic, and Wesleyan; there are also voluntary missions. See *Reisen der Brüder Schomburgk in Britisch. G.* (Frankf. 1852), and *Canoe and Camp Life in British G.* by C. Barrington Brown, late Government surveyor (Lond. 1876).

Dutch Guiana or *Surinam*, lies between British and French G., is bounded by the rivers Corentyn and Maroni. It is called by the Dutch Surinam, from its principal river. The population comprised in 1875, 706 Europeans, 3779 immigrants, and 45,363 natives, exclusive of the aborigines and of the Maroons, descendants of runaway slaves, who live in the interior. In 1875 the value of the exports was £200,778; of imports, £260,451. The trade is chiefly with Great Britain, Holland, and the United States. The sugar trade has greatly fallen off since the emancipation of the slaves in 1863; the field-labourers, who are greatly deficient in number, now mainly come from China, the W. Indies, and India. Gold diggings and washings have become so general as to bring to the treasury a considerable revenue for the granting of 'prospects' at 2d. a hectare, but the result till 1876 had only covered the preliminary outlay and daily expenses. The colony is under a governor-general and council of native freeholders. There is full religious toleration; the labouring classes mostly belong to the Moravian and Roman Catholic Churches. In 1875 the revenue was £70,938, the expenditure £101,085, and the subsidy from the mother country £30,147. The chief towns are Paramaribo (the capital), Batavia, Groningen, and Nassau. See Palgrave's *Dutch G.* (Lond. 1876).

French Guiana, or *Cayenne*, the most easterly of the colonies, is bounded by the navigable rivers Maroni and Oyapok. The low alluvial lands are in part covered with forests of mango-trees and palms, and with swamps formed by the overflowing of the rivers. The climate is less oppressive here on account of the trade winds. G. has a rich soil, well adapted for cultivation; but agriculture has of late years been almost abandoned for gold-digging. In 1874 the exports amounted to £191,411, of which gold formed £163,268, and cabinet woods £15,237; the imports to £274,738. In 1874, 1808 coolies were brought from Calcutta, Pondicherry, and Carical to work at the mines. Almost the whole of the settled part of the colony from N. to S. is taken up for gold-seeking; the richest and most populous field is Sinnamary. In 1874 the declared export of gold was 81,156 oz., but much more was smuggled out of the colony. The revenue of G. in 1874 was £40,434; the expenditure, £37,026. The receipts for concessions of land for gold-exploring alone was £7821. G. includes several islands, of which the chief are Cayenne, Le Grand Connétable, and Le Petit Connétable. Cayenne (q. v.), the capital, is on the island of the same name. The colony is under a privy council and a governor.

Guicciardi'ni, Francesco, one of the greatest Italian historians, was born at Florence, 6th March 1482. He early distinguished himself as a law-student and eloquent advocate, and in 1512 was sent by the Signoria on an embassy to Ferdinand of Aragon, and in 1515 was chosen to confer with Leo X., who took him into his favour, and made him governor of Reggio, Modena, and Parma. Clement VII. appointed him viceroy of Romagna in 1523, and lieutenant-general of the Papal troops in 1526. In 1531 he was appointed governor of Bologna, and in 1534 he returned to Florence as an adherent of the Medici. Mainly through his influence Cosmo de Medici became ruler of

Florence, and as Cosmo immediately afterwards discarded him, G. retired from public affairs and devoted himself to writing history. He died, aged fifty-eight, 22d May 1540. G. is a frigid, astute cynic, but ranks among the best of historians. His *Istoria d' Italia* (1561–64) is prolix and cumbrous in style, G. lamely following the manner of Livy; but the *Istoria Fiorentine* is far more succinct and thoughtful, and gives a peculiarly valuable analysis of Italian politics, and a peculiarly vivid picture of Italian society in the writer's times. It deals with Florentine history from 1378 to 1509, and is pregnant with calm and ripe reflection. The *Reggimento di Firenze* is a masterly treatise on the best form of government for Florence, G. declaring in favour of an oligarchy. His *Ricordi Politici e Civili* are a collection of occasional remarks, many of which have a truly proverbial terseness and point. An edition of G.'s works was published by Rosini (10 vols. Pisa, 1819). See Rosini's *Saggio sulle Azioni e sulle Opere di F. G.* (Pisa, 1822), and Symonds' *Renaissance in Italy* (Lond. 1875).

Gui'cowar (*gaekwar*, 'a cowherd'), the hereditary title of one of the great Mahratta families, who rule at Baroda (q. v.) in E. India, so called from the caste of the founder, Pilaji G., who rose to eminence by the Mahratta characteristics of valour and treachery, and first occupied Baroda in 1730. In 1755 his grandson wrested the province of Guzerat from the Mohammedans, as the nominal feudatory of the Peishwa (q. v.). In 1805 the G. accepted a treaty with the British, by which he bound himself to support a subsidiary force, and to enter into a regular alliance. See Baroda, and Grant Duff's *History of the Mahrattas* (Lond. 1826).

Gui'do, Carlo Alessandro, an Italian poet born at Pavia in 1650, won the favour of the Duke of Pavia, and afterwards of Christina, Queen of Sweden, who met him at Rome, worked with him on a pastoral drama, and received him into her literary academy. He died at Rome, June 10, 1712. G. was a sweet lyrical poet, writing with Horatian finish, and helped to check the euphuism introduced by Marini. Among his works are *Poesie Liriche* (1681); *Amalsunta in Italia* (1681); *Endimione*, a pastoral (1692); *La Dafne* (1692); *Lei Omelie di N. S. Clemente spigate in versi* (1712). A complete edition of his works was issued at Padua in 1818.

Guido of Arezzo, a Benedictine monk devoted to music, flourished about A.D. 1020. Scarcely anything else is known about him than that he was a native of Arezzo in Tuscany, and that he settled at Pomposa in Ferrara. For many centuries a host of musical inventions were loosely and fancifully attributed to him. G. certainly wrought a needed reform by discovering a *method* of teaching church-singing. He made use of a simple instrument called the *monochord*, and of the mnemonic syllables *ut, re, mi, fa, sol, la*, already associated with a certain melody, for teaching correct intonation. He wrote the *Micrologus*, the *Antiphonary*, and other theoretical works, which still exist in MS. See Burney's *History of Music*, vol. ii., and Fétis' *Biographie des Musiciens* (Par. 1862).

Guido Reni, one of the chief Bolognese painters, was the son of a musician, and was born at Bologna in 1575. When a youth he was trained by Denis Calvaert, a Dutch artist then in Bologna, in whose school he is said to have studied the works of Dürer. He afterwards joined the school of the Caracci, and on visiting Rome imitated Caravaggio. At Rome G. soon became famous, and was employed by several popes in decorating chapels, painting portraits, &c., but having quarrelled with the treasurer of Urban VIII. respecting the price of a picture, he returned to his native city, whence he was soon recalled to the capital. After a brief residence in Naples he taught a large school in Bologna, but became involved in debt through his passion for gambling. G. died at Bologna in 1642. Among his works are the famous 'Aurora' of the Rospigliosi Palace—his masterpiece—the 'Portrait of Beatrice Cenci,' 'Rape of Helen,' 'Fortune,' 'Michael Vanquishing Satan,' 'Crucifixion of St. Peter,' &c. He excelled in religious and pathetic subjects. His early productions show the influence of Caravaggio in their violent contrasts of light and shade; but his later works, though wanting in vigour and expression, are marked by exquisite sweetness, harmony, and grace. G.'s numerous paintings are scattered through the great European collections, and there are several in the National Gallery, London.

Guienne' (a corruption of Aquitaine), one of the thirty-two old French provinces, lay on the Lower Garonne, and comprised the modern departments of Gironde, Lot, Dordogne, Aveyron, with portions of Tarn-et-Garonne and Lot-et-Garonne. It was part of Aquitaine, and was of great importance as 'the English doorway into France' during the Hundred Years' War, when its nobles clung to England from dread of French aggrandisement, and its merchants because they were chiefly engaged in English trade. G. belonged to England from 1154 to 1451. See Kitchin's *History of France* (1873).

Guignes, Joseph de, a celebrated French Orientalist, was born at Pontoise, 19th October 1721. He studied Oriental languages, especially Chinese, under Étienne Fourmont, with such success that on the death of the latter he was, at the age of twenty, appointed to the vacant post of secretary and interpreter for Oriental languages to the King of France. In 1757 he became Professor of Syriac in the Collége Royale de France. His great work, the *Histoire Générale des Huns, Turcs, Mogols et autres Tartares Occidentaux* (published at Paris 1756–58, in 5 vols. 4to), is a monument of profound and accurate learning. He published also a life of Fourmont (1747), and contributed many articles to the journals. He also edited *L'Éloge de Moukden* (1770) and *Chou-King*, one of the Chinese sacred books. He was reduced to great distress by the French Revolution, and died at Paris, March 22, 1800. His son, **Chr. Louis Joseph de G.** (born 1759, died 1845), was also an eminent Orientalist, his chief work being his *Dictionnaire Chinois-Français et Latin* (Par. 1813).

Guilandi'na, a genus of Leguminous shrubs, embracing few species, found in warm countries. *G. Bonduc* and *G. Bonducella* are the best known. The seeds of the former, which are yellow, and of the latter lead-coloured, are very hard and used as beads; they are popularly known as nicker-nuts; they are tonic, and yield an oil which is used medicinally in India.

Guild'ford, the county town of Surrey, England, on the Wey, in a hollow of the N. Downs, 30 miles S.W. of London by railway. It is a quaint old town, ranging in long narrow streets along the E. side of the Wey, which is here crossed by a bridge of five arches. Besides the fine ruins of a Norman castle, G. has a charitable hospital (Archbishop Abbot's), an old church of St. Mary (restored in 1863), and another of the Holy Trinity dating from the 18th c., a royal free grammar-school founded by Edward VI., a townhall, a cornmarket, a county hall and assize court (1862), a county hospital (1866), a new church of St. Nicholas (1876), and a new temperance hall (1876). It is noted for its trade in 'Surrey wheats,' and has corn, paper, and powder-mills, iron-foundries, breweries, &c., cattle, lamb, and pig markets, horse and sheep fairs, and sends one member to Parliament. Six newspapers are published weekly. Pop. (1871) 9801. G., formerly *Guldford* or *Gyldeford*, was bequeathed by Ælfred to his nephew Æthelwald, and under the Confessor it ranked among the royal demesnes. It was bestowed by Charles I. on the Earls of Annandale, and eventually passed to the Onslow family.

Guildhall, the townhall or hôtel-de-ville of the city of London, at the foot of King Street, Cheapside, was originally built 1411–31, was almost totally destroyed by the great fire of London, 1666, was rebuilt in a debased style by Dance in 1789, and restored in better taste in 1865–68. The fine open timber roof of the Great Hall was constructed in 1867 at the cost of £3000. Several police and other courts are held here, and here the Lord Mayor and Sheriffs of the city are elected. The famous Lord Mayor's dinner is held in the Great Hall annually on the 9th November. The Hall is 153 feet long by 48 feet wide, and 55 feet high. The E. and W. windows are filled with fine stained glass, and the great, hollow, wooden figures of Gog and Magog flank the W. window. In this chief apartment, as well as in the numerous rooms around, are many interesting works in painting and sculpture. The very handsome Free Library, Reading-Room, and Museum, form a suite of noble halls, built 1871–72, and presented by the Corporation to the City of London.

Guilds, or **Gilds** (Old Eng. *gild*, 'a money payment'), were voluntary associations to maintain order and bestow mutual aid and defence, formed in many European towns during the middle ages. They closely resemble the *collegia opificum*—corporations of artisans who united for mutual aid under the later

Antoinette de Bourbon in 1513, and drove back the German Imperialists who invaded Champagne in 1523. He became Comte de G., an estate which the house of Lorraine held in Picardy, in 1520, and was in 1527 made Duc de G. He fought in Flanders in 1542, treated the Protestants of Elsass with great cruelty, and died at Joinville, April 14, 1550. His daughter, **Marie**, became the wife of James V., King of Scotland, and the mother of Mary Queen of Scots. This alliance greatly strengthened the power of the Guises.—**François, 2d Duc de G.**, son of the above, was born February 17, 1519. He soon became famous as a general—the Spaniards called him 'the great captain'—and in 1552-53 held Metz for two months against Karl V., who was forced to raise the siege. This successful defence gave him a European renown. He drove back an army of Spaniards and Flemings which had entered France, and in 1558 seized Calais, the last of the English continental possessions. The accession to the French throne of François I., the husband of Mary Queen of Scots, greatly advanced the influence of the Guises, and François was looked on as the head of the Romish party in France. Along with his brother Charles the cardinal, G. became guardian of the weak king, banished his rival Montmorency, dismissed Diana of Poictiers, persecuted the Huguenots with vindictive zeal, and sought to establish the Inquisition in France. He defeated the French Protestants at Dreux in 1559, but on the death of François I., Catherine de Medicis claimed the guardianship of the young Charles IX., and deprived G. of his almost absolute power. At the siege of Orleans. February 1563, G. was assassinated by a Calvinist named Polbrot.—**Charles, Cardinal of Lorraine**, the ablest of the G. family, was born at Joinville, February 17, 1524, became Archbishop of Rheims in 1538, Cardinal of Lorraine in 1547, and went to the Council of Trent in 1562. During the reigns of Henri II. and François II. he was, along with his brother, the chief ruler of France. He was ambitious of becoming Pope, and making his brother François, Duc de G., King of France. He prompted despotic measures and persecuted the Protestants, through united bigotry and statecraft, but on the death of François II., when his niece, Mary Queen of Scots became no longer Queen of France, his power began to decline. He founded the University of Rheims, and died at Avignon, December 26, 1574. He was able and learned, but heartless, deceitful, and licentious. —**Henri, 3d Duc de G.**, surnamed *Balafré* ('scarred'), eldest son of François, Duc de G., was born in 1550, became Duc in 1563, fought in Hungary against the Turks in 1566, and at Jarnac and Moncontour in 1569, forcing Coligny in the same year to raise the siege of Poictiers. He was one of the chief agents in the massacre of St. Bartholomew (August 21, 1572), and took command of the chief party of assassins. He defeated the Huguenots in 1575 near Chateau-Thierry, and there received the wound in the face from which he was surnamed *Balafré*. He was afterwards the real head of the League, which determined to make him King of France in place of the feeble Henri III., though the next heir to the throne was Henri of Navarre. This led to the 'War of the Three Henris,' which was followed by a brief and hollow reconciliation. The King, however, was bent on his rival's death, and had him assassinated at Blois, December 23, 1588. His brother Louis, Cardinal of G., was murdered on the following day.—**Charles, 4th Duc de G.**, the son of the above, was born in 1571, and after his father's murder was imprisoned in the castle of Tours until 1591, when he escaped, and joined the garrison which held Paris against Henri IV. Along with the Duc de Mayence he became the chief commander of the League, and after Henri IV. became king was pardoned, and made governor of Provence. He was banished by Richelieu in 1631, and died near Sienna in 1640. His son **Henri, 5th Duc de G.**, was born April 4, 1614. He was educated for the Church, and was made Archbishop of Rheims at the age of fifteen, but on the death of his elder brother, abandoned a clerical life, and became Duc de G. Having conspired against Richelieu, he was condemned to death, but fled to Germany, and on the death of Louis XIII. returned to France. In 1647 he set out, in hopes of winning a kingdom, to aid the Neapolitans who had revolted against Spain. He was enthusiastically welcomed by the people of Naples, but was betrayed to the Spaniards, and was kept a prisoner in Spain from 1648 to 1652. On gaining his liberty he joined first the Fronde, and then the court party, and finally became grand chamberlain to Louis XIV. He died at Paris in 1664. He was famed for his capricious gallantry and chivalrous courage, and his character, notwithstanding his fickleness and knight-errantry, is a pleasant contrast to the callous, sombre nature of the other leading members of the family. He was succeeded by his nephew, Louis, who died in 1664, and left an infant son, at whose decease, in 1675, the line of the Guises became extinct. See Da Trousset de Valincourt's *Vie de François de Lorraine, Duc de G.* (Par. 1681), Sismondi's *Histoire des Français*, and Forneron's *Les Ducs de G. et leur Époque* (Par. 1877).

Guitar (Span. *guitarra*, Ital. *chitarra*, from Lat. *cithara*, Gr. *kithara*, 'a lute'), a musical instrument with six strings used in France, Spain, and Italy to accompany the voice or dancing. The right hand of the performer *plucks* the strings, while the left hand *presses* them, and so forms the notes.

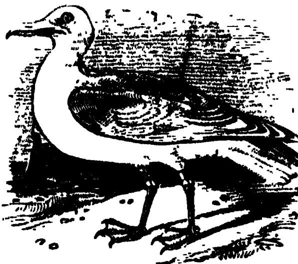
Gui'zot, François-Pierre-Guillaume, a French statesman and historian, was born at Nîmes, 4th October 1787. His father, a Protestant advocate, died on the scaffold, 8th April 1794; and Madame Guizot fled to Geneva, where her son received his education, having at the age of twelve mastered the learned languages, besides English, German, and Italian. Coming to Paris in 1805 to study law, G. was at first obliged to eke out his means by teaching, but adopting the profession of letters, he had by 1811 published three original works and a translation of Gibbon's *Decline and Fall*. He had also written for a magazine, *Le Publiciste*, edited by Mdlle. de Meulan, and this lady, though fourteen years his senior, he married in 1812, in the same year becoming Professor of Modern History in the Sorbonne. On the fall of the Empire, G., whose wife had great influence with the royalist party, received the Secretaryship of the Interior, which he vacated during the Hundred Days, but on the second restoration he again took office as Secretary of Justice and Director of the Indemnity Administration. A constitutional royalist, and with Royer-Collard a founder of the *Doctrinaire* (q. v.) school, he went out with the Decazes Ministry in 1820, and for ten years resumed the labours of author and professor, in his twelve works on history and politics belonging to that period maintaining so firm an opposition to the illegal measures of the Villèle Government as evoked a three years' interdict (1825) on his lectures at the Sorbonne. The July revolution of 1830 brought G. once more to the front. He was named in quick succession Minister of Instruction and of the Interior, and for eighteen years held a portfolio under every administration, except during a short residence in London as French ambassador (1840). But he failed as a politician. His adhesion to the 'peace at any price' policy, his action in the Tahiti question, and again in the Spanish marriages, had estranged his former partisans, and the part he took in the prohibition of the Reform Banquet (February 22, 1848) led not only to his fall, but to three years of exile in England. He returned to France shortly after the *coup-d'état*, and stood for Calvados in 1852, but being defeated, retired to his country seat of Val Richer in Normandy, whence he only issued to attend the sittings of the French Academy (of which he was director in 1861) or of the Protestant Conference, and where he died, September 12, 1874. It is by his historical writings that G. will be best remembered. His literary activity extended over upwards of sixty years, and in that time he produced between thirty and forty works, most of which have been translated into English. Manly and thoughtful, pure alike in style and sentiment, they are marred by an exaltation of theory over fact, and by that excessive dogmatism which won for their author among his co-religionists the title of 'Pope G.' The following are the most important:—*Histoire de la Revolution d'Angleterre* (2 vols. 1826); *Histoire de la Civilisation en France* (5 vols. 1828-30); *Histoire de la Civilisation en Europe* (1830); *Vie de Washington* (2 vols. 1839-40); *Mémoires pour servir à la Histoire de mon Temps* (9 vols. 1858-68); and an unfinished *Histoire de France, racontée à mes Petits-Enfants* (4 vols. 1875).—**Elizabeth-Charlotte-Pauline G.** (*née* **De Meulan**), wife of the preceding, was born at Paris, November 2, 1773. The death of her father in 1790, and the ruin in which the Revolution had involved her family, leading her to seek a livelihood by her pen, she produced a novelette, *Les Contradictions*, in 1800, which won a considerable reputation. It was followed by other romances, tales for children, and reviews, which appeared in a collected form as *Essais de Littérature et de Morale* (Par. 1802). She assumed the

joint editorship of Suard's *Publiciste* in 1807, married G. in 1812, and died 1st August 1827. Her best work, *Lettres sur l'Education*, was crowned by the Academy.

Gu'jerat, the chief town of the district of the same name, Punjaub, British India, 8 miles from the right bank of the Chenaub. It is a walled town, of some strategic importance, and the scene of the concluding battle of the second Sikh war, in which Lord Gough completely defeated 60,000 Sikhs.—The *district* of G. has an area of 1900 sq. miles; pop. (1868) 616,347.

Gujranwall'a, the chief town of the district of the same name, Punjaub, British India, N. E. of Lahore. It possesses a large square mud fort, the original residence of the family of Runjit Sing. — The *district* of G. has an area of 2657 sq. miles; pop. (1868) 550,576. It is bounded N. by the Chenaub river; the crops are wheat, rice, other cereals, and sugar-cane; the exports are wheat, wool, and ghee.

Gulan'cha, or **Galun'cha**, the name in India for an extract prepared from *Tinospora cordifolia* and *T. crispa*, two plants belonging to the order *Menispermaceæ*. G. is used as a tonic and diuretic, and also as a specific for the poisonous bites of insects.



Gul'den is the German name for a coin, originally of gold, and first made at Florence in 1252. It was called in Latin *florenus* (see FLORIN), and *Fl.* is still the usual written designation of the G. The golden G. disappeared in the 17th c., and the silver G., varying much in value according to time and place of coinage, took its place in Germany. In Southern Germany, where, till 1875, the G. was the standard, it was worth 1s. 8d.; the Dutch G. (*guilder*) has the same value; and the Austrian G. is valued at about 2s.

Gules (Fr. *gueule*, Lat. *gula*, 'the mouth and throat,' hence, from the colour of the throat, 'red'), in heraldry, red, the most honourable colour, denoting magnanimity or courage, and ranking next to *or* and *argent*.

Gulf Stream. See CURRENTS, OCEAN.

Gulf Weed, the common name for *Sargassum bacciferum*, a dark-coloured seaweed (Algæ, q. v.), which occurs in immense quantities in some parts of the Atlantic, forming what is known as the Sargasso or Sargazo sea. It is not native on the British coast, although it is occasionally brought thither by the Gulf Stream (q. v.).

Gull (of uncertain derivation), the name given to a large number of Natatorial or Swimming birds, the typical G. belonging to the family *Laridæ*, in which the wings are long and pointed and the bill straight. The hinder toe is usually short and the tail long. In the *Larinæ* or true G. the bill is long, straight at the base, and curved at the tip. The common G. or seamew (*Larus canus*) is one of the most familiar of British coast birds; and has a white head and neck a grey upper surface; the tail, tail-coverts, and under parts pure white, while the wing feathers are variously marked with black. The average length is 18 inches. The G. often follows in the wake of ships for many miles for the purpose of picking up morsels of food. It is readily domesticated, and destroys large quantities of slugs and worms in gardens. It has the habit of dancing or tapping with its feet on the ground, especially after rain, in order to attract the worms to the surface. The black-backed G. (*Larus maximus*) is less common than the preceding species, and is found on the British coasts at the mouth of the Thames, on the Swedish and Norwegian coasts, &c. The colour is a dark leaden grey above and white beneath; the head and neck are white. The average length is 30 inches. The little G. (*Larus minutus*) has a jet-black head and neck, and attains a length of 10 inches. The laughing G. (*Larus atricilla*) is so named from its hoarse cry. The herring G. (*Larus argentatus*) is a beautiful species, also known as the silvery G., and is white on the head and neck, the back being a silvery grey. The ivory G. (*Pagophila eburnea*) is so named from its white plumage. The genus *Rissa*, distinguished by the bill being longer than the head, is represented by the kittiwake G. (*R. tridactyla*), in which the hind toe is quite rudimentary. The name is derived from the bird's cry. The length of the kittiwake G. is about 16 inches; the head and neck are white; the upper parts a light grey; and the wings black and white. The genus *Stercorarius* is represented by several typical species of G., among which the best known is the skua G. (*S. catarrhactes*). This is a bird of large size, and of predatory habits. It robs other gulls of the fishes they have caught, and attacks smaller birds. It is also said to devour eggs. Its general colour is brown. In the genus *Stercorarius* the bill is curved at its base by the *Cere* (q. v.); and the nostrils are narrow, and lodged in the front portion of the cere.

Herring Gull.

Ivory Gull.

Gull'et. See ŒSOPHAGUS.

Gum is an exudation obtained from numerous plants, the name being applied to several classes of substances chemically and physically distinct from each other, and having different applications in the arts. True gums, of which G. Arabic may be taken as the type, are wholly soluble in water, making in their dissolved condition a strongly adhesive viscous mucilage, upon which property their value as a commercial commodity almost wholly depends. The entirely soluble chemical principle contained in a true G. is known as *Arabin*. A second class of G., of which tragacanth G. is an example, does not wholly dissolve in water, but partly swells up and softens and partly is dissolved. The insoluble portion in such gums is known as *Bassorin*. A third class is wholly insoluble in water, the material only swelling up and forming a kind of pasty or gelatinous mass. Such gums, of which there are numerous varieties produced in India, possess no adhesive properties, and though they may be useful as thickeners, they have little economic value. Various astringent vegetable extracts are also commercially recognised as gums, but they are really valuable only as tanning and dyeing materials or for medicinal purposes, and ought strictly to be classed with vegetable extracts like catechu, &c. G. resins again embrace a class of substances which, as their name indicates, possess in part the characters of both gums and resins. British G. or dextrine is an artificial preparation, obtained by roasting common starch, and it possesses the soluble and adhesive properties of a true G. The name G. is also very often improperly applied to a variety of the commoner true resins, as, for example, G. copal, G. asafœtida, &c. Of the true or soluble gums, the most important is G. arabic, the produce of *Acacia vera*, which is chiefly obtained from Turkish and other Mediterranean ports. Numerous closely allied commercial varieties, also the produce of various species of *Acacia*, exist, of which the most prominent are known as East Indian G., Barbary or Morocco G., G. Senegal, G. Gedda, and Australian G. Several acacia gums also occur in South America, some of which, however, are only partly soluble. True gums should not only be perfectly soluble, and yield a smooth uniform mucilage, but should be transparent, or as little coloured as possible. The commercial variety which most perfectly fulfils this condition is 'elect' or picked Turkey Arabic. Of the partly soluble gums, tragacanth, which is obtained from two or three species of *astragalus* in the South of Europe, is the only important commercial variety, and it is of more value in its medicinal relations than for industrial purposes. The common cherry-tree yields a G. having similar properties to tragacanth, for which it may be used as a substitute. Of the so-called astringent gums, the most important is kino.

Gumbinn'en, a town of E. Prussia, on the Pissa, an affluent of the Pregel, 68 miles E.S.E. of Königsberg. It has weaving, dyeing, brewing, and distilling industries, two hospitals, a public library, a gymnasium (1813), &c. Pop. (1875) 9116. G. was founded in 1724, and received many Protestant refugees, chiefly from Salzburg.

Gummi Rubrum, an exudation from the bark of the *Eucalyptus rostrata*, imported from Australia, and introduced into

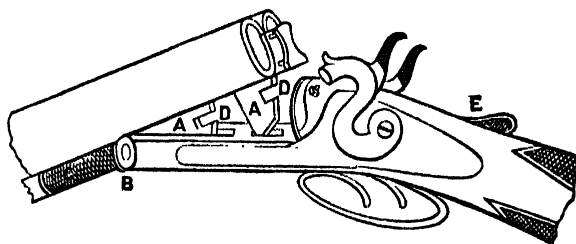
European practice by the late Sir Ranald Martin in cases of diarrhœa and dysentery. G. R. adheres with great tenacity to mucous surfaces, and is much used, in the form of lozenges, for the relaxed throat of public speakers; and, in combination with Cayenne, in cases of relaxed uvula. It is also administered in decoction, extract, syrup, and tincture.

Gum'ri, now **Alexandropol**, a fortified town in the government of Erivan, Russian Armenia, on the Arpa-Chai river, 85 miles S.W. of Tiflis. It stands 5860 feet above the sea, is the key to Armenia, and its fort can hold 10,000 men. Pop. 17,300.

Gums, Diseases of. Abscess of the gums is of very frequent occurrence from the inflammation of decayed teeth. A free and early incision should be made to give exit to the pus. Spongy and sloughing ulceration of the gums frequently occurs as the result of malaria, scurvy, syphilis, and from the use of mercury. Treatment:—*Internally*, tonics, with the chlorate of potass and mineral acids; *externally*, solution of nitrate of silver, with chlorinated or tannin washes, or escharotics, as muriatic acid, creosote, or permanganate of potass. Epulis is a fibrous tumour springing from the periosteum and edge of the Alveolus (q. v.), which grows up between and loosens the neighbouring teeth. It is most frequently met with in the lower jaw and about the molar teeth. Treatment—Removal of the whole mass, and of that portion of the alveolus from which it springs. The gums are also subject to cancerous ulcers and fungous growths from the alveolar processes. Treatment—as in epulis.

Gumsur', a town in the district of Ganjam, province of Madras, British India, notorious for the human sacrifices practised by the Konds, which required to be suppressed by armed force in 1845.

Gum'ti ('winding'), a river in India, which rises in the district of Shah-jehanpore, and flows through the province of Oude, with a very sinuous course, past Lucknow, where navigation begins. It falls into the Ganges below Benares. Total length, about 480 miles.



Gun. This general name may be said to include every species of firearm, be the calibre large or small, from the barrel of which there is forcibly discharged either ball, shell, or small shot by means of gunpowder or any of its modern substitutes. As guns of large calibre, however, have been or will be treated of under the headings ARTILLERY, CANNON, ORDNANCE, &c., this article will be confined to smooth-bore guns used for sporting purposes; to what, as a rule, sportsmen call 'a G.' or fowling-piece. This will of necessity exclude rifled small-arms, but these will be described under the heading RIFLE.

From the time of Nimrod till now, the killing of wild animals for food or sport has afforded employment or pastime to large numbers of the human race, and the invention or improvement of weapons intended to facilitate their capture has exercised the ingenuity of men during the same period of time. In the early ages (and, indeed, among savage races to the present day) the bow and arrow was the favourite weapon employed to secure the coveted prize, and it was a considerable time after the discovery of gunpowder that firearms for sporting purposes began to be used. The first of these portable firearms were merely clumsy and unwieldy iron tubes fixed on a straight wooden stock, and fired by a lighted piece of tow applied by hand to a small orifice at the breech end; but from this rude weapon has been developed the light, handy, and serviceable G. of the present day.

According to the most authentic accounts, portable firearms were first introduced into England in the reign of Henry IV. Shortly after an improvement was made in the means of ignition by the introduction of the match-lock, which was superseded in the time of Henry VIII. by the Italian wheel-lock. This latter method of ignition lasted till the reign of Charles I., when the flint-lock (a Dutch invention) took its place. Only forty years ago (in 1837), the Rev. Alexander John Forsyth, an Aberdeenshire clergyman, called attention to the advantages of igniting the charge by means of a fulminating substance, and patented his percussion lock, which was shortly afterwards followed by the invention of the percussion cap and nipple gun, the predecessors of the present central-fire cartridges and breech-loading guns. So far as regards the means of igniting the charge. The next important change was reducing the weight of the G. by the decrease of the metal in the barrels, and at the same time improving its quality, so as to supply the sportsman with a weapon that would not unduly fatigue him, and which, at the same time, would be safe, and capable of killing game at long distances.

Sporting guns are, as a rule, double-barrelled, *i.e.*, with two barrels placed side by side, the charge in each being fired by means of separate locks on each side of the stock. Till within a comparatively recent period muzzle-loading guns only were used. About twenty-five years ago breechloaders, now in general use, began to be talked of among sportsmen, owing to the invention of M. Lefaucheux, a Frenchman, the main features of which are preserved in the most modern breechloading guns of the present day. The principle of the Lefaucheux G. consists in an iron body fastened to the wooden stock, which, as a rule, is made of walnut, and of which it may be said to form a part. The barrels are attached by a hinge joint a short distance in front of the breech, and are allowed to turn down at an angle from breech to muzzle, so as to raise the breech end far enough above the top of the action to allow of the insertion of the cartridge. When closed, the breech end of the barrels fits accurately against the face of the action, and are secured in that position by a lever engaging with recesses in the 'lump,' which is brazed or dovetailed between the barrels. During the last fourteen or fifteen years breech actions have been the subject of the most fertile invention. Most of them, however, are based on the Lefaucheux system, so far at least as the falling barrels are concerned, the chief improvement being an increase in the ease and rapidity with which the G. can be loaded and fired.

The accompanying woodcut represents one of the best-known of the numerous systems of snap actions for guns, showing the

barrels opened and ready for loading. AA is a solid steel lump brazed between the breech end of the barrels, the forward part of which hooks on to the axle B, and with the fore-end C makes a hinge joint forming the centre of motion for the barrels. A sliding bolt, with catches corresponding to the recesses DD in the lump, works in a horizontal slot in the body of the G. When the barrels are being shut down, a bevelled face on the lump pushes back the bolt, and the latter, on the complete closing of the barrels, is forced by a spring into the recesses in the lump. In opening the G., the bolt is actuated by the lever E, which has a vertical axis between the hammers, the bottom being provided with an eccentric fitting into a notch in the back end of the bolt. On pushing aside the lever E, a partial rotation is given to the axis, and the eccentric motion of the projection at the bottom draws the bolt out of the recesses DD, and allows the barrels to drop into the position for loading.

Among recent inventions for facilitating the rapidity of loading is the rebounding lock, which, by means of a compensating mainspring, raises the hammer to half cock after driving it against the cap, the special action of raising the hammer to half-cock position by hand being thus avoided. Further improvements have recently been attempted in the way of making the locks self-cocking, but as yet these have not met with much favour. The most recent attempted improvement, only brought prominently forward within the last two years, has been in the direction of increasing the range, penetration, and pattern of the G., by making the barrels 'choke bore,' *i.e.*, contracting the bore at the muzzle, and there can be no doubt that the object aimed at has been to a certain extent obtained, though a great controversy is still maintained as to its practical advantages. Many gunmakers have adopted the system, or a modification of it, while many others are using a plan which at first sight would

seem entirely opposite, but which produces as good, or, it is said by some, better, because more uniform results, viz., making a slight recess in the barrels near the muzzle, so as to form a small chamber, which concentrates the shot just before leaving the barrel, and makes it carry closer and further than when propelled from the ordinary bored G. Sporting guns vary in calibre from twenty to eight bore (see BORE), the gauge most used, however, being twelve, with barrels 30 inches long, and the complete G. weighing about 7 lbs. For the charge for breech-loading guns and means of ignition, see CARTRIDGE.

Gunboat. See NAVY.

Gun-Carriage, the carriages upon which cannon are mounted, the particular form depending upon the nature of the service for which the gun is required. The earliest gun-carriages of which there is record were *carts of war*, for conveying light artillery, mentioned in a Scotch Act of Parliament of 1456. A field-piece is mounted on a two-wheeled carriage, to which is attached a single shaft, known as the 'trail,' under the breech end of the G. In transport the end of the trail is attached to the 'limber,' which may be described as a small two-wheeled cart with shafts, to which the horses are harnessed, and carrying the ammunition boxes for the service of the gun. When in action, the trail is detached from the limber, and its end rests on the ground. Cannon for naval or garrison service are mounted on strong frames with four low wheels. Siege guns are mounted much in the same way as field-pieces, the carriages being, of course, much stronger, to bear the greater weight of the gun, and the limber carrying no ammunition. A number of inventions for the improvement of the different kinds of gun-carriages have been brought forward within recent years, notably by Sir Joseph Whitworth, Sir William Armstrong, and Major Moncrieff. The latter gentleman is the inventor of the well-known 'protected barbette G-C.,' which is said to combine the security of a protecting parapet without embrasures. To obtain this the force of the recoil is utilised to lower the gun behind the protecting parapet (or below the level of the pit in which it may be mounted), in which position it is retained by a catch working on a toothed wheel till it is loaded, the gunners being all the time under shelter. A counterweight is suspended below the gun, which, on the removal of the catch, elevates it to the firing position.

Gun-Cott'on, an explosive substance of great power possessing weight for weight about six times the destructive force of ordinary gunpowder. It was discovered in 1846 by Professor Schönbein, of Basel, who in that year exhibited it at a meeting of the British Association at Southampton, under the name 'explosive cotton.' He kept the method of preparation secret, and proposed selling his invention to the German Government as a substitute for gunpowder. Pelouse, a French chemist, had previously prepared a somewhat similar explosive by the action of nitric acid on wood, and in consequence claimed the priority of discovery. In December of the same year (1846) in which Schönbein announced that he had converted cotton into an explosive, Professor Ellet of South Carolina College, U.S., communicated to the Legislature of that State a method of manufacturing G.-C.

The new explosive gained immediate favour, and its manufacture was eagerly proceeded with, both in this and other countries, the impression being that it was to supersede gunpowder for all purposes for which the latter was used, and from its great destructive power effect a revolution in modern warfare. A number of terribly disastrous explosions, however, occurring during manufacture or storage, it was almost entirely given up for some years. The subject of manufacturing and storing G.-C. with safety was from time to time revived, and in 1863 a committee was appointed by the Government to investigate the whole matter, and Professor Abel, chemist to the War Department, effected many improvements in the mode of manufacture; so much so, that it was thought the means of making and storing the material with perfect safety had been arrived at. A disastrous and fatal explosion at Stowmarket factory in 1871 dissipated this idea, and in 1872 the Government appointed a special committee to inquire into the subject. This committee recommended that G.-C. should be stored wet, and dried in small quantities as required—a mode of procedure that would have had many inconveniences; but in the course of subsequent experiments it was discovered that wet G.-C. could be exploded if only a small portion in immediate contact with the detonator employed to set off the charge be dry, thus allowing of the great bulk of the cotton being stored wet, and reducing to a minimum the danger of accidents.

The component parts of G.-C. are common cotton and sulphuric and nitric acids. The cotton fibre is finely carded, thoroughly cleaned and dried, and dipped into a mixture of three parts of sulphuric to one of nitric acid. After being drained over the tank, it is put into jars, which stand in water for some hours. It is then placed in a revolving drum, where it discharges most of the spare acids, is next thoroughly washed till all trace of acid has vanished, then pulped and dried, and finally pressed into cartridges of such size and shape as will suit the purposes for which they are intended. G.-C. is ignited at a temperature of about 400°, and when not confined, and fired by simple ignition, burns with a flash without smoke or report, but when fired by concussion its destructive force is immense. G.-C. has not proved so effective for artillery purposes as was anticipated, but it is largely used for mining purposes and the charging of torpedoes. The Government has a large establishment for its manufacture at Waltham Abbey.

Gundamuk', an Afghan village, 28 miles W. of Jellalabad, where, during the retreat from Cabul (q. v.) in 1843, the remaining British force of 100 soldiers and 300 camp-followers was massacred, only one man escaping.

Gunduk' (*Gandaki*), the name of several rivers in the N. of Behar, India. The G. proper, a large river, is formed by the junction of the Narayani or Salagrami, which is supposed to have its source to the N. of Mount Dhawalagiri in the Himalayas, with the Trisulgunga, which also rises in Nepaul. These two streams meet near Bhelaunji, where they first touch British territory and also become navigable. The G. then flows through Chumparun, Goruckpore, Sarun, and Tirhut, usually forming a district boundary, and falls into the Ganges at Hajipore, directly opposite to Patna, after an estimated course of 450 miles. It is confined within strong embankments throughout the lower part of its course, where, like other rivers in alluvial plains, its channel is considerably above the level of the surrounding country. It carries a considerable amount of traffic, especially with Nepaul. The Bara or Old G. flows to the W. of the former river, and after a course of 170 miles falls into the Gogra in Sarun district. The Chota or Little G. flows to the E. and joins the Baghmutti, after about 190 miles, in Tirhut district.

Gun Factories, the name given to establishments for the manufacture of cannon. The principal factories in Great Britain, excluding the Royal Factory, are those of Sir William Armstrong & Co. and Sir Joseph Whitworth & Co. At the former establishment there was turned out last year (1876) for the Italian Government the largest gun ever manufactured in this country, its weight being 100 tons. Artillery for the use of the British navy and army are for the most part made at the Royal Factory at Woolwich, first started in 1855. There machinery of the most powerful and elaborate kind has been erected for the production of cannon of all kinds and sizes. The greatest effort as yet made in the Royal Factory has been in the production of the 80 ton gun, but a gun to weigh 200 tons is about (1877) to be commenced, the resources of the establishment in steam-hammer power, boring machines, &c., being said to be fully equal to this gigantic undertaking.

Gunge (*ganj*), a word of Persian derivation, used throughout India (commonly in compounds, as Sahibgunge) for a village with a market-place containing grain and other necessaries of life.

Gun'ja (*ganja*), a narcotic drug akin to bhang and haschisch, prepared from the leaves and flowers of the hemp plant (*Cannabis sativa* or *Indica*), which is extensively smoked throughout India. The cultivation is almost entirely confined to a small tract in the district of Rajshahye, Bengal, where about 1,000,000 lbs. are annually produced. It is the policy of the Government to check the consumption by a gradual enhancement of the excise duty, which has hitherto been effected without any diminution in the revenue. In 1874-75 the duty on G. in Bengal alone amounted to £105,817.

Gun'making includes the manufacture of all kinds of sporting weapons and military small arms. The mode of manufacture,

however, of the two classes named differs so very considerably that they must be treated of separately.

Sporting Weapons.—The manufacture of sporting weapons is divided into a number of different branches, such as barrel making (already noticed under BARREL), action filing, lock making, stocking, &c. The chief seat of the barrel-making trade in this country is Birmingham, and the lock trade is extensively carried on in London, Wolverhampton, and Birmingham. The stocks of sporting guns and rifles are made almost exclusively of walnut wood, which is tough, durable, often finely figured, and takes on a beautiful polish. Space does not permit of details being given of the manufacture of the component parts of a rifle or fowling-piece, the processes being so varied and intricate, but a sketch may be given of the mode of making up a gun. Suppose a pair of barrels welded, bored, ground, and filed, the next process is to braze the steel lump, for attaching them to the action, between the breech ends, and fit and solder 'ribs,' both on the top and bottom sides; plugs are then screwed into the breech ends, and they are sent for provisional proof. Next they are handed to the action filer, who makes the action and fits the barrels to it, when the whole goes for definite proof. The action and barrels with the locks and mountings are then handed to the stocker, who stocks the gun in the rough, and passes it on to have the hammers fitted. At this stage the gun or rifle is usually shot and the barrels adjusted. The stocker then makes off, *i.e.*, trims up and buffs and chequers the stock, and 'strips' the gun. The ironwork is handed to the polisher, by him passed to the engraver, and by the latter to the hardener, who case-hardens the action lock-plates, &c., and 'blues' some of the other parts. The barrels, meantime, have been finely polished and browned, and the whole work now goes back to the stocker, who puts the parts carefully together, and the gun is complete. There are few finer or more beautiful pieces of mechanism than a well-made and highly-finished shot gun or rifle.

Military Small Arms.—These at the present day may be said to be entirely made by machinery, barrels, action, locks, and stocks being all machined, so that it only remains to put the parts together by hand labour. For the introduction of machinery we are mainly indebted to the Americans, who, some years previous to 1853, had a Government small-arm manufactory at Springfield fitted up with most ingenious machinery. A commission from this country to the New York Exhibition in 1853 was allowed to visit this manufactory, and their report induced our Government to establish a similar factory at Enfield in Middlesex. From being at first on a small scale, this manufactory has been developed and extended, till it is now capable of turning out over 1000 complete Martini-Henry rifles weekly. Large manufactories belonging to public or private companies also exist in London and Birmingham. In the Government factory and most of those large establishments the arms are made on the interchangeable system, *i.e.*, each particular part of a gun is made so exactly the same, that if any number of guns are taken to pieces and the parts mixed together, any series of parts can be assembled and put together as a perfect gun. The manufacture of arms, both sporting and military, is in this country a very important industry, Birmingham alone employing over 10,000 men in the trade.

Gunn'el, or Butt'erfish (*Centronotus*), a genus of Teleostean fishes belonging to the family *Blenniidæ*, or that of the Blennies (q. v.). The ventral fins are either small or wanting, and the scales are also small. The gill membranes are united below the throat, and no lateral line exists. The common or spotted G. (*C. gunellus*) is well known on the British coasts, and is an eel-like fish, about 6 inches in length, coloured brown, with black spots along the base of the dorsal fin. The head is small, and the muzzle blunt. The G. derives its name of 'butterfish' from the quantity of mucous secretion which, like the eel, it is capable of emitting from its skin. It is commonly found in rock pools after the tide has receded.

Gunn'er, in the British army, is a private artillery soldier, who is paid at the rate of 1s. 2½d. daily. Master gunners are pensioned artillery sergeants, who receive from 3s. to 5s. a day. G. in the navy is the highest warrant officer, and has charge of the great guns and the powder-magazine, and exercises the men in gun practice. His pay varies from 5s. 6d. to 9s. a day.

Gunn'era, a genus belonging to the natural order *Haloragaceæ* (q. v.), but some authors place it in *Araliaceæ* (q. v.). There are about a dozen species of G. known, chiefly natives of New Zealand, Java, and S. America. *G. scabra* or '*panke*' is grown in British gardens and pleasure-grounds as an ornamental plant. When growing in sheltered damp places, its leaves, which are very rough, attain a large size, and it produces a conical fleshy spike of minute flowers. Its roots are astringent, and are employed for tanning, and its leaf stalks eaten as rhubarb.

Gunnera scabra.

Gunn'ery, as a science, treats of the theory of Projectiles (q. v.), particularly in its military bearings; and, as an art, is concerned with the management of ordnance and the application of the theoretical principles to practice. In the 15th c. Leonardo da Vinci displayed a knowledge of the fundamental laws far in advance of his contemporaries. Tartaglia, in his *Nuova Scienza* (1537), was the first to endeavour to enunciate the principles of G. He explained the motion of a projectile, taking into account the resistance of the air, showed that the maximum range was obtained with an elevation of 45°, and proved that no part of the *trajectory* or line of flight was a straight line. Galileo followed this up in his *Dialogues on Motion* (1646) by demonstrating the parabolic form of the trajectory, leaving out of account the resistance of the air. Newton found that by reason of this resistance the path deviated much from the true parabola, and that, therefore, in the practice of G. this resistance must not be neglected—a principle which Galileo also urged. Not till the time of Benjamin Robins, however, did these suggestions receive the attention they deserved. His *New Principles of G.* (1742) formed unquestionably the foundation on which the science has been built. His Ballistic Pendulum (q. v.) provided a means of determining the velocities of cannon-balls at any point of their range; and from experiments with it Dr. Hutton of Woolwich, towards the end of the century, deduced formulæ which have been successfully used in the approximate determination of some of the most difficult problems in G. This instrument has only lately been superseded by the much more accurate and refined apparatus of Navez, Noble, Bashforth, and others, whose electric chronographs can record with perfect accuracy to tenths, and even much smaller fractions, of a second.

The forces which act upon a projectile during its flight are the explosive force of the gunpowder, which gives it its initial velocity; the force of gravity, which continually drags it down; and the resistance of the air, which acts against its motion, so as to diminish its velocity. While the bullet is in the bore of the gun, it experiences further resistance to its progress from the friction between the shot and the bore, and in rifled cannon this resistance is increased by the necessity of giving to the projectile rotatory motion. The advantages of rifling were early pointed out by Robins, but it is only within the last thirty or forty years that they have been generally recognised Under RIFLE the details of rifling will be noticed. Here it is sufficient to mention the general advantages accruing from its use. In the first place, by making possible the introduction of elongated in place of spherical projectiles, it greatly increases the range; while the rotatory motion given to the shot as it leaves the gun tends better to preserve it in its initial plane of projection, thus rendering the art of aiming a greater certainty. Experiment shows that the shot, while travelling the bore, gradually increases in velocity, so that it is going fastest just when it leaves the muzzle. The resistance of the air is an exceedingly important element, and depends chiefly upon the velocity of the projectile. For slow motions, this resistance varies as the square of the velocity; but for the high velocities attainable in modern artillery, other considerations come into play. Hutton made numerous experiments on this subject, and showed that the formula $r = mv^2 + nv$ (where m, n are experimentally determined constants, r the resistance, and v the velocity) gave results very approximately concordant with observation. All his results were obtained with spherical projectiles. Other investigators have used other formulæ. General Didion, for instance, made the second

term proportional to the cube of the velocity, and St. Robert of the Sardinian artillery to the fourth power. Bashforth from 1866–68 made a series of experiments to test the cubic law of resistance ($r = mv^3$); and this law, by making use of a *varying* coefficient, is found to be approximately accurate and very convenient for practical purposes. Experiments indicate that the *form* of projectile has a marked influence on the resistance of the air, the elongated being preferable to the spherical, and the ogival-headed (like a pointed arch in longitudinal section) to the conical, rounded, or square. See Owen's *Modern Artillery* (1871) and Bashforth's *Motion of Projectiles* (1874).

Gunn'y, a name of uncertain derivation given in India to the fabric of indigenous manufacture woven from the fibre of the well-known jute plant (*Corchorus*). G. bags are made in village households all over Eastern Bengal, and now also in mills worked by European capital. They are largely exported to serve for packing the wheat of Australia, California, and Egypt, and the rice of Burmah and the Straits Settlements. In 1875–76 the exports from Calcutta to foreign ports were valued at £431,000, having more than doubled in two years. The exports to British Indian ports, principally Bombay and Burmah, were valued at £587,000. G. cloth was also exported to the value of £44,000.

Gun'powder, an explosive agent, is a mechanical mixture of nitre, charcoal, and sulphur, in determinate proportions. It is employed in propelling projectiles from firearms, in blasting, and in pyrotechny. When first used for firearms in Europe, towards the close of the 13th or early in the 14th c., a thorough revolution was effected in the art of war. The place and time of the invention of G. are involved in obscurity. Its discovery about 1320 has long been popularly ascribed to Schwarz, a monk of Cologne, but Roger Bacon, who died in 1292, gives, in one of his treatises, the composition of G., and describes its properties, and in no way indicates that it was then new. No European writer prior to Bacon refers to G., except Marcus Græcus, who names its ingredients with their proportions. Some aver that he wrote in the 9th, and not in the 13th c., as others, with more probability, maintain. In early Arabic MSS., however, there are unmistakable allusions to it, and it is now generally accepted that G. was known and used for purposes of deflagration in the East centuries before it was known in Europe. India, where the soil is rich in nitre, is probably the country that gave it birth in some remote age.

The explosive force of G. on combustion arises from the rapid conversion of the nitre, charcoal, and sulphur, into an enormous volume of very expansible gases at a high temperature. The bulk of the gases chiefly consists of carbonic anhydride, and nitrogen. They are produced by the dissociation of the elements of the nitre, the nitrogen for the most part remaining free, and part of the oxygen uniting with part of the carbon of the charcoal. Sulphur is not essential to the formation of G., the other two ingredients alone forming an explosive mixture. Its action, however, is comparatively slow, and the addition of sulphur, which ignites at a lower temperature than the other ingredients, accelerates the decomposition of the nitre, while it unites with the potassium to form various compounds. The oxygen is also more speedily liberated for union with the carbon. The combustion of the sulphur also augments the temperature of the gases and thereby expands them. The products of the combustion of G. are very complex. The proportions of the ingredients of G. vary very little in different countries, and it is remarkable, considering that they are empirical, how closely they approximate to the theoretical proportions—two molecules of nitre, three atoms of carbon, and one atom of sulphur—which in 100 parts yield 74·9 of nitre, 13·3 of carbon, and 11·8 of sulphur. The proportions employed in different powders are as follows:—

	Nitre.	Charcoal.	Sulphur.
English and Austrian (war) .	75 parts	15 parts	10 parts
„ (sporting)	77 „	14 „	9 „
French and United States (war)	75 „	12·5 „	12·5 „
„ (sporting)	76·9 „	13·5 „	9·6 „
Prussian (war)	75 „	13·5 „	11·5 „
Russian „	73·8 „	13·6 „	12·6 „
Chinese	75·7 „	9·9 „	14·4 „

Blasting powder is made with a less proportion of nitre and more charcoal; the mixture is cheaper than ordinary G., but less rapid in action.

The manufacture of G. for the English Government is conducted at the Waltham Abbey Mills by the following processes. The first essential is to obtain the ingredients in a state of purity. The nitre, as imported from India, contains several impurities, chiefly the deliquescent salts (cubical nitre) and chloride of sodium, which unfit it for making G. until purified by lixiviation and crystallisation. From the crude sulphur of commerce fine yellow crystals are obtained by a process of distillation. The charcoal is prepared by the carbonisation of light woods yielding little ash imported from Holland and Germany. Three kinds of wood are employed—dogwood for fine rifle powder, and alder and willow for more common varieties. The nitre, sulphur, and charcoal are separately ground to a fine powder and sifted. The definite proportions for a charge of 50 lbs. are then weighed out and mixed in a 'churn,' or revolving drum, with internal projecting arms. The mixture, or 'green charge,' is now conveyed to an incorporating mill, water is added to make a stiff paste, and the whole is thoroughly ground and blended under iron runners. The incorporated product, called 'mill-cake,' is then broken up into 'meal,' and placed between gun-metal plates in a hydraulic press by which it is compressed into hard and dense cakes of different thickness, according as rifle or heavy G. is required. The thin 'press-cake' for rifle powder is broken up and granulated by toothed cylinders, and the grains in falling are received by the uppermost of a series of three tiered screens or sieves, placed in an inclined position, and designed to sift the powder into large and fine grains and dust. The sifted grains are then rounded and polished in rotating 'glazing barrels,' by friction of particle against particle. This operation renders the powder less liable to absorb moisture, and better adapts it for transport. The powder is afterwards dried by heated currents of air. It is then freed from dust, and passed again through the glazing barrels, and finally it is put up in barrels holding 100 lbs. 'Pebble powder,' for heavy rifled guns, is made by cutting thick 'press cake' into cubes, which vary in size with the projectile. One and a half inch cubes are employed for the 81-ton gun. After being dried, the cubes or pebbles are passed through the glazing barrels, a small quantity of blacklead being placed in them to impart a high gloss. Pebble powder is denser than small-grained powder, bulk for bulk, and this quality, as well as the degree of glaze, retards ignition.

The characteristic qualities of good G. are uniformity of texture, absence of light specks or glittering points, resistance to pressure between the fingers, crispness and cleanliness, paper not being soiled by contact, and rapid combustion with little residue. The specific gravity should not be less than 1·755. G. explodes at a temperature of about 600° F., or a little above the heat necessary to ignite sulphur. The size, form, and density of the grains modify their rapidity of combustion, hence the employment and value of pebble powder for charging heavy rifled guns. Small grains are unsuitable for this purpose, because of their instantaneous conversion into gas, whereby an excessive strain would be put upon the sides of the gun tending to rupture it. With pebble powder, however, the ignition and combustion proceeds comparatively slow, and the gases being gradually evolved, exert their greatest propelling force just as the projectile reaches the mouth of the gun. The exports of G. from Great Britain in 1874 amounted to 14,930,995 lbs., valued at £415,716.

Laws Regarding G.—Former Acts on the keeping and carriage of G. are superseded by 23 and 24 Vict. c. 139. It enacts that no charcoal be kept within 20 yards of any mill or engine for making G. No dealer in it may keep more than 200 lbs. in his premises. 300 lbs. is the most allowed to be kept in store for blasting. Not more than 30 barrels may be sent at one time by land, nor more than 2500 lbs. by water. Any one smoking on board of a ship carrying G. is liable to a fine of £5. The Act transfers the power of granting licences from justices in Quarter Sessions to justices in Petty Sessions. Special regulations are made for the security of the shipping in the Thames. See EXPLOSIVE MIXTURES.

Gunpowder Plot, the conspiracy of a number of English Catholics to destroy King James I. and his Parliament by blowing up the Parliament House on the 5th of November 1605. The king's children were then to be seized and an open revolt carried

out. The G. P. was originally formed by a small band of desperate men headed by Robert Catesby; later a few Catholics of fortune were made privy to the design. One of the latter, Tresham, betrayed the plot to a relative (Lord Mounteagle) endangered by it; Guido Fawkes was found in charge of the arrangements in the cellar beneath the Parliament House; and most of the conspirators were brought to the block. The horror of the Protestants at the G. P. and their delight at its frustration were long celebrated on every anniversary of the day.

Gunroom, a cabin on a man-of-war's lower gundeck situated aft, and used as a messroom by certain of the officers.

Güns (Magyar *Köszeg*), a town of Hungary, in the county of Eisenburg, on the river G., 57 miles S.S.E. of Vienna. It successfully resisted the Turks under Solyman for twenty-eight days in 1532, thus affording the Emperor Karl V. time to gather his forces. G. is inhabited by the descendants of Bavarian colonists, who speak a dialect of German peculiar to themselves. Pop. (1869) 6915.

Gun'shot Wounds constitute a species of contused and lacerated wounds varying in severity from a simple bruise to the tearing away of a whole limb or the destruction of the body, differing according to the nature of the projectile, its size, form, and momentum, as also the distance from which it has been projected, and its angle of incidence. G. W. may cause serious injury by concussion only, as of the heart; or by the powder charge only, as when driven into the mouth or abdomen. Wadding and soft material, as pieces of clothing, may inflict severe wounds according to the momentum; and such accidents frequently take place at reviews, fairs, and on the stage. Small shot often inflict serious injuries if the person wounded be within a few feet of the muzzle of the gun, and if at a greater distance, the scattered shot may injure an important or vital part, as the eye, the heart, or the femoral vein. Similar injuries are inflicted by splinters of metal, wood, or stone in blasting and mining operations, and in naval practice. Bullets, slugs, and grapeshot occasion more serious wounds, and give rise to every possible variety of injury. G. W. from bullets may have one aperture only, that of entrance, the bullet remaining in the part, dropping out of it, or injuring by concussion, as in the case of a spent ball; or they may have two or more openings, one being of entrance and the other of exit. A ball may split against the sharp edge of a bone and have two apertures of exit, or it may pass through two parts of the body, as the thighs. The direction of these openings is often of great importance in a medico-legal as well as a surgical point of view. In a case of murder Sir Astley Cooper ascertained that the fatal shot must have been fired by a left-handed man, and thus led to the detection of the criminal. By careful attention to this point the relative positions of the criminal and his victim, the distance between the two, and other points of importance may be ascertained. G. W. may be so situated as to render it impossible for them to have been self-inflicted, and they may be so situated as to render it in the highest degree improbable that they should have been inflicted by another, such as when a bullet has passed through the roof of the mouth. The entrance aperture of a gunshot wound is small, depressed, and circular, while the exit aperture is relatively large, everted, and irregular. There are differences in the apertures of round and conical bullets, and there are also differences depending on the momentum of the ball and on the resistance it meets with. If it strikes when at the maximum of its velocity, it makes a small round hole, smaller than the bullet itself, owing to the elasticity of the skin; and if it passes through soft parts, the point of exit is much like that of entrance; but if it meets with resistance, the point of exit is torn, large, and rugged. On the second day after infliction the aperture of entrance may appear to be larger than that of exit, owing to the protrusion of an eschar. Bullets are frequently deflected in their course, owing to the elasticity of the skin, the angle of incidence, or by their striking against a bone at a low momentum: thus the apertures may be so situated as to lead to the impression that the bullet had passed through the body or the skull, whereas it had passed along a rib or round the cranium. A case occurred in the experience of the writer in which a bullet passed through the body of one man, causing instant death, and was afterwards deflected on the body of the soldier next to him, the relative positions of the wounds in both cases being almost identical. See Taylor's *Medical Jurisprudence* (Lond. 1873).

Gun'ter, Edmund, an English mathematician, was born in Hertfordshire in 1581, studied at Christ Church, Oxford, where he took the degree of B.D. in 1615, and became Professor of Astronomy in Gresham College in 1619. He died December 10, 1626. G.'s *Canon Triangulorum* (1620) was the first table of logarithmic sines, tangents, &c., and in it are introduced for the first time, cosine, co-tangent, &c. He observed also the variations of magnetic declination, but is best known for his improvement of the Sector (q. v.), and for the invention of Gunter's Scale (see GUNTER'S LINE), which are described in his treatise *Of the Sector, Cross Staff, and Other Instruments* (1624). The fifth edition of his works was published by Leybourn in 1673.

Gunter's Chain. See CHAIN.

Gunter's Line is a scale on which are marked off lengths corresponding to the logarithms of the natural number, so that by the aid of a pair of compasses, simple questions in multiplication, division, involution, and evolution may be worked. Logarithmic sines and tangents of angles may be laid down in the same way; and if the limbs of a Sector (q. v.) are engraved with these lines (marked *N*, *S*, *T* respectively), the instrument goes by the name of *Gunter's Line* or *Scale*. It is used for solving simple problems in navigation, the results so obtained being sufficiently accurate for practical purposes.

Guntur' (*Gantur*), a town in the district of Kistna, province of Madras, British India, 225 miles N. of Madras and 47 W. of Masulipatam. Pop. (1871) 18,033, of whom many are Christians. G. was formerly the chief town of a district of the same name. The neighbourhood yields abundant rice and cotton; the breed of cattle is famous; and there is some manufacture of cotton cloth.

Gun'wale, or **Gunn'el**, the upper part of a boat's side, also the topmost bend of a ship's bulwarks.

Gur, the Indian name for unrefined sugar, made from the date-palm. It is extensively manufactured in the districts of Jessore and Nuddea, in the delta of Bengal, and it enters largely into native sweetmeats.

Gur'ges, in heraldry, is a charge representing a whirlpool. It is azure and argent, and occupies the whole field.

Gurgoon', the chief town, but by no means the most populous, in the district of the same name, province of the Punjaub, British India, 918 miles N.W. of Calcutta. Pop. (1868) 3539. It was formerly a military cantonment, and is now a station on the Rajputana State Railway.—The *district* of G. occupies the southernmost corner of the Punjaub, and is bordered on the E. by the Jumna river; area, 2016 sq. miles; pop. (1868) 696,646. The territory has been acquired at different periods since 1803, a considerable portion by forfeiture after the Mutiny of 1857. The soil is undulating, with numerous marshes, and is irrigated by wells. The staple crops are barley, millet, wheat, and cotton. Salt is made by evaporation from wells near the Mujufgarh marsh, and at Noh, to the amount of about 30,000 tons annually. The chief towns are Rewaree, Pulwul, Furrucknuggur, Ferozepur, and Sonah. The exports are salt, cotton, wool, and food grains.

Gurh (*garh*), a word of Sanskrit derivation, used throughout India (especially in composition) for a fort, particularly when the walls are of mud.

Gurhwal', the name of a district in the North-West Province, British India, and also of an adjoining native state. The British *district*, which has been formed out of Kumaon, has an area of 5500 sq. miles; pop. (1872) 310,288. It lies on the southern slope of the Himalayas, and contains the sacred source of the Ganges. There are copper-mines, and some trade in timber, wool, and fibrous hemp. In all respects it resembles the neighbouring more important district of Kumaon (q. v.). The native state, distinguished by the name of Tehri-G., which lies on the W. of the Aluknanda river, is still more entirely mountainous. Area, 4180 sq. miles; pop. about 150,000; revenue, £8000. The dynasty is very old, but owes its present security to the protection of the British after the Gurkha war of 1815.

Gur'jun Bal'sam, or **Wood Oil** (*Balsamum dipterocarpi*), an oleo-resinous substance, imported from India, resembles copaiba in appearance, and possesses similar properties. G. B. is procured from the *dipterocarpeæ*, gigantic trees found in the

districts E. of Bengal, by the double process of incision, and heat by fire, to promote exudation, each tree yielding as much as forty gallons in a single season. G. B. was introduced into English medicine in 1838 as a substitute for copaiba, and it has recently been extensively employed by Dr. Dougall in India as a specific in the tubercular thickenings and cachectic ulcerations of leprosy. It has also been employed in this country by Erasmus Wilson and others in cases of chronic eczema, lupus, and lepra with favourable results. It is stated to have afforded great relief at the Sultanpore dispensary in Oude, twelve lepers there having expressed the decided benefit they had received from its use. See *Lectures on Dermatology*, by Erasmus Wilson (Lond. 1875), and *Report on Sanitary Measures in India in* 1874–75 (Lond. 1876).

Gur'kha, a town in the state of Nepaul, India, 53 miles N.W. of Katmandu. It was the former capital of the present dynasty. The war between England and Nepaul in 1814 is known as the G. war. There are at present five battalions of Gurkhas in the Indian army, who have done good service both during the Mutiny of 1858 and in all subsequent border campaigns. They were sent to the Malay peninsula on the occasion of the disturbances at Perak in 1875. Accurately speaking the Gurkhas, who are an aboriginal tribe, ought to be distinguished from the Gurkhalis, who are the ruling race, are of mixed Hindustani origin, and claim to be Rajputs.

Gurmuktesar' (*Garhmuktisar*), a town in the district of Meerut, North-West Province, British India, on the right bank of the Ganges, 887 miles N.W. of Calcutta, and 31 S.E. of Meerut. Pop. (1872) 7962. The river is always navigable to this point; and G., besides being the site of an important ferry and bridge of boats to Moradabad, carries on a thriving trade as the port of Meerut. There are four temples here dedicated to the goddess of the Ganges; and a fair is said to be annually attended by 200,000 persons.

Gur'nard (*Trigla*), a genus of Teleostean fishes belonging to the *Acanthopterygious* section of the order and to the family *Triglidæ*, in which the scales and ventral fins are of small size. The head is large, and the opercular bones spinous. The pectoral fins attain a large size, and the dorsal and anal fins are also well developed, the former being frequently separated into two portions. The G. inhabits deep water, and is a fish of ungainly appearance. The sapphirine G. (*T. hirundo*) derives its name from the deep-blue colour of the inner surface of the pectoral fins. The flesh of this species is highly palatable. The scales are small, and the head is armed with spines. The red or 'cuckoo' G. (*T. pini*) is another common species; the colour of its body is a light red above, and silvery white beneath. The grey G. (*T. gurnardus*) has short pectoral fins, and a body of greenish-brown colour, spotted with white. It is the kind most frequently captured on the English coasts. The long-finned G. (*T. obscura*) has a very long second spine in the dorsal fin. The colour is red above and white below. The fins are red, with the exception of the pectorals, which are blue. The Oriental G. (*Peristethus Orientalis*) and the mailed G. (*P. cataphractum*) belong to a different genus from the preceding. See also BULLHEADS and FLYING GURNARD.

Gur'ney, Joseph John, a Quaker writer and philanthropist, and a younger brother of Elizabeth Fry (q. v.), was born near Norwich in 1788. He was educated at Oxford, became a Quaker minister in 1818, and died in 1847. G. devoted himself earnestly to benevolent labours, contributing largely to charities, &c., inspecting prisons and hospitals, and composing many religious works. Among his writings are *Notes on Prison Discipline* (1819), *Essays on Christianity*, *Biblical Notes*, *A Winter in the West Indies* (1840), &c.

Guss'et, in heraldry, part of the side of the shield. A G. was an *abatement* or sign of disgrace, indicating cowardice, adultery, or drunkenness.

Gustaf, the name of four Swedish kings.—**G. I.** ('Gustaf Vasa'), son of Councillor Erik Johansson (*Vasa*), and born at Lindholm in Upland, probably 12th May 1496. He was educated at an Upsala school, and in 1514 received at the court of his kinsman the regent Sten Sture. His first exploit against the Danes was in the campaign of 1517, and in 1518 he was chief standard-bearer at Brännkyrka. The ensuing negotiations placed G. in the custody of a distant relation, Erik Eriksön Banner of Kalö on the E. coast of Jutland; but hearing of Christiern II.'s preparations against Sweden, he fled to Lübeck, yet could not reach Calmar before the following year (1520). Having vainly tried to move the populace of Smaaland and Oestergotland, and being alarmed at the news of the massacre at Stockholm, he fled to 'The Dales' (Dalarne). Here, in hiding, he worked at daily toil for bread, protected by the fidelity of 'The Dalesmen' (Dalkarlarne). The new taxes imposed by Christiern at length led to an insurrection, of which G. became leader. Successful in the first action (at Vesteraas), he seized that town and Upsala. The revolution now became general. Seventy nobles and many representatives of the other classes held a diet at Badstena (24th August 1521), where G., refusing the crown, received their allegiance as regent. Though within a year Bleking, Bohuslän, and all the fortresses in the interior were his, the stinted aid of the merchants of Lübeck, who had undertaken to supply war-ships, &c., prevented him from becoming master of Stockholm and Calmar, as well as of Finland, before the latter half of 1523. Before the taking of Stockholm, a diet at Strengnäs (7th June 1523) had chosen G. king. Gotland was still Danish; an expedition against it in 1524 failed, and the 'Malmö Recess,' concluded at the mediation of Lübeck, gave it and Bleking to Denmark. The internal affairs of Sweden were almost desperate. The war of liberation had created a large debt to Lübeck, which had bargained for the exclusive trade of Sweden till its payment; the wars of a whole century had impoverished the people. One-third of the land was in the hands of the Church, and the revenue only covered one-third of the expenditure. G. now set himself to better the internal condition of Sweden, and diffuse Protestantism, to which he had been converted through Laurentius Andreæ. The bitter opposition of the bishops led him to offer to abdicate, but he accepted the compromise called 'Vesteraas Recess och Ordinantia' (1527), which gave him the appointment of all ecclesiastics, as well as the general direction of the Church. The Diet of Orebro (1529) did away with a large number of the Church rites. The plots, however, of the Church party gave G. much trouble; he had even twice to curb the unruliness of the Dalesmen. Christiern II. again attempted to win back his lost dominions, and Lübeck sought to check in the 'Count's War' the effort to be rid of its monopoly, but had to be content with the peace of 1537. Two years afterwards came the 'Dacke War,' the most dangerous outbreak of G.'s reign. In 1540 a diet at Orebro settled the succession on G.'s descendants (a resolution confirmed by 'Arveforeningen' at Vesteraas in 1544). The only other war of this reign was with Russia (1554–57), chiefly confined to mutual plundering on the Finnish border. Two years afterwards (1559) G. assembled the estates of the kingdom to hear his testament, and died the next year, at Stockholm, 29th September 1560. He was thrice married. G. was a stern and wise ruler. He promoted trade by fair legislation and treaties of commerce with England, France, Russia, and Holland; taxation, education, and the marine were brought into an excellent condition. His private character was spotless, and his piety sincere and fervent without being puritanical. See Fryxell's *Biography of G.* (Ger. trans. 1831).—**G. II., Adolf**, born at Stockholm 9th December 1594, was the son of Karl IX. (youngest son of Gustaf Vasa) and Christine of Holstein. His great natural faculties received an excellent education. From his tenth year he was present at cabinet councils, and when sixteen he held his first military command. Though yet a minor at his father's death in 1611, he received the crown on the resignation of the provisional government appointed by his father. Sweden was then engaged in a general war with all her neighbours, which closed in 1613 with the peace of Knœröd, leaving G. free to turn against the Russians, whom the peace of Stolbova (27th February 1617) deprived of Karelia and Ingermanland, and thereby excluded from the Baltic for a century. G. availed himself of the comparative quiet that followed for the internal improvement of Sweden. The army, the administration, and the courts of law were placed on a better footing, and just laws were enacted to regulate education and commerce. The war with Poland, however, continued till the six years' truce of 1629, and the next year G. landed in Germany (23d June 1630) with 15,000 men. He broke the power of the League at Breitenfeld, near Leipsic, 7th September 1631, delivered the hard-pressed Protestants of Mainz and the Rhine districts, and had already penetrated Bavaria, when Wallenstein's incursion into Saxony forced his return for its defence, and he

fell victorious at Lützen, 6th November 1632. (See Thirty Years' War.) G.'s life-object was to realise his father's idea of placing Sweden at the head of a great Protestant power in Europe, and to oppose Ferdinand II.'s encroachments on freedom of belief, as well as his schemes against the balance of power, and the political independence of the north. His full programme he had not time to carry out, but through him Sweden learnt her own power, and Germany won freedom of opinion. Though an ardent Protestant, he checked all unwarrantable retaliation against the Catholics, and his martinet discipline never lessened the deep love felt for him by his own army. See the important biographies of Gfrörer (4th ed. 1863) and Droysen (1870), and E. de Parieu's *Histoire de Gustave-Adolphe* (Par. 1875).—**G. III.**, eldest son of King Adolf Frederik and Louise Ulrike, sister of Friedrich II. of Prussia, was born at Stockholm, 24th January 1746. At his accession the people were in a state of discontent with the conduct of the nobles, and readily supported G. in the bloodless *coup d'état* of 19th August 1772, which, under pretence of suppressing a counterfeit rebellion, established a new form of government, assigning the executive, except the right of declaring war, to the king alone, and legislation to the king and the estates of the realm in common. G.'s moderation won the confidence of the Swedes; he abolished torture, gave freedom to the press, regulated the money system, established numerous trading companies, &c., for their welfare; but his love of display and imitation of French extravagance gradually alienated the affection of his people. In 1788 he entered on a war with Russia, but the greater number of his officers by common agreement ('Anjalaforbundet') refused to serve, on the ground that the king had not the right to initiate an offensive war. The Danes, in alliance with Russia, invaded Sweden, and their action roused the Swedes to support their king. The menaces of England erelong induced Denmark to withdraw, and G. took the opportunity to establish a new form of government under an act of security ('Säkerhetsakt'). The war lasted one and a half years longer, and was closed by the peace of Werelä (24th August 1790). Friendship for the house of Bourbon, and dread of revolutionary ideas, now tempted him to join the coalition against France. A diet was held at Gefle to deal with the national debt; but the nobles were displeased with the king's proposals, and conspired against him. At a masked ball, one of the conspirators named Anckarström wounded him with a pistol-shot, of which he died thirteen days after (29th March 1792). Judgments the most diverse have been formed of G. III., yet all must admit his great services in promoting the national taste and learning. He was the greatest orator of his time in Sweden. His speeches (chiefly political), dramas, letters, &c., were printed after his death under the title *Kon. G. III.'s Skrifter* (6 vols. 1806–12), having been published in French (by Dechaux) and German the year previous. Certain additional papers, forbid by G. to be published till fifty years after his death, appeared as *G. III.'s Efterlemnade Papper* (1843–44), but were found to be unimportant. See Beskow's *Biography of G.* (1868).—**G. IV., Adolf**, born November 1, 1778, at Stockholm, was still a minor at G. III.'s death, wherefore the government was intrusted till 1796 to his uncle, Duke Karl (afterwards Karl XIII.). G.'s reign began well, but his conduct gradually degenerated from firmness, justice, and the love of order to unfeeling self-will, with a trifling regard for forms. Some of his nobles saw fit to resign their titles, and the people became thoroughly disaffected through his attempts to curtail freedom of speech and of the press. To rescue trade from the English supremacy at sea, he formed an alliance in 1800 with Denmark, Russia, and Prussia, a step which also led to closer relations with France. In 1803 he undertook a journey to Baden, and during his stay there the imprisonment and death of the Duc d'Enghien occurred, to the great disgust of G., who refused to recognise Napoleon as emperor, and joined the Anglo-Russian coalition in 1805. With unparalleled obstinacy he rejected all offers of peace after the treaties of Tilsit, and would not sanction even an armistice concluded by the Swedish general in Pommern, in consequence of which that province was seized by the French, and Sweden became involved in war with Russia and Denmark. In this war the Swedes lost Finland. At last, when G. refused to assemble the estates, or hear any proposals of peace, and either his fall or that of Sweden seemed fated, he was seized and imprisoned by Adlercreutz on March 13, 1809. Seeking to abdicate in favour of his son, he, with his heirs, was declared in May to have for ever lost the crown of Sweden. The diet voted him and his family a yearly pension of 100,000 rigsdaler, which was some time afterwards discharged at a single payment. At the end of 1809 he went abroad, to live, at first as 'Count of Gottorp,' a rambling life in Germany apart from his family, then as 'Colonel Gustafsson' to become a citizen of Basel, though still continuing to travel in Germany and Switzerland till February 7, 1837, when he died at St. Gall. G. has given his own history in *Mémorial du Colonel Gustafsson* (1829; German trans. 1839), and *La Journée du 13 Mars 1809* (1835).

Güs'trow, the chief town in the Wendish circle, Mecklenburg-Schwerin, on the Nebel, 45 miles N.E. of Schwerin by rail. It was the fortified capital of the former duchy of G., and has a Gothic cathedral. It has distilleries, breweries, and a pop. (1875) of 10,923.

Gu'tenberg, Johannes, or **Henne**, also called **Gensfleisch**, who seems to have the best right to be regarded as inventor of the art of printing with movable types, was born at Mainz between 1395 and 1400, and was sprung from an old patrician family, taking the names of G. and of Gensfleisch from two estates in its possession. Of G.'s early life but little is known. Political troubles drove him about 1420 to Eltville and then to Strassburg, where he was certainly living in 1434. In 1438 he made a contract with Andreas Dryzehn and others for the prosecution in common of certain secret arts. From the records of a lawsuit in which G. had soon, unsuccessfully, to engage with Dryzehn's brother, it would appear that these secret arts included the rudiments of typography. In 1443 G. returned to his native city; and in 1450 we find him in company with Johann Faust (q. v.) or Fust, a wealthy goldsmith, who apparently provided the funds necessary for their common enterprise of printing. But ere long a quarrel separated the partners, and G. was compelled by the law courts to repay Faust for his advances. Faust also retained the printing apparatus, which he improved and wrought in partnership with Peter Schöffer (q. v.). G., on the other hand, obtained pecuniary backing from Hummer, one of the councillors of the city; and it seems that it was from G.'s new press that the *Catholicon* of 1460 came, as well as the Bible with 36 lines in the page, and the Letters of Indulgence of 1454 and 1455, &c. About 1465 G. was ennobled and attached to the court of Adolf of Nassau; he died 24th February 1468. The debt which the civilised world owes to G. for the art of printing has been very copiously discussed, and the most divergent opinions have been maintained concerning the relations of G., of Coster (q. v.), of Faust (q. v.), and of Schöffer (q. v.) to the development of the art. As the early printers practised their craft as a secret art, it is not singular that the controversy about the origin of an invention so recent and important should not have secured results clear and conclusive on every point. But against the view that G. stole the idea of using movable types from Coster (maintained most energetically by Koning in his *Verhandeling over het Oorsprong, &c. der Boekdrukkunst*, Haarlem, 1816), those who maintain G.'s sole right to be regarded as the inventor can allege the direct contemporary testimony of Ulrich Zell, who introduced printing into Köln, of the Alsatian scholar Wimpfeling, of Trithemus (who died in 1516), and of Johann, son of Peter Schöffer, and son-in-law of Faust. These all attribute the invention to G.; whereas the earliest positive testimony for Coster's claims is only the allegation of Junius in his work *Batavia* (Leyden, 1588). Schaab (in *Die Geschichte der Erfindung der Buchdruckerkunst*, Mainz, 1830–33) asserts that the printed works attributed to Coster are late and from types modelled on those of G. But a middle view, represented by Sotzmann (*G. und seine Mitbewerber*, 1841), grants that G. was excited to the discovery by specimens of Dutch xylography, but that to him belongs the grand idea of superseding copying in all its branches by printing; while the later xylographs and earliest type-printed works of Holland form a continuous series independent of foreign influence, though the superior German methods soon suppressed the Dutch art. See Printing.

Guth'rie, James, son of the laird of Guthrie, was a zealous minister of the Kirk of Scotland, and one of the first to suffer for his opinions after the Restoration. He was born before 1617, and was educated at St. Andrews, where he afterwards became professor of philosophy. In 1638 he was ordained at Lauder,

and in 1649 was translated to Stirling, where he remained till his death. G. was the leader of the Protesters or extreme Presbyterian party in Church politics, and in 1650 publicly excommunicated the Earl of Middleton for his hostility to the covenant. In 1651 G. was deposed for disowning the king's authority in spiritual matters, and in 1661 he was brought to trial for the same offence, for writing two pamphlets *The Western Remonstrance* and *The Causes of the Lord's Wrath.* He defended himself with great eloquence, but was found guilty of treason, and condemned to death. The sentence was executed 1st June 1661. G. was also the author of an attack on Cromwell (*Considerations, &c., concerning Dangers which threaten Religion,* 1660; reprinted 1738), of sermons, and a treatise on ruling elders and deacons.—**William G.**, cousin of the preceding, was also an eminent Scottish churchman and divine. He was born 1620, and studied at St. Andrews. On receiving licence to preach, he resigned his family estate of Pitforthy to one of his brothers, and was ordained minister of Fenwick, near Kilmarnock, in 1644. He soon became a popular preacher, and was appointed chaplain to the Scots army, in which capacity he was present at the battle of Dunbar. Like his cousin, G. was a leader of the party of the Protesters. As a parish minister, he was much addicted to rural sports, especially fishing and fowling, and was popular even with those who did not adopt his views. Shortly after the Restoration in 1664, he was suspended from his charge by Archbishop Burnet, and never preached again. He died 10th October 1665. G. was author of the well-known work *The Christian's Great Interest,* which was translated into Dutch, German, and French. See Muir's *Memoirs and Letters of G.* (Edinb. 1827).

Guthrie, Thomas, D.D., an eminent preacher and philanthropist, sprung from the same family as the preceding, was born at Brechin in Forfarshire, 12th July 1803. Having entered the University of Edinburgh, he completed in 1824 the course in arts and theology necessary for the ministry of the Church of Scotland, but remained two years longer at the university, attending classes in anatomy, chemistry, and natural history. He was licensed in 1825, and after spending six months at Paris in the study of the natural sciences, managed a bank at Brechin till 1830, when he was presented to the parish of Arbirlot in his native county. In 1837 he became collegiate minister of Old Greyfriars, Edinburgh. To this congregation and its mission charge, St. John's, he was attached till the Disruption of the Scottish Church in 1843, when he left the Establishment and removed to Free St. John's. Of this congregation he continued to be nominally minister till his death at St. Leonard's-on-the-Sea, 24th February 1873, though failing health had compelled him to cease regular work several years before. His rhetorical powers, chief elements of which were freshness of style, effective delivery, and force and copiousness of illustration, rendered G. one of the most popular speakers of his time, and till the end drew crowds of all classes to his church. While at Arbirlot he attracted notice by the ability of his defence of the Established Church during what is known as the Voluntary controversy; in the 'Ten Years' Conflict' he was a zealous nonintrusionist, and in 1848 he devoted himself with singular zeal and success to the raising of a fund to provide manses for the country ministers of the Free Church. The cause, however, in connection with which his name is best and most widely known is that of the 'Ragged Schools,' of which, at least in their present form, he may be said to be the originator. In 1849 he received the honorary degree of D.D. from the University of Edinburgh, and in 1862 he was chosen Moderator of the Free Church Assembly. G. contributed to religious journals, edited for years the *Sunday Magazine,* and published volumes of sermons. Of his many popular works the best known are *Pleas for Ragged Schools, The Gospel in Ezekiel, Christ and the Inheritance of the Saints,* and *Speaking to the Heart.* An autobiography and memoir by his sons was published in 1875.

Guthrie, William, a compiler of histories, was the son of an episcopal minister, and was born at Brechin in 1701 or 1708. He graduated at King's College, Aberdeen, and about 1730 came to London. Here he was at first employed on the *Gentleman's Magazine.* In some of the very numerous works that bear his name, it appears that he was only one of several authors employed. Besides numerous translations of Cicero and Quintilian, G. compiled, wholly or partly, *A General History of England* (1744), *A Complete History of the English Peerage* (1763), *A General History of the World* (1764), *A New System of Modern Geography* (1770), *A General History of Scotland* (1746). G. had a pension from the Pelham Ministry, and died March 9, 1770.

Guth'rum the Dane, or **Guthrum of East Anglia**, a Danish leader who long opposed King Ælfred. He was beaten by Alfred in a great battle at Edington in 878, and forced to surrender after standing a siege of fourteen days in his camp. He was then baptized as a Christian, and the peace of Wedmore was concluded.

Gut Manufacture. This art is concerned with the preparation of Catgut (q. v.), Gold-Beater's Skin (q. v.), bags for preserved meats, coverings for jars, &c., from the intestines of oxen, sheep, pigs, and other animals. Lathe cords are made chiefly from the muscular coat of horses' intestines, which, after being cured and dried, is cut into strips and twisted. The gut bags used by sausage-makers are prepared by scouring and washing in water, and by scraping off with a peculiar knife the mucous and peritoneal membranes, incipient putrefaction being induced to facilitate their separation. The middle or muscular membrane is thereafter freely treated with water until no taint is perceptible, after which one end is tied with a ligature, and the whole insufflated, closed, and dried. The ligature is then cut, and the air expelled, and the gut is finally bleached and protected from insect ravages by fumigation with sulphur.

Guts Muths, Johann Christoph Friedrich, a German educationist, was born at Quedlinburg in Prussian Saxony, 9th August 1759. In the practical work of a teacher, he was led to realise the value of systematic physical training. This he developed in the educational institute at Schnepfenthal, while his *Gymnastik für die Jugend* (1793, 3d ed. 1845) taught all Germany the importance of this branch of education, and was long the basis of all similar works. Besides writing other treatises on gymnastics, G. M. was editor of the *Bibliothek für Pädagogik, Schulwesen und die gesammte pädagogische Literatur Deutschlands* (1800–20), and composed a *Handbuch der Geographie* (1810, several times reprinted). He died 21st May 1839.

Guttæ (Lat. *gutta*, 'drop;' Fr. *gouttes*), small drop-shaped ornaments worked on the cornice of classical buildings, on the under side of the mutules, and below the triglyphs in the Doric order of Grecian architecture.

Gutt'a Opa'ca, an old name for Cataract (q. v.).

Gutta-Per'cha (Malay for Sumatra gum), or **Gum Tu'ban**, is the inspissated juice of *Isonandra gutta*, a tree growing in Sumatra, Borneo, and various other islands of the East Indian archipelago. The juice, which has a dirty milky colour, is obtained by making deep incisions in the trunk of the tree; but in the early years of its collection the trees were cut down entirely and the bark stripped off, a procedure which would soon have resulted in the complete extermination of the species. The juice quickly solidifies and hardens on exposure to the air, when the G.-P. assumes its well-known brown leathery aspect and texture. The deep reddish-brown tint it usually presents is, however, due to the presence of accidental impurities, as pure G.-P. has a dirty greyish-white appearance. At ordinary temperatures G.-P. is hard, tough, and only slightly elastic; at from 110° to 120° F. it becomes soft and doughy; heated in boiling water it becomes very soft, and two surfaces pressed together then unite and thoroughly amalgamate; above 230° it boils and distils, yielding an oil analogous to the oil of caoutchouc. G.-P. consists of a mixture of three chemical principles, from 75 to 80 per cent. being the pure *gutta* upon which the properties of the article chiefly depend, 14 to 16 per cent. being a white crystalline resin called *albin*, and from 4 to 6 per cent. consisting of an amorphous yellow resin termed *fluavil*. G.-P. is not acted on by water, alcohol, or dilute acids or alkalies, but chloroform and bisulphide of carbon dissolve it completely. It is an excellent insulator of electricity.

G.-P. was not known in Europe till 1843, when the first specimen was sent to the Society of Arts, London, and Dr. Montgomerie, by observing the uses made of it by the Malays, brought its properties prominently into public notice. On its first introduction it was applied to a great variety of uses, many of which were abandoned, but the consumption of the raw material has nevertheless steadily increased. For manufacturing purposes it is purified and kneaded with powerful machinery

with the aid of hot water and bleaching powder. It is then rolled out into thick sheets or plates ready for use. On account of its insulating properties G.-P. is much used for covering telegraph wires and as insulators. Its plasticity when heated is taken advantage of for obtaining the impression of seals, medals, coins, and also for preparing moulds of larger sculptured objects in the making of plaster casts. It is moulded into tubes in the same manner as lead and block tubes are prepared, and it is prepared in thin sheets for surgical purposes, and for wrapping up substances securely from air and moisture. It is extensively utilised as a cheap substitute for leather in the soles of boots and shoes, and it is moulded into many useful and decorative articles. Dissolved in bisulphide of carbon it forms a most tenacious cement, much used by shoemakers in patching, and combined with two parts of caoutchouc the advantages of both substances are obtained in the compound. Balata Gum (q. v.) is the produce of a South American tree *Sapota mullieri* having properties and composition the same as G.-P.

Gutta Sere'na, an old name for Amaurosis (q. v.).

Gutt'ée, Gutt'y, or **Goutt'ée** (Lat. *gutta*, 'a drop'), in heraldry, is applied to a field sprinkled with drops, which may be of various tinctures and convey various meanings.

Guttiferæ, an important natural order of trees and shrubs. See CLUSIACEÆ.

Gutz'kow, Karl Ferdinand, one of the most prominent among recent German poets, essayists, and novelists, was born 17th March 1811 at Berlin. His early efforts were miscellaneous, and chiefly connected with journalism. Denounced in 1835 as a leader of the 'Young Germany' (*Junges Deutschland*) party, he was imprisoned, and for many years afterwards suspected by the German Government. After 1839 G. has chiefly been known as a dramatist, and as the author of novels bearing on the social questions of the time. His works are very numerous. Of his tragedies *Richard Savage* (1839) and *Uriel Acosta* (1847) are the most important, and of his comedies *Zopf und Schwert* (1844). His novels *Die Ritter vom Geiste* (in 9 vols. 1850, 4th ed. 1865) and *Der Zauberer von Rom* (also in 9 vols. 1859, 3d ed. 1863), at once made their mark, are rich in character and incident, and display a great power of grasping and delineating the different aspects of Roman Catholic and Protestant life. His *Gesammelte Werke* in 13 vols. appeared 1845–52; his *Dramatische Werke* in 20 vols. 1862–63, 3d ed. 1871.

Gutz'laff, Karl, a missionary to China, was born 8th July 1803, at Pyritz in Pommern, Prussia, and learnt the trade of saddler, but to his great joy was in 1821 admitted to a missionary college in Berlin. In 1826 he was sent as agent of a Dutch missionary society to Sumatra, but owing to a war then raging was detained at Batavia. Here he was thrown much into contact with Chinese settlers, acquired their language, and resolved to devote himself to evangelising China. After a short residence at Siam, G. came to Macao, and did his utmost to carry Christianity into the heart of the empire. Besides preaching and distributing tracts, G., along with Mr. Medhurst, began a new translation of the Bible into Chinese; with Morrison founded a society for widening the intellectual horizon of the Celestials; and edited a monthly Chinese magazine. He visited various parts of the empire (see his *Journal of Three Voyages along the Coast of China in* 1831, 1832, and 1833, Lond. 1834; Ger. trans. Basel, 1835). In 1835 he was appointed chief interpreter to the British representatives in China, and when all his missionary efforts were systematically thwarted by the Chinese authorities, G. made himself most useful to Britain during the Chinese war, and in the negotiations of 1842. In 1842 he founded a society for the employment of native Chinese as missionary agents. He visited Europe in 1849, and shortly after his return to China died at Hong-Kong, 9th August 1851. His most important works are *China Opened* (2 vols. Lond. 1838); *Geschichte des Chinesischen Reichs* (Stuttg. 1847); *The Life of Tao-Kuang* (Lond. 1851; Ger. trans. Leips. 1852).

Guy, Thomas, a philanthropist and the founder of Guy's Hospital, was born in Horsleydown, Southwark, London, in 1645. He started in trade as a bookseller, and obtained the privilege of printing Bibles for the University of Oxford. Among his public acts of benevolence were large benefactions to Stationers' Company and Christ's Hospital, the founding and endowing of almshouses and a free library at Tamworth, the building and endowing of three wards in St. Thomas's Hospital (1707). By lucky investments in the South Sea stock (1720) G. amassed his fortune of near half a million. In 1722 he built the hospital in Southwark which bears his name, and bequeathed nearly £220,000 towards its maintenance. He sat in Parliament from 1695 to 1702, and died 27th December 1724.

Guy's Hospital, in Southwark, was built by Thomas Guy (q. v.), who just lived to see it completed in 1724. It cost £18,793 to build and furnish. In addition to the £219,499 left by its founder, it received from Mr. Hunt in 1829 £180,000, and it has since been enlarged (the last addition in 1871) and enriched by several other bequests to the extent of £10,000. The hospital, managed by a body of sixty self-elected governors, has now (1877) accommodation for 700 patients, and an annual income of £40,000. The celebrated school of medicine and surgery attached to G. H. dates from 1769, and comprises some thirty lecturers. The school buildings include extensive museums and theatres, a library, and an improved chemical laboratory built in 1872.

Guy'on, Jeanne Marie Bouvier de la Motte, a famous French mystic, was born at Montargis, April 13, 1648. She married M. Guyon in 1664, and being left a widow at the age of twenty-five, settled her property on her children, and engaged almost wholly in a life of religious contemplation. When residing at Gex she fell under the influence of Père La Combe, a Barnabite, who imbued her with an extravagant mysticism. Her peculiar tenets exposed her to repeated persecutions, and after wandering to various French and Italian cities, and gaining many converts to La Combe's doctrine of Quietism (q. v.), she was imprisoned in 1688 in the convent of St. Marie, Paris. Liberated at the instance of Mde. de Maintenon, she mingled with the highest Parisian society, amid which her mysticism spread so rapidly that her numerous works were handed over for examination to Bossuet, who, infuriated by her grotesque language and unintelligible teachings, assailed Mde. G. with indignant zeal, while her cause was espoused by Fénélon, who strove to show that her doctrines were those of St. Francis de Sales, St. Theresa, and other mystics unimpugned by the Church. Bossuet, however, prevailed, and Mde. G. was imprisoned for heresy at Vincennes, Vangirard, and finally in the Bastille, where she remained for four years, being released in 1702. She then retired to Blois, where she died, 9th June 1717. Mde. G. was a woman of pure and lofty piety, but her mysticism was irrational and enervating, and often incoherently and fantastically expressed. Among her works are *Torrens Spirituels* (Köln, 1704); *Poësies Spirituelles* (Amst. 1689); *Cantiques Spirituels*, *Lettres Chrétiennes* (Köln, 1716); *L'Ame amante de son Dieu* (Köln, 1716); *Opuscules Spirituels* (Köln, 1704), &c. See the articles FÉNÉLON and QUIETISM, and *Vie de Madame G., écrite par elle-même* (Köln, 1720), a work which seems to have been written by Poiret, who obtained several of her papers.

Guyon, Richard Debaufre, a distinguished officer in the Hungarian war of independence, was the son of a commander in the English navy, and was born at Walcot, near Bristol, 31st March 1813. He took service in the Austrian army in 1831, married a daughter of an Austrian field-marshal in 1838, and shortly after quitted the army to live on his wife's estates. In 1848 G. received a command in the Pesth volunteers, and headed his battalion at Sukoro and Schwechet, commanded the advanced guard during Görgei's retreat, and distinguished himself by his valour in several of the most important battles of the war. After Temesvar, G. fled to Turkey, and soon obtained, without renouncing Christianity, an appointment in the Turkish service. In the Crimean war G. became chief of the staff in Asia Minor, and showed great energy and skill in organising the army, and in the defence of Kars. He died of cholera at Constantinople, October 13, 1856. See Kinglake's *History of the Invasion of the Crimea.*

Gu'zerat, or **Gujrat** (so called from the Gujar caste), a geographical division of India, lying N. and N.W. of Bombay, which includes the dominions of the Gaekwar of Baroda, the Kattywar peninsula, and the British districts of Ahmedabad, Broach, and Surat. G. had a place in history, but has no longer any political importance. It has given its name to

famous breeds of cattle and horses, and to the Guzerati dialect, which is a vernacular derivative from the Sanskrit stock, and is the official language for a population of about 3,000,000. See Durnall's *Chronological and Historical Chart of India* (Lond. 1877).

Gwal'ior, a native state of Central India, covers a great part of the ancient province of Malwa. Area, 33,119 sq. miles; pop. 2,500,000; revenue, including tribute from feudatories, £1,200,000. G. is chiefly watered by the Chumbul, and is very fertile; produces the well-known Malwa opium, cotton, tobacco, iron, &c.; and has manufactures of iron, brassware, cotton and silk cloth. The ruler, Scindia, is one of the three great Mahratta chiefs. The first of the name was slipper-bearer to the Peishwa; the second founded the kingdom, and dominated over the Mogul Emperor; the third came into collision with the British and was defeated at Assaye and Laswari. Anarchy then prevailed for some time, but the present Maharajah, who succeeded in 1843, is a most enlightened ruler, with the military instincts of his family. He was loyal during the Mutiny of 1857, together with his minister, Dinkur Rao, but his army revolted. The present force consists of 48 guns, 6000 horse and 5000 foot, and is most efficient. Railways have been constructed at the cost of a million and a half sterling.

Gwalior, the capital of the preceding state, is 65 miles S. of Agra. Its most notable feature is the fort, which consists of a sandstone rock, 342 feet high, made precipitous by nature and art, and capable of containing a garrison of 15,000 men. It has been famous throughout Indian history, and was captured by the British in 1779; it is still occupied by the G. contingent, officered by Englishmen. A fine palace on the plain is now being built in the Italian style. The town lies W., and the Lashkar or military camps S. of the fort. In 1875 a person falsely supposed to be the Nana Sahib was arrested here by Scindia. The Prince of Wales was magnificently entertained at G. in the spring of 1876. On the 1st of January 1877 the Maharajah was made G.C.B., and honorary general in the British army.

Gwyn'iad (*Coregonus pennanti*), a species of Teleostean fishes belonging to the genus *Coregonus* (q. v.), found in the Welsh and Cumberland lakes, and known under the popular name of 'fresh-water herring.' The Powan (q. v.) of Loch Lomond is an allied species. The average length of the G. is 10 or 12 inches. It has a prominent first dorsal fin, but the mouth is small. The tail is forked.

Gwynne, Nell, a fascinating actress and a mistress of Charles II., born in London, February 2, 1650. At the Portugal Street Theatre and at Drury Lane she won the hearts of the town, especially by personating youthful gallants. Pepys calls her 'a mighty pretty soul!' She was a generous, witty, and very beautiful madcap, with a laughing face and curling golden-brown hair. It is said she received £60,000 in four years from Charles II., who intended to make her Countess of Greenwich, and whose last words were, 'Do not let poor Nelly starve.' She was pensioned by James II., and died in her thirty-eighth year, November 1687.

Gy'ges. 1. A Lydian who dethroned Candaules, married his queen and ascended the throne of Lydia about 716 B.C. According to Herodotus, Candaules, vain of the beauty of his queen, Nyssia, exhibited her naked charms to G. his favourite officer. Writhing under the affront, and bent on vengeance, she summoned G. and ordered him either to prepare for death, or to slay her husband and accept his kingdom together with her hand. G. chose the latter alternative, and became the founder of the dynasty of the Mermnadæ. The Lydians were at first unwilling to submit to his rule, but eventually accepted it in consequence of an oracle from Delphi. In gratitude G. sent splendid gifts to the shrine. He carried on war with several Asiatic cities, and his wealth passed into a proverb. He reigned thirty-eight years. Plato's well-known fable of the 'ring of G.,' reproduced by Cicero (*De Offic.* iii. 9), and frequently alluded to by medieval writers, is a moral allegory founded on the story of the Lydian king.—2, **Gyges**, called also **Gyas** or **Gyes**, a son of Cœlus and Terra, had fifty heads and a hundred hands. With the rest of the giants he made war against the gods, and was doomed to endless punishment in Tartarus for his impious and rebellious conduct.

Gymna'sium and Gymnas'tics. The gymnasium (from Gr. *gymnos*, 'naked') was the public building in which a Greek youth received his education. This education included grammar, music, and gymnastics. The last subject was deemed by the Greeks the most important; and while training in the others was left off after a certain period, gymnastic exercises were continued even to an advanced age by persons of culture, these exercises in the case of elderly persons being necessarily of a lighter and less fatiguing character. The practice arose from the conviction that bodily health was conducive to mental vigour. As the word denotes, gymnastic exercises were undergone by persons either quite nude or but lightly clad. The benefit of such public training, not only to the general health, but also to the arts of sculpture and painting, can hardly be over-estimated. On the other hand, at a later period of Greek history, it must be confessed that the effects of the public exhibition were most pernicious. Nearly every town in Greece had a gymnasium. Athens possessed three—the Lyceum, Cynosarges, and the Academia—all splendid structures, and containing covered and open apartments, colonnades, walks, baths, &c. The earliest regulations for the gymnasia are contained in the laws of Solon. From these we learn that they were open from sunrise to sunset; that adults were excluded while the boys were taking their exercises; and that slaves were not admitted to training. In Athens and in the Ionian States women were excluded from the gymnasium. In Sparta and other Doric States maidens took part in the exercises. The instructions were given by *gymnastæ* and *paidotribæ*. Among games may be mentioned those of ball and top, and a variety of amusements with the rope. Of the exercises, the most important were running, leaping, wrestling, boxing, dancing, and throwing the discus or quoit. Many gymnasia were erected by the Romans, but they never became popular, the thermæ and amphitheatres possessing for the Italian races a superior charm. In course of time gymnastics fell out of repute; indeed the science was not revived in Europe till the beginning of the present century. Prussia led the way in this revival, and also in the institution of gymnastic exercises as a branch of military training. In 1806 gymnasia were opened by Basedow (q. v.) and Salzmann; that of the latter at Schnepfenthal being under the direction of Guts Muths. (q. v.). Sweden followed, then France in 1844, and last of all Britain about twenty years ago set about establishing gymnastics at Aldershott and elsewhere. The system of instruction consists of two parts: the first—elementary gymnastics—embracing special movements for the purpose of developing the muscles, and giving the performer confidence and self-command; the second—applied gymnastics—comprising such exercises as leaping, climbing, vaulting, suspension, &c. Swimming (q. v.), Boating (q. v.), Golf (q. v.), Cricket (q. v.), Football (q. v.) are among the best of gymnastic exercises. The treatises on gymnastics—English and Continental—form a considerable library.

The term gymnasium is applied in Germany to a higher school—corresponding to the public school, high school, or grammar school in this country—in which boys are trained for the universities. The gymnasia differ, however, essentially from such public schools as Eton, Harrow, and Rugby, in respect that all the pupils are day scholars, and do not reside in the buildings.

Gymne'ma, the genus to which the Cow Plant (q. v.) of Ceylon belongs.

Gymne'trus, a genus of Teleostean fishes, including those popularly named 'Ribbon-Fishes' (q. v.) and 'tape-fishes,' from the great length and narrow conformation of their bodies. The familiar species is the *G.* (or *Regalecus*) *Banksii*, which is frequently captured off our coasts, and may attain a length of 11 or 12 feet. One specimen is mentioned as having measured over 60 feet, and the appearance of such a fish, seen at a distance swimming through the sea, may possibly have given rise to many of the tales of the Sea Serpent (q. v.).

Gymnoc'ladus, a genus in the order *Leguminosæ*, having only one species, *G. Canadensis*, a large N. American tree, popularly called Kentucky coffee-tree and chicot. Its fruit is preserved like tamarind, its seeds are used as coffee, and its wood, which is hard, is valued by cabinetmakers.

Gym'nogens, or **Gym'nosperms**, a section under the subclass *Monochlamydeæ* in the natural system of classification of

plants. G. include the natural orders *Coniferæ* (q. v.) and *Cycadaceæ* (q. v.).

Gymnoso'mata (Gr. 'naked-bodied'), one of the two groups into which the class *Pteropoda* (q. v.) of the Molluscan (q. v.) sub-kingdom is divided. This division includes the pteropods, such as *Clio* (q. v.), &c., in which no shell is developed.

Gymnos'ophists (Gr. 'naked sages'), a class of philosophical or religious ascetics in India, who denied themselves the luxury of raiment or other bodily pleasures.

Gymno'tus, a genus of Teleostean fishes, represented by the *G. electricus*, an electrical eel of S. American marshes, and included in the division *Malacopteri*, of the order *Teleosti*, and in the section *Apoda*, in which the ventral fins are entirely wanting. The G. derives its zoological fame from having organs adapted for converting nerve-force into electricity. (See ELECTRICITY, ANIMAL.) Its length is from 4 to 5 feet. The skin is soft, and is destitute of scales. The G. is caught by the Indians, who drive horses and mules into the water, and thus cause the eel to exhaust the full force of its electrical apparatus upon these animals. When the fish is exhausted it seeks the shore, and can then be captured without danger.

Gym'pie, a town in Queensland, Australia, 116 miles N. of Brisbane. It is entirely dependent upon the yield of the auriferous quartz reefs which surround it, and to the discovery of which, in 1867, it owes its existence. The value of the gold produced at G. since that date is about £1,500,000. Pop. (1875) 5793.

Gyne'rium, the generic name of the Pampas Grass (q. v.) (*G. argenteum*) of S. America. It is a splendid grass, and is frequently grown in British gardens as an ornamental plant.

Gynerium argenteum.

Gyo'ma, a town of Hungary, on the Körös, 89 miles S.E. of Pesth by railway. It is celebrated for its wine. Pop. (1869) 8587.

Gyöngyös, a town in the centre of Hungary on a stream of the same name, at the S. base of the Matra mountains, 55 miles N.E. of Pesth by railway. It has a large trade in a celebrated red wine, and in grain, fruit, horses, and cattle. Pop. (1869) 15,830.

Gypae'tos. See LAMMERGEYER.

Gyps, a genus of vultures, represented by the Griffon (q. v.), or fulvous vulture, and by other species.

Gyp'sies (cor. from Egyptians, *cf.* their Magyar name *Pharaoh-nepek*, 'children of Pharaoh'), a wandering race, formerly believed to have come from Egypt, but now understood to be an Indian tribe or group of tribes, made their first appearance in Asia Minor and in the Greek-speaking countries in the S.E. of Europe early in the Middle Ages—the exact date is unknown. The earliest mention of them is in 1322. The only existing record of their history is to be sought for in their language, and this line of investigation into the early annals of the race was first followed with success by Rüdiger in his *Neuester Zuwachs der Sprachkunde* (Halle, 1782–93), and has since been successfully prosecuted by recent scholars in Germany, England, America, &c. In 1417 considerable numbers of G. (followed in a few years by still larger hordes) appeared in the north of Germany, whence they gradually spread themselves over every country in Europe—to Britain on the W. and Spain on the S. They were led by a 'duke' and 'count,' and they carried with them commendatory letters from kings and princes, including one (probably a forgery) from the Emperor Sigismund. From the earliest times their character as a race has remained unchanged —they were vagabonds, tricksters, thieves on their first appearance in Europe, and such the *tent-G.* remain to the present day; though those who have become 'house-dwellers' conform more or less to the usages of the people among whom they are domiciled. With their own ever-varying accounts of their origin as a people, and of the reasons which caused them to migrate from the East into Europe, it is needless to concern ourselves; as such accounts were invented and coloured as occasion and necessity required. Certain swarms described themselves as having come from 'Little Egypt,' hence the name they bear in England. The immigrants of 1417, however, were named *Secani*, and they are now almost universally spoken of as *Cingari* or *Chingani*. In Italy the name is *Zingari*, in Spain *Zincali*, in Germany *Zigeuner*, &c. They never, however, speak of themselves by any of these names, but always as *Rommany*. Among other Indian tribes who tell fortunes by chiromancy, and are addicted to legerdemain, cheating and thieving, are the *Nats*; and the later immigrations of G. into Europe are supposed to have belonged to that race. To the investigations into the language of the G. by Pott of Halle and Miklosich of Vienna we owe a number of facts bearing upon the early history and successive migrations of this singular people. Their language was originally spoken by a border tribe of Northern India. During the continuous wanderings of swarms cast off from this tribe the original language became much modified, until in modern times it appears as Rommany. Many of the original words were lost and many new words were adopted from every country through which the vagrants passed. An analysis of the language as it at present exists, and a calculation of the number of foreign and corrupted words which have been engrafted upon it, prove that the G. entered and remained long in Persia, that they thence passed to a Greek-speaking country (many of the Rommany words, numbers, &c., are still Greek), and that they thence passed through Hungary into Central Europe. They paused in immense numbers in Bohemia before penetrating further west, and to the French they are still 'Bohemians.' We learn from Lieut.-Col. MacGregor's *Central Asia* that in Ghilan (Persia) G. are still very numerous. 'There they preserve the characteristics of their race, as in other parts of the world. Fortune-telling is the occupation of the women. They live in little camps formed of miserable tents, in which they migrate from the hot to the cold country according to the season. The donkey is their companion, and his master is the professional vendor of pots and pans. In features and habits they differ but little from their brethren in the W.' It is curious that among the English G. Leland has collected an immense number of Indian and Persian words, which have not yet been collected among the different Rommany tribes on the Continent, and thus this writer is led to believe that the English branch is a separate migration. The G. in England are described by those who have lived with them, and who have devoted years to the study of their language, habits, and character, as a robust and extremely handsome race. Writing in 1846, Borrow states that in no country do the G.—everywhere a strikingly handsome people—reach such perfection of form and complexion as in England. 'The women while young are of a very high type of beauty, but after the prime is past they become unusually ugly. The men are taller than the English peasantry, and far more active.' They first appeared in the S. of England in considerable numbers in 1512, and immediately began to develop their vagabond and thieving propensities with great industry and success. Native thieves joined them, and the old thieves' slang of the country, as well as a considerable portion of the more modern slang, is based upon Rommany. The authorities began to frown upon them in 1522, and regarded them as exercising 'no craft but palmistry and robbery.' Though 'wanted' by the authorities, in terms of an Act for the apprehension of vagabonds, G., conspirators, prophesiers, players, and such like, their numbers continued to increase, and it is said that there were 10,000 of them in England in 1563. The circumstance that Acts for their suppression were unavailing led to the enactment of unduly severe laws against them. A few years prior to the Restoration, thirteen G. were executed simply because they belonged to the vagabond class. They still furnish the majority of our hawkers and tinkers, chair-menders, mat and basket sellers, &c., and according to Leland, there is not a theatre or music-hall, either in England or America, that does not include one or more persons of gypsy descent, near or remote. At present (1877) the full-blooded or *tent-G.* in England are only a few thousands in number, while the *Kairengroes* or house-dwellers, those who

keep their gypsy blood a secret, and half-breeds, all of whom speak Rommany more or less perfectly, number perhaps as many as 20,000. In Scotland the wanderers first appeared in 1460, *i.e.*, if Simson's conjecture that they are referred to under the name 'Saracens' be correct, which is, however, very doubtful. In 1506 they were favoured so far by James IV. as to receive a grant of special privileges. During the 16th c. they multiplied and increased amazingly, and married well among the natives, their thieving habits, as Simson remarks, being no bar to matrimonial alliances among a people so accustomed to thieving as the Scotch. Early in the 17th c., however, several oppressive edicts were issued against them, and to be a gypsy was declared to be a capital crime. Nevertheless, the G. in Scotland were always in favour with the people; for though they were generally robbers and villains of the worst description, yet they were invested with a certain air at once of gallantry and 'uncannyness' which had their due effect among the peasantry. The consequence was that in Scotland the G. flourished so long as they were persecuted, but began to decline and decay as soon as persecution was withdrawn. At one time the small town of Yetholm in Roxburghshire was inhabited by them exclusively, but now few are found in the neighbourhood. The majority of the Scottish G. have emigrated to America. In the New World these wanderers have generally become 'house-dwellers,' and have become lost to view as a distinctive race. In Europe the number of G., who are massed principally in the basin of the lower Drave and in Hungary and Wallachia, is about 500,000. There are, it is computed, between two and three hundred works on the G. The following are probably the best:—Dr. R. Bright, *Travels from Vienna through Hungary* (Edinb. 1818); Dr. A. F. Pott, *Die Zigeuner in Europa und Asien* (Halle, 1844); Dr. A. G. Paspati, *Études sur les Tchinghianés* (Constan. 1870)—a most important work; Dr. F. Miklosich, *Ueber die Mundarten und die Wanderungen der Zigeuner Europa's*, published in the *Denkschriften der Wiener Akademie der Wissenschaften* (Vienna, 1872–76); C. G. Leland, *The English G. and their Language* (1874), *Egyptian Sketch-Book* (1873), and *English Gypsy Songs in Rommany* (1875); G. Borrow, *Romano Lavo-lil* (Lond. 1874); Dr. B. C. Smart and H. T. Crofton, *The Dialect of the English G.* (Lond. 1875). This last is by far the best work on the English G. For everything relating to the history of the G., apart from the language, the best works are those of P. Bataillard, *De l'Apparition et de la Dispersion des Bohémiens en Europe* (Par. 1849), &c.

Gyp'sum, a widely-distributed mineral, composed essentially of sulphate of lime and water. It crystallises in the monoclinic system, and is between degrees 1·5 and 2 in the scale of hardness. Pure and crystallised specimens are clear and transparent, with a pearly lustre; but varieties are obtained of all shades of grey, red, brown, and black. Before the blowpipe it becomes white and opaque, crumbling readily in the fingers to loose powder. It is frequently met with forming twin crystals, and it occurs also in laminar, fibrous, stellated, granular, and compact masses. *Selenite* includes all the transparent crystallised varieties, which generally cleave easily into thin flexible laminæ. Of uncrystallised variety, *alabaster* is the finest. It is fine-grained, compact, white, and semi-transparent, and easily workable into vases and small articles of ornament. Its slight solubility in water ultimately renders its surface rough and opaque. *Satin-spar* is a white, delicately fibrous variety, characterised by a fine play of colours. Though employed for ornamental purposes, its softness and liability to being scratched prevent its very extensive use. G., rendered anhydrous by burning, reduces easily to a powder, which is known as *plaster of Paris*. This powder, when mixed with its own bulk of water, sets almost at once into a firm white solid. G. is also ground down and used as a manure.

Gypsy-Wort, the English name for *Lycopus Europæus*, a labiate plant found by ditches and river-banks in Britain and throughout Europe. It yields a black dye, which is used by gypsies to render their skins darker, hence the name G.-W.

Gyr'falcon (*Falco gyrfalco*), a species of Falcons (q. v.) found in N. Europe, Iceland, and N. and S. America. The average length is about 2 feet, or rather less. The colour is nearly white, only the upper parts being marked by light-brown bars. The toes are yellow and the claws black. The G. is trained in Falconry (q. v.) to pursue other birds, and is capable of a high degree of training. It is sometimes named the Iceland falcon and Greenland falcon.

Gyri'nus, or **Whirl'igig Bee'tles**, a genus of *Coleoptera* (q. v.) or beetles common in ponds and rivers, and so named from their peculiar movements on the surface of the water. The *G. natator* is a familiar example. These insects are nearly allied to the species of the genus *Dytiscus* (q. v.). They dive and swim well, and are of small size. Their eggs are deposited on aquatic plants.

Gy'romancy (Gr. *gyros*, 'a circle,' and *manteia*, 'prophecy'), a mode of divination practised by means of a circle with letters or symbols placed or inscribed thereon. Round this circle the gyromancist walked repeating a formula of incantation and stopping at intervals. At each stoppage the letters or symbols were carefully noted, and at the conclusion of his rounds all these were collected, disposed into words or sentences, and interpreted. The result thus obtained was supposed to be the intimation of the will of Heaven. See DIVINATION.

Gyroph'ora, the generic name of the lichens called *Tripe de Roche* (q. v.).

Gy'roscope and Gy'rostat are instruments which show to the eye many curious dynamical effects of rotational motion. When any symmetrical body is set rotating round a principal axis, it will continue to so rotate, and, unless an external force act upon it, the axis will retain its original direction. It is this persistency in the direction of the earth's axis that gives rise to the succession of the seasons, and to the same principle we owe the greater efficiency of rifled arms, which project the bullet with a rotatory motion, as compared with that of smooth-bored weapons. The gyroscope consists of a heavy rimmed disc, whose axis of rotation is fitted in Gimbals (q. v.), like the box of a mariner's compass. If an effort be made to change the direction of this axis, while the disc is rotating, a powerful resistance will be experienced. A very curious effect is produced if a downward-acting force, such as a suspended weight, act at the one extremity of the axis of rotation. The extremity is, of course, depressed a certain distance, but there results a precessional rotation of the axis—a motion precisely analogous to that presented by a common spinning-top whose axis is off the perpendicular. When this instrument was first made is not known, but to Foucault (q. v.) is due the credit of bringing it into general notice. He used it to prove by ocular demonstration the diurnal rotation of the earth. More recently Professor Piazzi Smyth, Astronomer-Royal for Scotland, has employed it with considerable success to the steadying of a telescope at sea. The gyrostat of Sir William Thomson is simply a gyroscope enclosed in a rigid case, which is flat and wheel-like in shape. Such an instrument can stand upon its rim in any set position while the internal disc is rotating; and if it be made the bob of a pendulum under certain conditions, the plane of oscillation revolves in accordance with the laws of the composition of rotations. The same physicist has recently constructed a liquid gyrostat, which consists of a spheroidal metallic case filled with liquid. The equatorial axis is greater than the polar axis by one-tenth of either, and with this ellipticity the gyrostat when set in rapid rotation behaves in the same way as those of common construction—though the action of fluid friction introduces curious theoretical considerations. See *Nature*, vol. xv., February 1, 1877.

Gyu'la, a town of Hungary, in the circle of Békés, 30 miles N. of Arad by railway. It is divided by the White Körös into Hungarian and German quarters, and has a trade in cattle, oil, angel-fish, &c. Pop. (1869) 18,495.

H.

the eighth letter in the English alphabet, occupying the same position as in the Latin and the original Phœnician. In the last-mentioned alphabet, its form was *cheth*, a hard guttural, which the Greeks, who used no proper H, took to represent their long *e* or *eta;* but in Latin the same ideograph was recovered as the sign of the aspirate, but pronounced soft as in English. Though etymologically it is very valuable, as representing its cognates *c*, *k*, and *ch*, its pronunciation is very irregular. In modern Italian its very existence has been lost; the best French pronunciation of the present day omits it altogether; in English its use is apparently on the increase; while in the lisping Spanish and guttural German it occupies a prominent place. Its superfluous insertion in the spoken language, which is so prominent a mark of vulgar provincialism, was also reprobated at Rome by Cicero and Catullus. But, on the other hand, its disappearance from many English words which had it in their primary or Old English form has been injurious to philology. H is sometimes mute in the middle of a word, as in 'right;' and it has a peculiar sound in 'which,' &c., as preceding and not following the *w*. Examples of its interchanges are—Eng. 'horn' = Lat. *cornu* = Gr. *keras;* Span. *hembra* = Lat. *femina;* Span. *hermano* = Lat. *germanus*.

As an abbreviation H.R.H. stands for his royal highness; H.M.S. for her Majesty's ship; H.P. for half-pay.

Haar'lem ('the clayey mound'), the chief town of the province of N. Holland, in the Netherlands, on both banks of the Spaarne, 4 miles from the sea and 12 W. of Amsterdam by railway. One of the finest and healthiest towns in the Netherlands, it was formerly the residence of the Counts of Holland, is the see of a Catholic and of a Jansenist bishop, and has many fine buildings, of which the chief are the church of De Groote or St. Bavo's Kerk, dating from the 15th c., with its tower 138 feet high, and its world-famous organ (1735-38) 34 feet high, of register 68, and 8000 pipes; the old townhall, richly ornamented with carving; the well-endowed, half charitable, half scientific Teyler Institution, with its fine collections of physical instruments, large library, and astronomical observatory; the Royal Academy of Science, founded in 1752; and the royal palace of Welgeleque in the beautiful H. Hout (Ger. *Holz*) or Bosch. There is a famous royal school for teachers, another of clinical surgery, and many charitable refuges (*hofjes*). In the market-place a marble statue was erected to Laurens Coster (q. v.) in 1856. H. is intersected by the river, here crossed by five bridges, and by various canals. It is the centre of the great Dutch trade in flowers, bulbs, and seeds, and has considerable manufactures of velvet, silk, linen, gold and silver stuffs, the cotton and linen mixtures called *H. boutjes*, carpets, lace, &c. Pop. (1875) 34,132. H. was a place of importance as early as the middle of the 12th c., and took an active part in the wars against the W. Frisians. In 1492 it sided with the peasant or 'cheese-and-bread' insurgents, and was partly destroyed and deprived of its privileges. In the war of independence of the 16th c. it took the part of the allies, and heroically withstood a seven months' siege by the Spaniards, only surrendering eventually on fair conditions, which were violated with foulest treachery.

Haarlem Lake, a former lagoon in the vicinity of the above city, from which it took its name, and connected with the Zuider Zee. By the beginning of the 19th c. it had been increased by the advance of the sea to an area of 45,000 acres. Much damage was done to Amsterdam and Leyden by an overflow in 1836. At last a company of English engineers commissioned by the Government succeeded in draining the lake by cutting deep canals and using gigantic pumps. The work, which is one of the engineering triumphs of modern times, occupied from 1839 to 1852. See Gevers d'Eude-Geest, *Du Dessèchement du Lac de H.* (1853) and *Journal des Ponts et Chaussées* (1842-63).

Haar'lingen (Fries. *Harns*), the fourth seaport in Holland, and the great trade centre in the province of Friesland, on the coast near the mouth of the Zuider Zee, 12 miles W. of Leeuwarden by railway. It is intersected by canals, has old fortifications, and is protected from the sea by immense dykes 40 feet high. As the headquarters of the Friesian Steam Shipping Company it has regular communication with Amsterdam, the Nieuwe Diep, Hull, and the Thames. The exports are chiefly butter, cheese, and cattle. In 1874 there entered the port 705 vessels of 196,110 tons, and cleared 689 of 192,197 tons. H. has a Latin school, a drawing academy, and school of navigation. Pop. (1875) 9968. A town that formerly stood here was submerged in 1134.

Habakk'uk (Heb. 'the embracing'), **The Book of**, one of the Hebrew prophets, is divided into two parts—chaps. i. and ii., entitled 'The burden which Habakkuk the prophet did see,' and chap. iii. 'A prayer of Habakkuk the prophet.' Both parts refer to the judgment which Jehovah either threatens or executes on his people by means of a foreign nation, the Chaldæans (i. 6). Very various opinions have been entertained as to the age to which Habakkuk belonged, and the date of the composition of his book. All that can be gathered from the contents, which is the only source of information on the subject, is (1) that the Chaldæans had already extended their march to the west, and (2) that this march had only very recently begun, so that they had not yet arrived at Jerusalem, and were little known there (i. 6-11). These circumstances seem to render it most probable that the prophet wrote in the reign of Jehoiakim. The book, especially chap. iii., is one of the most beautiful and sublime remains of Hebrew literature.

Ha'beas Cor'pus Act is in England one of the main guarantees of the Rights of the People (q. v.). Under the Act 31 Car. II. c. 10, if any one be imprisoned he may have a writ of Habeas Corpus to bring him before the Queen's Bench or Common Pleas division, who shall determine whether the cause of his committal be just. This Act embraces only criminal committals, but 53 Geo. III. c. 100 extends the remedy to all cases, and the power of issuing the writ to all judges. By 25 and 26 Vict. c. 20, no writ of Habeas Corpus can issue out of England into any colony or foreign dominion of the crown, in which there is a law court having power to issue and execute the writ. In times of great political excitement, if treasonable conspiracies are suspected, the H. C. A. has sometimes been suspended. It was so in Ireland in 1866. But suspension does not entitle any authority to imprison a man without cause. It only prevents persons committed (see COMMITTAL) from being bailed, tried, or discharged during the suspension, leaving to the committing magistrate all the responsibility of illegal imprisonment. It is not uncommon therefore to pass subsequent to suspension an Act of Indemnity (q. v.) for the protection of those who either could not defend themselves in an action for false imprisonment without making an inexpedient disclosure, or who have acted illegally believing the illegal act to be for the public good. There are various sorts of Habeas Corpus. That which secures the liberty of the subject is the writ of Habeas Corpus *ad subjiciendum*, directed to the person detaining another, and commanding him to produce the body of the prisoner, with a specification of the day and cause of the caption and detention, and com-

manding the captor to obey the decree of the judge or court issuing the writ. The Scotch Act corresponding to the English Habeas Corpus is the Act of 1701, c. 6. See WRONGOUS IMPRISONMENT.

Haben'dum, in English law, is, in a deed of grant, the name of the clause descriptive of the estate granted, and of the length of time for which it is to be held.

Haber'geon (a French diminutive from Old Eng. *heals beorga*, 'a protection for the neck') was a short jacket of chain-mail reaching from the neck to the middle. Readers of Chaucer will remember the garb of the 'verray perfight gentil knight,'

'Of fustyan he werede a gepoun
Al bysmoterd with his *habergeon*.'

Hab'it may be defined as the specialised effect of repetition on the human mind. There are, in the first place, certain purely mechanical acquirements which depend on the endowments of the active organs concerned, the delicacy of the particular senses concerned, and any special interest which the mind may have in the process under consideration. Sets of muscles vary very much, not only in their contractile force, but in their spontaneity and their sensibility to degrees of expenditure. This last is most important, as no amount of flexibility or compass will enable us to rise above the discrimination of the effect produced. Effective training depends on the freshness of the system. Hence military drill takes place in early morning, after breakfast, and after dinner. Among the more strictly intellectual habits are language, the scientific faculty, and acquisitions in the fine arts. Language of course depends on the opportunities of hearing and speaking, but it is in most cases greatly modified by special interests. Hence the peculiar styles of great writers and speakers. There are, however, singular instances of pure verbal memory coinciding with total ignorance of the connection of names and things. The science of mnemonics addresses itself to this form of mental H. But the moral habits, or the acquirements relating to feelings and volitions, are the more generally interesting. Conscious control by self or others is more frequently directed to moral than to purely intellectual ends. The general conditions of moral acquirement are mental concentration and natural retentiveness. It is very important to avoid defeat. A simple case is the H. of morning bathing in cold water in all weathers. Here, ideal conceptions of ultimate good gradually weaken the repulsion of the physical shock. Another case is where the mind becomes indifferent to and is able to work amid noise and bustle originally of the most distracting kind. Habitual sympathy, stimulation, and encouragement have a great effect in developing a generally emotional character, often to the great detriment, sometimes to the complete starvation, of the intellect and will. Then, as regards special emotions, anger, terror, or some tender feeling, they are all capable of culture and of being put more or less under control. Apart from these, however, and from the command of trains of ideas which long practice gives, there is a distinct cultivation of the will which issues in the most valuable of all human qualities—endurance and persistence.

Habit (*Physiology*).—It is apparently a law in the organism of animals that after any function has been frequently performed, there is a tendency to a repetition of the function. This constitutes H. Thus all excito-motor and sensori-motor actions are repeatedly performed without any effort on the part of the individual, or even without his consciousness. It is also observed that actions which were at first acquired with painstaking care become after a time easily performed, thus also exemplifying the force of H.

Habit and Repute', a phrase of Scotch law denoting a force of public belief so strong as legally to prove the matter believed in. The most common application of the phrase is to marriage, which in Scotland may be constituted by the mere fact of a man and woman living together as husband and wife. That is, the law presumes that there has been consent on the part of each to the contract of marriage, and the presumption thus afforded is so strong that no evidence to the contrary will be listened to. H. and R. is also a phrase of the criminal law of Scotland applied to one who is notoriously a thief. The convict must have borne the character for at least six months to merit the severer sentence generally passed on the thief by H. and R.

Habita'tion, in Roman law, denoted a rule under which a dwelling-house could only be used as such. In England and Scotland the restriction can only be under contract.

Offences against Habitations are by law Arson (q. v.), Burglary (q. v.), Housebreaking (q. v.), and Stealing. See LARCENY OR THEFT.

Habit'ual Crim'inals Act. This Act was passed in 1869 to make further provision for the suppression of crime committed by convicts under Ticket of Leave (q. v.), but this statute was repealed, and 34 and 35 Vict. c. 112 put in place of it. Under this Act, any constable, if so authorised by the chief officer of police of his district, may take into custody any convict holding a licence, if there are reasonable grounds for believing that he is getting his livelihood dishonestly, and on proof before a court of summary jurisdiction, his licence is to be forfeited. A convict holding a licence must notify his residence to the chief officer of police of the district, and also any change of his residence. Criminals are to be registered and photographed. Persons twice convicted on indictment may be specially punished and subjected to police supervision. New penalties are imposed on harbouring thieves, and powers are given to search for stolen property, and to seize and secure property believed to be stolen.

Hack'berry, the common name for the fruit of certain species of *Celtis*, a genus of plants belonging to the natural order *Ulmaceæ*. See NETTLE-TREE.

Hack'länder, Friedrich Wilhelm, a German novelist and dramatist, was born 1st November 1816, at Burtschien near Aachen, was at first engaged in commerce, then in the state service of Würtemberg, and has since 1864 retired into private life. H. is a keen humorist, and has been called 'the German Dickens.' His works are very numerous, but of the tales the *Bilder aus dem Soldatenleben* (Stutt. 1847, 7th ed. 1862), *Humorist. Erzählungen* (3d. ed. 1862), have been most popular; of his novels, *Eugen Stillfried* (1852), *Tag und Nacht* (2d ed. 1861), *Furst und Kavalier* (1865), may be mentioned. His dramas *Der geheime Agent* (1850), and *Der verlorene Sohn* (1865), are the best known. Later works are *Die Marionetten* (1868) and *Der letze Bombardier* (1870). Several of H.'s tales have been translated into English.

Hack'ney, a suburban borough of London, in the county of Middlesex, lies to the N. of Victoria Park, 3 miles N.N.E. of St. Paul's. It is traversed from E. to W. by the North London Railway. The division of Tower Hamlets by the Reform Act of 1867 erected H. into a borough, including the parishes of H., Bethnal Green, and Shoreditch, and having an area of 4696 acres, and a pop. (1871) of 124,951. The inhabitants are of the poorer classes. There are many large establishments for the manufacture of chemicals, india-rubber, drugs, varnish, soap, tar, &c. H. returns two members to Parliament.

Hackney Coach (Fr. *coche-à-haquenée*, 'a coach let out for hire;' *haquenée* is from the Old Fr. *haque*, 'a pony,' or any small horse not required for military service). In London a H. C. is by statute declared to be every carriage except a stage carriage driven by animal power, and plying for hire at any place within ten miles of the General Post-Office. Drivers may ply on Sunday. Any one refusing to pay the driver, or to compensate him for loss of time in summoning for the fare, or to pay him properly for damage done by the hirer to his vehicle, may be imprisoned for one calendar month. Drivers refusing to go, or not going reasonably fast, or exacting more than their legal fare, are liable to a penalty of 40s.

Hadd'ington, the chief town in the county of H., Scotland, stands in an undulating district, sheltered by the Garleton Hills, on the Tyne, 16 miles E. of Edinburgh by rail. Among the chief buildings are the corn exchange and the parish church, an old Gothic building with a tower 90 feet high. H. is one of the most important grain markets in Scotland; it has also cattle sales, and brewing, distilling, tanning, iron-working, &c., are carried on. Here John Knox was born in 1505. H., North Berwick, Dunbar, Jedburgh, and Lauder unite to send a member to Parliament. Pop. (1871) 4004.

Hadd'ingtonshire, or **East Lo'thian**, a maritime county in the S.E. of Scotland, bound S.W. by Edinburghshire, S. and S.E. by Berwickshire, W. and N.E. by the German Ocean, and N. and N.W. by the Firth of Forth. Area, 280 sq. miles; pop. (1871) 37,771. Part of H. is traversed by spurs of the Lammermuir Hills, of which the highest points are Berwick Law (800 feet) and Trapraine Law (700 feet). The centre and N. are level. The coast is steep and rocky in the N. and N.E.

the cliffs at Tantallon being 100 feet high. The chief stream is the Tyne, which after a course of twenty miles enters the sea near Dunbar. Geologically, H. is trap in the N., Devonian in the centre, carboniferous in the W., and Silurian in the S. The soil is mostly a clayey loam, and is very fertile. In agriculture H. is reckoned the foremost county in Scotland. Wheat, beans, and turnips are largely produced, and cattle are now largely bred. Recent disclosures, however (*Scotsman*, February 6, 1877), seem to prove that the high farming of this county has not rewarded the farmer in proportion to his outlay of money and skill. The fault is not in the farming, but in the rack-renting of the farms, and that must in time cure itself. H. is rich in coal and limestone, and also affords a supply of iron, fireclay, shale, and potter's clay. The leading manufactures are salt, pottery, and distilling; and fishing is extensively carried on at Prestonpans and Dunbar. In 1674 the land rental was £14,072; in 1874-75 it amounted to £311,526. The chief towns are Haddington, North Berwick, Prestonpans, and Dunbar. H. contains many interesting antiquities, notably the old castles of Tantallon, Dunbar, Innerwick, Dunglass, Winton, and Dirleton. There are various encampments and tumuli, and Roman, British, and Danish works. H. returns one member to Parliament.

Hadd'ock (*Morrhua æglefinus*), a species of Teleostean fishes belonging to the sub-order Anacanthini, and to the *Gadidæ* (q. v.) or cod family. It attains an average length of a foot. In general conformation the H. resembles the Cod (q. v.). The lower jaw is provided with a small *barbule* or filament; the dorsal fins are three in number, two anal fins being developed. The lateral line is very prominent, and the colour is a brown on the upper parts and silvery white beneath. A black spot, not at all unlike the impress of a thumb, exists behind the pectoral fin on each side; and a peculiarly grotesque popular fancy has ascribed its origin to the apostle Peter's thumb, the H. being assumed to be the fish which was taken out of the fresh-water lake of Gennesaret to obtain the tribute money! The H. is most plentiful on the N.E. coasts of Britain, but it also occurs round other portions of the coast, and is common on some parts of the Irish coast. It is caught chiefly with the line, and is greatly relished as an article of diet both in its fresh state and also when dried and smoked. In the latter form it is known as *Finnan H.*

Had'ersleben (Dan. *Haderslev*, in the middle ages *Hatharslöf*, 'the property of Hada'), a town of Prussia in the N. of Slesvig-Holstein, on a fjord of the Little Belt, 45 miles N.N.E. of Flensborg by railway. It has some glove-making and fishing, and its harbour admits small vessels. Pop. (1875) 8362. H. was formerly an imperial free city, and the seat of a bishop till the Reformation. Its castle, which stood without the walls, suffered many sieges. Christoph of Oldenburg, the founder of the present Danish dynasty, was born here in 1448. H. was taken by the Prussians in 1864.

Ha'dēs (Gr. *Aidēs* or *Hadēs*, probably 'the concealer'), popularly called Pluto (Gr. *Ploutōn*, 'the wealth-giver'), the Roman Dis, Orcus, or Tartarus, was worshipped in ancient Greece and Italy as the god of the lower world. He was brother of Zeus and Poseidon, and husband of Persephone, and was believed to be a stern and relentless deity In the extant representations of H. he wears a gloomy aspect, is attended by the dog Cerberus, and bears the key of his shade-peopled realm, which was also called H. by the Greeks after Homer's time.

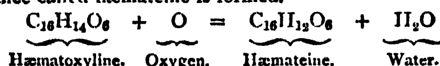
Had'ji Khal'fah, the title given to Mustafa Ben Abdallah, a Turkish historian and biographer, was born at Constantinople towards the close of the 16th c. After taking an active part in several campaigns, and performing a pilgrimage to Mecca, he returned to Constantinople in 1635, and there devoted himself to literary work until his death in 1658. His *Fedzlikeh* or *Tarikh-Kebir*, a universal history from the days of Adam down to 1655, is a work of vast information, containing notices of 150 Eastern dynasties. H.'s *magnum opus*, however, is his *Asam Kotoul ve alfonoum* ('Names of Books and Sciences'). It is, in fact, a comprehensive history of science, with a catalogue of books containing 25,000 names, and also notices of their authors. Flügel has translated it under the title *Lexicon Bibliographicum et Encyclopædicum* (7 vols. Leips. 1835-58), and it forms the basis of D'Herbelot's *Bibliotheca Orientalis* and Von Hammer's *Encyclopædia of Universal Knowledge.*

Had'ley, John, an English mathematician, was born about 1670. In 1717 he became a member of the Royal Society, before which he read his description of the quadrant or Sextant (q. v.) in 1731. In 1742, however, it transpired that Sir Isaac Newton in 1727 had described the instrument in a private letter to Halley (q. v.), who for some unaccountable reason suppressed it. This gave rise to a lengthened dispute as to priority, Newton's partisans going the length of accusing H. of plagiarism; but there seems little doubt that the two invented the instrument quite independently of each other, and that H. was the first who constructed it. H. died February 15, 1744.

Had'ramaut, the *Adramitæ* of Strabo, is the part of Arabia to the S. and S.E. of the great central waste. The name is more strictly applied to the smaller coast district to the N.W. of Aden, of which the chief town is Makulla. In the interior it is confined by the angle of the mountains Wadi Masilah and Wadi Doân, while a series of hills are dotted along the coast. The people, mostly in towns and villages, are of many tribes, and trade in camels, fine horses, dates, gums, &c. The country is rich in coal and copper. See Wrede's *Reise in H.* (1870).

Hadria'nus, P. Ælius, the fourteenth of the Roman emperors, was born at Rome, 24th January 76 A.D. His father, Ælius Hadrianus Afer, was married to Trajan's aunt. At fifteen H. went to Spain in a military capacity, was soon recalled, and became military tribune in 95, when he served in Lower Mœsia. In 98 he bore to Trajan the intelligence of Nerva's death. In 101 he attained the office of quæstor; in 105 he was tribune, and two years after prætor. In Trajan's expedition against the Dacians he greatly distinguished himself, and in 108 was sent as prætorian legate against the Lower Pannonians, in 109 he was consul suffectus, in 114 legate in the war against the Parthians, and in 117 consul-elect for the following year. Trajan, accompanied by H., now carried on war against the Parthians. In this campaign he was taken seriously ill, and having placed the command in the hands of H., set out for Rome, but died on the way at Selinus in Cilicia. H., then at Antioch, was proclaimed emperor, 11th August 117. The state of affairs in the empire was now perilous in the extreme; the eastern provinces were invaded; others were in a state of revolt. H.'s policy was peace. He made great but necessary sacrifices, settled the affairs of the empire, and returned to Rome 118, only to receive news of the invasion of Mœsia by the Sarmatæ and Roxolani. The Sarmatian war lasted, according to the Eusebian Chronicle, to 120. In 119 H. made his memorable 'progress.' First he went to Gaul, then to Germany, thence to Britain—everywhere introducing improvements and strengthening the empire. At this time was constructed the celebrated wall from the Solway to the mouth of the Tyne, of which many traces still remain. See *Lapidarium Septentrionale* (Soc. of Antiq., Newcastle-on-Tyne, 1875). H. returned through Gaul, went to Spain 121-122, and in the latter year visited Africa, from which he crossed to Asia. Western Asia was now (123) the scene of his travels, after which he visited the islands of the Ægean, Achaia, and Athens. At the last place he stayed three years. Thence he returned to Rome in 126 or 127. There he was saluted *Pater Patriæ*, and his wife *Augusta* For some years, with the single exception of a visit to Africa, he remained at Rome, introducing Greek rites and culture. In 129 he made his second journey to the East. In 131 he returned to Rome, and in 132 built the temple of Venus and Roma, and promulgated the *Edictum Perpetuum.* Then followed the Jewish war, which H. successfully terminated, and thereafter the outbreak of the Albanians and Iberians, which he also quelled. In the autumn of 132 he went to Athens, and in 134 to Egypt. He returned by Syria, superintended the settlement of a colony in Jerusalem, and fixed its constitution. H. died at Baiæ, whither he had gone in search of health, 10th July 138, at the age of sixty-three, and after a reign of twenty years. The senate, indignant at the cruelties which marked the latter part of his reign, wished to deny him the title of *Divus*, but Antoninus prevailed on them to be lenient towards his memory on account of the mental darkness that clouded his later years. The character of H. may be briefly sketched:—His reign was one of peace; his policy not cowardly, as some have said, but mild and wise; his liberality great; his military system well devised; his patronage of literature and art liberal and enlightened. He erected many splendid edifices, among which may be mentioned the

Moles Hadriani and the Ælian Bridge leading thereto. He founded several cities, the most famous of which was Adrianopolis, which still exists to perpetuate his name. Not less honourable to him than any of these was the *Athenæum*, a scientific institution which was founded and fostered by him at Rome, and which long retained its vitality. In the Latin Anthology are six epigrams by H.; in the Greek Anthology six; but not one is touched by the finger of genius.



Hæmatem'esis (Gr. *haima*, 'blood,' and *emesis*, 'vomiting'), vomiting of blood, may depend on some morbid change in the mucous membrane of the stomach, or on the rupture of some of its vessels. Treatment:—Small pieces of ice should be swallowed, and the horizontal position maintained. Astringents, such as oil of turpentine, acetate of lead and opium, alum and tannic acid, should be administered. The oil of turpentine should be given in doses varying from 10 to 20 minims in cold water, and repeated more or less frequently according to the urgency of the symptoms. See STOMACH, DISEASES OF.

Hæ'matine, a substance obtained from the colouring matter of the blood, having the chemical formula of $C_{34}H_{34}N_4FeO_5$. It is a reddish-brown amorphous powder, insoluble in water, alcohol, and chloroform, but soluble in alkaline solutions. With hydrochloric acid it forms crystals of the hydrochloride of H., of a rhomboidal form, the appearance of which constitutes one of the most important tests for blood stains. These crystals may be seen by adding to a drop of blood on a piece of glass a few crystals of common salt, and a drop or two of glacial acetic acid. This is placed in a warm atmosphere or before a fire for a few hours, at the expiry of which the microscope will show the characteristic crystals. This test is of considerable importance in cases where it is necessary to determine whether or not certain stains are due to blood.

Hæ'matite, one of the principal ores of iron, so named on account of the blood-red colour of its principal variety, *red H.*, which is a sesquioxide of iron, Fe_2O_3, occurring in large kidney-shaped masses in Great Britain, at the Garleton Hills, Haddington, Cumberland, and Cornwall. *Brown H.* is a hydrated sesquioxide, $F_2O_3, 3H_2O$, frequently found in small pellets, whence it is called pea iron ore. It is of great importance in France. H. has risen much in value since the introduction of the Bessemer process for steel manufacture.

Hæmat'ocele (Gr. *haima*, 'blood,' and *kēlē*, 'tumour'), a tumour containing blood, but specially an accumulation of blood in the tunica vaginalis, distending the sac and compressing the testis.

Hæmatox'yline is the colouring principle of Logwood (q. v.) (*Hæmatoxylon campechianum*). It is probable that the H. does not exist ready formed in the living wood, but in the form of a *Glucoside* (q. v.), as the colour of the wood does not develop till after it has been cut down, and exposed to the action of air and moisture. H. may be obtained in yellowish white crystals from a dried aqueous decoction of logwood by extraction with hot alcohol. Its composition is represented by the formula $C_{16}H_{14}O_6 3H_2O$. When heated to 100° C. it loses two of the three molecules of water, and the monohydrated compound $C_{16}H_{14}O_6H_2O$ remains. When an alkaline solution of H. is exposed to the air, exudation takes place, and a new substance called hæmateine is formed.

It is hæmateine and not H. that is employed by the dyer and calico-printer for producing shades of purple and black. Shades of violet and purple are produced by mordanting the fabrics with oxide of tin previous to passing them through the logwood decoction; black with a mordant of iron and bichromate of potash.

Hæmatozo'a, the name given to such parasitic animals as inhabit the blood-vessels of man and higher animals. The most common form is the *Bilharzia hæmatobia* (once known under the names *Distoma hæmatobium* and *Schistosoma hæmatobium*), which occurs chiefly in the *portal veins* of man—or those veins which carry venous blood to the liver for the manufacture of bile. Dr. Bilharz of Cairo was the discoverer of this parasite, the generic designation being derived from his name. Another form, at first supposed to be a new species (*B. magna*), was found by Dr. Cobbold in the portal vein of a Sooty monkey (*Cercopithecus fuliginosus*) which died in the London Zoological Gardens in 1857. This species, however, is now believed to be identical with the human parasite. *Bilharzia* is very common in Egypt. It was found in 117 cases out of 363 cases of death in which post-mortem examinations were made. The male is a cylindrical worm, attaining a length of about half an inch; the female being longer and narrower than the male. As in other Flukes (q. v.), suckers exist, and by one of these organs the animal attaches itself to the tissues of its host. Its effect in man appears to consist chiefly in dropsical and allied symptoms, along with hæmaturia and anæmia. Another species of H. is *Hexastorna* or *Hexathyridium venarum*, which also occurs in the human veins. In India Dr. Lewis has recently described a new hæmatozoon under the name of *Filaria sanguinis hominis*, which is said to induce *chyluria* and *elephantiasis*.

Hæmatu'ria (Gr. *haima*, 'blood,' and *ouron*, 'urine'), or **Bloody Urine**, may depend upon congestion of the kidneys, ulceration or malignant disease of the bladder or Prostate Gland (q. v.), or upon irritation caused by calculi in the Uretere (q. v.) or bladder. Lesions in the bladder, resulting in H. are also effected by the existence of a Distoma (*Bilharzia hæmatobia*) in the bladder. H. depending upon the existence of these parasites is endemic in Africa at the Cape of Good Hope, Uitenhage, Port Elizabeth, the Zambezi regions, and in certain parts of the Zanzibar territories, and especially at Tula. In ordinary cases H. may be checked by the administration of gallic acid or the sesquichloride of iron.

Hæmidro'sis (Gr. *haima*, 'blood,' and *idroō*, 'I perspire'), or **Bloody Sweat**, is a morbid condition which has been frequently observed and described by medical men. The greater number of cases of H. occur in young women, and are referable to vicarious menstruation. Cases have been described in which H. affected the greater part of the body, and others in which it flowed from the axilla during a paroxysm of fever. Mr. Erasmus Wilson describes several cases of H. referable to vicarious menstruation. In one case H. took place every fortnight from four circular spots, each about the size of a half-crown, and situated symmetrically on the face, one being on each cheek, one on the forehead, and one on the chin. In another case a young woman suffered a loss of blood from her ears, a little after at the points of her fingers, and then at her toes; presently after, at the umbilicus and corner of the eye; several times by sweat; and at length it burst out from the middle of her breast; afterwards on the foot, where the saphena is pricked in bleeding; then at both palms and backs of her hands. Two days after it flowed from her chin, and all this in a fortnight's time. Whenever it flowed from her breast or other parts like sweat, there was no vestige of an orifice to be seen. This curious affection seems to be identical with those extraordinary cases of religious neuropathia which are manifested by hæmorrhage from the hands and feet and from the left hypochondriac region—the so-called *stigmata* of the crucifixion of our Lord. Mr. Erasmus Wilson describes this disease as *neurotic excoriations*. A striking example of this affection, associated with hysterical and ecstatic phenomena, recently occurred in Belgium in the person of Anne Louise Lateau, born at Bois d'Haine, Belgium, in 1850. Her father died of malignant small-pox when she was only ten weeks old. Twelve days after the father's death the infant was seized with the same disease, and narrowly escaped with her life. At the age of eight she had to commence work for her own support, and continued to do so till she was seventeen, when she became ill with the ordinary phenomena of chlorosis. She had also a severe attack of pharyngites, with neuralgia, eczema, and axillary abscess. At eighteen, menstruation occurred for the first time, and during the period she exhibited certain mental phenomena supposed to be a visitation of divine light. Shortly after, the bleeding stigma appeared for the first time on her left breast; the week after, it appeared on the breast and back of the feet, and the following week on the breast, feet, and hands. Five months later it appeared on the forehead, and ten months after, she became the subject of trance. Instances of H. are noted as having taken place during vehement terror, and not unfrequently during the agony of hang-

ing or the torture. One memorable instance of this kind occurred in the experience of the founder of Christianity. See Buchner's *Repertorium*, 2d series, vol. v.; Stark's *General Pathology; Medical Essays*, abridged from the *Philosophical Transactions*, vol. i.; Essay by Dr. F. Lefebure, Professor of General Pathology and Therapeutics; Louvain on *Louise Lateau, de Bois d'Haine, sa Vie, ses Extases, ses Stigmates* (1870); *Lectures on Dermatology*, by Erasmus Wilson (Lond. 1875); Bartholinus, *Epistola*, i. p. 718.

Hæmodora'ceæ, a natural order of Monocotyledonous plants, embracing thirteen genera and about fifty species. The plants receive the name of blood-root from the red colour of the roots of many of the species which are used for dyeing. They are distributed in N. and S. America, Africa, and Australia. The vellozias or tree-lilies belong to the order, and give a striking feature to the mountain vegetation in Brazil.

Hæmoglo'bin, the colouring matter of the blood, is sometimes termed Hæmoglobulin or Hæmato-crystalline. It is the most complex substance known to chemists, as shown by its formula—$C_{600}H_{960}N_{154}FeS_3O_{179}$. This formula of course is quite empirical, but as it represents in the simplest numbers the ratios of the different elements in the percentage composition of the substance, it will at once be seen that it is extremely complex in chemical structure. It may be separated from the blood by various methods, and it is remarkable that it is more easily separated from the blood of certain animals than from that of others. It may be obtained readily from the blood of the guinea-pig or of the horse by simply diluting the fluid with water, and keeping it for several hours at freezing-point. In these circumstances, the coloured blood corpuscles apparently break down, and their colouring matter crystallises out as H. The crystalline form of H. varies in different animals. Usually it appears as elongated rhombo-dedra, but in some, as in the guinea-pig, it assumes the form of *texa* or octahedra. It is soluble in water, the solution having the red colour of blood; heat, in the presence of alkalies, augments the degree of its solubility; it may be split up into (1) *globin* or *globuline*, a coagulable albuminous substance, and (2) *hæmin* or *hæmatine*, a matter containing all the iron (Fe) of the blood. H. is of importance physiologically, inasmuch as it is the substance which combines with oxygen in the lungs, becoming a compound called *oxyhæmoglobin*, which is carried by the blood corpuscles to the tissues of the body. In the ultimate capillaries the *oxyhæmoglobin* gives up its oxygen to the tissues, and is reduced to H., which again goes to the lungs to receive a new burden of oxygen. Spectrum analysis distinguishes readily between the two conditions in which H. may exist. Thus a solution of *oxyhæmoglobin* gives two absorption bands in the spectrum between D. and E., while under the action of reducing agents (or those which take away its oxygen), such as sulphide of ammonium, these two bands disappear, and are replaced by a *single* band, which occupies the interval between the two preceding. H. forms compounds with other substances than oxygen, as, for example, with carbonic oxide. H., acted on by this gas, gives with the spectroscope two bands like those of *oxyhæmoglobin*, but these bands are not affected by reducing agents. Thus it would appear that carbonic oxide gas acts as a poison, because it prevents H. from carrying oxygen to the tissues.

Hæmop'tysis (Gr. *haima*, 'blood,' and *ptysis*, 'spitting'), expectoration of blood, is always indicative of organic disease of the lungs, such as engorgement of the pulmonary vessels, disorganisation of pulmonary tissue, as in tuberculosis, pneumonia, or cancer of the lungs, disease of the heart or thoracic aneurism. H. may occur from sudden changes of atmospheric pressure, as in ascending mountains, or descending in diving bells, or from violent straining or plethora. H. is always a serious symptom of disease, but the gravity of the symptoms depends upon the disease with which it is associated. In tubercular disease H. is frequently a fatal symptom. Treatment:—Bitartrate of potash in drachm doses, and the mineral acids in doses of from three to five drops, combined with opium or morphia, every four or six hours. Cupping, and the application of ice upon the spine, are useful in many cases, but afford only temporary relief, H. being a symptom of several diseases.

Hæ'morrhage (Gr. *haima*, 'blood,' and *hrēgnumi*, 'I burst forth'), a flow of blood from injured arteries, veins, or capillaries. The characters of the H. differ according to the nature of the vessel from which the blood escapes. If from a *vein*, the blood is of a dark colour, and flows in a uniform stream; and if there be any pressure applied between the wound and the heart, the force of the flow of blood will be increased. To arrest H., in such cases, pressure must be applied between the wound and the extremities. When an *artery* is wounded, the blood is of a bright scarlet colour, and flows by jets, synchronous with the contraction of the left ventricle, and between each jet the stream is continuous. To arrest arterial H. a ligature, or pressure, or other means must be applied to the cardiac end of the injured vessel. When there is H. from a wounded vessel into the cellular tissue of a part, the substance of organs, or internal cavities, it is termed Extravasation (q. v.). When H. is produced intentionally by surgeons it is called Blood-Letting (q. v.) and Cupping (q. v.). Treatment:—After the flow of blood has been arrested it may be necessary to adopt means to prevent fatal syncope. The patient should be placed in the recumbent posture, with the head low, and pressure should be applied to the abdominal aorta, and the main arteries of the limbs, to confine the blood as much as possible to the nervous and circulatory centres. When death appears imminent from the effects of H., as sometimes happens in cases of Flooding (q. v.), Transfusion of Blood (q. v.) may be had recourse to.

Hæ'morrhoids, or **Piles**. See ANUS, DISEASES OF.

Hæmus, Mount. See BALKAN.

Hæred'itas Ja'cens, a term of Scotch law denoting an estate to which the heir has not made up a title after the death of his predecessor.

Hæret'ico Comburen'do was a writ against a heretic who, having been convicted of heresy by the bishop, was delivered to the secular power to be burnt. It was abolished by 21 Car. II. It was put in execution upon two Anabaptists in the seventeenth year of the reign of Elizabeth, and upon two Arians in the 9th of James I.

Haff, a disused Danish word meaning 'the sea.' It occurs in the proper name of inlets of the Baltic—the Frisches H. (q. v.), Stettiner H. (q. v.), and Kurisches H. (q. v.).

Há'fiz (*Schems-ed-dîn-Mohammed*), the representative poet of Persia, whose name is inseparably associated with the city of Shiraz, where he lived and died, and whose lyrics throughout the East fill the position occupied by the poems of Homer among the Greeks. Of his life little is known, except that it extended throughout the greater part of the 14th c. He was undoubtedly at one time a dervish, professing the mystical system of doctrines known as Sufiism, which colours all his writings. He chiefly wrote in praise of love, wine, and every form of pleasure; and his felicity of language, readiness of wit, and flow of metre have won for him the name of the Eastern Anacreon. It is still a disputed question among commentators whether his erotic appeals are not to be understood in a semi-theological sense, as with the Song of Solomon. His magnificent tomb at Shiraz, which had become a place of pilgrimage, was overthrown by the destructive earthquake of 1853. The collection of the poems of H. called *The Divan* is used for purposes of divination, after the manner of the *sortes Virgilianæ*. It has been several times printed in the original—at Calcutta (1791); Cairo (1834); Constantinople (1840); Leipsic (1854-61); the best and most complete English version is that of Herman Bicknell, illustrated by J. Herbert, R.A. (Lond. 1875), in which the Persian metres are preserved.

Ha'gar (Heb. 'flight') was an Egyptian slave belonging to Sarah, Abraham's wife, whom Sarah gave to her husband for a concubine when she had no children of her own (Gen. xvi.). The story, true to human nature, describes how, when H. 'saw that she had conceived, her mistress was despised in her eyes.' 'And when Sarah dealt hardly with her, she fled from her face.' Having taken the way to her native land, she was found in the wilderness, 'in the way to Shur,' by an angel of Jehovah, who sent her back, and she gave birth to Ishmael (q. v.). At the feast on the occasion of the weaning of Isaac, Ishmael, being then seventeen years of age, was observed 'mocking' by Sarah, who was mortally offended, and prevailed on her husband to send away H. and her son. They went and dwelt in the wilderness

of Paran, and H. took for her son 'a wife out of the land of Egypt,' probably one of her own kindred (Gen. xxi.). She is held in honour by the Mohammedans as the mother of the Ismaelite Arabs, and her 'grave' at Mecca is much visited by devout pilgrims.

Hag'berry, a name applied to the Bird-Cherry (q. v.), and as an equivalent of Hackberry (q. v.).

Ha'gedorn, Friedrich von, a German poet, was born at Hamburg, 23d April 1708. He studied law at Jena, published a collection of poems in 1729, and shortly thereafter went to London. In 1733 he was appointed secretary to an English company at Hamburg, and there, having had abundant leisure to cultivate his muse and enjoy the delights of social intercourse, he died, 28th October 1754. Though lacking original power, H. was very successful in fables, short tales, and such poetic trifles as had hitherto been disfigured by the clumsiness of an imperfectly polished tongue. In purity of style and eloquence of versification, H. stands far above most of his contemporaries. An edition of his *Poetische Werke*, accompanied by a memoir, was published by Eschenburg at Hamburg in 1800 in 5 vols.

Ha'gen, a manufacturing town in the province of Westphalia, Prussia, 14 miles E.N.E. of Elberfield by rail, at the confluence of the Empe and the Volme rivers. A good deal of cloth is woven here. The town has dye and print works, also manufactures of wire, of iron and steel, and of tin and copper. Pop. (1875) 24,218.

Hagen, Friedrich Heinrich von der, a scholar who did much to awaken interest in the study of ancient German poetry, was born February 19th, at Schmiedeberg, in the N. of Brandenburg, entered into the public service at Berlin in 1803, and was in 1810 appointed Professor of the German Language and Literature at the newly-founded university, where he for the first time made the old German tongue a branch of university study. He died at Berlin, June 11, 1856. Besides editing the *Nibelungenlied* four times (viz., 1810, 1816, 1820, and 1822), the works of the *Minnesänger* (1838), and other ancient German poems, H. wrote a *Grundriss der Geschichte der Deutschen Poesie* (Berl. 1812).

Ha'genau (Fr. *Haguenau*, 'the enclosed meadow'), a town of Elsass-Lothringen, Germany, on the Moder, and in the great Hagenauer Forst, 20 miles N. of Strassburg by railway. It is girt with old towering walls and broad moats, and has manufactures of leather, oil, soaps, madder, and other dyes. Pop. (1875) 11,726. H. was founded by Friedrich Barbarossa in 1164, suffered in the Thirty Years' War, and passed to France in 1648. The French gained two bloody victories over the Austrians here in 1793. In the Franco-German war G. was taken the day after the battle of Wörth by Badenese troops under General La Roche, August 7, 1870.

Ha'genbach, Karl Rudolf, a German divine, was born March 4, 1801, at Basel, Switzerland, and became Professor in the university of his native city in 1828. H. is a representative of the 'Mediation School' (*Vermittelungs-Schule*) of modern German theology—the school, created mainly by the reviving influence of Schleiermacher, latitudinarian in all matters of confessional detail, free in its attitude towards critical questions, but earnest and hearty in support of the cardinal points of evangelical truth. H.'s sympathies are rather with the Reformed than with the Lutheran theology. His numerous works comprise a complete history of the Christian Church, published between 1834 and 1860 (new ed. in 7 vols. 1868-72, *Vorlesungen über Kirchengeschichte*), a valuable *Lehrbuch der Dogmengeschichte* (Leips. 1840–41, 5th ed. 1867), the well-known *Theologische Encyclopädie* (a manual of reference to the principal works in all departments of theology; 7th ed. 1864), and the *Grundlinien der Homiletik* (1863).

Ha'gerstown, a city of Maryland, U.S., 6 miles E. of the Potomac river, and 30 S.W. of Gettysburg by railway. It is a meeting point of three railways, and has some manufactures of machinery. Pop. (1870) 5779.

Hag'fish, or **Bo'rer** (*Myxine glutinosa*), a peculiar species of fish belonging to the order *Marsipobranchii*, which includes but another genus, the well-known Lamprey (q. v.). It is of slender, eel-like form, and has a circular mouth, furnished with eight *cirrhi* or filaments. The palate bears a single large tooth or fang, which is, in its turn, serrated or toothed on each side. By means of this great fang the H. bores its way into the bodies of other fishes. The cod is frequently assailed. A peculiar feature of the H. is the power it has of secreting a large quantity of *mucus* from the surface of the skin. The gills exist in the form of closed sacs or pouches which open into a common tube, the outer aperture of which is found on the lower body-surface. No paired fins or lower jaw are developed; and the skull is cartilaginous; while the spine is represented by the soft structure known as the notochord.

Hagg'adah (Heb. 'legend,' 'saga'; pl. *Haggadoth*), a certain element in the Jewish Talmud, so called in contradistinction to Halacah (q. v.), because it consisted of mere sayings without authority, of allegories, parables, or tales, the sole value of which was to point a moral or illustrate a subject. From its popular nature, however, the people clung to it, and in course of time gave to it alone the name of Midrash (q. v.) It has an exegesis, a system, and a method of its own, and transforms Scripture into a thousand themes for its variations. Everything being bound up in the Bible, there must be an answer in it to all questions; all the riddles in it are solved if only the key be found. 'The persons of the Bible—what they did and suffered, their happiness and their doom, their words and their lives—became, apart from their historical reality, a symbol and an allegory.' Besides, the H. supplied much that the narrative had omitted, filling up the gaps, explaining the motives, and finding connections between the remotest countries, ages, and persons; drawing sublime morals from the most commonplace facts. See E. Deutsch on *The Talmud* in his *Lit. Remains* (Lond. 1874).

Hagg'ai (Heb. 'the festal one'), was one of the twelve 'minor' Jewish prophets, and the first of the three who prophesied after the return from Babylon. Regarding his personal history there is nothing but unreliable tradition. In all probability he was one of the exiles who returned with Zerubbabel and Joshua. His four prophetic utterances, delivered between the sixth and the ninth month of the second year of the reign of Darius Hystaspis (B.C. 520), all relate to the rebuilding of the Temple. In the first he reproves the people for their selfishness and indifference in dwelling in their 'ceiled houses' while the house of the Lord was lying waste, and warns them that Jehovah will punish them therefor by unfruitfulness in the land (i. 1–11). The effect of this admonition is such that the building of the Temple is at once resumed (i. 12–15). The second message is intended to reconcile the people to the diminished splendour of the new Temple as compared with the old one (ii. 1–9). Two months after the prophet has again to rebuke the people for their sluggishness in carrying on the work of the Lord, but repeats the promise of the blessing of Jehovah (ii. 10–19); and in his last prophecy, delivered to Zerubbabel the same day, foreshadows the establishment of the Messiah's kingdom (ii. 20–23).

Haghe, Louis, a Belgian artist, was born at Tournay in 1802. He first acquired a name as a lithographer, but is best known as a member of the New Watercolour Society, and an illustrator of Flemish interiors. His picture 'L'Hôtel de Ville de Courtray' gained him a great reputation, and for fidelity as a historical painter he has few superiors. His eminence as a lithographer gained him a second-class medal in the Paris Exhibition of 1855.

Hagiog'rapha (Gr. 'holy writings') is a name which has been used by some writers as synonymous with Holy Scriptures; in the middle ages it was frequently used as synonymous with Apocrypha (q. v.). In its special and most limited sense it means the third division of the Jewish canon (see BIBLE), including Job, Psalms, Proverbs, Song, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, Chronicles.

Hague, The (Dut. *S'Gravenhage*, lit. 'the graf's hedge' or enclosure; Ger. *Der Haag*; Fr. *La Haye*), politically the chief city of the Netherlands, the residence of the king, and seat of the States-General, in the province of S. Holland, 3 miles from the coast, and 15 N.W. of Rotterdam by railway. A handsome, fashionable, healthy city, with many fine streets and squares (Weiher, Buitenhof, and Binnenhof), and stately build-

ings, it is intersected by numerous canals fringed with rows of linden trees, and spanned by elegant bridges. The finest parts of the H. are Het Vorhout, the Vyverberg, and the former Willemspark; and towards the centre, on the *Vyver*, or 'pond,' is the *hof* of the Counts of Holland, and later of the Stadtholders. Other notable buildings are the irregular pile of the States-General; the Buitenhof, where Oldenbarnevelt was confined and executed; the Gevangenpoort, a prison of historic interest over the entrance of the Buitenhof; the royal palace, with splendid interior (1815); the so-called Mauritz Huis; and the national museum, containing valuable collections of Dutch paintings; the church of St. James of 1309, with its hexagonal tower and chime of thirty-eight bells; and the townhouse, with a beautiful façade of 1525. In the archives of Het Plein are rare documents relating to the history of Europe for the last four centuries. The H. has a royal library of 100,000 vols., with rich collections of MSS., coins, medals, and gems; a Latin school, a technical school, and a royal academy of music. Its manufactures are chiefly gold and silver wares, furniture, brushes, soaps, perfumery, and carriages, but its prosperity greatly depends on the number of foreign residents. French, English, and German are widely spoken languages. The sea-bathing at Schevingen attracts crowds of summer visitors. Near the H., and in the heart of a beautiful wood is the Huis in 't Bosch, a royal summer palace, the walls and ceiling of which bear frescoes by Rubens. Also in the vicinity is Ryswick (q. v.), where was signed the treaty of peace in 1697. Pop. (1875) 100,254. A hunting castle built here by the Counts of Holland gave place to a palace erected by Willem, Duke of Holland and King of the Germans in 1250. In the 16th c. it became the residence of the States-General, and during the 17th c. was the centre of European diplomacy. It was the birthplace of William III. of England, and of other members of the House of Orange.

Hahn'emann, Samuel Christian Friedrich, born at Meissen in Saxony, 10th April 1755, was the founder of homœopathy. His father was a poor painter on porcelain. Going to study medicine at Leipsic, he supported himself by translating scientific works from French and English. It is said that at this time he slept only on alternate nights. After acting as physician and librarian to the governor of Transylvania at Hermannstadt, and taking his doctor's degree at Erlangen (1779), H., much to the disgust of his wife, left a good practice at Dresden, to return to study and translation at Leipsic. The chemistry of drugs engaged him chiefly; for, as appears in his letters to Hufeland, the great Berlin physician, he did not like the notion of prescribing unknown substances to be applied to unknown morbid states. Convinced that Providence must have supplied a simple remedy not far off from the disease, he was led to his fancied discovery that 'like cures like.' This he attempted to put in practice at Brunswick in 1794, but the ignorant trades-unionism of the allopaths drove him from town to town, and he retired to Leipsic, where he prescribed and taught publicly from 1811 to 1829. It was a matter of conscience with him to prepare his drugs; hence his enemies founded on the custom that no physician should deal in drugs. Until 1815 he remained at Anhalt Koethen, consulted from all parts of Europe, but persecuted shamelessly, the mob being instigated more than once to attack his house. His second wife took him to Paris, where he continued to practise down to his death (2d July 1843), strong in mind and healthy in body to the last. H.'s principal work is his *Organon der rationellen Heilkunde* (Dresd. 1810, 5th ed. 1833). The principle that a morbid physiological state may be abated or cured by the application of a substance which produces a similar morbid state in the healthy organism is apparently confirmed by a large number of incontestable empirical facts. The idea is expressed by Hippocrates, Stahl, and others, and implied in many unscientific customs. The really characteristic parts of H.'s doctrine are his explanation of chronic diseases (which he regards as inherited forms of psoriasis) and his theory of *infinitesimal attenuation*. The latter was parodied in the prescription 'Put in a grain of the specific above Schaffhausen, and take out a glass from the Rhine below Bingen.'

Hahn-Hahn, Ida, Countess, a German poetess and novelist, was born at Tressow, in Mecklenburg-Schwerin, June 22, 1805. The extravagance of her father, Count von Hahn, had impaired his large fortune; and in 1826 she was married to her cousin Friedrich Count Hahn, the owner of the finest baronial estate in North Germany. This union proving very unhappy, was terminated in three years by a separation, after which the countess gave herself up to foreign travel and authorship. Her first published works were poetical; but she is best known for her novels, which are clever and showy, though marred by much false sentiment and absurd prejudices of rank. In 1850 Countess H. suddenly became a convert to Romanism, entered a convent at Angers, and subsequently published an account of her conversion under the title *From Babylon to Jerusalem*. Her later writings have been on ecclesiastical topics.

Hai'ducks (Magyar, 'drivers'), originally cowherds, was in the 16th c. a name for a class of mercenary soldiers, who in 1605 had a district of country allotted to them on the E. side of the Theiss with several peculiar privileges. This territory has over 60,000 inhabitants, chiefly Magyars, and is still directly under the supreme Government. In the 18th c. the word came to be used for the servants of Hungarian officials and magnates.

Hail (Old Eng. *hagal* and *hagol*, Ger. *hagel*, Lat. *grando*, from an Aryan root meaning 'to rattle') is the name given to those discrete particles of ice which descend as a shower, usually before a heavy rain. The conditions under which H. is formed are not well understood, but they must be of a transient nature, since hailstorms last but a brief period, rarely so long as fifteen minutes. Immediately before the shower begins, a peculiar rustling sound is heard, like that produced by the shaking of peas or small pebbles in a bag, and at the same time the atmospheric electricity is greatly disturbed. The constant presence of electrical phenomena during a hailstorm early suggested an electrical origin; but it is quite as likely, so far as we at present know, that the electricity is an effect, not a cause, of H. There is no doubt, however, that to produce the material necessary for the formation of H. the cooling of a mass of moisture-laden air below the freezing-point is required. This cooling may result either from the indraught of a cold current of air, or from the sudden expansion of the mass of air itself. In the latter case a diminution of pressure must ensue, and in the former the condensation of the moisture may produce a like result. Thus an area of low pressure would be formed, and the inrushing air, on all sides, would gradually raise the temperature, and destroy the conditions necessary for the formation of H. The hailstones, which vary in size from that of a small pea to not unfrequently several inches in diameter, seem to grow by accretion in much the same manner as raindrops grow. The larger and more rapidly falling stones overtake, and come into collision with the smaller ones, and the pressure at the moment of concussion melts the surfaces in contact which then freeze together again, and form thus one stone. Professor Osborne Reynolds has lately investigated the shapes which on this supposition hailstorms would assume, and finds the theory supported by observation.

Haimu'ra (*Erythrinus macrodon*), a Teleostean fish, found in the rivers of Guiana, and most nearly allied to the *Salmonidæ* and to the *Clupeidæ* or herrings. It may attain a length of 3 or 4 feet, and derives its specific name (*macrodon*) from the size of its teeth. The flesh is palatable.

Hainan', an island of China, in the province of Canton, lies partly in the Gulf of Tonquin, 300 miles S.S.W. of Canton, in lat. 18°-20° N., and long. 108°-111° E. Area, 12,000 sq. miles; pop. 1,500,000. It is 180 miles long, and 100 broad, and is separated from the Lui Chu peninsula on the N. by a channel 5 miles in breadth, navigable only for junks. The climate is unhealthy; in summer typhoons are frequent along the coasts. In the interior it is mountainous and woody, and is occupied in part by wild tribes. The W. coast is low and fertile, yielding rice, sugar, indigo, &c., but is girt with shoals and sandbanks. The coast in the S., though rocky, has several good harbours, among them the chief town of H., Kiang Chu (q. v.), with a pop. of 200,000, open to foreign commerce since 1858.

Hainault, French, a district in the N.E. of France, annexed from the Belgian province of H. in 1678, and now included in the department of Nord.

Hainau't, formerly **Hainault** (Flem. *Henegouwen*), a province of Belgium, bounded N. and N.E. by Brabant and E. and W. Flanders, E. by Namur, W. by W. Flanders and France, and S. by France. Area, 1424 sq. miles; pop. (1874) 949,346. The surface is mainly level and very fertile. The forest of

Ardennes in the S. and S.E. is partly hilly. The chief rivers are the Scheldt, Sambre, Dendre, and Haine, from which the province takes its name. H. contains the richest coal-seams in Belgium (in 1873, 11,652,953 tons were raised), and also affords supplies of lead, slate, marble, and lime. Wheat, rye, barley, and flax are largely grown; and cattle, horses, and sheep are numerous. The chief towns are Mons, Tournay, and Charleroi.

Hain'ichen, a town in the kingdom of Saxony, Germany, 10 miles N.E. of Chemnitz by railway. It spins and weaves woollens, has cotton manufactures, and extensive bleaching and dye works. Pop. (1875) 8468.

Hair (Old Eng. *hær;* Ger. *haar;* comp. Lat. *hirtus*, 'hairy') is a growth of the epidermis. Each particular hair consists of a root embedded in the skin, of a shaft or stem, and of a point. The root expands at its lower end into a swelling or knob, called the *hair bulb*, and it grows from a recess or pouch in the skin called the *hair follicle*. This pouch receives near its mouth the openings of one or more sebaceous or oil glands. The shaft of the H. is usually round, but occasionally it may be somewhat flattened. The surface presents the edges of fine scales which are placed over each other like slates on a roof. In some specimens these project so far as to present sharp edges which interlock with those of adjoining hairs and thus form a felt. Each hair usually tapers to a point, and after reaching maturity tends to split up. When placed under the microscope with a magnifying power of about 300 diameters, it is seen to consist of a fibrous cortical portion, and of a cellular medulla or pith, and frequently the cells of the pith are filled with air, and occasionally with pigment. Sometimes hairs are met with having no pith, but composed entirely of fibrous structure, made up of highly compressed epidermic cells. Hairs vary in appearance in different animals. They may be classified as follows:—(1) *Fibrous* hairs, having no pith, and usually strong and coarse; (2) *cellular* hairs, consisting entirely of cells, which often contain air, an example of which we have in the H. of the roe-deer; (3) *fibrocellular* hairs, composed of a cortical and medullary portion, the most common form of H.; and (4) *irregular* hairs, which are characterised by their edges being serrated, as in the hairs of bats, or by being of irregular form, neither flattened nor cylindrical, as in ordinary hairs, but having expansions near their extremity, as may be seen in the H. of the *Ornithorhynchus paradoxus*, or Duck-Bill Platypus (q. v.). Many hairs have slender muscles attached to the follicles, by the contraction of which hairs may be erected, as seen after sudden fright or exposure to cold. The first hairs of the human being are a soft down called the *lanugo*, which disappear soon after birth, giving place to other hairs which are developed from a minute papilla at the bottom of the follicle. Each H. has a certain average duration of life, at the end of which it drops out and is succeeded by another. If the papilla be destroyed, or if it undergo atrophy, no H. will be developed. This is the probable cause of *baldness*. The animal matter of H. contains fat and a substance yielding gelatin on prolonged boiling. The mineral substances in H. consist of peroxide of iron, traces of manganese, silica, chlorides of sodium and potassium, sulphates of lime and magnesia, and phosphate of lime. H. is preserved long after the decomposition of the body, and consequently is frequently found in tombs and sarcophagi after all other remains of their occupants have disappeared.

Diseases of Hair.—The hair and hair follicles are liable to a variety of morbid conditions resulting from altered nutrition, or from inflammation of the formative structure of the hair, or of the hair-follicles. There may be augmentation of the hair cells, giving rise to simple increase in quantity or length, in situations naturally occupied by hair, or there may be increase of quantity or length in abnormal situations. The hair may also be diminished in quantity from arrested formation, resulting in simple thinning of the hair, and finally in complete alopecia or baldness. It is likewise subject to alteration of colour from disorder of the chromatogenous function of the formative organ, and is generally associated with an alteration of the *rete mucosum* of the skin. The most common change which takes place is blanching or Greyness (q. v.). There are several diseases closely associated with the hair, such as *ringworm, plica polonica, favus, sycosis,* &c.

Hair-Dressing. The natural covering for the head has ever been regarded as an ornament, and as such special care has been devoted to its arrangement. In most countries great diversity of style has shown itself at different periods. Most extravagant styles of dressing the hair are met with among uncivilised races, especially in Africa and the islands of the Pacific. The ancient Egyptians shaved the head and face, and wore wigs and false beards; ladies dressed their hair in innumerable plaits, which hung down the back and covered the sides of the face. The Assyrians wore their hair in luxuriant curls and plaited their beards. The Greeks, in ancient times, after reaching manhood wore the hair long; so did the Romans till about 300 B.C., when barbers were introduced, and short hair came into vogue. The coiffures of Greek and early Roman ladies were characterised by great simplicity and taste, but in the decline of the Roman empire, ladies overdressed their hair in costly and extravagant modes. Dyeing the hair, too, was then practised. The Teutonic tribes were distinguished for their long hair. The Britons, like the Gauls, allowed the hair to grow long and bushy. In England, since the Norman conquest, fashion in H.-D. has fluctuated violently. Previous to that event men cropped their hair and shaved their beards, but in the reign of Henry I., William of Malmesbury states that barons and gallants 'vied with women in the length of their locks,' and false tresses were even worn. At this period ladies wore long plaits reaching to the knees; sometimes they were looped up at the back of the head under the couvre-chef. A century later they appear to have adopted an Oriental mode of confining the hair in a caul or net of gold-thread or silk. In the 13th c. men wore thick wavy locks curled up at the ends, and short hair across the forehead. The fantastic caps of the ladies of the 15th c. entirely concealed their hair. Short hair was fashionable with men in the reign of Henry VIII. In Elizabeth's time ladies' hair was most elaborately dressed, and pins and wires were used to prop the 'curled, frizzled, and crisped' hair into many *outré* forms. Charles I.'s reign is noted for the introduction by the Cavaliers of the French 'love-lock,' a ringlet worn on the left side, and occasionally reaching to the elbow. The otherwise full flowing locks of this period contrasted greatly with the closely-cropped heads of the Puritans. Towards the end of the 17th c. the Sevigné style—curls on the forehead and ringlets at the side of the face—was followed by ladies, and gentlemen wore perukes of various forms, which remained in fashion till about 1760. Much of the extravagance of Elizabeth's reign was revived by the ladies of the 18th c., whose hair and head-dresses swelled upwards to inordinate dimensions. Hair-powder was then largely patronised. After the French Revolution short hair, *à la Titus*, became common among males. It is not possible, and, if it were, it is not necessary, to note the ever-changing female fashions of the present day.

Hair Dyes. The agents commonly employed to dye the hair are solutions of nitrate of silver or various preparations of lead with sulphur, pyrogallic acid, the juice of green walnut shells, and various other vegetable astringents. These substances are chiefly used to darken grey hairs, and it is affirmed that the use of leaden combs also tends to produce the same effect. The Arabs produce a yellow colour in their hair by the use of *Henna* (q. v.). When in recent years golden locks were fashionable, a poor bleached substitute for the warm yellow tint was artificially produced by the use of a preparation called *Auricome* or golden-hair water which consisted essentially of peroxide of hydrogen.

Hair Grass, the common name for species of Aira, a genus of grasses with narrow wiry leaves. There are about thirty known species, of which six are natives of Britain. They are of little or no agricultural value. *A. cæspitosa* is the tufted H. G., which is so useful in walking through bogs.

Hair Manufactures. The hair of different animals is applied industrially to a considerable variety of purposes according to its length, toughness, and other qualities. Human hair itself forms an article of commercial value for the purposes of wig-making, and for supplementary tresses and plaits for ladies. It is also frequently worked up into watchguards, bracelets, necklets, and other articles of ornament. The short hair of oxen and some other animals is of value in plastering for mixing with the mortar to bind it together on walls and roofs, &c. The short hair of other animals, again, principally the rabbit, hare, and vicuña, is extensively employed in felting (see FELT). Camels' hair, mohair, &c., are treated like sheep's wool for spinning and weaving into dress fabrics; and in recent years a fabric like Irish frieze has been woven entirely of cows' hair with the

view of passing it into the American market free of the duty levied on woollen articles. The stout thick hairs, called bristles, of the wild hog are used in Brushmaking (q. v.); and for certain kinds of soft brushes, the hair of the badger, polecat, marten, &c., and camels' hair are found serviceable. Artists' pencils or brushes are made from sable and camels' hair. The long and strong hair obtained from the tails of horses forms an important article for weaving into haircloth used for covering the seats of chairs, sofas, and other articles of furniture. It is very largely imported from South America. All dark-coloured hair is dyed a uniform glossy black with logwood and copperas, the pure white hair being either employed in its natural state or dyed in bright colours for damasked and fancy haircloth. This peculiar fabric is generally composed of worsted, cotton, or linen warp, and as the weft is composed of single separate hairs a peculiar hooked shuttle or long rod is used by the weaver for shooting them through the web as they are supplied one by one by an attendant who takes them from a box in which they are kept moist with water. Tail hair is also woven both as warp and weft for sieve cloth used for sieves and strainers in dairy and cooking operations. It is besides employed for twisting into salmon and trout fishing lines, and white hair plaited or woven under the name of crinoline is occasionally a fashionable material for ladies' hats and bonnets. The stiff petticoats which at one period distended ladies' dresses were originally made of horsehair, whence the name Crinoline (q. v.). The shorter hair of manes and cows' tails is twisted into ropy pieces and boiled, after which it is dried in an oven, and when uncoiled it preserves its curly structure, thus forming a very elastic material for stuffing seats, cushions, and mattresses, &c. The comparatively limited supply of hair for these varied purposes has led to the introduction of many substitutes, especially for brushmaking and stuffing-hair; but no article possesses the strength, elasticity, cleanliness, and freedom from felting which characterises hair, and from which its peculiar value arises.

Hair-Powder, composed of perfumed ground wheaten starch, was introduced into England from France about the end of the 16th c., and notwithstanding the inconvenience attending its application, was extensively patronised for two centuries. Taylor, the water poet, thus alludes (*Superbiæ Flagellum*) to its use in his time—

'Some every day do powder so their hair
That they like ghosts or millers do appear.'

H.-P. was lavishly used by the beaux and belles of the 18th c. to impart a softness to the features. In 1795 a tax was imposed on the use of H.-P., which thereafter was gradually laid aside. The impost was repealed by 32 and 33 Vict. c. 14.

Hairs, in botany, are conical projections from individual epidermal cells. Leaves which have no H. are said to be glabrous. In the cells of the H. of *Tradescantia* or Virginian spiderwort, movements of protoplasm are easily seen under the microscope. The loasa or Chili nettle and the common nettle (*Urtica*) have stinging H. Cotton (q. v.) consists of the H. which surround the seeds of *Gossypium herbaceum*. On the leaves of different species of sundew there are numerous glandular H.

Hair-Tail, the name given to various Teleostean fishes included in the special family *Trichiuridæ*. They are so named from the presence of the filaments which are attached to the tail, which is itself of attenuated form. The body is very long and much compressed. The dorsal fin is long, and both ventrals and pectorals are of small size. The silvery H.-T. (*Trichiurus lepturus*) has no tail-fin, the tail simply tapering to a hair-like point. This species occurs in the Atlantic, and off the W. Indian Islands. An allied species is the Savala (*T. savala*) of the E. Indian seas.

Hajipur' ('town of the pilgrim') is the name of several towns in India. The best known is at the confluence of the Gunduck with the Ganges, in the district of Mozufferpur, province of Bengal, just opposite Patna city. Pop. (1872) 22,306. In the neighbourhood is held the great cattle fair of Sonepur in November, and H. itself has a large trade, valued at £600,000 a year: exports, indigo and saltpetre; imports, piece goods, indigo seed, and grain. It was a place of some importance under the Mohammedans.

Hake (*Merlucius vulgaris*), a genus of Teleostean fishes belonging to the *Gadidæ* or cod family. It is common round the British coasts, and is also found in the Mediterranean Sea. Its colour is grey above and white below, and its length varies from 3 to 4 feet. The head is flat, and the fore part of the body is somewhat deeper than the hinder portion. The first dorsal fin is short, the second long, as is also the anal fin. No barbules or mouth-filaments exist. The flesh is coarse, but the fish is captured in great quantities for the purpose of being dried and salted like ling and cod.

Hak'im, Ben All'ah, or **Ben Hash'em**, surnamed **Mokann'a** ('the Veiled,' or 'the One-Eyed'), was the chief of an Arabic sect which took its rise in the second half of the 8th c. He first appears in A.D. 774 at Meru, the capital of Khorassan, as a private soldier in the service of the Abassidian Calif Mahadi. He seems from the first to have exercised a powerful influence over the minds of his fellows, and, rising to be captain in the army of the calif, subsequently obtained command of a troop of his own. He is next found simulating himself to be God in human form, feigning to have been previously incarnate by the transmigration of souls in Adam, Noah, and other famous personages, down to Abu Muslem, a prince of Khorassan. One of his eyes having been pierced in battle by an arrow, he constantly wore a veil over his face in order to conceal the defect, and hence was called the 'veiled prophet.' So formidable did his party speedily become, that the calif had in 780 to march against him in person; and after standing a long siege in his fortress, the prophet was finally reduced to the last extremities. The end of H. was consistent with his extraordinary life; for, after poisoning his partisans with wine at a feast, he threw himself into a vessel filled with some powerful acid, so that his body might be completely dissolved, and his followers believe in an apotheosis. The sect founded by H. sunk into insignificance after the death of its leader. The story of H. forms the subject of Moore's first tale in *Lalla Rookh*—the *Veiled Prophet of Khorassan*. See D'Herbelot's *Bibliotheca Orientalis*.

Hak'luyt, or **Hack'luyt, Richard**, an Elizabethan author, was born in 1553, studied at Westminster School and at Christ Church, Oxford, becoming lecturer on cosmography in his university. He accompanied the English embassy to Paris in 1584 as chaplain, on returning to England began to collect accounts of English maritime discovery—a work in which he was aided by Raleigh; published *The Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation* in 1598-1600; received a prebend in Westminster Abbey and a living in Suffolk, and died in 1616. H. seems also to have been the chief compiler of *A Selection of Curious, Rare, and Early Voyages, &c.* His works are full of invaluable details regarding our early navigators, and are written with pleasing simplicity and quaintness. Mr. Froude calls them 'the prose epic of the modern English nation,' adding that 'their plain, broad narratives rival legend in interest and grandeur.' *H.'s Voyages* have been issued by the Hakluyt Society, founded in 1846, with the aim of publishing records of early voyages and travels, but no good edition has yet appeared.

Hakod'ate, or **Hakoda'de**, the most northerly of the open ports of Japan, on the S. coast of the island of Yesso, at the base of a lofty promontory, on the Strait of Tzagar, with a background of wild hill scenery, 440 miles N. of Yeddo. It has a splendid harbour, somewhat difficult of access, and was connected by telegraph cable with Yeddo in 1875. The chief industry is fishing, and a foreign trade, which has developed since the opening of the port in 1859. The climate is severe in winter—the temperature has been known to reach 18° below zero. Snow lies till April, and is followed by heavy rains brought from the Pacific by S.E. winds. In 1875 there entered and cleared the port 77 vessels of 24,179 tons, of which 44 vessels of 16,290 tons were British. The exports, chiefly seaweed, irico, cuttlefish, awabi, dried fish, deer horns, and sharks' fins, amounted in value to £89,078; the imports, coals, kerosine oil, and manufactured goods, to £15,103. Customs and shipping dues amounted (1875) to £3754. Of the resident firms thirteen are British, six American, three Russian, two French, two German, and two Danish. Pop. (1872) 14,633.

Hal'acah (Heb. 'rule,' 'guide;' pl. *Halacoth*), an element in the Jewish Talmud, consisted of traditionary legal dicta and decisions bearing on the Jewish law after the captivity, and intended to harmonise the precepts of the law with the altered circumstances of the people. They were of the highest

authority as precedents, Moses himself being said to have promulgated some H. in explanation of certain precepts of the law; in which respect they differed specially from the Haggadah (q. v.). Of the greater part of the H. Hillel (q. v.) was the reputed author. He probably collected what were in existence in his time, and added others. They are classified by Maimonides as follows:—(1) Mosaic and scriptural; (2) Mosaic and traditional; (3) generally received though questionable; (4) decisions of the wise as 'hedges of the law;' (5) counsels of prudence, well to follow, but not having the force of law. See E. Deutsch on the *Talmud* in his *Literary Remains* (Lond. 1874).

Halas', a town of Hungary, in Lesser Cumania, on Lake Halastó, 80 miles S.S.W. of Pesth. It has a large wine trade. Pop. (1869) 13,339.

Hal'berd, or **Halbert** (Fr. *hallebarde*, Ger. *hellebarde*, Old Ger. *helmbarte*, 'a pole-axe'), a weapon consisting of a long pole, on which was mounted a steel head, comprising a spike for thrusting, an axe face for hacking, with a hook behind. Formerly used by companies of halberdiers in foot regiments; it is now borne only for ornamental purposes on civic occasions.

Hal'berstadt, an old town in Prussian Saxony, on the Holzemme, a branch of the Saale, 30 miles S.W. of Magdeburg by railway. It has many quaint, picturesque houses, ornamented with curious wood carvings, and its cathedral of the 13th c. is in the purest Gothic style. The church of Our Lady (1005–1284) is a fine Byzantine structure. H. has rich collections of pictures, antiquities, &c., a 'Poetical Society' founded by the poet Gleim, and two large libraries. The manufactures are woollens, cottons, leather, soap, gloves, oil, cigars, &c. Pop. (1875) 27,800.

Hal'cyon Days (Gr. *alkyonides hēmerai;* Lat. *alcedonia*), fourteen days, seven before and as many after the winter solstice, during which the halcyon (Gr. *alkyōn;* Lat. *alcedo*) or kingfisher was fabled by the Greeks to brood, the sea meanwhile remaining profoundly calm. The term H. D. is often used as a synonym for quiet and peaceful times, *e.g.*, De Quincey, 'Deep, *halcyon* repose.'

Halcyon'idæ. See KINGFISHER.

Hale, Sir Matthew, a notable English lawyer, was born at Alderly, Gloucester, 1st November 1609, and studied at Oxford. Bred to equity under Sergeant Glanvil at Lincoln's Inn, he was called to the bar shortly before the Civil War, during which, by his affected indifference, he managed to secure the custom and confidence of both parties. H. signed the Solemn League and Covenant, and sat in the Westminster Assembly. Cromwell made him a commissioner for reforming the law, and a Judge of the Common Bench (1653). In 1660 he became Chief Baron of Exchequer, in 1671 Chief Justice of the King's Bench. He died on Christmas day 1676. It is interesting that H., although a judge, was elected a member of the House of Commons for the Three Kingdoms, there being then no House of Lords. He also sat in the Convention Parliament of 1660, where he moved that the Restoration should be agreed to only on constitutional conditions resembling those in the Treaty of Newfort. No one has disputed H.'s eminence as a Common Law judge; his impartiality was perfect, and indeed sometimes carried to absurdity, *e.g.*, when he refused a circuit-dinner as a bribe. It is a reproach more to his age than to himself that at Bury St. Edmunds he sentenced to death two women accused of witchcraft, but against whom no substantial evidence had been brought. H. wrote two important works, *History of the Pleas of the Crown* and *History of the Common Law of England;* and he left many valuable MSS., including his Commonplace Book, to the library at Lincoln's Inn. Richard Baxter called him 'the pattern of honest plainness and humility.' See Williams' *Memoirs of the Life, Character, and Writings of Sir Matthew Hale* (Lond. 1835).

Hales, Stephen, an English naturalist, was born at Beckesbourn, in Kent, September 17, 1677. He studied at Benet (now Corpus Christi) College, Cambridge, where he took his degree of Bachelor of Divinity in 1711. About the same time he was presented to the living of Teddington, and there devoted himself to his favourite studies, botany, anatomy, and physics. As a fellow of the Royal Society he communicated many papers of scientific interest, especially on methods of ventilation; and was the author of several works, the most important of which are *Vegetable Staticks* (1727); *Hæmastaticks* (1733); and *Philosophical Experiments on Sea Water, Corn, Flesh, and other Substances* (1739). H. died at Teddington, January 4, 1761.

Hal'évy, Jacques Fromental, a distinguished musical composer and teacher, was born at Paris, May 27, 1799. He entered the Conservatoire in 1809, became a teacher of 'solfeggio' there in 1816, of harmony in 1827, and of counterpoint and fugue in 1833. He studied five years under Cherubini and two at Rome. Among his operas represented at Paris, *La Juive* (1835), *La Reine de Chypre* (1841), and *Les Mousquetaires* (1846) deserve mention. He died at Nice, 17th March 1862. See Léon Halévy's memoir, *F. Halévy, sa Vie et ses Œuvres* (Paris, 1862).

Half Blood. The term in law, and generally, denotes the relationship of those who have had only one common ancestor. When that is a male, the relationship is called *consanguinean;* when a female, it is called *uterine.* By the succession law of England the H.-B. relation by the father's side succeeds to real estate (see ESTATE IN LAW) after the full-blood relation. As regards personal estate, the H.-B. relations on both sides share equally with the full blood. In Scotland, in collateral succession the H.-B. consanguinean succeeds after the full blood; thus, if a man die leaving a son and daughter by his first marriage and a son by his second marriage, and if the son of the first marriage takes the succession and dies without issue, being survived by his full sister and half brother consanguinean, his sister by the full blood will succeed as *her brother's* heir-at-law. But if the eldest son of the first marriage had predeceased his father, the son of the second marriage would have succeeded as *his father's* heir-at-law to the exclusion of the daughter of the first marriage.

Half-Pay. Under the Consolidated Royal Warrant of 1870, the following are the *daily* rates fixed for combatant officers:—

Rank.	Cavalry.	Infantry.	Artillery and Engineers.
	£ s. d.	£ s. d.	£ s. d.
Col.-Commandant	...	...	1 15 4
Colonel	0 15 6	0 14 6	0 16 9
Lieut. Colonel	0 12 6	0 11 0	0 11 8
Major	0 10 0	0 9 6	...
Captain	0 7 6	0 7 0	0 7 4
Lieutenant	...	0 4 6	0 4 8
Cornet	0 3 6	...	...
Ensign	...	0 2 6	...

Officers who have enjoyed 'Distinguished Service Pay' obtain slightly increased rates when they retire on a reduction, or on account of wounds, or of illness contracted during service. On the other hand, those exchanging for their own convenience to H.-P. before seven years' service receive reduced rates. After twenty-five years' full-pay service, every officer of the household troops, or cavalry, or infantry of the line, has an unqualified right to retire on H.-P. If twelve years have been spent in the W. Indies, or sixteen on the W. coast of Africa, the period is reduced to twenty-one and sixteen years respectively. The Secretary of State may suspend H.-P. The period of service entitling quartermasters, adjutants, and ridingmasters is generally thirty years, the rate of daily pay being 10s. After the same period a chaplain gets 17s. 6d. a day; a controller, £1, 10s.; a commissary, 16s. 8d.; a paymaster, 12s. 6d.; an inspector-general, £1, 17s. 6d.; an apothecary, 9s. For fifteen years' service a surgeon is entitled to 13s. 6d. a day. Originally H.-P. was just a *retainer* for future services. The Commons always jealously watched the payments to 'Reformado' officers, as they were called. In 1718 and 1811 movements were made towards the principle of recognising the *past* services of officers. See the history of the subject, as well as of pensions and unattached pay in Clode's *British Army*, vol. i. App. G.

Halibur'ton, Thomas Chandler, an Anglo-American humourist and historian, was the son of a Nova Scotia judge, and was born at Windsor, in that province, in 1796. After leaving college he joined the bar, and made rapid progress in his profession, finally becoming Judge of the Supreme Court of Nova Scotia in 1840. In 1829 he published a *Historical and Statistical Account of Nova Scotia*, in 2 vols., and in 1837 appeared his famous *Clockmaker.* Allowing for some exaggerated touches, Sam Slick has been accepted as a type of the 'cute,'

inventive, ready-witted, and inextinguishable Yankee, and his *naive* and ingenious 'sayings and doings' have since produced a host of imitations. A visit to England in 1840 resulted in the publication of *The Attaché, or Sam Slick in England* (4 vols. Lond. 1843–44). In 1850, resigning his judgeship, H. settled in England, where he published *Sam Slick's Traits of American Humour*, and *Rule and Misrule of the English in America* (1852), and *Nature and Human Nature* (1855). He entered Parliament in the Conservative interest as member for Launceston in 1859. H. died August 27, 1865, when engaged on a new edition of his works, which includes, beside those enumerated, *Bubbles from Canada; The Letter-Bag of the Great Western; The Old Judge, or Life in a Colony*, &c.

Hal'ibut, or **Hol'ibut** (*Hippoglossus vulgaris*), a genus of Flat-fishes (q. v.), or *Pleuronectidæ*, attaining a length of 4 or 5 feet, and common off the British coasts. The H. has been known to measure over 7 feet, and to weigh more than 300 lbs. The colour of the upper side is brown, the surface being smooth. The body is longer, in proportion to its width, than is usually the case with the flat-fishes. The scales are of small size, of oval shape, and of soft consistence. The flesh is firm, but somewhat dry. The Greenlanders capture the H. in great numbers, and store the flesh up in a dried state for winter food; while oil is obtained in considerable quantity from the liver and other parts.

Halicarnass'us (originally *Zephyra*, now *Budrum*), a Dorian city on a S.W. promontory of Caria in Asia Minor, facing the island Cos, and nearly opposite Cnidus on the other side of the Ceramic Gulf. It was the birthplace of the historian Herodotus and the rhetorician Dionysius, but was chiefly famous for the magnificent sepulchre of Mausolus, erected by his queen, Artemisia, the name of which has become generic for a costly tomb. Sculptures from this building may be found in the British Museum. H. was early isolated from the Dorian Hexapolis, fell in time under the power of the Persians, during whose rule it was held by the dynasty of Lygdamis, sided with Athens in the Peloponnesian war, and (before B.C. 380) was included in an independent Carian kingdom governed by the dynasty of Hecatomnus. On its capture by Alexander the Great in 334 B.C., the city was burned to the ground, and it never regained importance. After the conquest of Antiochus the Great by the Romans, H. was made a part of the government of Rhodes, and later of the province of Asia.

Halicore. See DUGONG.

Halicz'. See GALICZ.

Hal'idon Hill, a strong military position about a mile from the town of Berwick, and between the Tweed and the Whiteadder, was the scene of a battle in the Scottish war of independence, 19th July 1333, between Edward III. of England and Douglas, Regent of Scotland acting for David Bruce. The Scotch, abandoning the defensive tactics of Bannockburn, rushed, after a long march, right up H. H. to storm the English position, and were thoroughly routed by the showers of arrows from the ranks of their opponents. The defeat, in which Douglas and the flower of the Scotch nobility fell, gave a temporary lease of power to Edward Baliol, and occasioned a renewal of English attempts upon Scotch independence; but its chief result was the final surrender of Berwick to England.

Hal'ifax ('holy face,' said to be named from an image of St. John once kept here), a town of England in the W. Riding of Yorkshire, on the right bank of the Ribble, 7 miles S.W. of Bradford, 16 W.S.W. of Leeds, 25 N.E. of Manchester, 203 N.N.W. of London by railway. It is pleasantly encircled by hills, and has a natural position of great industrial importance. Its principal buildings are the townhall, designed by Sir C. Barry, and opened by the Prince of Wales in 1863; the Piece Hall, covering 10,000 sq. yards, built in 1779 as a market for piece-goods, and now used as a wholesale market for fish and vegetables; the parish church of St. John, in Late Perpendicular style, with a length of 180 feet; the church of All Souls, one of the chief works of Sir G. G. Scott (1861), a structure in the Early Decorated style, rich in ornamental granite, serpentine, marbles, in mural paintings, stained glass, and elaborate sculpture, and built at the sole cost of Edward Akroyd, Esq.; and St. Mary's church, built by the late M. Stocks, Esq., from designs by Mr. W. S. Barber, also in the Early Decorated style. H. possesses three parks, viz., Savile Park of 50 acres; the People's Park of 12½ acres, given by the late Sir Francis Crossley; and the Shroggs Park of 25 acres, laid out in 1877. H. has many charities, including the great Crossley Orphanage for 300 children. The free grammar-school at Heath was founded under royal charter in the reign of Elizabeth. A new school, at a cost of nearly £10,000, is to be built shortly. H. has also a mechanics' institute (1856) with a public hall and library, an extensive infirmary (1864), a museum, assembly and concert rooms, and a theatre. The great manufactures are carpets, woollens, worsted, damasks, camlets, cottons, cotton cards, rugs, silks, serges, shalloons, tammies, kerseys, and calimancoes. Many of the inhabitants are employed in the neighbouring coal-mines, ironworks, stone quarries, chemical works, dyeworks, &c. Pop. (1871) 65,510. The old 'H. gibbet law' applied to all offenders within a certain area accused of theft to the value of 13½d., who were tried by the frith-burgers of the liberty, and if convicted were executed by a kind of guillotine on the first market-day following. The axe is preserved by the lord of the manor at Wakefield. H. sends two members to Parliament.

Halifax, the capital of Nova Scotia, is the military head-quarters of the Dominion of Canada, and the chief naval station for British N. America and the W. Indies. It is situated near the head of Chebucto Bay. Its harbour, regarded as one of the best in the world, runs over 15 miles inland. The city and harbour are defended by the citadel on a hill behind, by six forts, and by masked batteries and martello towers. H. is well built, with spacious streets, and has an area of about two miles in length by three-quarters of a mile in breadth. The chief public buildings are Province Building, the Post-Office, Government House, Admiralty House, Dalhousie College (with sixteen professors), Insane Asylum, the barracks, hospital, and jail. Several of the twenty-three churches and of the seven banks are handsome structures. The commerce of H. is considerable; the exports amounting in 1869 to £660,320, and the imports to £1,500,520. The city, called Chedabucto or Chebucto till 1749, received its present name from the Earl of H., a zealous promoter of enterprise in Nova Scotia. H. is 189 miles from St. John, N.B., and 786 from Ottawa. Its pop. was 1400 in 1749, 11,516 in 1818, and about 30,000 in 1870.

Halifax, Charles Montagu, Earl of, statesman and poet, grandson of the first Earl of Manchester, was born at Horton, Northamptonshire, 16th April 1661, and educated at Westminster and Cambridge. A poem on the death of Charles II. procured for him the patronage of Lord Dorset, under whose auspices he entered Parliament. He voted for the dethronement of James II., and became a staunch adherent of William III., from whom he received, partly as a reward for a poem on the battle of the Boyne, a pension of £500. He was appointed in 1692 a Commissioner of the Treasury, in 1694 Chancellor of the Exchequer, in 1697 Premier, and on his resignation in 1700 was created Baron Halifax. While in office H. displayed great financial ability. In 1692, in order to raise a million of money for war purposes when the exchequer was severely strained, he conceived the idea of a national debt; in 1694 he adopted William Paterson's scheme for the formation of the Bank of England with great success; and in 1694 he carried out a recoinage with the assistance of Sir Isaac Newton. Although out of office during the whole of the reign of Queen Anne, H. rendered effective aid toward the Union of 1707. He warmly supported the Hanoverian succession, and on George I.'s accession became Prime Minister with the rank of earl. He died 19th May 1715. H.s poems and speeches were collected and published with a biography, for which he supplied the materials, in the year of his death.

Halio'tis, or **Ear-Shell**, a genus of Gasteropodous molluscs, forming the type of the family *Haliotidæ*, in which the shell is ear-shaped, with a very large, expanded lip and aperture, and very small whorls. No operculum exists, and the outer lip is perforated for the passage of a respiratory siphon. The siphon is periodically shifted in position as the shell increases in size, so that old shells possess a row of apertures along the outer side. The H. is very common in the Channel Islands, the *H. tuberculatus* being known as the Guernsey sea-ear or 'ormer.' The ass's ear (*H. asinus*) is another species. These shells are highly

valued for the beautiful hues and lustre of their lining, which is largely used in the manufacture and decoration of *papier maché* ornaments.

Hall is the name of several German towns, and, like Halle and Hallein, signifies that the places so named possess salt springs or saltworks. The root is probably Celtic, and connected with the Gr. *hals*, 'the salt sea.'—1. **H.**, called commonly, to distinguish it, **Schwäbisch-H.**, is an old, irregularly-built town of Würtemberg, situated on the Kocher, and is 40 miles N.E. of Stuttgart, with which it is connected by rail. The salt-mine at Wilhelms Glück (nearly 3 miles distant) produces annually from 90,000 to 100,000 cwt. of salt, mostly used for baths. A little cotton-spinning is done at H., which was once an imperial city. Pop. (1871) 7793.—2. **H.**, in Tyrol, Austria, is 6 miles E. of Innsbruck on the main line of railway, and lies on the river Inn. Its industry depends mainly on the salt, which is brought in a state of solution to the saltworks in pipes from the mines, 10 miles further N. amongst the mountains. The annual produce is close on 14,500 tons of salt. The pop. of H. is (1869) 5010.

Hall, Mrs. Anna Maria, an English novelist, was born in Dublin in 1802. The name of her father was Fielding, and her mother was of Swiss and French descent. In 1824, after a nine years' residence in London, she married Mr. Spencer Carter Hall, whom she has assisted in many works, such as *Ireland* (1841–43), and in literary efforts in the interests of temperance. Her own writings as a novelist, dramatist, and author of books for children are very numerous, but her most successful works are those which deal with her native country, such as *Sketches of Irish Character*, *The Groves of Blarney* (acted 1838), *Stories of the Irish Peasantry*, and *The Whiteboy* (1845). Mrs. Hall's style is graphic and touching. The 'golden wedding' of Mr. and Mrs. H. was celebrated in 1874.

Hall, Basil, Captain, R.N., a popular English writer, son of Sir James Hall of Dunglass, was born at Edinburgh in 1788. He joined the navy at fourteen, and served in the junior grades of the service in American and East Indian waters. In 1813 he accompanied Admiral Sir Samuel Hood in a journey through Java, and three years later had the command of a sloop, forming part of Lord Amherst's expedition to China. His experiences during the latter cruise were published in 1818, under the title *An Account of a Voyage of Discovery to the Western Coast of Corea and the Great Loo Choo Island*. As post-captain of the *Conway*, he was stationed on the S. American coast at the time of the disputes between Spain and her colonies from 1820–22, *Extracts from a Journal* then kept by him appearing in 2 vols. in 1824. Five years later appeared his *Travels in North America*. Between 1831–40 he published 9 vols. of *Fragments of Voyages and Travels*. *The Castle of Hainfield*, published in 1836, and *Patchwork*, a fascinating collection of reminiscences of travel in the form of tales (3 vols. 1842), complete the list of his larger works. H.'s industry brought on an attack of mental aberration in 1842, and he died in the Royal Hospital at Haslar on 11th September 1844.

Hall, Joseph, distinguished as a churchman and author, was born July 1, 1574, at Bristow Park, near Ashby-de-la-Zouch; and after an education at the public school of that town, entered Emanuel College, Cambridge. When twenty-three years of age, he published six books of satires, under the title *Virgidemiarum, or a Gathering of Rods*, which assail with some wit the follies and abuses of the time, and were burned by command of the Archbishop of Canterbury. H. eventually took holy orders, and after filling the incumbencies of Halstead and Waltham, became in 1617 Dean of Worcester. He attended the Synod of Dort in the next year as one of the English delegates, and was decreed a gold medal by the Synod as a token of respect. In 1627 he accepted the bishopric of Exeter, and was translated to the see of Norwich in 1641; but at this period his zeal and honesty had begun to expose him to the suspicion of Puritanism. His numerous pamphlets in favour of the divine right of episcopacy, however, might have secured him from any such aspersion; and in November 1641, having united with the bishops who protested against all measures passed during their enforced absence from Parliament, H. was sent to the Tower. In June of the next year he was released on bail for £5000; but in 1643 his estates were sequestrated by the Parliament. He then retired to Higham near Norwich, where he died, 8th September 1656. The chief works of Bishop H. are his *Contemplations* (on historical passages of the Bible), his *Sermons*, his *Characters of Virtues and Vices*, his *Occasional Meditations*, and his *Three Centuries of Meditations and Vows*, all of which, but especially the last two, are full of subtle beauties of illustration, exquisitely cogent reasoning, and a devout and tender sentiment. The only contemporary churchman who surpassed him in genius was the 'modern Chrysostom,' Jeremy Taylor. His collected works were published in 12 vols. at Oxford (1837–39).

Hall, Robert, a learned and eloquent Baptist divine, was born 2d May 1764 at Arnsby in Leicestershire, England, where his father was a pastor. He early showed signs of a powerful intellect and a taste for study, and in 1781 was sent to the University of Aberdeen, where he took the degree of M.A. He thereafter became a minister in the Baptist connection, and held a charge successively at Bristol, Cambridge, Leicester, and again at Bristol, where he died, 21st February 1831. In consequence of his intense devotion to his studies he was thrice afflicted with mental derangement, from which, however, he completely recovered. H. was one of the foremost and most powerful pulpit orators of his time, and his works are still ranked amongst English classics. Among the more notable are *Christianity Consistent with a Love of Freedom* (1791), *Apology for the Freedom of the Press* (1793), *Modern Infidelity* (1799), *Reflections on War* (1802), *The Sentiments Proper to the Present Crisis* (1803), and a *Funeral Sermon on the Princess Charlotte* (1817). A collected edition of his writings, with a *Life of H.* by Dr. Olinthus Gregory, was published in 6 vols. (1831–33).

Hall'a, a town in Scinde, British India, near the left bank of the Indus, 36 miles N. of Hydrabad. Pop. (1872) 4096. It is famed for the manufacture of glazed pottery, and conducts a trade in agricultural produce valued at £11,000 a year. In the neighbourhood are some old Mohammedan tombs.

Hall'am, Henry, a great English historian, son of the Dean of Bristol, was born at Windsor in 1777, and educated at Eton and Oxford. After leaving the university H. joined the Whig party in London, and wrote for the *Edinburgh Review*. His profound linguistic acquirements are alluded to by Byron in *English Bards and Scotch Reviewers*—'the classic H., much renowned for Greek.' In 1818 appeared his *View of the State of Europe in the Middle Ages*, which gives valuable sketches of the growth of ecclesiastical power, of civil organisation, of feudalism and chivalry; in 1827 his *Constitutional History of England from the Accession of Henry VII. to the Death of George II.* In 1837–39 he produced his *Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries*, a full account of the revival of letters, and of the development of a literature in each of the great vernacular languages of Europe. H. died at Penshurst, 21st January 1859. As Macaulay has said, H. is a critical and argumentative historian, of great industry, acuteness, and impartiality, with a massive style which sometimes rises into a grave and sober eloquence. He has been called an anatomist, and compared to Macchiavelli; but his appreciation of the inner currents of political feeling indicates some spiritual insight, and his somewhat unimpassioned conclusions generally are based on the best-authenticated facts. The value of his critical judgments, however, is impaired by the fact that in his survey of European literature he is necessarily forced to rely in great measure on the knowledge and criticism of foreign historians.—**Arthur Henry H.**, eldest son of the preceding, was born in London on 18th February 1811. Morally and intellectually he was precocious. Educated at Eton and Cambridge, he probably owed the decisive tone of his mind to spiritual poetry and art to a long stay which he made in Italy in 1827–28. He did not attempt any university honours except the English Declamation Prize of 1831. But his metaphysical acumen, his imaginative power, and his literary taste made him in fact one of the most distinguished men of his time. In 1832 he began to study law at the Inner Temple, but found time to reply to Rossetti's work on the *Antipapal Spirit* in the great Italian poets, and to write memoirs of Petrarch, Voltaire, and Burke for the *Gallery of Portraits*. He died suddenly at Pesth, 15th September 1833. His character has been immortalised in Tennyson's *In Memoriam*. His poetical remains, with a preface by his father, were published in 1863 (Murray, Lond.).—**Henry Fitzmaurice H.**, younger brother of the preceding, was born on 31st August 1824, and

was educated at Eton and Cambridge. He was a very distinguished scholar, and before leaving for the bar founded the Historical Debating Society. His quiet, sincere, strongly intellectual, and deeply religious nature was very like his father's. He died suddenly in 1851. See *Memoir* by Sir H. S. Maine and F. Lushington (Lond. 1863), prefixed to an edition of his brother's *Remains*.

Hall'e, an important city and railway centre in the province of Saxony, Prussia, on the river Saale, 20 miles N.W. of Leipsic, on the Leipsic-Magdeburg Railway. It is ancient and irregularly built, the streets being narrow and very crooked. Of its six churches one dates from the 12th, another from the 14th, a third from the 16th c. It has manufactures of starch, beetroot-sugar, chemicals, carpets, machinery, and beer. The saltworks of H. are famous, and produce over 10,000 tons annually. The brine comes from springs within the town, and is worked partly by a private company, partly by Government. The workmen connected with the salt manufacture form a special class in the community. They are called *Halloren*, and are distinguished from the other natives of the district by features, dialect, and costume, though they now intermarry with their neighbours. The *Halloren* are presumed to be of Wendish, or more probably of Celtic origin, and still enjoy some special privileges.—The *University* of H., founded in 1694, had the still older one of Wittenberg incorporated with it in 1817. The university nearly expired in Napoleon's time, but is now one of the most influential in Germany, having in 1875 95 professors and teachers and 989 students. The important educational institution founded by and named after Francke (q. v.) consists of an orphanage, an elementary school, a gymnasium or classical academy, a commercial school, a school for the poor, a workshop, a printing-work, and a book warehouse. H. first appears in 806 as a German border-fortress of Karl the Great's on Slavic soil. In 965 the Emperor Otto I. gave it to the Archbishops of Magdeburg. In 981 Otto II. made it a town. In the beginning of the 12th c. it began to be a thriving place of trade, and was a member of the Hansa in the 13th and 14th centuries. At the Reformation it finally threw off the authority of its ecclesiastical princes. Pop. (1871) of H., with its suburbs Glaucha and Neustadt, 52,615 (including 526 soldiers).

Hall'e, Charles, pianist, was born April 11, 1819, at Hagen, in Westphalia. Early in life he went to Paris, where he became a professor. But in February 1848, in consequence of the Revolution, he came to England, and attracted notice as a pianist at the matinées of Mr. Ella, director of the Musical Union in London. Soon afterwards he settled in Manchester as director of the Musical Institution. He appears every season in London and Edinburgh. Although H. has published few compositions, he has done very much to elevate musical taste in England, and to introduce the best orchestral works. His own playing is exquisitely classical.

Hall'eck, Henry Wager, an American general, was born at Waterville, New York, U.S., 16th January 1815, graduated at West Point in 1839, and entered the army as an engineer. He served in Mexico and California, but resigned his commission in 1854 to establish himself at San Francisco as a lawyer. Soon after the outbreak of the civil war he became general of the Western Federal Army at St. Louis, and afterwards held the command-in-chief of all the United States' armies from July 1862 till March 1864, when he was made chief of the staff. During a few months in 1865 he was commander at Richmond, whence he was transferred to the division of the Pacific, and in March 1869 to Louisville, where he died, 9th January 1872. He is the author of *Elements of Military Art and Science* (1846, 2d ed. with critical notes on the Mexican and Crimean wars, 1858); the *Mining Laws of Spain and Mexico* (1859); a treatise on *International Law* (1861); a translation of Jomini's *Life of Napoleon I.* (1864), &c.

Halleck, Fitzgreene, an American poet, was born at Guildford, Connecticut, U.S., 8th July 1790. Most of his life, from 1811 to 1849, was spent in a New York bank, and he also acted as secretary to J. J. Astor, the millionaire, but his practical and commercial surroundings did not prevent his wooing the Muses with fair success. *Twilight*, which appeared in a New York paper in 1818, was his first printed poetical effort; and in the following year, in conjunction with J. R. Drake, whose early death he touchingly commemorates, he contributed the *Croaker Papers* to the *Evening Post*. *Fanny*, a biting satire in verse on the follies and fashions of the day, was anonymously published by him in 1819, and achieving great popularity, passed through several editions. In 1827 he issued a volume containing *Burns*, *Alnwick Castle*, *Marco Bozzaris*, and other poems, principally suggested by a visit to Europe in 1822. Enlarged editions of his works appeared in 1836, 1842, 1849, and 1858; a poem, *Young America*, in 1864; and a complete edition of his works after his death, which took place at Guildford on 19th November 1867. An obelisk at Guildford and a statue at New York testify to the affectionate regard in which he is held by his fellow-countrymen.

Hall'el ('Heb. 'praise') is a hymn of praise which was used by the Jews at certain of their festivals. The Egyptian H., consisting of Psalms cxiii.–cxviii., was chanted in the temple at the festivals of the Passover, Pentecost, Tabernacles, and Dedication, and in private families at the celebration of the Passover. From the 2d c. A.D. it was also recited by the Jews at Babylon at every festival of the new moon. The Great H., Ps. cxviii. (according to some authorities cxx., or even cxxxv. 4)–cxxxvi., was recited at the Passover Supper by those who wished to have a fifth cup. At the present day the Jews recite the Egyptian H. on all the festivals of the year except the New Year and the Day of Atonement.

Hallelu'jah (Heb. 'sing ye praises to Jehovah;' Gr. Alleluia) occurs in Psalm cxvii., and in the headings of several other Psalms, *e.g.*, cxiii., cxviii. (see HALLEL), and was used by the Jews as a general formulary of praise; from whom it passed into the Christian Church. Being deemed fitting, however, only for joyful occasions, its use was in many churches limited to the season between Easter and Whitsunday, but afterwards its use was forbidden in the West only between Septuagesima and Easter. In the early days of the Church 'the people sang it together in divine service, monks assembled to its sound, and it was chanted at funerals, by labourers in the field, and seamen on shipboard.'

Hall'er, Albrecht von, a Swiss anatomist, physiologer, and botanist, who was also distinguished as a poet, was born at Bern, 8th October 1708, and educated at the gymnasium there. He studied medicine at Tübingen and Leyden, and afterwards visited England and France. In 1728 he devoted himself to the study of the higher mathematics at Basel, but was compelled by failing health to make a tour among the Alps. Here his love for botany was awakened, and here he wrote his great didactic poem, *Die Alpen*. In 1729 he settled in Bern as a medical practitioner; in 1736 he accepted a call to a professorship in Göttingen, where he laboured for seventeen years, and published eighty-six works on medical and scientific subjects. The most important are *Enumeratio Methodica Stirpium Helveticarum* (1742), *Icones Anatomicæ* (1743), *Primæ Lineæ Physiologiæ* (1745), *Elementa Physiologiæ Corporis Humani*, and Boerhaave's *Methodus Studii Medicinæ* (1751). To the *Götting'sche Gelehrte Anzeigen* H. contributed, it is said, upwards of 12,000 reviews and articles. His fame was in all countries, and honours from all quarters were showered on him. In 1753 he returned to his native town, and devoted himself to the promotion of education, of industrial and agricultural science in Switzerland, but found time to write three political romances (*Usong*, *Alfred*, *Fabius und Cato*), and to maintain, in five languages, a correspondence with the leaders of European thought. He died 12th December 1777. His services to natural science and medicine are imperishable; amongst them his observations on irritability in organic life, the processes of generation, and the development of life in the fertilised egg. His poetry is didactic, like that of his English models, but is distinguished by richness of thought, depth, and earnestness. The first collection of his *Schweizerische Gedichte* appeared 1732; the twelfth in 1828, accompanied by a memoir by Wyss. See his own *Tagebuch* (Bern, 1787), his *Leben* by Zimmermann (Zur. 1755), and Baggesen's *H. als Christ* (Bern. 1865).

Hall'ey, Edmund, an English astronomer, was born at Haggerston, near London, October 29, 1656. While studying at Queen's College, Oxford, he published, in 1676, the calculation of the time of the sun's axial rotation from observations of the motion of a spot. In the same year he went to St. Helena, where

for two years he worked at the preparation of a catalogue of the southern stars (published 1679). On his return he became a Fellow of the Royal Society; and in 1680, took a year's tour through Europe, during which he made observations of the comet which goes by his name. In 1684, he made the acquaintance of Newton, who intrusted him with the publication of the *Principia*. In 1698, he was sent as commander of a vessel to the Western ocean to test the truth of his theory of magnetic variation. The mutiny of the crew obliged him to return, but the next year he set sail again, and got as far S. as the Antarctic ice would allow. The results of this voyage he published in a general chart, and soon after his return home was employed in making a chart to represent the correct course of the Channel tides. In 1703 he succeeded Dr. Wallis as Savilian Professor of Geometry at Oxford, and in 1710 published a new edition of the works of Apollonius of Perga. On the death of Flamsteed in 1719, he was appointed Astronomer-Royal. The remainder of his life was spent in astronomical observations and calculations, and especially in studying the motions of the moon. One of his last services was pointing out, for the benefit of his successors, the great importance of accurately observing the approaching transit of Venus across the sun's disc. H. died at Greenwich, 14th January 1742. His *Tabulæ Astronomicæ* were published in 1749.

Halley's Comet. See COMETS.

Hall'iwell, James Orchard, F.R.S., was born at Chelsea, June 21, 1820, and studied at Cambridge University. He has devoted himself to Shakespearian criticism, and among his many works are *Shakespeariana* (1841), *A History of Freemasonry* (1842), *Dictionary of Provincial and Archaic Words* (1844-45), *Life of Shakespeare* (1845), *Popular Rhymes and Nursery Tales* (1849), *An Account of the New Place, Stratford-on-Avon* (1864), an edition of *Shakespeare*—his greatest labour (1865), and *Illustrations of the Life of Shakespeare* (Part I. 1874). He has published large numbers of forgotten pamphlets, plays, &c., of the Elizabethan age, and has enriched his edition of *Shakespeare* with many archæological notes. A peculiarity of H.'s *Shakespeare* is its containing the novels and tales which supplied the plots of the dramas.

Hall'ow Even, or **Halloween**, the night of October 31, being the eve before All Saints' or All Hallows' Day, which falls on November 1. During the middle ages it was believed that every invisible spirit walked about on this night, and hence it was long customary in the rural parts of England and Scotland to celebrate H. with half-sportive, half-superstitious customs, which are humorously and minutely described in Burns's *Halloween*. There seems to be a connection between H. and the German Walpurgis Nacht.

Hallu'cinations (Lat. *hallucinatio*, 'a blunder') are morbid conditions of the mind, resulting in perceptions where no impression has been made upon the brain or the external organs of the special senses. These organs may be morbidly affected, causing sensations, not dependent upon any external object, but upon the morbid conditions of the organs themselves. Such phenomena are termed Illusions (q. v.), and sometimes H. There may be also incipient disease or morbid excitation of the brain, giving rise to sensations or trains of thought not adequately referable to any external cause, and such phenomena are strictly H. H. may be transient, recurrent, or permanent. They often occur in those of a highly excitable nervous temperament, and also after great mental concentration and exhaustion. Sir Walter Scott was subject to them; the late Earl Grey was haunted by a gory head; Luther seems to have been affected in a similar manner; and Swedenborg imagined that he saw members of the heavenly hierarchy seated among the ministers at the council board when he was at the head of the government. H. are of very frequent occurrence amongst the insane; those of vision and of hearing are the most numerous; those of taste, smell, and touch, less frequent. Esquirol held that of 100 lunatics four-fifths at least would be affected with H., and M. Baudry found that of 145 insane people at Bicêtre 56 presented H. When the organ of hearing is affected, or that part of the brain through which the sensation is transmitted, the insane persons may be dangerously suicidal or homicidal, for in such cases the voices and commands are frequently ascribed to God, and implicit obedience is given. See Brière de Boismont *Des Hallucinations* (Par. 1845); Aubanel and Thore, *Recherches Statistiques faites à l'Hospice de Bicêtre*; Michéa, *Du Délire des Sensations* (Par. 1848); *Psychological Journal* (Lond.); Bucknill and Tuke, *Manual of Psychological Medicine* (Lond. 1874).

Hall'uin, a town in France, department of Nord, 10 miles N.N.E. of Lille. It carries on weaving, cotton-spinning, bleaching linen, and calico printing. Pop. (1872) 12,946.

Hal'malille, a name given to *Berrya Ammonilla*, a large Ceylon tree belonging to the lime-tree order. It yields a valuable light timber much used for building purposes and making oil casks. In Madras, to which the wood is exported, it is called *trincomali wood*.

Hal'ogens. The H. consist of a group of the four elements *chlorine*, *bromine*, *iodine*, and *fluorine*, all of which possess many properties in common, and are, in fact, closely related to one another chemically. They derive their name of H., or 'salt-producers' (Gr. *hals*, 'sea,' and *gennaō*, 'I produce'), from the readiness with which they combine with metals to form salts—common salt, indeed, being itself a compound of a haloid (chlorine) and a metal (sodium). Of the H., fluorine has never been isolated, at least in quantities sufficient to admit of an examination of its properties; but there can be no question that, could it be obtained in the pure condition, its properties would resemble those of the other haloids. In its compounds at least, this analogy is well marked. In comparing, then, the properties of the H. in the free state there remain but three, viz., chlorine, bromine, and iodine. The first is a gas, the second a liquid, and the third a solid at ordinary temperatures. The colour of chlorine is pale green (Gr. *chlōros*, 'pale green'), that of bromine dark red, and of iodine black or dark grey, except in the condition of vapour, when it is of a beautiful violet (Gr. *iōdēs*, 'violet'). This gradation in physical properties is also apparent in the specific gravities of the three haloids, which are as follows:—

Liquified chlorine.	Bromine.	Iodine.
1·38	3·19	4·95

It will be observed that the specific gravity of bromine is very nearly the mean of the specific gravities of iodine and chlorine. Similar differences are observed in the atomic weights of the haloids, which are as under:—

Fluorine.	Chlorine.	Bromine.	Iodine.
19	35·5	80	127

Thus the atomic weights gradually increase from fluorine to iodine. The haloids are remarkable for the compounds which they form with hydrogen, each of them forming a single compound, containing an atom of haloid and an atom of hydrogen. These compounds form the important group of acids known as the hydracids. Their names and formulæ are as follows:—

HF	Hydrofluoric acid.
HCl	Hydrochloric acid.
HBr	Hydrobromic acid.
HI	Hydriodic acid.

The hydracids are gaseous. They have a powerful affinity for water, actually condensing it from the atmosphere as a cloud. They readily act on many metals (both in solution and in the gaseous state), yielding the haloid salt of the metal and free hydrogen; on oxides, yielding water and haloid salt; and on peroxides, forming water, a haloid salt, and free haloid. It is upon this last reaction that the ordinary method of preparing the haloids depends. The affinity of the haloids for hydrogen varies, being so powerful in the case of fluorine, that when once the compound is set at liberty, its hydrogen cannot be removed by oxidation. With chlorine it is also powerful, a mixture of the two gases exploding when brought into sunlight. With bromine the affinity is much slighter, the two bodies only combining directly when strongly heated; and with iodine so weak that no compound can be obtained by direct synthesis. The haloids may be arranged in the order of their affinity for hydrogen as follows:—

Fluorine,
Chlorine,
Bromine,
Iodine.

It should be observed that this is also the order of their affinity for the metals. As a consequence of this difference of affinity,

the haloids may be made to replace one another in their compounds. Thus a metallic bromide or hydrobromic acid when treated with chlorine is decomposed, with formation of the chlorind of the metal or hydrochloric and free bromine. An iodide when treated either with bromine or chlorine yields the bromide or chloride and free iodine. These facts are turned to account in the manufacture of bromine and iodine.

The affinity of the haloids for oxygen is in the reverse order, that of iodine being the most powerful, and of fluorine so slight that no compound of the two can be obtained. It follows that the haloids replace one another in their oxygen compounds in exactly the reverse order of that just described for the hydrogen and metallic compounds, iodine decomposing a compound of bromine and oxygen, and both bromine and iodine one of chlorine and oxygen.

The oxides of chlorine are numerous but unstable; the stability, however, increases with the amount of oxygen they contain. Owing to this instability they are powerful oxidising agents. No simple compounds of bromine and oxygen exist, but acids containing bromine, hydrogen, and oxygen. Iodine yields two oxides and the corresponding acids. They are comparatively stable bodies.

With the exception of fluorine the haloids occur in sea water, chlorine in the largest proportion. Iodine and bromine are abstracted from the water by marine plants, and it is from the burnt seaweeds (kelp) that most of the iodine is obtained. Fluorine occurs in tolerable abundance in fluor spar or fluoride of calcium.

Hal'oid Salts are compounds of the halogens with metals. Common salt is the most familiar substance of a haloid salt. It consists of a compound of an atom of chlorine and one of the metal sodium (NaCL). The existence of H. S. could not be accounted for on the old hypothesis that a salt was a compound of an acid and a base, and that an acid contained oxygen. After the discovery of the hydracids, however, and when acids were defined as compounds of hydrogen with *salt radicals—i.e.*, elements or groups of elements which can combine with a metal to form a salt—the existence of H. S. was satisfactorily explained, and their relations to the hydracids and oxyacids, as well as to the oxysalts, at once made clear. Thus

Hydrochloric acid, H(CL)	Nitric acid, $H(NO_3)$
Chloride of sodium, Na(CL)	Nitrate of sodium, $Na(NO_3)$.

Haloragea'ceæ, an order of calycifloral dicotyledons, embracing nine genera and about eighty species, many of which are aquatic plants found in various parts of the world. They have no properties of importance. In Britain the order is represented by the mare's-tail (*Hippuris vulgaris*), and three species of *Myriophyllum* or water-milfoils. The genus *Gunnera* belongs to the order, the species of which are found in various countries and have large coarse leaves. *G. scabra* and *G. manicata* are cultivated in gardens for ornament. See GUNNERA.

Halorageaceæ.

Ha'los (Lat. *halos*, Gr. *halōs*, 'a threshing-floor,' which among the ancients was *circular*) are coloured concentric rings which, under certain conditions, are observed round the sun and moon. There are many distinct phenomena included under this general term, which receive particular names, and which are due to different causes. For instance, *coronæ* are coloured rings of a few degrees in diameter, which may be almost always seen round the sun or moon when either is shining through a mist or cloud (which is not a cirrus). This appearance is due to Diffraction (q. v.), occasioned by the presence of small spheres of water floating in the air through which the rays of light are passing. To the same cause are referred the *glories* or *Anthelia* (q. v.) which surround the shadow of the spectator's head when cast by the sun on a fog bank. Rainbows (q. v.), which present the same alternation of colours, though not included under this head, are due simply to combined reflection and refraction through spherical drops of water, which are too large to produce any diffraction phenomena.

The most interesting of all H., however, are those great concentric rings which, though rarely seen in our latitudes, surround the sun in Polar regions with dazzling brilliancy. They depend upon the presence of innumerable minute *crystals* of ice, which float as a cirrus cloud in the higher strata of the atmosphere; and are often accompanied by *parhelia* or mock suns. Huyghens was the first to attempt the explanation of these; but he was ignorant of the crystalline form which ice takes, and also of its refractive index, so that his theory was necessarily far from complete. Marriotte, with fuller knowledge, explained many of the curious attendant phenomena; and Young and Kaemtz may be regarded as having finally perfected the theory. Bravais' memoir, published in the *Journal de l'École Polytechnique*, gives a systematic treatment of the whole question, and is indeed the great authority upon the subject.

The characteristic features of a solar halo, with its accompanying phenomena, are as follows:—(1) *The halo of* 22° *radius.* This is due to the refraction of the sunlight through those prisms with refracting angles of 60°, which are in the position of *minimum deviation* (see SPECTRUM ANALYSIS), with respect to the sun and the observer. Since the different coloured lights are differently refracted, it follows that the halo is variously coloured like the rainbow, passing from red on the inside through yellow and green to purple on the outside. Again, the ice-crystals are slowly falling through the air, and they consequently take up certain positions depending on their form. Long and thin crystals probably fall with their axes vertical, while flat hexagonal plates most likely descend edgewise. If the majority have their axes placed vertically, the laws of optics indicate that besides the halo there ought to be bright-coloured images of the sun, at the same altitude as that body, and distant from it, one on each side, by an angular distance which depends upon the angle of incidence made by the refracted ray. If the sun be on the horizon, these so-called *mock-suns* or *parhelia* lie on the halo of 22°; if otherwise, they are external to it. Observation in this instance corroborates the results of theory. The light *reflected* from the vertical prisms gives rise, in accordance with optical laws, to a white horizontal line passing through the sun and parhelia—a phenomenon often observed. (2) *Tangent arcs to the halo of* 22°. These are the result of the overlapping of innumerable parhelia, formed each by refraction through short hexagonal plate-like crystals with their horizontal axes all pointing in the same direction. The more acute the angle which the parallel axes make with the line joining the sun and the observer, the further removed from the medial line is the parhelion corresponding to that position; and, as there are crystals in all conceivable positions, the result is two curved lines of coloured light touching the circular halo at its highest and lowest points, and extending outwards on both sides. For certain altitudes these tangent arcs curve downwards and meet, forming a closed elliptical curve. (3) *The halo of* 46° *radius.* This is formed by refraction through the *right angle* which the sides of the hexagonal prisms make with the terminal plane. Its explanation is the same as that given for the small halo of 22° radius, the only difference being in the greater angle of refraction and the consequently greater size of the halo. It also has its parhelia and tangent arcs, which, when present, surpass in magnificence of colouring the attendants on the smaller halo. The parhelia may themselves give rise to *secondary* H., which, though necessarily fainter than the *primary* appearances, have been observed under favourable circumstances. There are other phenomena resulting from the various combinations of planes which are possible in a prism terminated by a six-sided pyramid; but their explanation is scarcely possible without the use of mathematics. The fullest details are found in Bravais' memoir above mentioned.

Hal'stead, a market-town of Essex, England, on the Colne, 43 miles N.N.E. of London. It has a very fine parish church, a grammar-school (Lady Mary Ramsay's), and carries on manufactures of silk, crape, velvet, &c. Pop. (1871) 5783.

Hal'yards (from *haul* and *yard*), ropes aboard ship for hoisting sails and yards.

Hal'yburton, Thomas, a Scottish theologian, born at Dupplin, near Perth, in December 1674, became minister of Ceres, in Fife, in 1700, and in 1710 Professor of Divinity in St. Leonard's College, St. Andrews. He died at the age of thirty-eight, on September 1712. H.'s best-known writings are directed against the Deists. The chief are *Natural Religion Insufficient, and Revealed Necessary to Man's Happiness* (Edinb. 1714); *Memoirs of his Life* (1715); *The Great Concern of Salvation* (1718); *Ten Sermons* (1722). The memoirs of H.'s life appeared in 1715; a complete edition of his works at Glasgow in 1836.

Ham, a name most frequently applied to the hind-legs of pigs, cured and preserved for use in a variety of ways, but also given to the preserved flesh of other animals, more especially mutton and beef. Bacon or pork H. is cured, among numerous other ways, by thoroughly rubbing over the fresh meat with a mixture of equal parts, say 1 lb. of salt and sugar, with 4 oz. of saltpetre, and keeping it for four or five weeks in the brine from this mixture, occasionally turning over the meat. Thereafter it is removed from the brine, drained, and hung up to dry in a cool place, and finally sewed up in canvas. The flavour of the H. is, however, improved by *smoking* after its removal from the brine. This is done by hanging the H. over a fire of any non-resinous wood. Beef is corned or made into H. by treating it with salt and a little saltpetre to preserve its red colour, and spices are sometimes added in the curing process. Mutton H. is prepared in the same way as pork H., but requires less time to cure it. What is termed goose H. is extensively prepared in Pomerania, where geese in vast numbers are cured, being salted, and so hard dried in smoking that they require no further dressing. The best hams are Westphalian and Belfast, and curing is an important industry at Cincinnati, &c., in America.

Ham, an old town in the department of Somme, France, on the river Somme, 70 miles N.N.E. of Paris. As early as the 9th c. coins were struck at H., the seigniory of which, successively held by the families of Courcy, Orleans, Luxembourg, and Vendome, was raised to a duchy in 1407. The massive fortress or castle of H. built in 1470, has in recent time, as a state prison, received many distinguished visitors. Louis Napoleon, the late Emperor of the French, was confined here 1840-46. Pop. (1872) 2836.

Ham (Heb. 'sun-burnt') was one of Noah's three sons (Gen. v. 32), apparently the youngest (*cf.* ix. 24, and Jos. *Ant.* i. 6, 3), and according to the Biblical narrative, the ancestor of all the Southern nations of the earth (x. 6-20). His sons are: (1) Cush, whose descendants are made to people the whole region from Ethiopia across the South of Arabia to Babylonia; (2) Mizraim (Egypt); (3) Phut [the Libyans (called in Old Egypt. *Phet*, in Coptic *Phaiat*), or North Africans]; and (4) Canaan, whose descendants peopled the region from the boundaries of Syria in the north to Gaza.

Hamadan', the ancient *Ecbatana* (q. v.), a town of Persia, in the province of Irak-Ajemi, at the N. base of Mount Elwund, 180 miles W.S.W. of Teheran, at a converging point of several important caravan routes. It is embowered in gardens and orchards, and has a fine climate, except for four winter months of extreme cold. There are many mosques, baths, and bazaars, and manufactures of leather, carpets, coarse woollens and cottons, &c. At H. are the reputed tombs of Mordecai and Esther, much visited by Jews, and that of Avicenna (q. v.), which attracts crowds of pilgrims. Estimated pop. 40,000.

Hamadry'ads. See NYMPHS.

Ham'ah (Gr. *Epiphania*, the Biblical *Hama'h*), a town of Syria, Asiatic Turkey, on the river Orontes, 120 miles N. of Damascus. The chief buildings are the residence of the governor, the mosques, bazaars, baths, and aqueducts. It has manufactures of silk, cotton, and woollen goods. Pop. 30,000. H. is one of the oldest cities in the world. It was the capital of a kingdom as early as the exodus of the Israelites from Egypt.

Hamamelid'eæ. See WITCH HAZEL.

Ham'ann, Johann Georg, a German philosopher, known as 'the Magus of the North,' was born at Königsberg, East Prussia, August 27, 1730. He studied philology and law, and after a wandering life, during which he acted as tutor, clerk, and commercial traveller, settled at Königsberg in 1777 as superintendent of a bonded warehouse. He died at Münster, June 21, 1788. Faith is the central thought of H.'s philosophy. He was consequently a keen opponent of rationalism in philosophy and religion. He took delight in the mysteries of the Christian faith, and in spite of his intense religious fervour, and the admiration for him expressed by Herder, Jean Paul, and Goethe, he was almost wholly neglected by his contemporaries. His thought is unsystematic, his style very abstruse, and his writings chiefly in the pamphlet form; but his *Schriften* were at last collected and edited by Roth in 1821-25. See Gildemeister, *H.'s Leben und Schriften* (5 vols. Gotha, 1857-68).

Hamba'to, a town of Ecuador, S. America, at the N.E. base of Chimborazo, and 8860 feet above the sea, has a trade in wheat and other grains, cochineal, and sugar. Pop. 10,000. H. was destroyed by an eruption of Cotopaxi, which is 25 miles distant, in 1698, and again by an earthquake in 1796.

Ham'burg ('harbour town'), the largest of the three Hanse towns of the German empire, the greatest port of the Continent, and, next to London, Liverpool, and Glasgow, the most important commercial place in Europe, is situated on the N. bank of the Elbe, 75 miles W.S.W. of its mouth, 67 N.E. of Bremen, and 170 N.W. of Berlin by railway. It is a gay, bustling city, with a quaint Altstadt of picturesque houses, tortuous streets, and sluggish canals, and a fair, stately Neustadt, enclosing a beautiful lakelet, the Binnen-Alster, upwards of a mile in circumference, and girt on three sides by quays (the Alte and Neue Jungfernstieg, and the Alsterdamm) planted with trees, and flanked by lines of splendid mansions, hotels, and shops. The Alster (q. v.), a small stream from the N., forms a basin, the Aussen-Alster, 2 miles long and 1100 feet broad, on the outskirt of the city, the Binnen-Alster within it, and is then discharged by locks and canals (*fleths*) into the many branches of the Elbe that intersect the mercantile quarter. Among the principal buildings are the church of St. Nicolai (1842) on the Hopfenmarkt, designed by Sir G. G. Scott, and erected at a cost of over £200,000, in the rich Gothic style of the 13th c., with one of the highest (483 feet) spires in Europe; the Grosse Michaeliskirche, of 1750-65, in Renaissance style, with a spire 450 feet high; the exchange (1842), where some 5000 merchants and brokers congregate daily, and which has a commercial library of 40,000 vols.; the Johanneum or grammar-school, a large Italian edifice founded in 1529; the gymnasium, established in 1611; the H. *real schule*; the town library of 250,000 vols., 5000 MSS., &c.; the Kunsthalle (1863-69), containing fine specimens of Flemish, Italian, and modern German art; the new Zollvereins-Niederlage, covering 13 acres, &c.; and the Thalia theatre (1842). H. has also large hospitals, an asylum, extensive botanical and zoological gardens, and innumerable music halls and other places of amusement. The old fortifications have been transformed into gardens and walks, which encircle the city proper, and beyond which are the suburbs of St. Georg in the N.E., Dammsthor in the N., and St. Pauli or Hamburger Berg in the W. Altona (q. v.) is now connected with H. by St. Pauli. The environs, thickly dotted with the villas of merchants, are singularly beautiful, especially along the steep, woody N. bank of the Elbe in the direction of Blankenese (q. v.). A fine view is commanded from the Elbhöhe or Stintfang of the low-lying city, of the harbour with its forest of masts, and of the many branches and islands of the Elbe to the S. The quays, which now stretch along the river for three miles, can accommodate 400 sea-going vessels, and as many river craft and barges, and are provided with steam cranes and rails in connection with the main lines. Besides the outer quays, and the great Nieder Hafen for the protection of vessels in the season of floating ice, there are extensive inner harbours, as the Sandthor Hafen ('Sandgate Harbour'), 1100 yards long and 100-140 wide, the Grasbrook Hafen, 1000 yards long, the Holz Hafen ('timber harbour'), with an area of 400 acres, and the Binnen Hafen, receiving many of the canals, which are navigated by *schuten* or flat-bottomed boats for the conveyance of wares to the storehouses. Opposite H., on the large islands Steinwärder and Kleine Grasbrook, to which steam ferryboats cross, there are wharves, dry docks, and shipbuilding-yards. In 1875 there entered the port 5260 vessels, 2739 steamers, of 2,117,822 tons, with crews of 61,305; while 6000 barges and 100 rafts arrived from the Upper Elbe. The imports (including bullion, £12,000,000), amounted in value to £96,151,421, of which

£57,078,182 were by sea, and £39,073,239 by land and river; while the exports were estimated at £12,000,000. H. is a packet port, and trades extensively with Great Britain (imports, 1875, £24,692,483), the United States, W. Indies, Brazil, France, Holland, Venezuela, Chili, Peru, and China. The imports are cotton yarn and twist, raw cotton, wool, sugar, dyes, coffee, drugs, pig-iron, coals and coke, &c.; and the exports by sea are grain, refined sugar, machinery, cigars, musical instruments, and fancy goods. The value of ships and cargoes insured here in 1875 was £87,686,000. H. is the great emigrant port for N. Europe. Next to London it has also the largest money exchange business in Europe. Its chief industries are shipbuilding, sugar-refining, and the manufacture of steam-engines, tobacco, cigars, &c. Pop. (1875) 239,107, of whom 14,000 are Jews and 7800 Roman Catholics. A 'burg' was founded here by Karl the Great in 811, and H. became the seat of a bishop in 831, and of an archbishop in 834, though then but a fishing village. In 1215 it was made a free city by Otto IV., but was seized by the Danish Knut IV. in 1223. The citizens recovered it for 1500 marks silver, and by its covenant with Lübeck was founded the Hanseatic League (q. v.) in 1241. H. adopted the Reformed faith in 1529, and remained completely unaffected by the Thirty Years' War. Its commerce increased immensely during the American war of independence; but in 1806 it was seized by the French, and held almost continuously till 1814, during which period the loss sustained is estimated at £13,000,000 sterling. The citizens were treated by Davout with merciless severity. The only great subsequent disaster in the annals of H. is the fire that raged from 5th to 8th May 1842, destroying nearly a quarter of the city. H. became a member of the German empire in 1871.

The small republic of H. has an area of 158 sq. miles, and a pop. (1875) of 338,974. According to its constitution of 1860, the legislative power is vested in a senate of eighteen members, and a municipal council of 192; the executive in the senate alone. In 1876 the estimated expenditure was £1,263,230, the revenue £1,263,230, and the public debt £7,040,000. H. is outside of the German Zollverein, to which it pays for exemption £156,860. It only levies slight dues on a few articles for local consumption. H. sends three members to the Imperial Parliament, and with Bremen and Lübeck furnishes as its military contingent the 75th and 76th regiments of infantry. See Lappenberg, *Hamburg. Urkundenbuch* (Hamb. 1842), and *Hamburgische Chroniken* (1860), and Gallois, *Geschichte der Stadt H.* (1867).

Ham'eln, a town in the province of Hannover, Prussia, 26 miles S.W. by rail of the town of Hannover, where the Hamel joins the Weser. Formerly a fortified city, it still preserves its walls and towers. H. was the scene of the exploits of a sorcerer who in 1284 undertook for a handsome sum to free the town from a plague of rats, and by means of a strain on his pipe compelled them all into the river. When the town-council refused the promised reward, the piper again tuned his lay, and led the children of the town into a chasm of the Kuppelberg, which yawned to receive them. The children were believed to have come to light again in Transylvania. Robert Browning, in his *Pied Piper of Hamelin City*, has made Englishmen familiar with the quaint miracle. H. has some trade, and makes beer, paper, cement, cloth, and carpets. Pop. (1871) 8530.

Hame'sucken, in Scotch law, is the offence of feloniously beating or assaulting a person in his own house. A shop is not held to be a house as regards H. Premeditated design is essential to the crime. Punishment is usually arbitrary, but when serious injury is done, the offence is capital. For English law see BEATING AND WOUNDING, BATTERY.

Hamil'car, a name borne by many illustrious Carthaginians, of whom the following are the most notable:—1. The commander of the Carthaginian expedition to Sicily, defeated and slain by Gelon at Himera, 480 B.C. 2. A commander in the Carthaginian army, defeated by Timoleon at the passage of the Crimissus, 339 B.C. 3. A Carthaginian general in the first Punic War, who gained several important victories over the Romans in Sicily, but was defeated in the naval engagement off Ecnomus, on the southern coast of the island, 256 B.C., after which he was recalled to Carthage, now menaced by the Romans. 4. H., surnamed *Barca* (an epithet supposed to be akin to Heb. *Barak*, and to mean 'lightning'). In 247 B.C., while still a youth, he received the command of the Carthaginian forces in Sicily. The Romans then possessed the whole island except the strongholds of Drepanum and Lilybæum. H., after ravaging the shores of Bruttium, landed on the N. coast of Sicily and established his army on Mount Hercte (*Pellegrino*), a position which he held for nearly three years. In 244 B.C. he suddenly removed to the foot of Mount Eryx and converted the town of that name into a fortified camp. Here, notwithstanding that the Romans held the fort on the summit of the hill, and that one of their armies lay entrenched at its base, H. for two years defied all their efforts to dislodge him. The Romans, in despair, now endeavoured to regain their supremacy by sea; and the total defeat of Hanno, the Carthaginian admiral, off the Ægates in 241 B.C., compelled H. to resign his command and leave the island. After suppressing the revolt of the mercenaries (239–238) he was appointed generalissimo of the Carthaginian army, and entered on his Spanish campaign about 237 B.C. In Spain he saw the possibility of founding a new empire which should more than compensate for the loss of Sicily and Sardinia, and afford, at the same time, a basis of operation against Rome. Setting out from Carthage, he marched westward, crossed at the Strait of Gibraltar, penetrated the country, and subdued many tribes. The wealth he acquired both by pillage and from the silver mines was enormous. Altogether he spent nine years in Spain, but of his history during this long period we know next to nothing. He was slain in battle with the Vettones, 229 B.C. Of H.'s private character we know little. He seems to have been liberal, generous, and lenient where leniency was possible, impatient of control, a man of undoubted patriotism, and by the unanimous testimony of antiquity a military genius second only to his son Hannibal.

Ham'ilton, a town of Scotland, in Lanarkshire, on the left bank of the Clyde, above its junction with the Avon, 11 miles S.E. of Glasgow by railway. It has a townhall, county buildings, large cavalry and infantry barracks, a fine railway station, mechanics' library, several charities, Hamilton Academy (higher-class school), St. John's (middle-class school), Gilbertfield House (a high-class boarding and day school), &c. The Clyde is spanned by a five-arched bridge, and there is a railway bridge over the Avon. Hand-loom weaving and tambouring have given place to industries in the coal and ironstone with which the district abounds. Near H. is H. Palace, the seat of the Dukes of H. and Brandon, in the midst of a finely wooded park of 1600 acres, and containing the finest private art collection in Scotland. The famous Cadzow Castle and oak forest are also in the neighbourhood. At Cadzow a herd of the original white cattle or *Urus* is still preserved. Pop. (1871) 11,299.

Hamilton, a flourishing port of entry in the Dominion of Canada, province of Ontario, on Burlington Bay, at the W. extremity of Lake Ontario, 40 miles S.W. of Toronto by the Great Western Railway. It has excellent water and gas works, and is connected by the Desjardins Canal, a deepened channel, with Dundas (q. v.). The manufactures are machinery, iron wires, sewing-machines, paper, glass, gunpowder, soap, carriages, &c. H. is the see of a Roman Catholic bishop, and among its institutions are a technical college, a public library, six benevolent associations, a hospital, a deaf and dumb asylum, &c. It is known locally as the 'ambitious city.' Pop. in 1841, 3500; in 1850, 10,312; and in 1871, 26,716.

Hamilton, the surname of a noble Scottish race, the members of which have played a leading part in court and camp at many an eventful epoch of Scottish story. In 1542 the head of the house of H. was declared by the estates of Scotland the second person of the realm, and a popular delusion continued to regard this noble line as, after the royal family, next heirs to the Scottish crown, even long after the Union and the accession of the Brunswick family. The name is derived from the manor of Hambledon in Leicestershire. A William de H. is found in Yorkshire in 1274; but the first H. who is positively known to have been established N. of the Border is Walter de H., also called Fitz-Gilbert, who figures in the Paisley chartulary in 1294. This Walter adhered to the English interest during Bruce's wars, and was made Governor of Berwick by Edward II. But he soon made his peace with Robert Bruce, from whom he received in gift the barony of Cadyow in Lanark and other domains. His son, Sir David de H., Dominus de Cadzow (Cadyow), was, like his father, a faithful and valued servant of

David Bruce. Sir David's grandson and great-grandson were repeatedly sent on important political missions to the English court, and James, great-grandson of the latter, was in 1445 created a lord of Parliament under the title of Lord H. of Cadyow. James joined the confederacy headed by Douglas in 1452, and, after taking the field with the murdered Douglas' successor, became reconciled to the King, and filled several high official posts. He died in 1479. The second Lord H., James' son, was one of the commissioners who negotiated the marriage of James IV. with the Princess Margaret of England, and at the marriage received from his grateful sovereign a gift of the island of Arran, being at the same time created earl thereof. During the expedition which ended at Flodden, Earl James was ambassador in France. On his return he became one of the principal personages that stand prominent throughout the stormy period of James V.'s minority, aiming steadfastly at the regency, and venturing repeatedly to measure his strength with Albany and Angus. Dying in 1529, he was succeeded by his son James, who, on the death of James V., was declared regent of the kingdom. At first, in treaty with England, the regent did much to promote the Reformation movement in Scotland; but, becoming reconciled to Cardinal Beaton, he was persuaded to form a new league with France, and in 1544 had to face the English army on the fatal day of Pinkie. Still faithful to the French alliance, he was, in 1548, created by the French king Duke of Chatelherault in Poitou—a title still claimed by the Dukes of H., and by the Marquises of Abercorn. He afterwards joined the Lords of the Congregation, and was induced to agree to Moray's regency after the battle of Langside, though the Hamiltons were mostly 'queen's men.' He died at H. Palace, in 1575. His son James, third earl, succeeded as Earl of Arran, the dukedom of Chatelherault being resumed by the crown of France. He was a suitor for the hand of Queen Mary, but died childless and insane in 1609 (Captain James Stewart, the notorious favourite of James VI., was titular Earl of Arran, and held possession of the H. estates from 1581 till 1585). Meanwhile, Lord John H., the second son of the regent, Duke of Chatelherault, and Lord Claud, fourth son, had been amongst the most zealous of Queen Mary's supporters, and now returned from banishment in 1585. Both were kindly received by the King: John was received into special favour, and was created Marquis of H. in 1599. He died in 1604, and was followed by his second son, James, the second Marquis of H., who, on the death of his uncle James, third earl, in 1609, came into the possession of the H. estates and dignities as fourth earl. He was further created a peer of England as Earl of Cambridge in 1519, and died in 1625. James, third marquis and son of the second, was first a courtier, then served under Gustavus Adolphus, was commissioner to the famous General Assembly of 1638, and in 1639 led an English army against the Covenanters. In 1646 he was made hereditary keeper of the Palace of Holyrood, headed the forces raised in 1648 by the Scots Parliament for the defence of the King, was defeated at Preston, and was beheaded in Palace Yard, Westminster, on March 9, 1649. William, second duke, was, like his brother the first duke, a zealous adherent of Charles I., accompanied Charles II. from Holland into Scotland, and in 1651 entered England with the Scotch army. He died September 12, 1651, of wounds received in the battle of Worcester. The estates and the title of Duchess of H. now devolved on Anne, eldest surviving daughter of the first duke, while the representation of the house of H. in the male line fell to James, second Earl of Abercorn (see below).

Anne, Duchess of H., married Lord William Douglas, eldest son of William, first Marquis of Douglas. Lord William obtained the title of Earl of Selkirk, and at the Restoration was, in consideration of his marriage, made Duke of H. for life, since which time the title of Duke of H. has been held by a branch of the Douglas family, but bearing the H. name. The new duke honourably distinguished himself by his opposition to the arbitrary and barbarous administration of Lauderdale, and at the Revolution was president of the meeting of the Convention of the Scottish Estates which declared the crown vacant, and offered it to William and Mary. James, eldest son of the preceding, adhered to King James, but in 1698, when his mother (who survived her husband) resigned her title, became fourth duke. He was zealous in the effort to secure for Scotland commercial privileges equal to those of England, and in 1707 was a determined opponent of the Union. In 1711 he was, nevertheless, created Duke of Brandon in the peerage of Great Britain. He fell in a duel with Lord Mohun, November 15, 1712. James George, seventh Duke of H., great-grandson of the fourth, became in 1761 male representative of the ancient house of Douglas, as Marquis of Douglas and Earl of Angus, and in the famous 'Douglas cause' asserted the right to the estates also, but unsuccessfully. The present Duke of H. (with the family name of Douglas-H.) is twelfth Duke of H. and ninth Duke of Brandon in regular succession.

The male line of H. is represented by the Abercorn family. James, first Earl of Abercorn, was eldest son of Lord Claud H. mentioned above, who was fourth son of the first Duke of Chatelherault. He was a lord in high favour with James VI., and was raised to the dignity of earl in 1606. James, eighth earl (born 1712), was a man of great ability; he was one of the first to powerfully promote systematic agriculture in Scotland, and to him in great measure the town of Paisley is indebted for its commercial advancement.

The title of Earl of Haddington was in 1627 conferred on Sir Thomas H., son of Sir Thomas H. of Priestfield, who was descended from a branch of the original stock of the Hamiltons of Cadyow. Sir Thomas, honoured by King James' friendship under the name of 'Tam o' the Cowgate,' became eminent in the legal profession, and in 1616 attained to the dignity of Lord President of the Court of Session. He was one of the King's Commissioners to the notorious General Assembly of Perth (where the 'Six Articles' were passed), and had been created Lord Binning and Byres and Earl of Melrose before the earldom of Haddington was conferred. On the death of the ninth earl, the succession passed to a member of the Baillie family, who as tenth Earl of Haddington, assumed the surname of H. The present earl is the eleventh in succession.

Lord Charles H., third son of the Duchess Anne, became Earl of Selkirk in 1688. But his successors never returned to the ancient name of Douglas, which is now borne by the sixth Earl of Selkirk. The fifth son of the Duchess Anne was in 1696 created Earl of Orkney. The present earl is his descendant, but is of the family of Fitzmaurice.

Sir James H., descended from Thomas, brother of James first Lord H. of Cadyow (1445), was created Lord Belhaven and Stenton in 1647. On the death of the eighth Lord the title was for some time dormant, but in August 1875 the House of Lords declared James H., born 1822, to be the nearest heir. On members of the same great family the titles Viscount Boyne in the peerage of Ireland, and that of Viscount Clanboy and Earl of Clanbrassil were conferred. But the most ancient cadet branch of the Hamiltons is the family of H. of Preston and Fingalton, on which a Nova Scotia baronetcy was conferred in 1673. The second baronet was the Sir Robert who commanded the Covenanters at Drumclog and at Bothwell Brig. To his family belongs the illustrious metaphysician Sir William Hamilton (q. v.).

Of the numerous families of position priding themselves on their descent from the original H. stock, the most noted are the Hamiltons of Airdrie, sprung from John, second son of the seventh representative of the house of Preston; the Hamiltons of Silvertonhill, possessing a Nova Scotia baronetcy, and descended from Alexander de H., second son of Sir James H., dominus de Cadyow; and the Hamiltons of Kincavil, descended from Sir Patrick H., natural son of James, first Lord H., and brother of the first Earl of Arran. For the history of the Hamiltons, see *Historical and Genealogical Memoirs of the House of H.* by Anderson (Edinb. 1825). A MS. *Account of the Family of H.* by Dr. James Baillie (first half of 17th c.) is preserved in the Advocates' Library at Edinburgh.

Hamilton, Alexander, a celebrated American statesman of Scotch extraction, was born in the Island of St. Kitts, 11th January 1757, and studied at Columbia College, New York. In 1774 he made a speech at a great revolutionary meeting, and ever afterwards wrote, spoke, and acted for his country's freedom. When the war broke out, he became Washington's favourite aide-de-camp. In 1782 he was chosen to represent New York in the Congress which adjusted the Constitution. Distrusting the abstract principle of self-government, he supported with great eloquence and political insight the doctrine of Federalism, afterwards expounded in a series of letters to the *Daily Advertiser*, which were

collected and republished in *The Federalist.* As the first Secretary to the Treasury, H. had to face all the financial problems presented by a large and hastily incurred national debt. In spite of the clamour of the Democratic party, he put all the common war expenses to one joint account, instead of letting each state pay its own war debts, imposed taxation sufficient to meet the current charges, and to provide for gradual writing off, and founded the national bank. He supported the proclamation of neutrality when the French wars began, and the sending of Jay to England. In 1795 he withdrew from the cabinet to legal practice. When in 1798 the Army of Defence was organised, Washington insisted that H. should be first major-general of his command. With his usual sagacity and patriotism, H. strongly opposed the election of the adventurer Burr as against Jefferson, although the former was the Federalist candidate. The second disappointment of Burr, when Jefferson was re-elected president in 1804, so infuriated him that he found means to entrap H. into a duel, and shot him dead, 12th July 1804. His premature death caused profound and widespread sorrow. See the memoir of H. by his son, who has published his father's writings in 7 vols.

Hamilton, Anthony, Comte de, born in Ireland in 1646, was descended from the Scottish Dukes of H. He entered the army of Louis XIV., afterwards joined the Irish service, was made governor of Limerick, and on the dethronement of James II., accompanied that king to St. Germain, where he died in 1720. He was famed as a wit and author. Among his works are *Contes de Féerie*, a French translation of Pope's *Art of Criticism*, and the lively and interesting *Mémoires du Chevalier de Grammont* (Lond. 1772). H.'s works were issued at Paris in 1805 (3 vols), and in 1812 (4 vols.).

Hamilton, Patrick, the protomartyr of the Scottish Reformation, was born in 1503 or 1504 in or near Glasgow. He was of noble descent, his father being a natural brother of the first Earl of Arran, and his mother daughter of the Duke of Albany, second son of King James II. Having taken his master's degree at Paris in 1520, he was for a time at Louvain and at Basel, and in 1523 became a member of the University of St. Andrews. H. had already attached himself to the views of Erasmus, but he was regarded with much greater suspicion by the ecclesiastical authorities when he adopted and defended the heresies of Luther. He fled to Germany in 1527, and at Marburg, and, perhaps, at Wittenberg also, became confirmed in his sympathies with the German Reformation. When he returned to Scotland in the same year, the zeal with which he preached the new doctrines, his learning, courtesy, blameless character, and noble birth, gave great weight to his teaching, and made him specially obnoxious to the clergy. He was apprehended, and, on March 1, 1528, brought to trial before Cardinal Beaton. After examination he was condemned as an obstinate heretic, delivered over to the secular arm, and on the afternoon of the same day he was burnt at the stake in front of St. Salvator's College. H. left a brief statement of his views in a work called *Patrick's Places or Commonplaces*, originally in Latin, but translated into English by John Frith, and republished in 1807 as a *Treatise on the Law and Gospel.* See Dr. Lorimer's *Life of Patrick H.* (1857).

Hamilton, Sir William, the most learned and potent metaphysician that Scotland has yet produced, was the son of Dr. Thomas Hamilton, Professor of Anatomy and Natural History in Glasgow College, and was born there, March 8, 1791. He studied at Glasgow (1803-7), went up as Snell exhibitioner to Oxford, and when going in for his degree astonished his examiners by the number of works in philosophy in which he offered himself for examination. In 1812 he settled as an advocate in Edinburgh, and married, but did not obtain practice. In 1820 he was defeated by John Wilson in a competition for the Chair of Moral Philosophy, but in 1821 succeeded Mr. Fraser Tytler in the Chair of History, which he held till 1836. During this period, after a sharp criticism of the popular phrenology, he produced his famous *Edinburgh Review* articles on the Philosophy of the Conditioned (in which he annihilated M. Cousin's Semi-Hegelian Intuition of the Absolute), on Perception (in which he criticises Brown's view of the irresistible suggestion of the non-ego, and tries to develop his own doctrine of natural realism out of the common-sense of Dr. Reid), and on Logic (in which, using his extensive knowledge of Aristotle and his commentators, he tries to make the formal syllogism cover the facts of inductive reasoning). This last subject he afterwards elaborated into his theory of the Quantification of the Predicate, which is described in the *New Analytic of Logical Forms*, by Professor Spencer Baynes. In 1836 he succeeded Mr. Ritchie in the Chair of Logic and Metaphysics, defeating Isaac Taylor and Mr. George Combe, and began those original and learned Lectures which were posthumously edited by Dean Mansel and Professor Veitch (4 vols. 1859-61). He had a large and enthusiastic class, and whatever may be the ultimate fate of his philosophy, his influence in stimulating speculation in Great Britain was great and beneficial. Besides the lectures and the Discussions on Philosophy (1852), which include papers on Oxford University reform, and against the utility of mathematical education, he wrote valuable notes and dissertations to his collected edition of Reid's works. He died May 6, 1856. H.'s fundamental position is that on the one hand consciousness is to be trusted, and on the other hand that it relates only to the conditioned. Hence a vein of contradiction which runs through all his writings. He accepts the doctrine of relativity of human knowledge, insists upon cognitive limitations, and admits the apparent universality of causation. But, by a resort to faith, or a consciousness which is indistinct and inconsistent with itself, he asserts a direct knowledge of external material objects and their primary qualities, the analysis of which he declines to enter on; a consciousness or belief in the absolute, infinite, and the conditioned, and also a belief in the freedom of the will as the foundation of human responsibility. He imperfectly realised the operation of the laws of inseparable association, obliviscence, and necessary dissociation. His views on these subjects, and his teaching on logic as the science of the fundamental and applied laws of pure mental consistency, have been criticised by Mr. J. S. Mill in his Examination of H.'s philosophy (1865). See also Stirling's *Philosophy of Perception*, and Bolton's *Inquisitio Philosophica.* Professor Veitch has written a memoir of H.

Hamilton, Sir William, born in Scotland 1730, was English ambassador at Naples from 1764 to 1800, and took an active part in the excavations at Pompeii and Herculaneum. He spent his time in preparing his *Campi Phlegræi*, a series of scientifically arranged coloured plates, showing the local volcanic phenomena, and his *Etruscan, Greek, and Roman Antiquities*, published in 1766. He acquired the Porcinari collection of vases, &c., and some of his marbles are still in the Townley Gallery. H. died at Merton, in Surrey, 6th April 1803.

Hamilton, Sir William Rowan, the most original of the mathematicians of this century, was born in Dublin, August 4, 1805. At the age of ten he began the study of mathematics, and when only thirteen had a fair knowledge of thirteen languages. In 1822 he presented to Dr. Brinkley, Astronomer-Royal for Ireland, his first original paper on *Contacts between Algebraic Curves and Surfaces.* He entered Trinity College in 1823, and his course was marked by most unprecedented success. While still an undergraduate, he succeeded Dr. Brinkley in 1827 as Astronomer-Royal and Professor of Astronomy in the university. He entered ardently upon his new duties, and his lectures were characterised by an eloquence which is rare in exact science. Meanwhile he had applied algebraic geometry to problems in optics, and his first paper before the Royal Irish Academy, entitled *Theory of Systems of Rays*, is a most elaborate development of his earlier investigations on contact of curves. He continued the subject in several subsequent papers, and in 1833 predicted, as a mathematical consequence of the undulatory theory of light, the existence of two kinds of conical refraction. This was experimentally verified by Lloyd. In 1834 his *General Method in Dynamics* appeared in the *Philosophical Transactions* —a paper which attracted more attention in the mathematical world than probably any other single paper has ever done. These researches all turn upon the differentiation of *one* function with respect to different variables. All H.'s memoirs are characterised by a grasp of the fundamental conceptions of mathematics, and by a power of generalisation, which have perhaps never been equalled; and that for which his name is most famous, the invention of Quaternions (q. v.), is no mere development of older methods, but has for its very basis notions of the properties of space which, though known to previous mathematicians, were not recognised in their full importance.

H. was knighted in 1835, was president of the Irish Academy in 1837, and died at Dublin, September 2, 1865. His great works are *Lectures on Quaternions* (1853), and *Elements of Quaternions* (1866).

Hamm, a town in the province of Westphalia, Prussia, at the confluence of the Lippe and Ahse, 17 miles S.S.E. of Münster by railway. It has a castle, a gymnasium, linen and iron industries, and is girt by old walls now converted into promenades. Pop. (1875) 18,904. H. was a member of the Hanse League. It figures as a strong fortress in the Thirty Years' War, and was bombarded by the French in 1761 and 1762.

Hamm'er. An immense number of varieties of this well-known tool exist, each adapted for some particular work or for some particular material. All possess the same general features, each consisting of a long wooden handle to which is attached a metal head, the size and form of which is the principal characteristic of the tool. In general the head is of iron or steel, or of iron faced with steel, but for some special purposes lead, copper, and even tin heads are employed. The heaviest class of hand hammers is that used for forging by the 'strikers' in smithies, and called a 'sledge H.' The head of a sledge H. sometimes weighs 25 or 30 pounds.

At a very early stage of manufacturing art it became necessary to have a more powerful forging tool than the hand-worked H., and this want was met by the tilt H. or 'helve,' which for an immense period was the only power H. in existence. It was simply a large hand H. with the end of the handle fixed to a rocking shaft. The H. was raised at intervals by projecting teeth, called wipers or tappets, attached to a continuously revolving disc, set in motion at first by a water-wheel, and in later times steam-engine. As soon as each wiper had done its work and lifted the H. to its full height, the latter was released, and the head fell by its own weight, the piece to be forged being placed, of course, on an anvil underneath it. This tool was a very rough one in all ways, and no means existed of regulating the force of the blow, which obviously had the smallest force when the piece of iron on the anvil was largest, that is just when the heaviest blow was required.

It has been found with the H., as with the sewing-machine and in so many other cases, that the very natural attempt to imitate manual methods in machinery is a mistake. A machine may do the same work as the hand, but in almost all cases it does it best in a very different manner. Both James Watt (1784) and a Mr. Deverell (1806) patented a power H. in which the head should be attached directly to the piston rod of a steam-engine, but in neither case does the matter seem to have been carried further than the patent specification. It is only within the last forty years that this direct-acting H., now familiar everywhere, has come into use. In 1838 some difficulty arose as to the forging of a paddle-wheel shaft of unprecedented size, which no forge in the country would undertake to make. Mr. Nasmyth, of Patricroft (the firm being then Nasmyth & Gaskell) was applied to about the matter, and at once gave its solution in what proved to be the germ of the present 'steam H.' This consists of an anvil resting on the ground, a framing carrying a vertical steam cylinder directly over the anvil, and a block of iron for giving the blow attached to the rod of a piston working in the cylinder. This block is so guided that it can move up and down only; it is lifted by admitting steam under the piston, and then allowed to fall by its own weight. Owing to various circumstances the first H. made in this country (in the meantime a Nasmyth H. had been set to work by M. Schneider, at Creusôt) was not constructed until the beginning of 1843. Although a great improvement on the helve, it was yet by no means altogether satisfactory, its principal drawbacks being the considerable manual labour required to work the valves, and the want of adjustability in the force of the blow. The self-acting valve gear which remedied these defects, and without which the Nasmyth H. would have had little general value, was invented by Mr. Robert Wilson (who has now for many years been managing partner at the Patricroft works) in 1843, and it was to this gear that the early steam-hammers owed the extraordinary delicacy and adaptability to all kinds of work which brought the new tool so rapidly into general use. For many years Wilson's valve gear formed an essential part of direct-acting hammers, but latterly this has been superseded by other arrangements scarcely more perfect in their action, but much simpler, invented both by Mr. Wilson himself and by others. Into these we cannot here enter. We need only mention that in many hammers now used steam is admitted above the piston to aid the blow, and in this way the power of the H. is enormously increased. In armour plate, gun factories, and other large works, hammers are now used of which the weight of the falling mass is from 25 tons to 40 tons, and in a few cases even more.

Hamm'erfest (Scand. 'the rock fortress'), the most northerly town in Europe, and port of the amt of Finmark, in Norway, on the bare island of Kvalö ('the whale'), in Soro Sund, lat. 70° 40′ N., and long. 23° 30′ E. It lies at the base of a rocky ledge, is sheltered by the island of Soro and the Fuglenäs peninsula, and has a temperature never below 3° F. Its exports, valued in 1873 at £119,280, are chiefly stock-fish, train-oil, reindeer hides and horns, walrus skins and tusks, and the skins of the seal, fox, and otter. The copperworks at Kaafiord were taken over by an English company in 1847. In 1873 there entered the port 152 vessels of 17,125 tons, of which 97 were Russian and 30 German. For two months in summer the sun never sets, and fishing is carried on during the whole year. H. has regular steam communication with Trondhjem. Pop. (1876) 2125.

Hamm'erhead, or **H. Shark** (*Zygæna* or *Sphyrinas*), the name given to various species of *Squalidæ* or Sharks (q. v.), distinguished by having the head produced at each side into two prominent processes or lobes, on the extremities of which the eyes are borne. The common species (*Z. malleus*) attains a length of 7 or 8 feet, and is most common in warm seas. Occasionally it is found in British waters. It produces living young, the eggs being retained within the parent-body until the young are hatched. One specimen captured at Tenby in 1839 measured 10 feet in length, and contained thirty-nine young. Other species are the *S.* or *Z. laticeps*, the *Z. tiburo*, and the *Z. tudes* of the Mediterranean Sea.

Hamm'er-Purg'stall, Joseph, Freiherr Von, a celebrated Orientalist, was born at Gratz, in Styria, June 9, 1774, and educated at Vienna. After a long and varied official career, he died in the Austrian capital, November 23, 1856. H.-P. was a most voluminous author, and his writings are valuable. Though deficient in critical insight, and not adequately equipped in philology, he has immensely enlarged our knowledge of Eastern tongues and of Eastern history and literature. Among his more important works are *Des Osmanischen Reichs Staatsverfassung und Staatsverwaltung* (2 vols. Tüb. 1816); *Geschichte des Osmanischen Reichs* (10 vols. Pesth, 1827–34), still the standard authority on Turkish history; *Geschichte der Assassinen* (Stutt. and Tüb. 1819); *Gemäldesaal Moslemischer Herrscher* (6 vols. Darmst. 1837–39); *Geschichte der Khane der Krim* (Vienna, 1856); *Geschichte der schönen Redekünste Persiens* (Tüb. 1818); *Geschichte der Osman. Dichtkunst* (4 vols. Pesth, 1836–38); *Geschichte der Arab. Literatur* (7 vols. Vienna, 1850–57), besides editions of numerous Eastern authors—Turkish, Persian, and Arabic. See Schlottmann's *Joseph von H.* (1857).

Hamm'ersmith, a parish of Middlesex, and member of the parliamentary borough of Chelsea, on the Thames, 3½ miles W. by S. of Hyde Park Corner by the Metropolitan and N. London Railway. It is united to London by continuous lines of streets, and its once famous market-gardens are now mostly covered with buildings. Its parish church dates from 1631, and was consecrated by Bishop Laud; other public buildings are the church of St. John the Evangelist (1860), a Roman Catholic chapel (1866) and training college, three convents, the W. London hospital, and William Godolphin's school, re-erected in 1862. Here are the extensive works of the W. Middlesex water company. The Thames at H. is spanned by a bridge completed in 1827 at a cost of £80,000. Pop. of parish (1871) 42,691.

Hamme-sur-Durme, a fortified town of Belgium, province of W. Flanders, 3 miles N. of Bruges. It lies at the intersecting point of two important canals, and has considerable trade and some industry in linens and lace. Pop. (1874) 10,518.

Hamm'ock, the strong piece of hempen cloth, about 6 feet long, which forms the framework of the sailor's bed, and is swung from hooks in the deck overhead. The name is derived from a W. Indian word *hamaca*, meaning a network used as a bed.

Hamm'ond, Henry, D.D., an Anglican divine, born at Chertsey, Surrey, August 18, 1605, and educated at Eton and Oxford. He was appointed Fellow of Magdalen College in 1625, rector of Penshurst in 1633, archdeacon of Chichester in 1643, and subsequently canon of Christ Church. A keen Royalist, he acted as chaplain to Charles I. during the king's captivity until 1647, when he was chosen sub-dean of Christ Church. Stripped of his offices by the Parliament in March 1648, he devoted the remainder of his life to literature and charitable schemes at Westwood, Worcestershire. At the Restoration he was selected for the bishopric of Rochester, but died before consecration, 25th April 1660. His works, which are learned and mainly controversial, were collected in 4 vols. folio, 1674–84. His celebrated *Paraphrase and Annotations on the New Testament* was published in 1653, and in an improved edition in 1702.

Hamoon'. See SEISTAN LAKE.

Hamp'den, John, an English statesman and patriot, born in London in 1594, was the son of a Buckinghamshire squire, whose family was historical as early as the 13th c. He was educated at Oxford, and studied for the bar. In the stormy Parliaments of the reign of Charles I., he represented successively the boroughs of Grampound and Wendover, and the county of Buckingham. He at once joined the party of Pym, Selden, and others, who were resolved to assert popular liberties against the encroachment of the prerogative. His refusal to contribute to the compulsory loan or benevolence of the second Parliament was followed by the great ship-money case of 1637, which was decided against him by the servility of all the judges but two. It had been clearly shown that the tax had formerly been levied only in cases of sudden emergency, and only on the coast and in the port towns. Matters were now becoming serious, many were leaving England to escape tyranny, and it was chiefly the noble stand made by H. and others in the Long Parliament that precipitated the civil war. Once war was declared, the hero of the constitution displayed (chiefly in Berkshire, Oxford, &c.) the highest military skill. As a member of the Committee of Public Safety, he condemned the Fabian policy of Essex, and received his death-wound at Chalgrove Field, 18th June 1643, dying six days after. The pathos and dignity of his dying prayer are well known. He has been described as a 'man of consummate ability, unequalled power of persuasion, keen intelligence, ripe learning, and a character singularly pure and lovable.' See Nugent's *Memorials of H.* (2 vols. Lond. 1831; new ed. 1854), and Clarendon's *History of the Rebellion.*

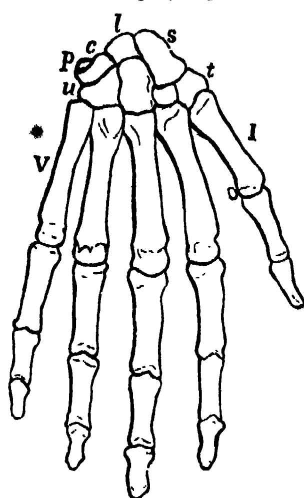
Hamp'shire, Southamp'tonshire, or **Hants**, a maritime county in the S. of England, bounded N. by Berkshire, E. by Surrey and Sussex, S. by the English Channel, and W. by Wiltshire and Dorsetshire. Including the Isle of Wight, its area is 1,070,216 acres; pop. (1871) 544,684. The coast is often deeply indented, generally low in the E., but high and steep W. of Hurst Castle. The surface is undulating and irregular, the county being traversed by the N. Downs, S. Downs, and Alton Hills. The chief rivers are the Anton or Test, the Itchen, and Hamble, which flow into Southampton Water, and the Avon, which drains the W. of the county. H. is richly and beautifully wooded, including the New Forest in the W., which covers 63,000 acres, and belongs to the crown, Bere Forest in the S.E., of 11,000 acres, and the smaller forests of Woolmer, Harewood, Alice Holt, and Waltham Chase. Geologically H. is chalky in the N. and tertiary in the S. The climate is peculiarly mild, and the soil is fertile in the N., but sandy and gravelly W. of the lower Avon. Large crops of wheat, barley, oats, rye, peas, and trefoil are raised; fruit and hops are also grown, and sheep are extensively reared on the chalk downs. Apart from the naval yards at Portsmouth and Gosport, the manufactures are not important, but brewing, tanning, and the making of paper, bricks, pottery, &c., are carried on. The chief towns are Winchester, Portsmouth, Southampton, Andover, Alton, Bishop's Waltham, Basingstoke, Fareham, Fordinbridge, Romsey, Havant, Kingsclere, &c. Excluding the Isle of Wight, H. returns four members to Parliament. H. was the heart of the old kingdom of Wessex, and the scene of many important events in early English history. It suffered greatly from the Danish invasions, and from William the Conqueror's arbitrary extension of the New Forest, in which two of his sons and his grandson met their deaths. H. abounds in Roman remains.

Hamp'stead (Old Eng. *Hamstede*, 'homestead'), a suburban district of London, on the S. slope of a hill, the summit of which forms H. Heath, covering 260 acres, and commanding a fine view of London. H. was once famed for its mineral springs, and is still much frequented on holidays. The chief streets are High Street and Heath Street, and there are many fine villas in the neighbourhood. H. is rich in literary associations, having been a favourite resort of Pope, Gay, Arbuthnot, Akenside, Johnson, Coleridge, Keats, Leigh Hunt, Hazlitt, and Moore. A private house on the heath was formerly the Upper Flask Inn, where the Kit-Kat Club (q. v.), of which Addison, Steele, Richardson, Marlborough, and Walpole were members, used to assemble. Pop. (1871) 32,281.

Hamp'ton, a village in the county of Middlesex, England, on the left bank of the Thames, 12 miles S.W. of London. It is a station on the South-Western Railway. Pop. (1871) 2207. A mile below the village stands **Hampton Court Palace**, a splendid building, formerly a royal residence. It was founded by Wolsey, who lived here in great splendour, and was afterwards enlarged by Henry VIII. and William III., the more modern portions, including the Fountain Court and grand front, having been added by Sir Christopher Wren. It has been partly restored during the present reign, and comprises three quadrangles and several smaller courts, and is surrounded by gardens laid out in the Dutch style. Its picture gallery contains above 1000 paintings, among which are seven cartoons by Raphael, various specimens of the old masters, Lely's 'Beauties of the Court of Charles II.,' and works by Holbein, Kneller, West, &c.

Hampton, a village on Chesapeake Bay, Virginia, U.S., which gives name to Hampton Roads, the wide deep channel by which the James, Nansemond, and Elizabeth rivers flow into Chesapeake Bay. These roads are defended by Fort Monroe and Fort Wool. On March 8 and 9, 1862, the U.S. frigates *Congress* and *Cumberland* were sunk here, and the first engagement between ironclads—the *Monitor* and *Virginia*—took place.

Hampton Court Conference was held 12th–18th January 1604 in presence of King James I., to settle the dispute between the High Church party and the Puritans. The questions discussed were not doctrinal, for the doctrine of both parties was Calvinistic. The objections of the Puritans 'lay entirely against matters of form and ceremony, or against expressions in the Prayer-book capable of misapprehension.' Some slight concessions were made to them: private baptism by women was forbidden, the Church Catechism was enlarged by the addition of the explanations of the sacraments, and it was on the suggestion of Dr. Reynolds that the authorised version of the Bible was undertaken; but their request that the sign of the cross should be omitted in baptism was treated with contempt; and the Puritans retired browbeaten and dismayed.



Ham'ster (*Cricetus frumentarius*), a species of *Rodents* belonging to the *Muridæ*, or rat and mouse family, and inhabiting N. Europe. It is a short, thick-set animal, attaining a length of 15 inches. The tail is about 3 inches. The H. is provided with cheek-pouches, in which food, consisting of grain, peas, beans, &c., can be temporarily stored. The colour is grey tinted with brown on the back; the under parts are black; the cheeks, sides, and shoulders are marked with yellowish tints. The skin is of considerable value. The H. lives in burrows. From six to eight young are produced at a birth, and several broods appear annually. The H. is exceedingly destructive to grain-crops and stores; upwards of 60 lbs. of corn having been found in the burrow of one specimen.

Han'au, a town in the province of Hessen-Nassau, Prussia, on the Kinzig, near its junction with the Main, and 11 miles E. of Frankfurt, on a main line of railway. For its thriving industries in silks and woollen wares, in jewellery, and in gold and silver work, H. is indebted to Flemish and Walloon refugees who settled here in the 17th c. It has also carpet factories and coachworks, and manufactures buttons, tobacco, &c. Pop. (1871) 20,294. Here, on 30th and 31st October 1813, Napoleon fought the disastrous battle of H., the last he fought in Germany. See *Die Schlacht bei H.* (Han. 1864).

Hand. This part of the body, by its peculiar construction and mechanism fitting it for grasping minute objects and for executing delicate movements, constitutes one of the special bodily

characteristics of man. Existing in a more or less rudimentary form in the lower vertebrates, and used as an instrument of prehension only in the highest, it attains its greatest degree of complexity in man, and serves as the most important instrument he possesses in carrying out the commands of his high cerebral organisation. Anatomically it consists of three parts, which may be specially studied in the skeleton.

These three parts are (1) the *carpus*, or bones of the wrist; (2) the *metacarpus*, or palm; and (3) the *phalanges*, or fingers.

The carpus is composed of eight short irregularly-shaped bones, in two rows, four in each row. Enumerated from the side next the thumb, the first row consists of the *scaphoid* (*s*), the *semilunar* (*l*), the *cuneiform* (*c*), and the *pisiform* (*p*); and the second row, or that next to the metacarpus, contains, in the same order, the *trapezium* (*t*), the *trapezoid*, the *os magnum*, and the *unciform* (*u*). The *metacarpus* consists of five shafted bones, of which the first is that of the thumb while the others are numbered successively 2, 3, 4, and 5, the latter being that of the little finger. The *phalanges*, or bones of the fingers, are fourteen in number, three for each finger, except the thumb, which has only two. See *The Hand, its Mechanism and Endowments*, by Sir Charles Bell, late Professor of Surgery, University of Edinburgh (Lond. 1852).

These various bones are more or less connected together by ligaments, and have joints between them which admit of a certain amount of movement. These movements are effected by the action of numerous muscles, part of which originate in the forearm, while the others belong to the hand itself. Without going into anatomical details, it may be briefly stated that these muscles consist of (1) *flexors*, for bending the fingers, which arise from the inner aspect of the limb; (2) of *extensors*, for extending the fingers, arising from the outer or posterior aspect of the limb; (3) of special extensors for the thumb and index or fore finger, which permit accurate movements to be effected; (4) of the *muscles of the thumb*, which form the prominence or ball of the thumb, consisting of four muscles—an abductor, an opponens, a short flexor, and an adductor; (5) of the *muscles of the little finger*, forming the fleshy mass at the inner border of the hand, consisting of three muscles, viz., an abductor, a short flexor, and an opponens; and (6) of seven *interosseous* muscles which occupy the intervals between the metacarpal bones. These muscles are supplied by vessels and nerves, are firmly bound together by fascia, and are covered over by skin, in which the sense of touch is largely developed.

Comparative Anatomy of the Hand.—The number of carpal bones is increased to ten in chelonians, and it is reduced to two in birds. In the number of metacarpal bones man agrees with many vertebrates, but in some the number is much reduced. Thus there may be only a single metacarpal (the third) with the rudiments of two others, as in the horse, or there may be a single bone formed of the third and fourth fused together, as in the sheep. In the birds we have the second and third metacarpals, along with a rudiment of the first, fused together to form a single bone. The number of fingers which may be developed varies. Thus there may be only one, as in the horse; two, as in the ox; three, as in the rhinoceros; or four, as in the pig or dog. There are never more than five. When one is wanting, it is usually the thumb; but it may be the fifth, or the fourth and fifth, as in birds. The thumb may be opposable, as in most monkeys; or two fingers may be opposed to three, as in the chameleon. The fingers may be remarkably short, as in the tortoise; or of extreme length, as in the hand of a bat, commonly called the wing. There are many variations in the arrangement of the muscles, which in no animal are so specialised as in man. The thumb of the human hand can be brought into contact with the tips of all the fingers, whereas in the higher monkeys the fingers are so long and the thumb is so short as to make this almost impossible. The hand of a monkey is specially suitable for grasping a cylindrical object, such as a branch; but the hand of man, from its concave form, as produced by the great development of the eminences of the thumb and little finger, is adapted for grasping a sphere. In addition, from the great multiplicity of its muscular arrangements, the amount of movement possible in its various joints, and its elaborate nervous arrangements, the hand of man is capable of doing work requiring most delicate adjustment and manipulation.

Hän'del, Georg Friedrich, one of the greatest composers that ever lived, was born at Halle, in Prussian Saxony, February 23, 1685. His father, a surgeon, though at first not wishing the boy to give himself wholly to music, was persuaded to place him, at the age of seven, under Zachau, organist of Halle Cathedral, who sent him to Berlin in 1696, confessing he had no more to teach him. Under Zachau H. studied harmony and composition, and learned the organ, harpsichord, violin, and oboe. He was again in Halle from 1697 to 1703, when he went to Hamburg, being thrown on his own resources by his father's death in the former year. At Hamburg he wrote a *Passion Music*, his first recorded work, and *Almira*, his first opera. From 1706 to 1709 he was in Italy, remaining in turn at Florence, Venice, Rome, and Naples, exciting the highest admiration by his readily-written operas and oratorios (the Venice theatre resounded with 'Viva il caro Sassone' when *Agrippina* was played), and meeting with splendid hospitality from the Marchese de Ruspoli and others. As he found no settled employment, however, in Italy, he accepted the post of chapel-master to the Elector of Brunswick, afterwards George I. of England. Twice, viz., in 1710 and 1712, he visited London. After the latter date it became his home, and only on four occasions did he return to the Continent—in 1716 to Hanover with the King, in 1729 to Italy to prepare for opening a London opera season, and to Germany to see his mother, in 1736 to Aix-la-Chapelle to recover his health, and in 1750 to Germany just after making his will. H. received pensions from Queen Anne and George I. and accumulated much money besides; but he twice lost large fortunes (in 1737 and 1745), the first time through the expense and failure of theatre management. Yet he accumulated a third fortune, which again enabled him to exercise his large generosity, especially to poor musicians. In 1752 he became blind. He died at London, 13th April 1759. It is unnecessary to name the many Italian operas which H. composed from 1712 to 1741; his fame rests on his sublime oratorios, of which it is not too much to say that they are the noblest tribute ever offered by music to religion—*Esther* (1720), *Deborah* (1733), *Saul* and *Israel in Egypt* (1739), *The Messiah* (1742), *Samson* (1743), *Belshazzar* (1745), *Joshua* and *Judas Maccabæus* (1747), *Solomon* and *Theodora* (1749), *Jephtha* (1751). Other notable compositions of H.'s are the *Te Deum and Jubilate* for peace of Utrecht (1713), *Coronation Anthems* (1727), *Acis and Galatea* (1721), *Alexander's Feast* (1736), *Ode to St. Cecilia's Day* (1739), and instrumental music, including organ *Concertos* and harpsichord *Suites*. See Schoelcher's *Life of H.* (Lond. 1857) and Chrysander's *Georg Friedrich H.* (2 vols. Leips. 1858–60).

Hand'icapping, is the term given in horse-racing and other sports to the placing of competitors upon an equal footing by artificial means. Thus a superior horse is made to carry certain weights—the adjustment of which is left to a chosen handicapper. See HORSE-RACING.

Hands, Imposition of, as a symbol of blessing and consecration, was in use from the most primitive times (Gen. xlviii. 14–20; Num. xxvii. 18–20). 'It was as though the superior desired to let his whole spirit stream over through the glowing nerves of his hands on to him whom he honoured with his blessing and highest commissions.' Virtually the same thing was done when the priest, in greeting and blessing a multitude of people, stretched his hands over the crowd (Lev. ix. 22). So when the priest or the offerer laid his hands on the head of the victim to be offered, it indicated that he desired to transfer his own feelings to the creature which was, as it were, to appear in the presence of God for him (Exod. xxix. 10, 15, 19; Lev. i. 4,

&c.). The practice kept its hold down to Christian times, when it came to life again with new vigour, and the I. of H. was regarded as the symbol, the means, and the commencement of the communication of a divine influence of salvation, and especially of the Holy Spirit (Mark vii. 32; Acts viii. 18; 1 Tim. iv. 14; Heb. vi. 2).

Hand'sale. Anciently among Northern nations shaking of hands was held essential to complete a bargain. A sale thus made was called a H. In time the word came to mean the Earnest (q. v.) money given after the shaking of hands, or instead of it. In Scotland it is pronounced *hansel*, and means a small pecuniary gift, or *tip*. In that country the practice is not yet discontinued of making a present on or about the first Monday in the year (hence called *Hansel Monday*) to postmen, lamplighters, message-boys, &c.

Hand'writing. The strongest direct proof of any one having executed a writing is his own avowal, when he is a competent witness. The next best is the evidence of any one who saw the writing executed. The best indirect evidence is that of one acquainted with the H. of the individual; but this is insufficient in a criminal case. Writings in question are sometimes submitted along with the admittedly genuine writing of the individual to engravers and other skilled persons; but this latter mode of proof is considered somewhat inconclusive and unsatisfactory. In England, a jury is now allowed to form its own opinion by comparison of the disputed H. with that admitted to be genuine. In Scotland a Holograph (q. v.) will is held genuine without attestation, but it is not so held in England or Ireland.

Hang-Chow-Fu, the finest city in China, and the capital of the province of Chi-Kiang, on the Tsien-Tang, 20 miles from its mouth, in the Bay of H.-C.-F., and 150 miles S.E. of Nankin. It lies at the S. terminus of the Grand Canal, the various branches of which are spanned by innumerable bridges. A lofty wall, 20 miles in circumference, with ten monumental gateways, encloses but a portion of the city, which spreads over an immense area, most of the houses being of only one story. The 'Tartar city' (the name given to the Mantchu military colony or garrison) is hemmed off in the N.E. by a low wall. The streets, comparatively wide, are well paved, and there are many splendid temples and other stately buildings. Of these, the most remarkable are the palace of Kien-lung, containing the imperial library, a temple with 500 life-sized richly-gilded images of the Buddhist saints (*Jo-han*), and the ruined tower 'of the thundering winds.' There are several colleges and literary institutions, and in the vicinity many vast rock-cut images of a religious and mythological character, to which pilgrims resort in crowds. The neighbourhood is enriched by the arbor vitæ, and by camphor and tallow trees, and every available spot within the city is devoted to the cultivation of the mulberry. H.-C.-F. is widely celebrated for its silks, and especially for its embroidery. Its port is Chapu, on the N. shore of the bay, distant 50 miles. The great equinoctial *eagre* or bore, rising to a height of 30 feet, though guarded against by dykes and other works costing yearly some 130,000 dollars, is often very destructive. Estimated pop. 800,000. H.-C.-F. was the imperial capital under the Mongols, and was visited by Marco Polo in the 14th c.

Hang'ing is the mode of executing Capital Punishment (q. v.) most common in the countries of Western Europe. It was adopted in England as early as 1241, in the case of William Marise, a man of rank, who was hanged for piracy. Hanging murderers in chains near the scene of their crime, and dissecting the body after execution, were long prescribed in brutal cases by statute, but were abolished by 6 and 7 Will. IV. c. 30. Between the passing of sentence and the infliction of death there may elapse not less than fifteen, nor more than twenty-seven days. Public executions ceased in England in 1868. Reprieves are granted on certain legal and other grounds, and on account of mental alienation or pregnancy. Death in H. is produced by Strangulation (q. v.). The windpipe is compressed, the flow of the blood is stopped, and in some cases the jerk of the cord fractures the vertebræ. In France the substitute for H. is the guillotine, and in Spain the garotte.

Hanging Gardens, The, of Babylon, were regarded as one of the Seven Wonders of the world, and were said to have been the work of Semiramis or Nebuchadnezzar. The H. G. were a mass of terraces supported by pillars and elaborate masonry, forming an artificial hill of pyramidal shape in the vast plain of the Euphrates. They had an area of four acres, and were covered with luxuriant vegetation of all kinds, irrigated from a reservoir at the summit of the whole. The evidence for the existence of the H. G. has been questioned both in ancient and modern times.

Hankow' (*i.e.*, 'Han-port'), a great trading city in the heart of China, in the province of Hu-pé, at the confluence of the Han-kiang and Yang-tse-kiang, 600 miles from the mouth of the latter river. It is strictly a suburb of Wu-chang-fu, on the opposite side of the Yang-tse-kiang, and faces another suburb, Han-yang-fu, on the W. side of the Han-kiang. The river is navigable as far as H. for large steamers, and the cost and delay of transhipment has been abolished by securer lighting and pilotage. In the vicinity of H. are several large sheets of water; the surrounding country and great part of the settlement is submerged by the periodical floodings of the river. H. is fast becoming the chief market for the Hunan and Hu-pé teas and the depôt for the supply of the minor ports. The choicest teas are bought for Russia, and there are here a number of Russian firms and three factories, with steam apparatus for making brick-tea. Coal is found in considerable quantity in the vicinity. H. is a centre of various Chinese manufactures, notably ribbons, felt, and velvets. Regular steam lines are established with England and Odessa. In 1875 there entered the port 383 vessels of 284,944 tons; and cleared, 483 of 294,288 tons. Of these, 352 were British, 285 American, 203 Chinese, 22 German, and 4 Russian. In 1875 the value of the exports was £5,652,094; of the imports, foreign, £2,677,717; native, £2,176,091. The value of black tea exported was £3,067,903, of brick tea £197,290, of green tea £30,365, of raw silk £83,718, of tobacco (a new staple) £356,217, of fungus £136,920, of hemp £146,200, drugs £192,335, wood oil £444,364, and coal £24,851. The chief imports are cotton and woollen goods, opium, sugar, pepper, and fish from Japan and the Straits, and metals. The tobacco, which is of good quality, and of which 13,548,431 lbs. were exported in 1875, is sent *viâ* America to the European markets as genuine Havana. Estimated pop. of H., together with Wu-chang-fu and Han-yang-fu, 1,000,000. H. was opened to foreign commerce in 1858, and partly destroyed in the Tae-ping rebellion in 1861.

Han'ley, a market-town of Staffordshire, ranking since 1857 as a municipal borough, is 1½ miles from Stoke-upon-Trent, and is a terminus of a branch of the N. Staffordshire Railway. H., a comparatively modern town, is one of the most prosperous in the region of the Potteries. Its staple manufactures are those of earthenware, porcelain, and encaustic tiles, and has coal and iron pits in the neighbourhood. The public buildings are the town-hall, the mechanics' institute, the school of design, the North Staffordshire museum, the new Exchange (1875), and three large covered markets. For parliamentary purposes H. is part of the borough of Stoke-upon-Trent; the township of Skelton is included in the municipality of H. Pop. (1871) 39,976.

Hann'ibal, a city of Missouri, U.S., on the W. bank of the Mississippi, 150 miles above St. Louis by river, and 130 W. of Springfield by railway. It has a large lumber, grain, and tobacco trade, railway engineering works, and iron foundries. The river is here spanned by the splendid iron bridge of the Toledo, Wabash, and Western Railways, erected in 1872. Pop. (1870) 10,125.

Hannibal ('the grace or favour of Baal'). Many persons of this name occur in the history of Carthage, but by far the most celebrated was H. 'Barca,' born 247 B.C. When nine years old he accompanied his father Hamilcar to Spain after taking the memorable vow of everlasting enmity to Rome. He received his early training under the eye of his father, at whose death in battle he was present 229 B.C. Though only eighteen years of age at the time, he was intrusted by Hasdrubal (the son-in-law and successor of Hamilcar) with many important military enterprises, and on the assassination of the latter 221 B.C., was appointed commander-in-chief of the Carthaginian army. H., now twenty-six years of age, steadily followed in

the footsteps of his father, and already contemplated the conquest of Italy. His first act was to complete the subjugation of Spain. In the spring of 219 B.C. he attacked Saguntum, a city in alliance with the Romans, and took it after a siege of eight months. Embassy after embassy was sent by the Romans vainly demanding the surrender of H. War was therefore declared, 218 B.C., and thus began the tremendous struggle known as the second Punic War. Starting from New Carthage in the spring of 218 B.C. with 90,000 foot and 12,000 horse—a force that was considerably diminished by the assignment of 11,000 men to Hanno to keep the conquered province, by repeated encounters with the tribes between the Iberus and the Pyrenees, and by desertion—he pushed on towards Italy. From the foot of the Pyrenees he marched to the Rhone unopposed, crossed the river, though Scipio was at Marseille only four days' journey distant, continued his march along the left bank of the river to its confluence with the Isère, and by a timely interposition in his favour secured the efficient assistance of one of the chiefs of the Allobroges. He then crossed the Alps in fifteen days—one of the most memorable achievements on record, encountering almost insurmountable difficulties. Whether H. crossed the Cottian Alps by the pass of Mount Cenis, or the Graian Alps by the Little St. Bernard, will probably never be settled. Both theories have found eminent advocates; but, as Dr. Liddell observes, 'the controversy will probably last for ever; the data seem insufficient to enable us to form a positive judgment.' In five months H. had reached the plains of Italy. He now rested, and recruited his army, then marched against the Taurini, whom he soon subdued. Meanwhile Scipio, who had sent his own army into Spain, hastened to the N. of Italy, undertook the command there, and met H. on the plains to the W. of the Ticinus. H.'s Numidian horse were irresistible. Scipio, himself severely wounded, was defeated and recrossed the Po. At the Trebia the Romans fared no better. After the winter was over H. pushed southward through Liguria and the fens of the Arno with great loss (217 B.C.). Here he lost the sight of one eye by an attack of ophthalmia. He next reached Fesulæ, where he gave his troops a brief repose. He then defeated the consul Flaminius near Lake Thrasymenus with terrible disaster, crossed the Apennines to Picenum and Apulia, recrossed the Apennines, and descended into the rich Campanian plains, which he laid waste far and wide. He endeavoured to draw into battle the consul Fabius (q. v.)—surnamed, from his policy, *Cunctator*—who had been sent against him, but in this he was unsuccessful. H., however, managed to get out of the net which the wary Roman had spread for him, established himself in Apulia, and laid in provisions. He wintered at Gerunium, and late in the spring of next year surprised the Romans at Cannæ, where he fixed his headquarters. About the middle of June, on the banks of the Aufidus, quite near to Cannæ, he attacked and nearly annihilated the Roman army of 90,000 men under Terentius Varro and Æmilius Paulus. About 50,000 Romans were left on the field of battle, among whom were the consul Paulus, both the consuls of the past year, above eighty senators, and a host of knights and men of mark. Had H. now marched direct to Rome, he might have taken it without difficulty, and another civilisation might have influenced the destinies of Western Europe. But the blunder was irreparable. H. now tried to make himself master of Naples, but without success. Capua, however, opened its gates to receive him, and there he wintered (216-215 B.C.). The luxury of this city, is said to have demoralised his troops. Be this as it may, the star of H. now began to wane. He tried to turn the Italian nations against Rome, and to crush her by her own allies. In this he failed. In 211 B.C. he marched to Rome, and received a check. Still he traversed Italy, gained many signal victories, took many towns; but he was no nearer Rome than ever. The defeat and death of Hasdrubal, and the total loss of his army on the Metaurus 207 B.C., effectually turned the scale against H. For four years more (207-203 B.C.) he held his own in Bruttium, and at last, after fifteen years in Italy, during which the Romans estimated their loss in the field at not less than 300,000 men, he was recalled to Carthage, now in turn threatened by Scipio. The two generals met near Zama, and H., notwithstanding the heroic conduct of his veterans, was defeated with the loss of 20,000 men (202 B.C.). This blow was fatal to Carthage, and a peace was concluded in the following year. H., thwarted in his cherished scheme, now set about reforms at home; but his enemies accused him to the Romans of setting Antiochus III., King of Syria, against them, and he was compelled to leave Carthage. He fled to the court of Antiochus at Ephesus, where he was received with great honour. H. advised Antiochus, now (193 B.C.) on the eve of a war with Rome, to carry his arms into Italy, but without effect. On the conclusion of the war, one of the conditions was the surrender of H., who sought an asylum at the court of Prusias, King of Bithynia. But Rome could not rest while her arch-enemy lived, and T. Quintius Flamininus was sent to demand his immediate surrender. To avoid falling into the hands of his enemies he poisoned himself about 183 B.C. As a man H. was humane and magnanimous; as a general he was unrivalled. Among ancient authorities, Polybius, Dion Cassius, Plutarch, and Nepos may be consulted. See also the histories of Rome by Niebuhr, Arnold, Mommsen, &c., and, for the noblest tribute yet paid to the genius of the great Carthaginian, Professor Nichol's *H., a Historical Drama* (Glasg. 1873).

Hann'o, a more common name at Carthage than even Hamilcar or Hannibal. The most distinguished men who bore it were (1) H., the navigator and author of the *Periplus* (see next art.); (2) H., commander of the Carthaginians in Sicily in one of their wars with Dionysius, afterwards crucified by his countrymen for exciting a rebellion, 356-346 B.C.; (3) H., commander of the Carthaginian garrison at Messana, 264 B.C. For surrendering the citadel to the Romans he was condemned to be crucified on his return to Carthage; (4) H., son of Hamilcar, one of the three ambassadors sent to Regulus to sue for peace after the defeat near Adis; (5) H., commander of the Carthaginian fleet, defeated by Catulus off the Ægates, 241 B.C.; (6) H., surnamed the *Great*, on account of his successes in Africa, was long the leader of the aristocratic party at Carthage. While still young he held a command in Africa in the first Punic War. So great was his fame that he was regarded as the rival of Hamilcar Barca. When the mercenaries who had been employed in Sicily under Hamilcar returned to Africa, H. was sent to treat with them regarding the abatement of a part of their promised pay. Being unsuccessful, he was superseded by Hamilcar (q. v.). After his displacement H. refused to act with Hamilcar, but in time a formal reconciliation was effected. The two completed the subjection of Africa by the reduction of Utica and Hippo. After this H. was powerful in the councils of his country, uniformly opposed the Barcidæ, and thwarted to the utmost of his power the measures of that ambitious family.

Hanno, a celebrated navigator, whose work, the *Periplus*, written in the Punic language, still survives in a Greek translation. All that we know of his period is that he lived when Carthage was in the zenith of its power ('Punicis rebus florentissimis, Carthaginis potentia florente'). He was sent with sixty ships and 30,000 souls—an incredible number—to found colonies beyond the Pillars of Hercules. How far S. along the W. coast of Africa the fleet sailed is still matter of dispute. The *Periplus* of H. was first published at Basel, 1534; again at Strassburg, 1661; at Leyden, 1674; and with an English translation by Thomas Falconer at London, 1797, 8vo.

Hanno'ver (Eng. **Han'over**), a province of Prussia in the N.W. of Germany, has an area of 14,855 sq. miles, and a pop. (1875) of 2,018,868. The country belongs for the most part to the great N. German plain, only about a fourth of its area being hilly, chiefly in the region of the Harz. H. is watered by the Elbe, the Weser, and the Ems, with their numerous tributaries. The soil is generally poor, the great moor of Lüneburg and the marshy region and peat mosses of the N.W. comprising much ground wholly unfit even for pasture. All available ground is, however, diligently cultivated, and agriculture and cattle-breeding are the main occupations of the inhabitants. Manufactures are progressing, especially metal-working and the linen manufactures. The forests of the Harz, as well as its mineral treasures, are a source of wealth. Along the flat coast of E. Friesland shipbuilding and the fisheries are of importance. The people mainly belong to the Old Saxon stock. In most of the rural districts *Platt-Deutsch* (Low German) is the prevailing language, cognate to the Dutch and Frisian extensively spoken in the N.W.

History.—H. forms part of the land occupied by the Old Saxons, who furnished a large proportion of the Low German in-

vaders and conquerors of Britain in the 5th c., and who three centuries later, under their leader Wittikind, offered a stubborn and protracted, though in the end unavailing resistance to the arms of Karl the Great. For a notice of the earlier history of the country, see BRUNSWICK and SAXONY. The Brunswick-Lüneburg family, of which the dispossessed King of H. is the representative, was founded by Wilhelm the Younger, who in 1569 divided the territories of the Brunswick family with his brother Heinrich, the founder of the reigning ducal house of Brunswick. Wilhelm's descendant Friedrich left at his death in 1648 several sons, of whom Christian Ludwig and Georg Wilhelm founded the houses of Celle and H. respectively. But dying without male issue, they were succeeded in 1679 by a younger brother, Ernst August, who was in 1692 raised to the dignity of *Kurfürst* ('Elector'). By his marriage with the Princess Sophia, daughter of the unfortunate Friedrich, King of Bohemia, and Elizabeth, daughter of James I. of England, Ernst August secured to the house of H. the succession to the English throne, and in 1714 his son Georg Ludwig became George I. of England, as the nearest Protestant kinsman of Queen Anne. His new dignity did not alienate the affections of the English sovereign from his ancestral Hanoverian possessions, which in many ways benefited by their connection with England, the ports of H. becoming the main inlet and outlet of all German commerce with England and her colonies. During the great French war, especially between 1801 and 1806, H. was alternately in the possession of Prussia and of France. In 1807 a great part of it was transferred to the new kingdom of Westphalia, and in 1810 the remainder followed, with the exception of a strip along the coast, which was retained by the French Empire. In 1813 the British rights in H. were restored, the ancient feudal institutions being re-established, and next year H. was made a kingdom. A considerable addition of territory was secured in 1815. The next great event in the history of H. was in 1833, when a new constitution, based on liberal principles, was introduced. In 1837, on the accession of Victoria to the British throne, the crown of H. fell to the Duke of Cumberland, women being excluded from the succession in H. The new king Ernst August signalised the beginning of his reign by the abolition of the liberal institutions of 1833 by royal patent, and a return to the old constitution of 1819. Protest was unavailing, and the seven professors of Göttingen who declined the oath of allegiance under the new conditions were summarily deposed. In 1848 it was found necessary for the Government to sanction reforms much more advanced than those withdrawn by Ernst August, and it was not till 1855 that a thoroughly reactionary Ministry came into power. This Government ventured to modify the constitution in its own spirit, and showed itself distinctly hostile to German aspirations towards national unity. Alliance with the enemies of Prussia at the outbreak of the Austro-Prussian war in 1866 was fatal to H. The issue was the occupation of Hannoverian territory by Prussian troops on the 17th June, three days after the declaration of H.'s policy, the hopeless and fruitless battle at Langensalza on the 27th June, and the final incorporation of H. with Prussia on the 17th August. The new Prussian province retained but one or two distinctive privileges; amongst others, the state church in H. is still the Lutheran, and not, as in the old Prussian provinces, the United (Lutheran and Reformed).

The history of H. has been written by Spittler (1798), Havemann (1853–57), Schaumann (1864), and Oppermann (1860).

Hannover, capital of the province, is an important railway centre, and is situated on the navigable river Seine. It consists of an old town irregularly built, and a handsome new town which has come into existence since 1837, the line of the ancient fortifications being now occupied by wide avenues of trees. The palace in H. was restored in 1817. The magnificent townhouse dates from 1439, and the Marktkirche was built in 1349. There is a large museum and a polytechnic school; and the town possesses one of the handsomest theatres in Germany. The industry of H. is considerable, and includes iron founding and iron manufacturing, sugar refining, flax spinning, and cotton weaving. Machinery, chemicals, cement, linseed oil, and varnish are largely made. Near the town are the castles of Welfenschloss and Herrenhausen. Pop. of H., including the suburbs of Glocksee and Linden (1871), 104,248.

Han'sard, the name of a family and firm which has long been identified with the printing of British parliamentary documents, and especially of the semi-official reports of the debates. The founder, Luke H., was born at Norwich, 5th July 1752, succeeded Hughes as sole printer to the House of Commons in 1800, and died in London, 29th October 1828. His career, based on high intelligence, zeal, and probity, is ably sketched in the *Gentleman's Magazine* for December 1828. Although parliamentary printing is now no longer confined to one firm, the Messrs. H. produce, besides the debates, the bills before Parliament, the reports of committees, &c. The report of the debates, or *H.*, as it is specifically called, is compiled from the London newspapers. Each speech, however, is generally revised by the individual speaker, and to this is due the character of authenticity that attaches to the reports. Copies are procurable by purchase.

Hanseat'ic League, or **Hansa** (Ger. *hanse;* Goth. *hansa*, 'a league'), the most powerful of all the German confederations of cities, arose from a union made in 1241, between Hamburg and Lübeck, to protect their commerce, Brunswick entering into the alliance in 1247. The league was soon joined by other towns on the Baltic and in the neighbouring states, and in 1261 the first diet was held at Lübeck, the head city. There were at one time eighty-five towns in the confederacy, which sent representatives to the triennial diet, and which were divided into four circles:—(1) The Wendien, of which the chief city was Lübeck; (2) the Western, presided over by Köln; (3) the Saxon, of which the capital was Brunswick; and (4) the Eastern or Russian and Livonian, at the head of which was Danzig. The four chief foreign depots were at London, Bruges, Novgorod, and Bergen. The Hansa soon became very wealthy and powerful, maintained large fleets, defended Eric and Hakon of Norway, and Waldemar III. of Denmark, deposed Magnus of Sweden in 1348, and forced the rulers of England and France to form alliances favourable to the league. In the 14th c. much of the English export trade was in the hands of Hanseatic merchants, who were spoken of as *Easterlings*, whence the modern *sterling*. Had the union between the cities been closely cemented, and had they continued to act on broad commercial principles, they might have become rulers of all Northern Germany. But after their commercial monopoly was confirmed by the treaty of Colmar in 1285, they showed a narrow and jealous mercantile spirit, pursuing a ruinous, exclusive policy, and denying foreign merchants the privileges accorded to Hanseatic traders in other countries. The H. L. came to the height of its power in the 15th c., but the discovery of America turned trade into new channels. The strength of the League was sapped in constant embroilments, and after an unsuccessful struggle in the first half of the 16th c. with the Scandinavian kingdoms, whose union under Christiern II. the League had sought to break up, and against the German aristocratic party, the H. L. were decisively defeated at Assens, a blow from which they never recovered. In 1598 the blind adherence of the H. L. to their old prerogatives provoked Queen Elizabeth to expel their traders from London, while Drake seized sixty-one of their ships. The League, which was never formally recognised by the Empire, was practically dissolved in 1630, on the plea that most of the towns were no longer able to pay the expenses necessary to keep it up. Lübeck, Hamburg, Bremen, and Danzig, however, maintained their old alliance until 1810, when they were united to the French Empire. In 1813 they joined Frankfurt to form the league of free Hanseatic cities. In 1866 Frankfurt was added to Prussia; but Lübeck, Hamburg, and Bremen are still nominally free Hanse towns. The H. L. was at first formed to check feudal and kingly aggression, suppress piracy, and regulate and foster commerce. In these aims it was at first highly successful, and at one time exerted a most beneficial influence, stimulating enterprise, strengthening a love of freedom, and inculcating the general principles on which modern mercantile law is based, besides vastly increasing the wealth of the cities, and favouring agriculture, mining, and fisheries, as well as manufactures and trade. See Sartorius, *Geschichte des Hanseatischen Bundes* (3 vols. Gött. 1802–8); Lappenberg, *Urkundliche Geschichte des Ursprungs der Deutschen H.* (2 vols. Hamb. 1830); Barthold, *Geschichte der Deutschen H.* (3 vols. Leips. 1854); Falke, *Die H., als Deutsche See- und Handelsmacht* (Berl. 1862).

Han'sen, Peter Andreas, a German astronomer, was born at Tondern, in Schleswig, December 8, 1795. In 1825 he

became director of the Lieberg Observatory in Gotha, a position which he still holds. He is the author of several astronomical works, as *Untersuchungen über die gegenseitigen Störungen des Jupiter und Saturn* (1838); *Theorie des Aequatoreals* (1854); *Geodätische Untersuchungen* (1865); and *Anwendung der Methode der kleinsten Quadrate auf Geodäsie* (1868). His great reputation, however, rests upon his *Sonnentafeln* (1854) and *Mondtafeln* (1857). In the preparation of the latter he was led to call in question the then universally accepted value for the sun's parallax, which had been deduced from the transit observations of 1761 and 1769. He found that, for the concordance of theory and observation, the parallax would require to be increased (*i.e.*, the sun's distance diminished) by 1-30th. Leverrier was somewhat later led to the same conclusion, and their deductions have been fully verified by subsequent and more accurate determinations.

Han'si, an old town in the district of Hissar, Punjaub, British India, on the canal of Feroz Shah, 89 miles N.W. of Delhi. Pop. (1868) 13,563. It was fortified by the adventurer George Thomas at the end of the last century, and was the former capital of Hureeanah. Since the Mutiny, when the sepoys stationed here murdered the Europeans, the cantonment has been removed.

Han'steen, Christoffer, a Norwegian astronomer and physicist, was born at Christiania, September 26, 1784. In 1814 he was chosen Professor of Mathematics in the University of Christiania, and in 1819 published his great work on terrestrial magnetism, which attracted wide notice, and brought into general use his methods of observing magnetic phenomena. Two years later he discovered the regular daily variation of the horizontal intensity; and in following up his investigation travelled to various places, remaining in Siberia from 1828 to 1830. On his return to Norway, his exertions procured the erection, in 1833, of an observatory at Government expense, especially intended for magnetic observations. In 1837 he undertook the direction of the trigonometrical survey of Norway. He wrote treatises on geometry (1835) and mechanics (2 vols. 1836–38), and numerous memoirs in the *Magazin für Naturvidenskaberne*. More recently he published *Observations on Magnetic Inclination from* 1855 *to* 1864 (1865), and *On the Secular Variations of Magnetism* (1865). H. died 11th April 1873.

Han-Yang-Fu, a suburb of Wu-chang-fu, China, on the Yang-tse-kiang, at the point where it is joined by the Han-kiang, and on the opposite side of the latter river from Hankow (q. v.). It has manufactures of silks, velvets, ribbons, ...its, &c., but most of the inhabitants are engaged in the tea trade. Estimated pop. 300,000.

Haps'burg, or **Habs'burg, House of**, the family to which the present royal family of Austria belongs, received its name from the castle of Habsburg or Habichtsburg ('hawk castle') in Aargau, Switzerland, which was founded in 1020 by Bishop Werner of Strassburg, first Count of H., through whose brother Kanzeline it passed to Werner, second Count of H. The great-grandson of the last Albrecht III. ruled over Aargau, Elsass, and part of Suabia, and on the death of his son Rudolf I. in 1232 the possessions of the house were shared between Albrecht IV. and Rudolf II. The latter founded the Hapsburg-Lauenburg line, which became extinct in the male branch in 1408, though represented by the Denbigh family in England, and in 1415 the possessions of Rudolf II.'s descendants reverted to the Hapsburg-Hapsburgs, descendants of Albrecht IV., whose son Rudolf III. had been made King of the Germans in 1273, and had added the duchy of Austria, Styria, and Carinthia to his dominions, after defeating Ottocar of Bohemia in 1278. Rudolf's descendants held the office of Holy Roman Emperor from 1438 to 1806, and besides governing Austria have ruled in Spain, Burgundy, Tuscany, and Modena. See Coxe's *House of Austria*. Lichnowski's *Geschichte des Hauses Habsburg* (2 vols. Vienna, 1836–37).

Har'ald I., Haar'fager ('fair-haired'), the founder of the kingdom of Norway, was the son of Halfdan Svarte ('swarthy'), a great jarl (earl) in the S. of Norway, and a descendant of the Ynglinga family, the earliest Swedish dynasty. His father was accidentally drowned when H. was only ten, probably in 860, and the chieftains whom he had subdued and confirmed as his subjects by the 'Eidsiva Law' (*Heidsævis lög, Sefs lög*), sought to dismember the young king's inheritance, but were gradually reduced under the military skill of Hertug (Duke) Gutorm. Success awaking higher ambition, H. did not rest for ten or twelve years, till, as king of all Norway, he had won the Lady Gyda's hand, which the legend tells could only be gained at this price. A feudal system of government was then established, the udal-right ('Odel') of the common people was taken away, and the petty kings replaced by 'jarler,' and (under them) 'herser' (bailiffs)—the chief of all these being his stout helper Hakon Griotgardsön. H.'s good fortune in this was largely due to the desire of many prominent men, and especially Ragnvald, afterwards Mörejarl, to check the bloody feuds of the *smaa-konger* ('sma' kings') by placing the whole land under one head. At last, in the decisive battle of Hafrsfjord, near Stavanger, in 872, he defeated the combined fleet of the southern chieftains, after which many of them fled over seas, as 'Vikinger,' to escape from his stern rule. Iceland, the Faröes, Shetland, and the Orkneys were colonised by these exiles, and Normandy seized by Rolf, a powerful young viking from Möre. H. extended his dominion to the Hebrides. His rule was wise, and he greatly discountenanced the general piracy of his time, but his last years were embittered by the perpetual bickering and misconduct of his many sons, among whom at first he divided his kingdom. To restore unity, in 930 he made over the crown to his son Erik (Blodöxe), and died three years after, aged eighty-three.—**Harald III., Haardraade** ('hard-ruling'), son of Harald Haarfager's descendant, Sigurd Syr, 'jarl' of the uplands of Ringerike in Norway, fought at the battle of Stiklesbad (1030), along with his half-brother Olaf the Saint, when only fifteen. After this defeat he had to leave Norway, and passed through Russia to Constantinople, where he took service among the Emperor's mercenaries, the Varangians, still, however, keeping up connection with the Russian grand-dukes. After twelve years' eventful warfare had brought him great riches, he came to Norway at the end of his nephew Magnus the Good's reign. Joining Magnus's enemy, the Danish king Svend Estridson, he forced his nephew to give him a share in the government, an arrangement which led to many quarrels, Magnus's death in 1047 alone preventing a civil war. Though on his death-bed he had resigned to Svend his claims to the Danish crown, H. continued the war, now mainly confined to forays. The warlike, unquiet H. knew not how to conquer. He wanted one essential quality of a military ruler—the power of gaining the love of his own army and his own land. His avarice and severity often caused disobedience and the desertion of his own supporters, and his assassination of the brave Einar Tambeskjælver roused popular hatred against him. At last he was persuaded by Tostig, the brother of Harold Godwineson, to join an expedition against this, the last of the pre-Norman kings of England, but suffered a defeat at Stamfordbridge, near York, in which he fell (1066).

Har'bour (Old Eng. *hereberga*, lit. 'a station or resting-place for the army' on its march, but afterwards applied to a station for ships) is a port or haven which by its natural configuration or artificial construction affords a safe refuge and anchorage to vessels. The essentials of a good H. are protection from the violence of the waves and easy accessibility; and if to these is added sufficient depth of water at all tides, its value as a H. is greatly enhanced. The great majority of harbours are, however, *tidal*, so that, though they may be useful as harbours of refuge, they are very inconvenient for purposes of lading and unlading. Accordingly, when such a H. is of any commercial importance, it is provided with an enclosed dock, into which ships enter at time of high water. (See DOCK.) Permanent harbours, which have always a sufficient depth of water, may dispense with the dock; but the same inconvenience in shipping and unshipping cargo is present on account of the rising and falling of the tide. In the Mediterranean, Caspian, and other inland seas and lakes, where the tides are hardly perceptible, this disadvantage does not exist. These permanent harbours are employed either for military or civil purposes. To the former class belong the extensive harbours of Plymouth, Portsmouth, Cherbourg, Brest, &c.; and to the latter the smaller harbours of Southampton, Liverpool, Glasgow, London, Bordeaux, Havre, &c.

The construction of harbours necessarily accompanies the rise of commerce, and the remains of the great H. works at Tyre attest the genius and energy of the early Phœnician engineers. The coast of Greece was so well provided with natural harbours

that this art of naval construction did not develop to more than the erection of simple moles, breakwaters, or other minor works. The Romans, however, were forced through circumstances to resort to the formation of artificial ports; and perhaps their most perfect undertaking was the H. of Ostia, at the mouth of the Tiber. The revival of commerce in the middle ages resulted in the construction of the ports at Genoa and Venice. France soon followed the example of Italy; but not till the latter half of last century was England impressed with the importance of having ports and havens for the protection of its commerce and the safety of its shipping.

In constructing a H. the engineer must take into account many local characteristics, such as the geological features of the coast, the direction of prevailing winds and currents, the line of greatest reach of open sea in front, the maximum height of the waves and the character of the breakers, the effects of tidal influence, and other minor details. The protecting walls must be of the form best suited to resist the force of the waves; but engineers are not decided upon which really is the best, some arguing in favour of a perpendicular front, others maintaining the superiority of a gradual slope. Another important consideration is the relation which the width of the entrance bears to the area of H.; for upon this depends the tranquillity or reductive power of the H. Mr. Thomas Stevenson, the author of a work upon harbours, gives the following formula for the reductive power:—$x = \frac{H}{\sqrt{B}} \left\{ \sqrt{b} - \frac{1}{50} (\sqrt{B} + \sqrt{b}\sqrt[4]{D}) \right\}$ where x=height of wave at place of observation; H=height of wave at entrance; B=breadth of H. at place of observation; b=breadth of entrance; D=distance from mouth of H. to place of observation. $x \div H$ is the reductive power. The material employed for constructing the walls of harbours may be wood, metal, or stone. Wood, however, is not suitable for positions of great exposure; and all three are gradually wasted away by mechanical or chemical action. The great improvement of late years has been the introduction of Portland cement, which can be formed into blocks of any size, and which, when hardened, is nearly as durable as sandstone. Besides Stevenson's work above mentioned, see Sir J. Rennie's *Harbours* and the *Minutes of Proceedings of the Institute of Civil Engineers.*

Laws Regarding Harbours or Ports.—Ports are *inter regalia;* the right to erect or hold them being vested in the crown, except when the right is given by royal or parliamentary grant to a subject. Any one obtaining a grant of a harbour is bound to keep it in proper repair, and is entitled to levy harbour dues for the purpose, the rate of dues being regulated by custom. The granter is not bound to repair or improve the harbour at his own expense; but he is not entitled, without the authority of Parliament, to exact additional dues to indemnify himself for any extraordinary expenditure or improvement. The Act 10 Vict. c. 27 applies to the United Kingdom. It regulates the procedure of all bodies having charge of piers, docks, and harbours. It also defines their duties as regards the levying.

Har'burg, a town of Hanover, Prussia, on the southern branch of the Elbe, 6 miles S. of Hamburg, with which it is connected by railway. H. has foundries and machine works, manufactures of india-rubber, waxcloth, and sailcloth, and has a thriving trade. In 1871 1227 sea-going ships of 43,220 tons entered the port. Pop. (1875) 17,131.

Har'denberg, Friedrich, Freiherr von, better known by his assumed name *Novalis,* was born on the family estate near Mansfeld, in Prussian Saxony, May 2, 1772, studied philosophy and law at Jena, Leipsic, and Wittenberg, but in 1795 accepted a post in connection with the saltworks at Weissenfels. His early death, March 25, 1801, prevented the fulfilment of the rich promise of his youth; yet the originality and poetic power of his unfinished novel, *Heinrich von Ofterdingen,* entitle H. to rank as one of the best representatives of the 'Romantic school.' His religious poems are among the most beautiful that exist in the German tongue. H. regarded his *Hymnen an die Nacht* as his most perfect work. He is often fantastic, more frequently obscure; but the mystical form never conceals the wealth of pure and tender feeling that everywhere lurks under it. His friends Tieck and F. Schlegel superintended an edition of H.'s *Sämmtliche Schriften* in 1804 (5th ed. Berl. 1837-46). See Carlyle's *Miscellaneous Essays.*

Hardenberg, Karl August, Fürst von, born 31st May 1750 at Essenroda, in Hanover, of a noble family, early devoted himself to the political service of his native state. The seduction of his wife by the 'first gentleman of Europe,' the Prince of Wales of the period, was the occasion of his accepting a public post from the Duke of Brunswick, whom in 1791 he left for the service of Friedrich Wilhelm II. of Prussia. Under Friedrich Wilhelm III., H. in 1804 succeeded Haugwitz as Prime Minister, the French policy of the latter having ended in the military occupation of Hanover. H. endeavoured to maintain neutrality, and also to cultivate English interests. After the disaster of Jena he undertook for a short time the *portfolio* of foreign affairs. When Stein came into power in 1810 he was made chancellor, and began that brilliant series of internal reforms which are associated with his name, and to which Prussia owes her present position. He swept away ecclesiastical and aristocratic exemptions and corporation abuses. He created the class of free peasants, permitting them to redeem feudal burdens by the surrender of a portion of their lands. His labours, both diplomatic and legislative, were rewarded in 1814 by the title of prince. He next revised the political constitution and the municipal organisation of his country. He equalised custom duties, improved the system of public records, and was favourable to the introduction of a representative system. Having gone to Rome to sign a concordat, he fell ill, and died at Genoa, 26th November 1822. See Klose's *Leben Karl August's, Fürsten von H.* (Halle, 1851). His autobiography and papers were issued by L. von Ranke as *Denkwürdigkeiten des Staats Kanzlers Fürsten von H.* (4 vols. Leips. 1877).

Har'derwijk, a seaport of Holland, province of Gelderland, on the E. shore of the Zuider Zee, 20 miles S.W. of Zwolle by railway. It has extensive fisheries and an export trade in grain, butter, eels, herrings, &c. Pop. (1873) 5067. H. is an old Hanse town, and has frequently suffered the misfortunes of war.

Har'dicanute. See HARTHACNUT.

Har'dinge, Henry, Viscount, an English general and statesman, was the son of a Durhamshire rector, and was born 30th March 1785, entered the army in 1800, and served through the Peninsular and Waterloo campaigns; at the battle of Ligny he lost a hand. He afterwards became Secretary of State for War, Secretary for Ireland, and finally Commander-in-Chief of the British army on the death of the Duke of Wellington in 1852. But he is best known as Governor-General of India from 1844 to 1848, a period which included the first Sikh war, in which Lord H. took a personal share by the side of Lord Gough, the commander-in-chief, and was made a Viscount for his services. He died 24th September 1856. His pension of £3000 a year is continued to his two next successors in the peerage.

Hard'ness is a property of matter possessed only by solids. In mineralogy, the H. of a body is measured by its power of scratching other substances. Thus the garnet scratches felspar, but is scratched by topaz, and accordingly it is intermediate in hardness to these. For comparison, a *scale of H.* has been constructed of ten well-known minerals, which increase gradually in H. from *talc* to diamond. This scale is as follows—(1) *talc;* (2) *rock salt;* (3) *calc spar,* transparent variety; (4) *fluor spar,* crystallised variety; (5) *apatite,* transparent crystal; (6) *felspar,* cleavable variety; (7) *quartz,* transparent variety; (8) *topaz,* transparent crystal; (9) *sapphire,* cleavable variety; (10) *diamond.* The first six can be scratched with a knife, so that by one simple trial the position of any substance in the scale can be approximately determined.

Har'douin, Jean, commonly called **Père H.,** a French scholar, born of humble parents at Quimper, Brittany, in 1627. He early became a Jesuit, devoted himself to ancient literature and numismatology, and sought to establish the wild theory that most of the Greek and Latin classics, except Plautus, Virgil's *Georgics,* Pliny's *Natural History,* Horace's *Satires* and *Epistles,* Homer's *Iliad,* and Herodotus, were monastic forgeries of the 13th c. He declared that Virgil's *Æneid* was an allegorical account of St. Peter's journey to Rome, and that the New Testament was originally written in Latin. H. was made librarian of the Collège Louis-le-Grand in 1683, and died September 3, 1729. Among his works are an edition of Pliny's *Natural History* (1685); *Chronologia ex nummis antiquis restituta* (1697); *Conciliorum Collectio* (1715); *Apologie d'Homère* (1716); *Opera Varia* (1733); and *Prolegomena ad Censuram Veterum Scripto-*

rum (1766), in which his strange opinions on ancient literature are set forth.

Hard'ware, a trade term signifying all kinds of articles manufactured from the base metals, as iron, steel, copper, brass, &c. Birmingham, Wolverhampton, and Sheffield are important seats of the industry.

Hard Wood, applied to the *duramen* or heart wood of exogenous trees. Hard-wooded trees are those in which the timber is hard and heavy, such as oak, elm, beech, ash, &c.; while soft-wooded trees are those in which the timber is soft and light such as poplars, willows, &c.

Hare (*Lepus timidus*), a species of *Rodentia* belonging to the family *Leporidæ*, of which group it and the Rabbit (q. v.) are the typical examples. The family is distinguished by the presence of four incisor teeth in the upper jaw, but the H. has two additional incisors of small size. The molars are rootless. The fore-feet have five, and the hind-feet four toes. The tail is rudimentary. The ears in the H. are larger than in the rabbit; the hind limbs also attain a greater relative length. No canine teeth are found. There are six premolars in the upper and four in the lower jaw, while the molars number six in each jaw. The fur of the H. is redder than that of the rabbit. The average weight of the animal is from 8 to 13 or 14 lbs., the length about 2 feet. The under parts are white, as also the breast. The H. is usually accounted of a timid disposition, but instances are on record of its turning upon its oppressor with considerable fury. That it possesses no small amount of instinct is evident from the skilful way in which it contrives to double, and to take every advantage of inequalities in the ground when pursued by the Greyhound (q. v.) and other dogs. Many of the popular notions regarding its timidity have probably arisen from the fact that its habits have seldom been carefully studied, and that we oftenest associate the H. with its pursuit by a pack of hounds. Other varieties are the Irish H. (*Lepus Hibernicus*), which is generally believed to represent a distinct species. It has shorter limbs and ears, and a head of more rounded conformation than the common H.; the Alpine or blue H. (*Lepus variabilis*), noted for its change of coat in winter, hence called 'the changing' H.; the Arctic H. (*L. glacialis*), which also assumes a white colour in winter, its summer fur being of a brownish-grey hue. Various other species occur in India, N. America, N and S. Africa, &c.

Law Regarding Hares.—It is a misdemeanour in England punishable by fine or imprisonment to take or kill a hare in any warren or ground used for keeping them between the first hour after sunset and the beginning of the last hour before sunrise. The same offence in the daytime is punishable by a fine not exceeding £5. The owner of enclosed land may kill hares without a license; so may the tenant if his lease entitle him to kill them. Nor is a license required to hunt them with greyhounds or beagles. The Act 11 and 12 Vict. c. 31 enables all persons having a right to kill hares in Scotland to do so, or to authorise others to do so, without a game certificate. See GAME LAWS.

Hare'bell, the popular name for *Campanula rotundifolia*, called also bluebell, and witches' thimbles in Scotland. *Hyacinthus nonscriptus* (*Scilla nutans*), a plant belonging to the lily order, is the bluebell of England.

Hare's-Ear, applied to species of *Bupleurum*, a genus of plants belonging to the natural order Umbelliferæ (q. v.), and natives of temperate regions. They have no economic value, although early medical authors ascribe certain virtues to them. *B. rotundifolia* is one of the four British species, and is called thorow-wax from the stem 'waxing' or growing through the leaf. Several species are cultivated in gardens for the curious inflorescence.

Har'fleur (anc. *Arefluctus*; medieval, *Hare-flot*), a village in the department of Seine-Inférieure, France, near the mouth of the Lézarde, on the right bank of the Seine, about 4 miles E. of Havre. It stands in a marshy district, and has a castle in the Renaissance style, and a fine Gothic church built by the English to commemorate Agincourt. In the middle ages H. was a place of commercial importance, and had a strong fortress, taken, after a brave resistance, by Henry V. of England in 1415. H. was again taken by the French in 1433, by the English in 1448, and by Charles VII. of France in 1450. Pop. 1800.

Har'greaves, James, inventor of the spinning-jenny, was born at Stanhill, near Blackburn. He was an uneducated weaver and spinner, and in 1760 invented the carding-machine. After unsuccessfully trying to spin several cotton threads at once, having noticed on one occasion when his child upset the spinning-wheel that the spindle revolved vertically, while the wheel revolved horizontally, the idea flashed on him of placing several vertical spindles side by side, and from this idea he developed his invention of the Spinning-Jenny (q. v.) in 1764. The invention was at first kept a secret, but his neighbours, noticing how much cotton he and his family spun, entered his house and broke his machine, whereupon, in 1768, he established a spinning-mill at Nottingham. Having unfortunately sold machines before they were patented, he lost the claim to the patent on his invention, and died a poor man in April 1788.

Hari-Kari, a Chinese expression signifying a 'happy despatch,' and used of suicide effected by the infliction of two cross gashes in the abdomen—a form of self-destruction much practised in Japan. Officials guilty of a grave offence are invited by the authorities to perform H.-K., and are thus enabled to escape formal degradation and disgrace. H.-K. is also had recourse to by private persons who have received any intolerable affront.

Hăr'ing, Wilhelm, a German novelist, known by the pseudonym of Wilibald Alexis, was born at Breslau, 23d June 1797. He studied law, but soon devoted himself wholly to literature, and attained great celebrity in the field of 'historical romance.' His first successful work, *Walladmor*, which appeared as a translation from Sir Walter Scott (3d ed. Berl. 1823-24); *Schloss Avalon* (1827); *Cabanis* (1832); *Der Roland von Berlin* (1842); *Der falsche Waldemar* (1842); and *Dorothea* are H.'s best-known works. He also published tales of travel, and edited a collection of criminal trials. His *Gesammelte Werke* in 18 vols. appeared at Berlin in 1861-66. H. died at Arnstadt in Thuringia, 16th December 1871.

Hari'ri, Abu Mohammed al Kassim Ben Ali, an Arabic philosopher and poet, was born at Bassorah about A.D. 1054. The name H. means 'the silk-worker,' and refers to the occupation of his parents, who were wealthy. In spite of the troubles caused by the invasion of Malek Shah, the Turk, H. probably received a good education. He became *Sahib-al-Khabar*, or political intelligence agent, about the time when Baldwin of Flanders led the crusade to Edessa and some of these events are alluded to in his work the *Makamas* (1101), a collection of fifty short dramas, partly verse, partly prose, which was modelled on the work of Hamadani, and is probably after the Koran the greatest of Arabic classics. The leading characters are the wise and decorous Haret, and the clever vagabond, Abu-Seid. Some of these dramas H. read in public at the mosque. They contain many proverbs and literary and grammatical observations, and some verses which became popular songs. Assonance, or the incomplete rhyme which consists in the repetition of vowel sounds, is much used. During his life H. was accused of being a mere *mushi* or compiler, and also of treating frivolous subjects in opposition to the text of the Koran. H. died in September 1122. While H.'s works are much more artificial than the early poems such as the *Moallakat* of the 6th c. or the *Hamasa* of Abu Temman (A.D. 830), they represent a reaction in favour of natural simplicity of taste against the extravagant conceits of Motanabbi and Abul-Ola. The *Makamas* have been largely imitated, and commented on in Hebrew and Syriac as well as Arabic; a similar work, called *The Meeting of the Two Seas*, was produced by a Maronite writer as lately as 1857. The same author (Nasif-al-Jazidji) published, in 1848, a criticism of Silvestre de Sacy's edition of the *Makamas*, now superseded by that of Reinaud and Derenbourg (1847-53). The *Makamas* have been translated into German by the poet Rückert (1826), and into English by Preston (1850), who translates *Makamat* as 'rhetorical anecdote.' H. also wrote the *Molhat-al-Irab*, or 'The Delights of Grammatical Analysis,' and the *Dorrat-al-Gaouas*, 'The Pearl of the Diver,' a work on subtle errors of speech. See Chenery's translation of the 'Assemblies' (Lond. 1867).

Harlaw', Battle of, took place in the year 1411. It was caused by a conflict over the earldom of Ross between the great Highland chieftain of the times, Donald, Lord of the Isles, and the Regent of Scotland, the Duke of Albany. Donald, being promised the support of an English fleet, invaded the Eastern

Lowlands at the head of 10,000 men, ravaged the country as far as Aberdeenshire, when he was confronted at Harlaw, on the Ury, 18 miles from Aberdeen, by a force of Gordons, Buchans, and others, under the Earl of Mar, on the 20th July 1411. Although Mar was confronted by an army outnumbering his by ten to one, a desperate struggle ensued, in which the Lowlanders stood their ground, but with a fearful loss of gentry and men-at-arms. The provost and chief magistrates of Aberdeen were also killed. The retreat of the 'hieland kern' next day gave the fruits of the victory to the Earl of Mar, and ultimately the Duke of Albany was able to force from the Lord of the Isles the earldom of Ross, and vassalage to the Scottish crown. Of the ballads commemorating the fight Scott's fragment in the *Antiquary* is by far the finest. See Fullarton's *Scottish Highlands* (new ed.), and Burton (*History of Scotland*, vol. iv.), who says that the defeat of Donald of the Isles 'was felt as a more memorable deliverance even than that of Bannockburn.'

Har'lequin, Clown, Pantaloon', and Col'umbine, the chief characters in the harlequinade of the modern pantomime. The harlequin is the *arlechino* (Fr. *arlequin*) of the Italian *Commedia dell' Arte*, and was transferred to the Italian stage from the Roman *Fabulæ Atellanæ*. (See PANTOMIME.) In the modern pantomime he is supposed to be the hero of the 'burlesque opening' transformed into a magician, who is the lover of the columbine, and the stroke of whose wand produces sudden changes of scenery. In Italy the harlequin was at first the same as the mime, or actor who mimicked everyday life; he afterwards sank into a stupid glutton, the butt of his companion who was named *Brighella*. Goldoni changed him into a wit, in which capacity he was transported to the French theatre. The character of harlequin is said to have been introduced to the English stage by Rich in the 18th c. The clown, who is descended from the *sannio* or jester of the Roman *Fabulæ Atellanæ* through the Italian *zanni*, is perpetually engaged in knavery and comic, and is assisted in his mischief-making by the pantaloon, represented as a weak old man. The last character, as well as the columbine, are of later origin than the harlequin and clown. The pantaloon arose from the Spanish *capitan* or captain, who was at first represented as a hectoring bravo, and who, after kicking a Spanish *capitan*, was caned by the harlequin. But when the Spanish power in Italy waned, the Spanish *capitan* was turned into an abject coward, who still wore the Spanish dress, and who is the pantaloon of the modern English pantomime. The columbine is the heroine of the burlesque introduction to the pantomime, whose function now lies merely in dancing. The H., C., P., and C. all appeared in the old *Commedia dell' Arte* of the Italians.

Har'lequin Duck' (*Clangula histrionica*), a species of duck belonging to the genus *Clangula*, distinguished by the peculiar mottling and variegation of its plumage, which is marked with hues of black, white, and grey. It is an inhabitant of northern regions. The average length is 16 inches.

Har'ley, Robert, Earl of Oxford, an English politician, belonging to a Herefordshire family at one time prominent among the Presbyterians, but afterwards devoted to the Restoration, was born at London in 1661. Soon after entering Parliament H. became a Tory, and was elected Speaker when Rochester and Godolphin came into office in 1701. When, in spite of the Occasional Conformity and Queen Anne's Bounty Bills, Lord Nottingham quarrelled with Marlborough in 1704, H. and St. John entered the Cabinet as Secretary of State and Secretary for War respectively. H.'s interest was promoted by his cousin, Abigail Hill, soon to become Mrs. Masham. The introduction of Cowper and Sunderland to the Ministry rendered his position insecure, and the conviction of his clerk Gregg for treasonable correspondence with France decided his dismissal in 1708. When the peace party triumphed over Marlborough in 1710, H. became Chancellor of the Exchequer. The absurd incident of the Guiscard assault made him very popular, and he became Lord High Treasurer, and was created Earl of Oxford and Mortimer. He and Bolingbroke negotiated the Peace of Utrecht (1713), and passed the Schism Act, and began to intrigue with St. Germains. On the Queen's death they both were impeached by the House of Commons. After two years' imprisonment, H. was discharged without trial. He died May 21, 1724. H. bequeathed to the British Museum the Harleian MSS., which include the two golden Latin Gospels, the oldest *Odyssey*, and a great number of topographical and historical papers, abbey registers, parliamentary regal records, antiphonars, &c. See Defoe's *Eleven Opinions of Mr. H.* (1711), and *The Secret History of Arlus and Adolphus* (H. and Godolphin), *Minister to the Empress of Grandinsula* (Lond. 1710).

Har'lingen. See HAARLINGEN.

Har'maline and **Har'mine** are two Alkaloids (q. v.) which occur in the husk of the seeds of the Syrian rue (*Peganum harmala*), a plant which is cultivated in the steppes of Southern Russia, and is employed in dyeing silk shades of red. Harmaline is a white crystalline substance, having a bitter astringent taste, and colours the saliva yellow. It is but slightly soluble in water and ether, but is readily dissolved by hot alcohol. It forms yellow salts with acids. Its composition is represented by the formula $C_{13}H_{14}N_2O$. By limited oxidation harmaline may be made to lose two atoms of hydrogen, and to become transformed into harmine, $C_{13}H_{12}N_2O$—a substance which, as just stated, is also found in the Syrian rue. Harmine is crystalline, only slightly soluble in alcohol and ether, and nearly insoluble in water. It is a powerful bane, actually expelling ammonia from its salts when boiled with their solutions, and uniting with the acids they contain. It forms colourless salts with acids, the solutions of which are bluish in colour when dilute, yellow when concentrated. When harmaline is submitted to the prolonged action of oxidising agents it yields a red substance, the salts of which form the red colouring matter known as *Harmaline Red.*

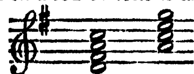
Harmatt'an, a dry and withering hot wind that blows from the interior of Africa along the coast of Guinea. Its influence, injurious alike to the human frame and to vegetation, is felt chiefly in the months of January, February, and March. The H. has the same origin as the Sirocco (q. v.) of the Mediterranean.

Harmo'dius and **Aristogei'ton,** two Athenian youths who, to revenge a private insult, conspired to destroy the Pisistratidæ. During the Panathenaic festival, B.C. 514, they attacked and slew Hipparchus, but H. was cut down by the guards, and A. was seized and executed by Hippias. Though the Pisistratidæ were not expelled till 510, the two friends were regarded by posterity as the true restorers of freedom. Their descendants had admission to the free table in the Prytaneum, statues were erected to their honour, and their glory sung by the poets, especially in the *Scholia* or 'table-songs.'

Harmon'ica, the name given to several different musical instruments. In all, the tones are produced by the friction of the finger or the striking of a hammer on *glass*. The harmonica invented by Dr. Franklin consisted of bell-shaped glasses, tuned in semitones, which revolved round a spindle and were touched by the moistened fingers.

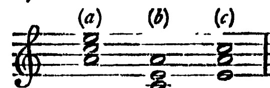
Harmon'ic Mo'tion, in kinematics, is any motion which recurs periodically. *Simple H. M.*, which plays such an important part in many physical phenomena, is rigidly defined as the orthogonal projection upon a straight line of uniform circular motion. Now, this motion is approximately that of a pendulum, or of the simplest vibrations of a tuning-fork, and of the media through which sound, light, heat, &c., are propagated. Considering the motion of a long pendulum, it is observed that the bob has a certain range on each side of the position it would occupy when at rest. The greatest range from the mean position is called the *amplitude;* and the smaller the amplitude in comparison to the length of the pendulum the more approximately is the motion a simple H. M. The *period* is the time which elapses from any instant till the bob again moves through the same point in the same direction. The *epoch* is the time which elapses from the era of reckoning (an arbitrarily chosen element) till the bob first comes to its greatest distance from the middle position measured in the positive direction. Simple H. M. is intimately related to all wave motions. This will be at once evident when it is observed that a water wave, for instance, travels along the surface of the water in virtue of the up and down motion imparted to each particle. For a detailed discussion, see Thomson and Tait's *Natural Philosophy*, vol. i.

Harmon'ic Progress'ion is a series whose successive terms are the reciprocals of the terms of an arithmetical progression, such as $1, \frac{1}{4}, \frac{1}{7}, \frac{1}{10}$, &c. $\frac{1}{a-b}, \frac{1}{a}, \frac{1}{a+b}$ is an H. P. of

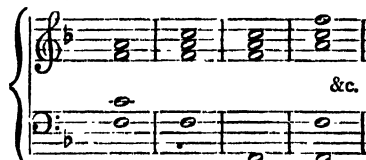


three terms; and $\frac{1}{a}$ is the harmonic mean between $\frac{1}{a-b}$ and $\frac{1}{a+b}$. In geometry, a straight line is said to be divided in *harmonic ratio* when the ratio of the parts into which it is divided by an internal section is equal to the ratio of its parts by an external section. The base of a triangle, intersected by the lines which bisect the interior and exterior vertical angles, is divided in harmonic ratio.

Harmon'ics, the sounds which go to make up what to the ordinary ear is itself *one sound*. As the vibrations of a whole string, or a whole column of air, produce a tone of a certain pitch, so the vibrations of its aliquot parts, which proceed along with those of the whole, produce higher, weaker, but not inaudible tones, which play their part in the total effect of the 'note' in question. The experiments which prove this cannot be described here; the reader may consult Sedley Taylor's *Sound and Music* (Macmillan, Lond. 1873). The H. are produced by vibrations whose numbers per second are respectively 2, 3, 4, &c., times as great as those of the fundamental tone of the string (if we use the 'string' as the most convenient example), in other words, by the vibrations of ½, ⅓, ¼, &c., of the length of the whole string. We give the H. of a low 'C,' or at least 10 of them—9 'overtones' and the 'fundamental.'



A sound need not contain the full number of H., but 'in no case can a tone intermediate in pitch between any two consecutive members of the series make its appearance.' A tuning-fork, again, furnishes an example of a simple, indivisible sound.



Harmo'nium. A musical instrument, with keyboard, whose sounds are produced by the passage of air through vibrating 'reeds.' A reed, in this sense, is a slip of metal of rectangular shape, free to move except at one end; it forms part of a larger piece, and moves up and down in a slit just its own size. The bellows are moved by means of footboards, and, as the air is sent into a wind-chest, a continuous stream presses against the reeds. The stops draw away wooden slides, and so open the particular sets of reeds—according to the number of stops, there may be one reed or several to each note—to the influence of the wind. The 'expression' stop brings the action of the wind on the reeds under the more direct and rapid control of the player. The instrument has a range of five octaves, from C to C, but sometimes there are stops which add an octave above and below, each note giving a sound an octave higher or lower than its normal one. The harmoniums used in this country are principally of French manufacture. Debain (the inventor), and Alexandre (at Paris), Schiedmayer (at Stuttgard), and Kaufmann (at Dresden) are the chief makers.

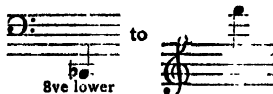
Har'mony. In a musical sense this word means the simultaneous sounding of different tones. In the vibrations of *one* string or column of air there are heard various tones, but the physical facts underlying the 'consonance' or agreement of tones must not be confounded with that consonance itself. The first answer to the question, 'What tones sound well together?' is 'Any tone along with its major or minor third and its fifth.' (See INTERVAL.) Such a combination is called a 'common chord' or 'triad.' Of the triads in the major scale, that on the seventh tone—with imperfect fifth——and that on the third tone are the least common. Of course it is sufficient to consider one key—if the minor be only a 'mode' of the major—in order to get a complete view of the chords of all keys. The tones G, B, D make up *different chords* in keys G and C respectively. At intervals within the octave, we find, next, 'chords of the seventh,' in which a fourth tone is used—

The seventh is discordant with the 'root' (D, A, are the roots in diagram), and is employed under certain limitations. Even ninths, elevenths, and thirteenths to any given tone sometimes bring into existence distinct and original chords, though as intervals they are only compound forms of smaller intervals (the octave being merely a reduplication). Any single chord may stand in various positions, thus—

Moreover, the parts may stand at different distances from one another, and may be more or fewer in number, and wider or narrower in extent, thus—

H. involves also the *progression* of chords, and many other essential matters that cannot even be named here. See Banister's *Music* (Bell & Sons, Lond.); Curwen's *How to Observe H.*; and Macfarren's *Lectures on H.* (new ed. Lond. 1877).

Har'mony, although in its more extended sense it means a book in which the Scriptures, either of the Old or the New Testament, are arranged in chronological order, in its original and more limited sense deals only with the Gospels, which are four narratives of the life of Christ requiring to be harmonised on account of their real or apparent discrepancies. (See GOSPELS.) The first work of the kind was that of Tatian (q. v.), in the 2d c., which, however, was not a H. proper, but a *diatessaron*, that is, a single continuous narrative extracted from the four Gospels. The first H. proper, in which the four Gospels were arranged in two, three, or four parallel columns, according as a narrative of the same particular occurs in two, three, or four of them, was compiled in the 3d c. by Ammonius of Alexandria, who, taking Matthew as his standard, arranged in parallel columns the corresponding passages of the other three. On this work was founded the more elaborate *Ten Indexes* of Eusebius. Since the Reformation at least two hundred attempts have been made to compile a H., showing both the interest taken in the subject and the difficulty of the undertaking. Four of the latest and best are those by Stroud (1853), Anger (1851), Tischendorf (1851), Robinson (1845), Greswell (1830).



Har'mony of the Spheres, the music made, according to an ancient fancy, by the orderly motions of the stars and planets. See Shakespeare's *Merchant of Venice*, act v. scene 1, and Milton's *Hymn on the Nativity*.

Harms, Klaus, a revered leader of Lutheran orthodoxy, was born at Fahrstedt, in S. Ditmarsch, Holstein, May 25, 1778, and till his nineteenth year assisted his father in the management of a cornmill and attached farm. But his zealous desire to study theology triumphed. He became pastor in 1806, archdeacon at Kiel in 1816, and died there as *oberconsistorialrath*, 1st February 1855. H. was a powerful preacher, and was throughout his life an earnest and energetic enemy of Rationalism in all its forms. In 1817, in remembrance of Luther's theses just 300 years earlier, he nailed ninety-five theses against the religion of nature to the door of the University Church in Kiel, and published in 1819 a large work to the same effect. His sermons, *Winter- und Sommer-Postille* (published 1808-15), reached a sixth edition in 1846. His *Pastoral Theologie* appeared in 1830. See H.'s Autobiography (Kiel, 1851).

Har'old I., surnamed **Harefoot**, King of England, was the son of Cnut, whom he succeeded in 1035. It was not until 1037, however, that he had any real control over Wessex. His reign was marked by lawlessness and bloodshed. Little is known of his character. He is said to have received his surname from his swiftness. To this time belongs the great Mercian earl, Leofric, the husband of Lady Godiva (q. v.).—**H. II.**, known also as **H. Godwineson**, the second son of Earl Godwine of Kent, and of Gytha, a Danish lady. During the latter

part of Eadward the Confessor's reign, the chief administrative power rested with H., who followed out his father's wise and peaceful national policy, preserving strict justice and order, and developing the kingdom's resources. He invaded Wales successfully in 1063, drove his brother Tostig—who was plotting to succeed Eadward—to Flanders, and on Eadward's death was chosen king, January 10, 1066. Shortly before he had been shipwrecked on the coast of Normandy, where William, duke of the country, had forced him to swear on the bones of Norman saints to aid the duke in his claim to the English throne, a claim which William prepared to enforce on H.'s accession. Tostig now invaded Yorkshire with a great host under Harald Hardrada, King of Norway. H. routed them decisively at Stamford Bridge, September 25, 1066, shortly before William of Normandy landed on the southern coast. When that event took place, H. at once marched against the new enemy without having time to muster his kingdom's strength, and was slain by an arrow which pierced his right eye in the battle of Senlac, or Hastings, October 14, 1066. H. was a skilful and fearless soldier, and a clear-headed, strong-willed, prudent, and just ruler. As the last of the dynasty of purely English kings, and the antagonist of the Normans, he has been raised into a kind of national hero, and painted in somewhat deceptive romantic colours. See Freeman's *Norman Conquest*, vol. i.

Harp (Old Eng. *hearpa*, Ger. *harfe*, Fr. *harpe*, probably named from the way of sounding it by 'snatching' at the strings; if so, comp. Gr. *harpazō* and Lat. *carpo* and *rapio*), a musical stringed instrument that was in some forms known to the Hebrews, the Egyptians, the Assyrians, and the old Celtic and Teutonic nations. With the Greeks the *lyre* was commoner, and the Roman 'cithara' is indifferently translated 'H., lyre, lute, guitar,' &c. Harps and harpists were highly honoured by our forefathers, as the stories about King Ælfred, Caedmon the poet, and many others testify. The H. is still in use in Wales, and occasionally appears in a modern orchestra. A revival of its popularity took place about 1820, but of this few traces are left. Of the several kinds of H. now in use the most important is Erard's, which has given the modern impetus to H.-playing. The compass of this instrument is from

Each string can be altered two semitones by the action of pedals, so that it represents three notes in all.

Harpe, Jean François de la, a French author whose reputation has faded, was born at Paris, 20th November 1739. He lost his parents when young, received a good education by charity, and began a literary life at twenty with a volume of heroic verses, which was followed by the tragedy of *Warwick*, called by Grimm 'the first effort of a young man of sixty.' In spite of its want of force and originality, the play was a success. His other dramas were failures, and after a residence of three years at Ferney in the intimate friendship of Voltaire, he began the more congenial career of a critic in the *Mercure*. *Mélanie or the Nun*, written against forced vows, gained him admission to the French Academy. But his greatest hit was his *Cours de Littérature* at the Lycéum, opened in 1786. He did not know or understand much of classical literature, or of the historical beginnings of French literature. But the authors of the 17th and 18th centuries, and especially the French tragedy as understood by Racine and Voltaire, he expounded with perfect knowledge and considerable force. Of this he printed twelve volumes during his life. The last edition, with additions, contains 18 vols. (1825-26). When the Revolution came, H., who had adopted the philosophical standpoint of Voltaire, welcomed it with enthusiasm. This did not save him from being thrown into prison in April 1794. There he seems to have suffered conversion to Catholicism, and when he came out he was an ardent Royalist. He died at Paris, 11th February 1803. See Petitot's *Memoirs of H.*, and a notice by Daunon.

Har'per's Ferr'y, a village of Virginia, U.S., at the confluence of the Potomac and Shenandoah, 70 miles W. of Baltimore by railway. It is a railway junction, and the seat of a Government arsenal and armoury. Pop. (1870) 2500. H. F. was held for a few hours by John Brown and the Abolitionists in 1859. In April 1861 it was occupied by the Confederates, who, on being forced to retire, destroyed the bridge over the Potomac, the arsenal, and armoury. During Lee's invasion of Maryland, in September 1862, the Confederates compelled it to surrender, and received 12,000 prisoners, 73 guns, 13,000 small arms, besides a large quantity of stores.

Har'pies (Gr. *harpyiai*, 'the snatchers') are in Greek mythology the symbols of the rushing storm-wind. In Homer, who gives the name of one, Podarge, they are swift goddesses, the ravishers of all that disappear without trace. Hesiod mentions Aello and Okypete, the winged and fair-locked daughters of Thaumas and Electra; but afterwards their number grew, and they were represented as winged monsters, half maidens, half birds. In the legend of the Argonauts, they are the tormentors of the blind seer Phineus, who seize and soil his food, until driven away and slain by Zetes and Calais, the winged sons of Boreas; or, as others say, pursued to the Strophades, and there compelled to pledge their oath to leave Phineus in peace. It is there that they are met with in Virgil. In the story of the Argo, however, the H. are personifications, not of the storm-wind, but of foul, omnivorous hunger.

Harpoc'rates (the *Har-pe-chret*, 'the child Horus' of the hieroglyphics), youngest son of Osiris and Isis, was regarded by the Greeks as the god of silence. Among the Egyptians H. was properly only a surname of the young Horus, considered as the rising sun. He was represented as a child, naked, and in a sitting posture, with his finger on his mouth.

Harpoon' (Fr. *harpon*, from *harper*, 'to seize with the nails;' of Teutonic origin), a kind of spear with flattened barbs used for striking whales and other large fish. The H., attached to a long line, is generally thrown from the hand, though gun harpoons, projected from a small swivel cannon fixed in the whaling boat, are also employed.

Harp-Shell (*Harpa*), the popular name given to various species of Gasteropodous mollusca belonging to the family of the whelks (*Buccinidæ*). Of the H.-S. the best-known species are the imperial H.-S. (*H. imperialis*) and the little H.-S. (*H. minor*). They are found in tropical seas, and are distinguished by the regular ridges developed on the outer surface of the shell. The colour of the former is chestnut and white with yellow tints; the latter is darker, and about 1½ inches in length.

Harp'sichord (Ital. *cembalo*, Fr. *clavecin*, Ger. *flügel*), a keyed musical instrument, in shape like a grand pianoforte, whose strings were twanged by pieces of crowquill or hard leather. The date of its invention is uncertain, but it was in use in the 16th c., was introduced into England early in the 17th c., and was manufactured here in the 18th c. principally by Kirkman, Broadwood, and Schudi. Important music was written for it, *e.g.*, by Händel. In its most improved form it could give forth differences of tone, but was deficient in the *shading* of loud and soft into each other. See PIANOFORTE.

Har'py Eagle (*Thrasætus harpyia*), also known as the crested eagle, inhabits S. America, and attains a size even exceeding that of the Golden Eagle (q. v.). The feathers of the head and neck form a ruff or crest, which under excitement is capable of being raised or erected, and entirely changes the aspect of the bird. The general colour is a very dark slate grey, the under parts being white, and the tail barred with black and grey. The crest itself is grey, the feathers having black tips. The H. E. is very rapacious, killing and carrying off young deer, sheep, and smaller animals. The wings have their fourth, fifth, and sixth quills longest, and the talons are especially powerful.

Har'quebus. See ARQUEBUS.

Harr'ier, a collective name applied to various species of Raptorial birds nearly allied to the sparrow-hawks, but included in a special sub-family—that of the *Circinæ*. Their characters are found in the wavy form of the bill-margins, and in the large oval nostrils hidden by feathers. The third and fourth quills are the longest. The tail is long and rounded. The outer toe is longer than the inner, and the claws are long and slender. These birds are distributed throughout the world. The common or hen H. (*Circus cyaneus*) is found in Britain, and is the enemy of small

field animals, of lizards, snakes, frogs, &c. The general colour is an ashen grey; the hinder parts are white; the toes, beak, and cere yellow. The average length is 18 inches, but the females are somewhat larger, and of darker colour. The marsh H. or moor buzzard (*C. æruginosus*) is a second species. Its plumage is grey, and it attains a length of 2 feet. Jardine's H. (*C. Jardinii*), inhabiting Australia, has the under surface spotted with white on a chestnut ground.

Hen Harrier.

Harr'ier, a variety of dog, so named from its being generally used in the pursuit of the hare. It is very closely allied to the foxhound, many authorities regarding it as simply a foxhound of small size. The average height is 17 or 18 inches, and the colours are generally of the boldly-marked nature seen in the foxhound. The scent of the H. is keen.

Harr'ington, James, an English political author, the son of Sir Sapcotes H., was born in Rutlandshire in January 1611. Educated at Oxford under Chillingworth, he visited several of the European courts, and became the intimate friend of Elizabeth of Bohemia and the Prince of Orange. After the execution of Charles I. he withdrew into private life to think out a political system for England, and in 1656 published his rigorously republican romance, *The Commonwealth of Oceana*, which he dedicated to Cromwell. H.'s leading idea is that political power is necessarily founded on property in land. Hence the whole people should practically be the landlords. Olphaus Megaletos (Cromwell) appears as Lord Archon of Oceana, 'the sea-girt isle.' The whole people is divided into freemen and servants, and government carried on by a council of fifty, deliberating by ballot, which is also used in the election of clergy, local judges and officers, deputies, &c. The *Oceana*, abridged into the *Art of Lawgiving* (1659), was the subject of discussion at the Rota Club, formed by H., of which Cyriac Skinner, Milton's friend, was a member. In 1661 he was thrown into the Tower, and in spite of *Habeas Corpus* detained prisoner at St. Nicholas Island, Plymouth, on a charge of treasonable practices, but was afterwards released. He died 11th September 1667. Montesquieu has reproached H. with building air-castles instead of studying the noble constitution of his country. The best edition of H.'s works is that of Hollis (1771). See the *Life of H.* (1700) by Toland.—**Sir John H.**, an English poet, born in 1561, died in 1612, is known as the translator of the *Orlando Furioso* (1591), and the author of the *Metamorphosis of Ajax* (Lond. 1596, new ed. 1814), and of the *Epigrams* (Lond. 1615).

Harr'is, a parish of Scotland, comprising the S. portion of Lewis (q. v.), and the islets Taransay, Scarpa, Pabbay, &c.

Harr'is, James, an English philologist, was born at Salisbury, 20th July 1709. His mother was Lady Elizabeth Cooper, sister of Lord Shaftesbury. After studying at Oxford, he devoted most of his leisure to the classics, entered Parliament in 1761 for Christchurch, held some Government posts, became Comptroller to the Queen, and died 22d December 1780. His chief work is the now almost forgotten *Hermes, or a Philosophical Inquiry concerning Language and Universal Grammar* (1751). Sentences he divides into forms of assertion and forms of command. Words are significant either by themselves or by relation. These give him nouns and verbs on the one hand, and articles and conjunctions on the other. Along with verbs, he takes adjectives and participles, and translates a good deal of unintelligible matter from Aristotle about the 'latent parts' and the 'supposed affections' of verbs. Conjunctions, he says, are void of meaning, and language itself he puts on the basis of an 'original compact.' It is obvious that this book is without scientific value. *Hermes* was preceded by *Essays on the Fine Arts and Happiness*, and followed by *Philosophical Arrangements*, the first part of a work on Aristotle's logic, and by *Philological Inquiries*. His Life, by his son, Lord Malmesbury, is prefixed to the edition of his works in 1801.

Harr'isburg, capital of Pennsylvania, U.S., lies on the E. bank of the Susquehanna, 60 miles from its mouth, and 106 W.N.W. of Philadelphia by railway. It is the junction of five railways, the terminus of the Pennsylvania Canal, and a great depôt for lumber *viâ* the Susquehanna, which is here spanned by three railway bridges and a carriage one, each over a mile long. Besides handsome state buildings in the midst of a fine park, H. has thirty-eight churches, a state library of 40,000 volumes, an opera-house, a lunatic asylum, three daily and six weekly newspapers, &c. It is the seat of a Roman Catholic bishop. The chief industrial establishments are Bessemer steel-works, blast-furnaces, ironworks, cotton, flour, and saw mills, and broom factories. Pop. (1870) 23,104. H. was settled by John Harris in 1733.

Harr'ison, John, an English mechanician, was born at Faulby, Yorkshire, in 1693. He made many improvements in watchmaking, and is specially celebrated as the inventor of the *compensation curb* and the *gridiron pendulum*, which modify and lessen the effects of varying temperature upon the rate at which the timepiece goes. His *going fusee* and *remontoir escapement* were also important improvements in horology. H. was the first who constructed a chronometer for determining longitude, which, after two successful voyages to Jamaica (1761–64), obtained for him the Government award of £20,000. He died in London, March 24, 1776.

Harr'ison, William Henry, ninth President of the United States, was the third son of Governor Benjamin Harrison, and was born at Berkeley, Virginia, 9th February 1773. When nineteen years of age he entered the army, and distinguished himself in the frontier wars with the Indians, resigning his commission in 1797. From 1801 to 1812 he acted as Governor of Indiana, when he was appointed brigadier, and subsequently major-general in command of the north-western frontier. He became a senator in 1824, and was the unsuccessful Whig candidate for the Presidency in 1836. In 1840 he was elected President by 234 votes against 60 for Mr. Van Buren, but only lived to reign at the White House for one month. He died on 4th April 1841 from illness brought on by excitement and fatigue.

Harr'ogate, a town in Yorkshire, England, beautifully situated in Knaresborough Forest, near the river Nidd, 3 miles S.W. of Knaresborough, and 15½ N. of Leeds by railway. It is a fashionable spa, with many sulphurous, saline, and chalybeate springs, pleasure grounds, baths, hotels, &c. The visitors are said to number 40,000 annually. The springs, discovered in 1571, were minutely reported on by Professor Hoffmann in 1854. The former villages, Low and High H., the latter 596 feet above the sea and commanding a splendid view, are united by what is now called Central H., consisting of lines of modern houses. Pop. (1871) 6843.

Harr'ow (Old Eng. *hyrwe*, 'anything that *tears up*'), an agricultural implement consisting of a series of long iron teeth or tines set in a strong wooden or iron framework, and so arranged that, when dragged over the ground, each tine makes a separate groove or rut. The H. is used principally for covering over seed after it has been sown in ploughed land, and being dragged across the ploughed ridges it at once smooths the ground and disposes the seed roughly in lines corresponding to the depressions between the ridges. A drill-H. is a two-handed implement with strong curved tines for pulverising and cleaning between the furrows of green crops. A grubber is an implement of a similar nature to the drill-H., employed for pulverising ploughed or fallow land previous to depositing seed therein.

Harr'ow-on-the-Hill', a town of Middlesex, England, on an elevation commanding a view over thirteen counties, is 11 miles N.W. of London by railway. Its church of St. Mary has a square embattled tower visible for many miles, and contains the tombs of Sir Samuel Garth, John Lyon, the founder of H.-on-the-H. school, &c. It is gas-lit and has a good water supply. Pop. (1871) 4997. H.-on-the-H. is chiefly notable on account of the famous grammar-school founded here and endowed by John Lyon, a wealthy yeoman, in 1571, for the education of poor boys of the parish, but which has developed into one of the most famous higher class schools in the kingdom. The many modern additions have been kept strictly in harmony with the original brick Elizabethan building. An elegant school chapel was built from de-

signs by Sir G. G. Scott in 1859. Out of the Lyon Memorial Fund (1872) of £28,000, a new speech-room, gymnasium, laboratory, &c., were erected. In 1877 the school had twenty classical masters, and over 500 pupils. There are ten scholarships at Oxford and Cambridge, the annual value of which is £625. Among illustrious Harrovians are Dr. Parr, Sir William Jones, Richard Sheridan, Lord Byron, Sir Robert Peel, and George Canning.

Harry, Blind, or **Henry the Minstrel,** a Scottish author of the 15th c., who about 1470 wrote *The Adventures of Sir William Wallace,* which he pretended was based on a Latin life of Wallace by his chaplain Arnold Blair. Almost our only knowledge of B. H. is derived from a passage in Joannes Major's Latin *History of Scotland.* He is mentioned in the Treasury accounts of the King as an occasional recipient of the royal bounty, the last of these notices occurring in January 1492. It is therefore improbable that he survived the close of the 15th c. The oldest existing transcript of the poem bears the date 1488, and curiously enough neither it nor the first printed editions (1520 and 1570) say who was the author. It was repeatedly reissued in the 17th c., and was immensely popular. In the 18th c. Hamilton of Gilbertfield executed a modernised version (1722), which kept alive the national enthusiasm. Burns says, 'The story of Wallace poured a Scottish prejudice into my veins, which will boil along there till the floodgates of life shut in eternal rest.' The work, generally rough and bold in style, is in no sense whatever historical. Its animosities are those of the 15th, and not of the 13th c. Admitting that the poem abounds with evidence of topographical knowledge, and that the wandering minstrel had gathered from every nook and corner of the land the romantic traditions of a heroic life, it must still be pronounced in its great outlines a tissue of wild fiction, told with a somewhat blatant energy of patriotism, and marked by a coarse and even ludicrous zest for bloodshed and revenge.

Hart. See STAG.

Hart, Solomon Alexander, R.A., an English artist, born at Plymouth in 1806, became a student in the Royal Academy in 1823, worked first as a miniature painter, but afterwards devoted himself to oil-painting, and soon gained a wide reputation. He was made A.R.A. in 1835, R.A. in 1840, Professor of Painting in the Royal Academy in 1857, and librarian to the Royal Academy in 1868. Among his works are 'The Elevation of the Law' (1830); 'Wolsey and Buckingham' (1834); 'Cœur-de-Lion and the Soldan Saladin' (1835); 'Milton Visiting Galileo in Prison' (1847); 'The Three Inventors of Printing' (1852); 'Lady Jane Grey in the Tower' (1860).

Harte, Francis Bret, an American novelist and poet, born in Albany, New York, on 25th August 1839. In 1854, while the gold fever was raging, he went to California, and, mining, teaching, and travelling, there gleaned that ripe experience of life which characterises his works. After three years' wanderings, he settled down as a compositor in the office of the *Golden Era,* San Francisco; and some happy original sketches put into type by himself attracting the attention of the proprietor, he was transferred to the literary department of that journal. From 1864 to 1870 he acted as Secretary to the United States Mint in San Francisco, and during this time *John Burns of Gettysburg, The Society upon the Stanislaws,* &c., appeared in Californian newspapers. In July 1868 H. started the *Overland Mail,* in which his best works appeared. Of these, the best known are *The Luck of Roaring Camp, The Outcasts of Poker Flat, Tennessee's Partner,* and *Plain Language from Truthful James, or The Heathen Chinee.* A volume of clever parodies, *Condensed Novels,* was published in New York in 1867, republished in Boston in 1871, and it has since been followed by four new volumes of the same kind. In 1870 H. was appointed Professor of Modern Literature in the University of California, but in 1871, resigned his appointment and removed to New York. In 1880 he was appointed United States Consul at Glasgow. *East and West Poems* appeared in 1871, *Poetical Works Illustrated* in 1871, *Select Poems* in 1874, *Gabriel Conroy,* a novel, and in 1876 *Thankful Blossom* and *Two Men of Sandy Bar.* His style is terse, and his tales abound in graphic descriptions. His colours are dashed on with a bold and powerful brush, and with a few skilful strokes he produces grand effects. The characters of his stories are rough and rugged as the land in which they move, but they stand out in fresh, true realism—outcasts, vagabonds, adventurers—their human weaknesses not blinked, but their human virtues tenderly revealed. Unknown a few years ago, he is now widely read in French and German, and M. Deutzon, in the *Revue des Deux Mondes,* has given an elaborate analysis of his powers.

Har'tebeest, a Dutch name given to several kinds of antelopes, of which the most typical example is the H. (*Alcephalus Caäma*) of S. and Central Africa. The genus to which it belongs is distinguished by horns of a lyrate shape, which are thick at the base and bent acutely backwards at their tips. The muzzle is broad, and the 'muffle' small. The colour is a greyish brown, and the animal may be readily known by a large white patch on the haunches, and a black mark on the cheek. The average height is about 5 feet. The bastard H. (*Damalis lunatus*) is of reddish-brown colour, and has simple lyre-shaped horns, widely separated at the tips. It inhabits districts near the tropic of Capricorn.

Hart'ford, the capital of Connecticut, U.S., on the W. bank of the Connecticut river, and 60 miles from its mouth, 111 N.E. of New York by railway. It is a great railway centre, has daily steamboat communication with New York, and freight lines to Philadelphia, Baltimore, and Albany, besides some 200 sailing craft in the coasting trade. In 1873, after years of controversy, and after sharing the honour with New Haven, it was made sole capital of the State, and a grand State legislative building of white marble was erected (1875) at a cost of $1,500,000. H. is the seat of Trinity College (Episcopal), founded in 1823, and of a Roman Catholic bishopric, and has, among many other churches, the first Congregational Church in New England (1638), a library of reference of 25,000 volumes, a free library of 25,000, an athenæum, an arsenal, a lunatic and a deaf and dumb asylum, a picture gallery, three daily newspapers, &c. The leading business is insurance, the gross assets of its ten companies being 14,420,411 dollars. Two offices have granite buildings that cost 750,000 dollars each; the cost to the companies of H. by the fires of Chicago and Boston alone (1871-72) was 12,000,000 dollars. Among the chief manufactures are firearms, silks, tobacco, cottons, carriages, machinery, boilers, &c. The Colt's firearms works (capital, 1,000,000 dollars) are confined within a dyke 1½ miles long, 32½ feet high, and 50 feet wide at its base, reclaiming 123 acres from the overflow of the river. Pop. (1870) 37,743. H. was settled in 1635, and named after Hertford in England, the birthplace of Rev. Samuel Stone, a Congregationalist. It had the first written constitution in America, of date 1639; and the first code of laws was drawn up here, reducing the criminal offences (160 in England) to fifteen, in 1650. In 1662 Charles II. granted the colony a charter, secreted for safety (1687-89) in the hollow of an oak, which hence came to be called 'the charter oak,' and gave to H. the name of 'charter oak city.'

Hart'ford Convention was an assembly at H. (15th December 1814 to 5th January 1815) of several leading citizens of Federal politics nominated by the Legislatures of Massachusetts, Connecticut, and Rhode Island, and opposed to the war with Great Britain of 1812-15, for the purpose of proposing the amendment of defects in the constitution disclosed by the condition of things in New England during the war. They were held to be treasonably contemplating a dissolution of the Union, and subsequently incurred much unmerited obloquy.

Hart'ington, the Right Hon. Spencer Compton Cavendish, Marquis of, eldest surviving son of William, 7th Duke of Devonshire, was born July 23, 1833, and educated at Trinity College, Cambridge, where he graduated B.A. in 1854 and was made LL.D. in 1862. He entered the House of Commons in 1857 as one of the Liberal Members for North Lancashire, moved a vote of no confidence in Lord Derby's Government in 1859, and was appointed a Lord of Admiralty in March 1863, and in the April following Under-Secretary for War. In 1866 he became Secretary for War in Lord John Russell's second administration. He lost his seat for North Lancashire at the general election of 1868, but was soon after returned for the Radnor Boroughs. In the Gladstone Cabinet he held the office of Postmaster-General till January 1871, when he became Chief Secretary for Ireland. Shortly before the assembling of Parliament in 1875, Mr. Gladstone resigned the leadership of the Liberal party, and in February 1876 the Marquis of H. was chosen his successor. During the momentous period from 1876

to 1880 he led the Liberal Opposition with skill, sagacity, and moderation. In the winter of 1877 he was elected Lord Rector of the University of Edinburgh, and about the same time addressed a great meeting in that city, when he enunciated the lines of policy on which he thought his party should move. It was at this time understood that he would be the head of the next Liberal ministry, but the enthusiasm evoked by the speeches of Mr. Gladstone during the years 1879-80 compelled the latter to resume the conduct of affairs in the Liberal ministry of 1880. The Queen indeed sent for the Marquis of H., and requested him to form a ministry, but he declined the responsibility and recommended Her Majesty to accept again the services of Mr Gladstone, in whose Cabinet he holds (May 1880) the office of Secretary of State for India.

Hart'lepool, a seaport of England, in the county of Durham, on the N. side of a small headland forming the Bay of H., opposite W. H., 4 miles N. of the Tees estuary, 20 E.S.E. of Durham, and 10 N.E. of Middlesbrough by railway. It has a good harbour, extensive docks, iron-shipbuilding yards, iron-works, puddling furnaces, brass and iron foundries, mast and block lofts, sawing and planing mills, &c. It is supplied with hard water for domestic use by tapping the springs in the magnesian limestone upon which the town is built, and with soft for industrial purposes by the rain stored in reservoirs at Hart, 3 miles distant, capable of holding 25,000,000 gallons, and now being enlarged. Besides several churches, one a fine specimen of Norman architecture, recently restored, H. has a townhouse of brick and stone in the Italian style, built in 1866, and covering a market 300 feet square. Its trade is chiefly in the export of coal and coke, cottons, woollens, machinery, &c., and in the import of timber, grain, flax, cattle, cheese, spirits, &c. In 1875 there entered the ports of the two Hartlepools 2208 vessels of 525,637 tons, and cleared 5170 of 964,528 tons. Pop. (1871) 13,166. **West H.** lies on the S. side of the bay, 1 mile distant from H., with which it is united by railway. The docks extend between the two towns, and are the property of the North-Eastern Railway Company, who are now constructing extensions. The area of the present docks (1877) is 32¼ acres, and the new docks 34 acres, making 66¼ in all, besides timber ponds covering 1·2¼ acres. W. H. was founded by Ralph Ward Jackson, a railway speculator, in 1847, rapidly grew, and now has a similar and more extensive trade than old H., as well as greater industries. The official trade-returns of the two ports are given jointly under H. The two Hartlepools, with the adjacent Throston, Stranton, and Seaton Carew, send one member to Parliament. Pop. (1871) 26,804.

Hart'ley, David, an English philosopher, the son of a Yorkshire clergyman, was born August 30, 1705. He studied at Cambridge for the Church, but not being able to sign the Articles, became a physician, and practised successively at Newark, Bury St. Edmunds, London, and Bath, where he died, August 25, 1757. His uneventful life was marked by piety and benevolence. In 1748 H. published his *Observations on Man—his Frame, his Duty, and his Expectations* (2 vols.), the theory of which he had suggested in *Conjecturæ quædam de Sensu, Motu, et Idearum Generatione*. The possibility of deducing the intellectual pleasures and pains from associations had been first maintained by Gay in a dissertation prefixed to Law's translation of King *On the Origin of Evil*. Newton, at the end of the *Principia*, and in the questions annexed to his *Optics*, had hinted that vibrations of an ether might be a cause of sensation. Premising that the *white* medullary substance of the brain, spinal marrow, and nerves are the instruments of sensation and motion (physiology now regards the *grey* matter as the immediate organ), H. argues that external objects cause continuing vibrations of the infinitesimal medullary particles of nerve and brain, which are propagated by an ether penetrating the pores of the nervous substance. He even supposed there might be an infinitesimal elementary body intermediate between the soul and the gross body. All this remained, like the 'vibrations' of Descartes, and the 'transformed sensations' of Condillac, the rudest hypothesis. H. knew nothing of the length or duration of the objective vibrations, on which the sensations of light, sound, and heat have now been ascertained to depend, and he did not even imagine a law of nervous vibration, according to which the simplest mental operation might physiologically be explained. Accordingly the theory is omitted from the abstract of the observations by Dr. Priestley. The real psychological value of the work lies in the application to some of the lower processes, called automatic and secondarily automatic, of the principles of association already enunciated by Hobbes and Locke. This is done with a simplicity and vigour of style which has fascinated many, notably Coleridge, who used to sleep with the book under his pillow.

Hart'mann, Eduard von, a retired officer of Prussian cavalry, and author of the most paradoxical and popular of recent metaphysical systems. H. was born in Berlin, 23d February 1842, was disabled by an accident from entering on active military service, and devoted himself to philosophy in 1864. The *Philosophie des Unbewussten* ('Philosophy of the Unconscious'), to which H. owes his fame, appeared in 1869, and in 1874 had reached a sixth edition. H.'s system is strictly monistic, the basis, principle, or cause of the universe being regarded as unconscious spirit, with the attributes of will and ideation. Both attributes attain to consciousness only in the animal world. With Schopenhauer H. is convinced that the universe contains upon the whole much more evil than good, and that it were much better that the universe did not exist. In so far H. is thoroughly pessimistic; but he declines to affirm that ours is the worst of possible worlds. On the contrary, the teleological perfection which an unconscious providence has brought about goes far to prove that this is the best of *possible* worlds. Still, man's chief end is to hope for, and to strive, according to prescribed methods, towards the extinction of existence, towards the blessedness of *Nirvana*. Like Schopenhauer, with whose system H.'s has the nearest affinity, H. has the deepest contempt for 'professor-philosophy,' and the professors are in return agreed that H.'s system is but dillettanti philosophising. H. has also, though an adherent of the development theory, written against the mechanical aspect of Darwinism; and as an advocate of a return to a purified Brahmanical faith, published a work on the *Selbstzersetzung des Christenthums* ('Self-Dissolution of Christianity,' 2d ed. 1875). His *Gesammelte Studien* began to appear in Berlin in 1876. In 1877 he published *Wahrheit und Irrthum im Darwinismus*.

Harto'gia, a genus of Dicotyledons belonging to the natural order *Celestraceæ*, represented by one species (*H. Capensis*) found in S. Africa. It is a small shrubby tree, the wood of which is often used for veneers at the Cape of Good Hope. The genus is named in honour of Hartog, a celebrated Dutch traveller.

Harts'horn, or Spirits of Hartshorn, is still employed to designate a solution of Ammonia (q. v.). The name is derived from the solution having been formerly prepared by distilling shavings of horn.

Hart's-Tongue, a species of *Scolopendrium*, a genus of Ferns (q. v.) characterised by their simple tufted fronds. They are highly ornamental plants. There are about a dozen known species—one, *S. vulgare*, is British—of which there are innumerable varieties cultivated.

Hart's-Tongue (*Scolopendrium*).

Hartz'enbusch, Juan Eugenio, a dramatic author of German descent, born at Madrid, Spain, September 6, 1806. He was educated by the Jesuits, but gave up the Church for literature, working also as a carpenter until 1835, when he was placed as a reporter on the staff of the *Madrid Gazette*. He afterwards held a post in the royal library, Madrid, and was made president of the theatrical council in 1852. He has produced many dramas, of which the chief are *Doña Mencia* (1838); *La Redoma Encantada* (1839); *La Visionaria* (1846); *Alfonso el Casto* (1841); *Primero Yo* (1842); *La Coja y el Encogido* (1843); *La Madre de Pelayo* (1846); *La Archiduquesita* (1854); *Vida por Honra* (1854); *El mal Apostol y el buen Ladron* (1860). His plays are original, imaginative, and vigorous in language, imitating the ancient dramatists without being frigid or affected. H. has also produced excellent editions of Molina (12 vols. 1839-42); Calderon (1849-51); Alarcon (1852); and Lope de

Vega (4 vols. 1853). More recently he has published *Cuentos y Fabulas* (2 vols. 1861); *Obras de Encargo* (1864); and *Obras Escogidas* (1865).

Hârun' al Rash'id ('Aaron the Just'), the most famous of the Abbasides, and the second son of the Calif Mohammed Mehdi, was born at Rei, Persia, in 765. He was trained to arms from his youth, and while still in his minority took part in several military expeditions. In 781, when only sixteen, he attacked the Byzantine empire, and forced the Empress Irene to pay a yearly tribute of 70,000 gold dinars. On the death of his elder brother Hadi in 786, he succeeded to the califate, and thenceforth intrusted the control of his dominions, which spread from Khorassan to Egypt, to the Barmecides Yahya and Giaffar, who ruled with great energy and wisdom, maintaining H.'s empire in prosperity and order. H. is specially famous for his patronage of literature, science, and art. He fostered commerce and industry, bestowed great attention to the teaching and practice of medicine, founded a university at his capital, Bagdad, and made that city a brilliant centre of learning and poetry. He forced the Emperor Michael III. to pay a yearly tribute of Greek books, and it is said that during his reign camels laden with volumes entered Bagdad daily. He kept up a political relation by means of Jewish ambassadors with Karl the Great, to whom, according to a rather dubious story, he sent the keys of the Holy Sepulchre, along with an elephant and a wonderful clock. During his later years he became capriciously jealous of the Barmecides, whom he caused to be massacred in 803, not sparing even his favourite, Giaffar. On the deaths of these wise administrators his affairs were plunged into confusion, revolts broke out, and H., while marching against the rebels of Khorassan, died of apoplexy at Tus in 809. The glory which encircles his name is partly fictitious. His character was blemished by avarice, cruelty, and indolence, and much of his fame is due to the *Arabian Nights*, which represents him as a generous, good-humoured sovereign, pursuing romantic nocturnal adventures in the streets of Bagdad. See D'Herbelot's *Bibliothèque Orientale*, and Gibbon's *Decline and Fall of the Roman Empire*.

Harus'pices (sing. *haruspex*, containing the root *spec*, 'behold,' in the second part, the first being akin to Lat. *hira*, Sansk. *hirâ*, Old Norse, *gar-nir*, all meaning 'the entrails,' and also to Lat. *harviga*, 'a sacrificial ram'), or **Extispices**, those who practised *haruspicina* or divination from signs in victims' entrails (*exta*), an art originally derived from Etruria. The H. also took cognisance of uncommon natural phenomena (*portenta*), as thunder and lightning. Though inferior to the Augurs (see AUGURIES and AUSPICES) in estimation and importance, they were recognised by the state. During the Empire they kept in vogue the Chaldean astrology. Claudius particularly favoured them, forming their class into a regular *collegium*. They were, however, in 419 abolished by a law of Honorius directed against all soothsayers (*Mathematici*).

Har'vard Univer'sity, the oldest and most important educational institution in the United States, is situated at Cambridge (q. v.), in Massachusetts, 3 miles W. of Boston. As early as 1636 the general court of the colony of Massachusetts Bay voted £400 for the purpose of founding a college. In 1639, John Harvard, an English Nonconformist clergyman, bequeathed upwards of £800 and his library of 300 volumes; and in the following year was opened *Harvard College*. The college was incorporated by charter of 1650. In 1873 the vested funds of the university amounted to 2,750,000 dollars, besides its grounds, libraries, buildings, &c. It is under a board consisting of the president, treasurer, and thirty others elected by the graduates for a term of six years; has forty-six professors, twenty-five assistant professors, twenty-three tutors and instructors, and some 1200 students; is unsectarian and (since 1865) independent of the state. Voluntary courses of study are allowed after the first year. The buildings comprise nine dormitories, with 400 rooms, various class-rooms, laboratories, a general library (150,000 volumes, 100,000 pamphlets), a chapel, and a memorial hall erected by subscription in 1874. The medical school (founded 1782) is connected with Boston hospitals. Other professional schools are those of theology (founded in 1812), with a special library of 16,000 volumes; of law (1817), with a library of 15,000 volumes; and of science (1847), the gift of Abbot Lawrence of Boston, with which has been connected a school of mining and practical geology since 1865. The Agassiz zoological museum (1859) has a library of 12,000 volumes. There is also a botanic garden and herbarium, an astronomical observatory (1846), a department of agriculture (the 'Bussey Institution'), and a Peabody archæological museum.

Har'vest (Old Eng. *hærfæst* and *harfest*, Low. Sc. *hairst*, Ger. *herbst*, 'autumn;' probably connected with Gr. *harp*—Lat. *carp*—'to snatch, gather'), the season of gathering in, or reaping corn and grain, or any crop. H. is also applied to the corn gathered in, and that which is reaped.

Har'vest Bug (*Leptus autumnalis*) a little mite belonging to the *Acarina* or mite order of the class *Arachnida* (q. v.), common in fields, especially in autumn, and of a dark red colour. It infests plants, rabbits, dogs, &c., and is able to bite so severely that small pustules are formed. The treatment consists in bathing the bitten parts with a weak solution of ammonia, and afterwards using simple oil, or other emollient applications.

Har'vest Moon, an astronomical phenomenon observed in our latitudes at the autumnal equinox, when the full moon rises nearly at the same time for several successive evenings. It follows from the fact that the moon's retardation is for all northern latitudes then at its minimum, and at its maximum for all southern latitudes. In March, again, there is minimum retardation in the S. latitudes.

Har'vest Spi'der (*Phalangium longipes*), a genus of Spiders (q. v.) common in fields and gardens in autumn, and distinguished by the great length of the legs, the feet being pointed with a single claw, and the tarsi consisting of from 10 to 15 joints. The cephalothorax or front portion of the body is closely united to the abdomen, the latter region being plaited or folded in a transverse manner. These animals have the singular habit of throwing off one or more of their legs when irritated.

Har'vey, Sir George, a Scottish painter, was born at St. Ninians, near Stirling, in 1805. At an early age he showed a keen taste for drawing; and, studying at the Trustees' Academy, Edinburgh, made great progress in his art. He took much interest in the origin of the Royal Scottish Academy; became an Associate in 1826, and an Academician in 1829, and showed the interest he took in the institution by publishing (1870) *Notes of the Early History of the Royal Scottish Academy*. His subjects were chiefly religious and pastoral. H. was, perhaps, too exclusively national to be adequately admired beyond the Tweed, but no painter has more tenderly expressed the poetry of nature in her grassy solitudes, none has with subtler magic of art revealed the soft mystery of mountain scenery, and imbued his canvas with 'the sleep that is among the lonely hills.' Among his best known works are 'Covenanters' Preaching' (1830); 'Curlers' (1835); 'Battle of Drumclog' (1836); 'John Bunyan in Gaol' (1838); 'Quitting the Manse' (1840); 'Dawn Revealing the New World to Columbus;' 'A Highland Funeral' (1844); and 'The Penny Bank' (1864). He succeeded (1864) Sir John Watson Gordon as president of the Royal Scottish Academy, and was knighted in 1867. He died at Edinburgh, 22d January 1876.

Har'vey, William, an illustrious English physician, born at Folkestone, in Kent, 1st April 1578, was educated at Cambridge and Padua, where Casserius and Aquapendente were his teachers, became physician to Bartholomew's Hospital about 1610, and in the Lumleian Lectures for 1615 first suggested his hypothesis of the circulation of the blood. Before this it was thought that the veins distributed blood to the body, that the arteries distributed vital spirits (formed from air and blood), the vapours or *fuligines* being returned to the lungs by the left ventricle. How the blood came to the left side of the heart was the subject of mere guesswork. According to Boyle in his *Treatise on Final Causes*, the idea of circulation was suggested to H. by the form of the valves of the veins. This he followed up by extensive dissections and vivisections, which proved the correspondence between the systole or contraction of the heart and the supply of blood through the pulmonary arteries and the aorta. After describing the return of fœtal blood by the *foramen ovale*, he explained the course of the blood in the adult through the lungs to the left ventricle, thus developing the conception of Galen, and by the simple experiment of ligature demonstrated its

return to the heart. These views remained very unpopular till near the end of H.'s life, Parisanus, Riolanus, and other learned men combating them. Besides his *Exercitatio Anatomica de Motu Cordis et Sanguinis* (1628), he published a work on *Generation*, in which he minutely examines the formation of the common fowl's egg, which he took as the universal type of reproduction. H. was appointed physician-extraordinary to James I., and in 1632 physician to Charles I. He attended the latter monarch in the early part of the Civil War, and was made Master of Merton College, Oxford, in 1645. When Oxford surrendered in the following year, many of his MSS. were lost in the disgraceful burning of his house by the Parliamentary troops, and H. withdrew to London. In 1654 he was elected President of the College of Physicians. He died 3d June 1657, and was buried at Hampstead, Essex. A Life by Lawrence is prefixed to the 4th edition of H.'s works, 1766. See also Flourens' *History of the Discovery of the Circulation of the Blood.* The best edition is that of Willis, published by the Sydenham Society in 1847.

Har'wich, a seaport and fashionable watering-place of England, in the county of Essex, on a headland, at the point where the estuaries of the Stour and the Orwell unite, 5 miles N. of the Naze, and 65 N.E. of London by railway. It has a good harbour, that is only entered by a narrow channel, marked out by lights and buoys. The coast here is bold and cliffy, and the beach well adapted for bathing. H. has some shipbuilding, considerable fisheries, and manufactures of Roman cement, artificial manure, sails and tackle, &c. A few years ago the harbour was in danger of being choked by the increase of shingle on the Suffolk coast, but this was avoided by the construction of two groins or jetties, respectively 1350 and 1000 feet long. In 1875 there entered the port 878 vessels of 239,738 tons, and cleared 897 of 223,021 tons. H. is defended by a redoubt with heavy guns and by three martello towers. Its suburb of Dovercourt has a fine promenade and a chalybeate spring, over which stands the Spa House, containing a museum and library. Pop. (1871) 6079. The town seems to have got its name from being the 'wick' or 'vik' where the Danish 'army' had a depot.

Harz Mountains ('the forest mountains'), a congeries of mountain ranges in North Germany, 23 miles wide, 70 miles in length from N.W. to S.E., and occupying an area of about 880 sq. miles, of which 450 belong to Prussia (province of Hanover), the remainder mostly to Brunswick, but partly also to Anhalt. They form the watershed between the rivers Leine and Saale. The most northerly portion, the *Oberharz*, is for the most part wild and dreary, but has valuable mineral treasures. The highest summit, the Brocken, rich in tales of diablerie, is the scene of the Walpurgisnacht in *Faust.* The *Unterharz*, more varied in picturesque beauty, is richly wooded. Both are much frequented by tourists. The minerals include silver, iron, lead, copper, zinc, and arsenic.

Has'drubal ('helped by Baal'), a name of common occurrence in Carthaginian history. The most prominent of the name are—1. The son of Mago, one of the chief founders of the military power of Carthage. He had three sons, Hannibal, Hasdrubal, and Sappho, who, with their three more celebrated cousins, sons of Hamilcar (q. v.), had much to do with Carthaginian affairs. 2. A famous general in the first Punic War, called by Polybius a son of Hanno. He took the field against Regulus 256 B.C., mismanaged the affairs of his country, was virtually superseded by Xanthippus, but never actually deposed. He was totally defeated by the Roman consul L. Caecilius Metellus at Panormus, 250 B.C. 3. The son-in-law of Hamilcar Barca, whom he accompanied into Spain 238 B.C., where he distinguished himself at first by his astute policy and conciliatory manners. He founded Nova Carthago, and did much to consolidate the Carthaginian empire in Spain. After holding the command in Spain for eight or nine years, he was murdered by a slave, 221 B.C. 4. The son of the great Hamilcar Barca, and brother of Hannibal. He was present at the battle in which his father was slain, bore a distinguished part in the second Punic War, opposed the Scipios, conquered Cn. Scipio in Spain 212 B.C., afterwards commanded the Carthaginian army in Italy, and was defeated and slain by the consuls C. Nero and M. Livius at the battle of the Metaurus, 207 B.C. Nothing of the character of H. is known to us. He seems, however, to have possessed all the qualities of generalship for which his family was so distinguished. 5. The son of Gisco, general in Spain in the second Punic War, is first mentioned in 214 B.C. as an auxiliary of Hannibal and Mago. He was defeated along with Syphax by Scipio in Africa 204 B.C., was condemned to death for his ill success, had his sentence reversed on Hannibal's return from Italy, but, finding his enemies implacable, poisoned himself. His head was struck off by the populace and paraded through Carthage in triumph.

Ha'se, Karl August, one of the most venerable of living German theological professors, was born at Steinbach, in Saxony, 25th August 1800, and studied theology at Leipzig, Erlangen, and Tübingen. The share he took in the political movement of the German students in 1822 cost him eleven months' imprisonment in the state prison of Hohenasperg. Since 1830 H. has been attached to the theological faculty of Jena, where his jubilee as professor was celebrated in 1870. H. belongs to the theological school technically termed Æsthetic-Rationalists, but, save in the freedom of thought which he demands, has little in common with the 'vulgar rationalists,' of whom he has always been an opponent. On his theology the influence of Fichte, Schelling, and Schleiermacher is apparent; Christ as the ideal man is the centre of his teaching. Amongst his many works may be mentioned *Lehrbuch der Evangelisch. Dogmatik* (Stutt. 1825, 6th ed. 1870); *Gnosis* (Leips. 1826); *Leben Jesu* (1829, 5th ed. 1865); *Hutterus Redivivus* (Leips. 1828, 11th ed. 1868); *Kirchengeschichte* (Leips. 1834, 9th ed. 1867), and many valuable and delightfully-written monographs, such as *Franz von Assisi* (Leips. 1854); *Geistliche Schauspiele* (Leips. 1858); *Caterina von Siena* (Leips. 1862).

Hashish', is the Oriental name for the flowering tops of the female plant of the *Cannabis Sativa*, from which the resin has not been removed. H. is the *majoon* of Calcutta, the *mapouchari* of Cairo, and the *dawames* or *dawamese* of the Arabs. Dr. Moreau of Tours (*Du Hachisch et de l'Aliénation Mentale*, 1845) describes in highly coloured terms the *real happiness* produced by H., but the use of the drug more frequently produces violent homicidal mania. The writer of this article has seen many cases in which those intoxicated with H. have suddenly rushed out into the streets and market-places with drawn dagger or sword, stabbing and cutting every one whom they met.

Has'lingden, a town of Lancashire, England, on an eminence 20 miles N.N.E. of Manchester by railway. It lies on the border of the Forest of Rossendale, and has a church of St. James, rebuilt in 1780, a handsome townhall, a literary institute of 1861, large cotton-mills, iron-foundries, fulling and sheeting mills, size-works, &c. Near H. are many collieries and stone and slate quarries. Pop. (1871) 7698.

Hasp and Sta'ple, in Scotch law, is the term denoting the old form of entering an heir under Burgage Tenure (q. v.). The heir took hold of the H. and S. of the house door, then entered and bolted himself in.

Hass'an, the chief town of the district of the same name, in the state of Mysore, India, 114 miles W. of Bangalore; pop. (1871) 6305. The *district* of H., which is mountainous, has an area of 3291 sq. miles; pop. (1871) 668,417. The crops are *ragee* (largely exported), rice, tobacco, chillies, and areca nuts. Coffee, introduced in 1843, is now grown on 50,000 acres; every native has a few coffee-trees. There is a fine breed of cattle, used for draught. Brassware of excellent quality is manufactured.

Hass'elt, the capital of the province of Limbourg, Belgium, on the left bank of the Demer, 47 miles E.N.E. of Brussels by railway. It is walled, and has twenty-nine distilleries, large salt-refineries, lace and linen industries, and a trade in madder, tobacco, cattle, &c. Pop. (1874) 11,379.

Has'tings (Old Eng. *Hastingas*, *Hæstingaceaster*), a watering-place of England, in the county of Sussex, midway between Beachy Head and Dungeness, and 75 miles S.E. of London by railway. It is situated at the base of high cliffs, which shelter it from the N. and E. winds. The chief industry is fishing, but the boats (some 160) have to be beached for want of a harbour. St. Leonard's-on-Sea, the fashionable western suburb, has

sprung into existence since 1828. A splendid 'parade' skirts the beach, and on the summit of the West Cliff, 400 feet above the sea, are the ruins of a castle of unknown antiquity. From Fairlight, 600 feet above the sea, is obtained a view of the Dover cliffs and the coast of France. Pop. (1871) 29,291. In his *Saxons in England*, Mr. Kemble suggests that H. was the fortress of the tribe called *Hæstingas*. A mint was established here by Æthelstan in 924. H. was the landing-place of William the Conqueror in 1066, and there are traces of a supposed Norman camp in the vicinity. The 'battle of H.' was fought on a heath between H. and Battle (q. v.) on the 14th October 1066. In the time of the Confessor, H. was made a Cinque Port, but the harbour was destroyed by a storm in the reign of Elizabeth. It has returned two members to Parliament since Edward III.'s time.

Has'tings, a famous viking or sea-rover of the 9th c., born most probably in Denmark, who ravaged the shores of France, Spain, Portugal, and Italy, sailed up the Seine, Garonne, Loire, Tagus, and Guadalquiver, and sacked Rouen, Lisbon, Seville, Spezzia, and many other cities. H. invaded England in Ælfred's reign, but after an unsuccessful struggle of a year in Wessex, was defeated at Benfleet by the Mercian leader Æthelred. He afterwards renewed his plunderings in France. The manner of his death is unknown. Many wild legends were told of him, and it has been held that the exploits of other rovers of the same name have been wrongly attributed to him.

Has'tings, Warr'en, first Governor-General of India, was born 6th December 1732. He belonged to a cadet branch of the ancient family of H. of Daylesford in Worcestershire, which was ruined by the Civil War. Losing both parents at an early age, he was sent by an uncle to Westminster School, where among his schoolfellows were Cowper the poet, Churchill, Colmar, and Cumberland. In 1750 he obtained a writership in the service of the E. India Company, and spent the next few years at Fort William and Cossimbazar (the river port of Moorshedabad), doing purely mercantile work. His political services during the war with Surajah Dowlah brought him under the notice of Clive, who appointed him agent at the court of Meeraffier. From 1761 to 1764 he served at Calcutta as member of council, taking no part in the systematic plunder of the natives which the feeble rule of Vansittart permitted to English servants. On one occasion he was openly insulted on this account, and struck in the face in council. In the latter year he returned to England, where he lived for the next five years. In 1769 he accepted the post of member of council at Madras, and on his way out fell in love with the Baroness Imhoff, whose husband he paid to procure a divorce. Appointed president of the Supreme Council of Bengal in 1772, he found in the fall of the Mussulman minister Mohammed Reza an opportunity of establishing a system of internal administration by English servants. He sold Allahabad and Corah to the ruling family of Oude, and cut down the pension of the Nabob of Bengal. The assistance he gave for a large sum of money to the conquest of the Rohillas was sharply condemned by Clavering, Francis, and Monson, the majority of the new council which, from 1773, acted with H. as Governor-General over all the presidencies. Then began the disgraceful controversy in which Nuncomar and other worthless natives were encouraged to bring charges of corruption against H., while the latter, on the other hand, by his influence with Impey, the Chief Justice, obtained the execution of Nuncomar on a charge of forgery. This event brought back to H. his power and patronage. His London agent, fearing an impeachment, now sent in a formal resignation by his principal. H. denied the authority, obtained from Impey a judgment on his position under the Regulating Act, and, in spite of the opposition of Clavering, continued to act as Governor-General. This was acquiesced in at home, where American troubles had now led to war. When France took up arms, H. lost no time in fortifying the settlements, seizing the French factories, and countermining French influence in the W. and centre by taking a side in a great feud among the Mahratta chiefs. A bribe to Impey ended the claims of jurisdiction asserted over the natives by the supreme court; and H. was able to send Sir Eyre Coote to Madras in time to check the victorious advance of Hyder Ali of Mysore. The war expenses he provided for by an arbitrary tribute from Chayte Sing of Benares, whose territory he soon after took by force of arms. The Princesses or Begums of Oude were next robbed of the treasure lying in the 'Beautiful Dwelling' at Fyzabad. Impey was concerned in this, and was soon recalled by Parliament. H., however, retained the confidence of the Company till 1785. In fact he voluntarily resigned, and found on his return to England that both the Company, the Government, and the court were friendly. Burke, however, undertook an impeachment. He was assisted by Fox, Sheridan, Windham, and Grey, in speeches which have become classical. After eight years' trial H. was acquitted of all the charges; but his fortune was ruined by the expenses. Accepting a handsome annuity from the Company, he retired to Daylesford, where he died, 22d August 1818. See Gleig's *Memoirs of the Life of W. H.* (Lond. 3 vols. 1841), and Lord Macaulay's Essay.

Hat, the prevailing head covering of both sexes among civilised races, includes articles of the most diverse material, shape, and construction. As an article of male attire, the principal form is the silk or so-called dress hat, a tall cylindrical structure, which, from an obvious resemblance, is also known as the chimney-pot. Hats of felt and straw are also common head-coverings of the male sex. Ladies' hats run such riot in form and material, that it is impossible to define them. The chief material consists of straw, after which come felt, silk, and fancy materials. The silk hat is the modern substitute for the beaver hat, which, introduced in the reign of Queen Elizabeth, is now entirely superseded. The manufacture is divided into two departments, body-making and finishing. The body or shell is composed of stout calico, prepared with a hard varnish which at once stiffens and renders it waterproof. Pieces of the prepared calico, after it has been dried on a stretching frame, are cut to size and folded round a hat-block of the size and shape of the hat to be made. It is brought into shape by hot-ironing. The finisher cuts out three pieces of plush for the crown, the side, and the upper brim, and the body being coated with varnish, these are neatly fitted on and made to adhere without showing any joints. The whole is then polished and smoothed by hot ironing and 'lureing,' the under brim is covered with merino, the rim is bound and turned over, the interior lined, a silk band put round the body at the junction with the brim, and the hat is ready for use. Innumerable patents for easy-fitting, ventilating, and grease-proofing hats have been taken out, but these are valuable only for advertising purposes. Felt hats are made chiefly of sheep's wool, rabbit and hare fur, and occasionally of the hair of other animals. Mechanical processes are now adopted for felting operations, the details of which vary according as wool or short fur is used for felting. For a simple felt hat, a loose triangular cone of wool or fur, technically termed the 'bat,' has first to be formed. The bat is slightly hardened so as to admit of free handling, by moistening it with steam and pressing it under a piece of leather till it attains some degree of consolidation. It is then 'planked' or felted at the 'battery,' a leaden vessel containing hot water acidulated with sulphuric acid, into which the material is occasionally dipped, while it is rolled and hard pressed on a wooden board till the fibres interlace into a firm texture. The body so formed is stiffened, if hard felt is desired, by dipping in a shellac varnish; it is next dyed, then blocked and drawn into shape. It is now ready for finishing by smoothing with sandpaper, trimming, and lining. The French excel in the manufacture of felts of fine quality. See also STRAW MANUFACTURE.

Hatch, Hatch'way. A hatch is the covering of the hatchway or opening in a ship's deck leading to the hold or to a deck below. In a large ship there are the fore hatchway, close abaft the foremast, the main hatchway close before the mainmast, and the after hatchway between the mainmast and the mizen. Hatchways are generally covered with gratings, but in rough weather they are securely battened down to hinder the water from entering between decks.

Hatch'ment (a corrupted form of *Achievement*, a word generally used in the same sense), is a lozenge-shaped frame displaying the armorial bearings of a deceased person, which is placed in front of the house, in the church, or on the hearse at the funeral. The H. varies according as the deceased was husband, wife, widower, bachelor, &c.

Hat'field or Bish'op's Hat'field, an old town of England, in the county of Herts, on the slope of a ridge between the valleys of the Lea and Colne, 7 miles S.W. of Hertford, and 20

of London by railway. It has a parish church of St. Ethelreda of the 13th c., some silk and paper industries, and militia barracks. In the vicinity is H. House, a fine Elizabethan structure (1605–11), the seat of the Marquis of Salisbury. Pop. (1871) 3998. The palace of the bishops of Ely stood near H. House, and was appropriated with the manor of H. by Henry VIII. It was the temporary residence of Edward VI., of Elizabeth, and of Charles I., and was destroyed by fire in 1835.

Hat Money, or **Primage**, is the small sum besides the freight paid to the master of a ship for his care of the cargo. The amount is regulated by the custom of the port.

Hatras', a town in the district of Allygurh, N.W. Province, British India, 97 miles S.S.E. of Delhi, and 33 miles N. of Agra; pop. (1872) 23,589. It was formerly fortified with a strong citadel, which was bombarded and dismantled by the British in 1817. During the Mutiny of 1857, it was loyally held by the Hindu Rajah, and was a refuge for the Europeans. A light provincial railway is now in course of construction to this town from the main line, 5½ miles distant. H. is the commercial centre for all the neighbourhood, the exports being grain, oil-seeds, cotton, sugar, and ghee. The sugar alone amounts to 6000 tons a year. The imports are iron, piece-goods, and all articles of native consumption.

Hatt'eras, Cape, the E. point of a low angular island, separated from N. Carolina, U.S., by Pamlico Sound, in lat. 35° 15′ N. and long. 75° 30′ W. Shoals extend here far out to sea, and two miles N. of the cape rises a lighthouse, 190 feet high, with a flashing dioptric light.

Hatt'i Sherif' (*i.e.*, 'exalted writing'), the Turkish name for the Sultan's edicts or rescripts, which are irrevocable, are written in Divani, the Arabian court-hand, and are marked by the Tugra or Rishani Sherif, an intricate flourish in black, red, or gold, as a sign of authority. The celebrated H. S. of Gulhane, guaranteeing the life and property of all subjects of the empire, was promulgated by Abdul Medjid in 1839, and renewed in 1856, but has been practically a dead letter. Recent events (1876–77) have not inspired Europeans with increased faith in the value of such documents.

Hatt'o, the second Archbishop of Mainz bearing that name, was consecrated in 968. He is famous in connection with the legend recorded by the Centuriators of Magdeburg, and commemorated by Southey in his ballad, *God's Judgment on a Wicked Bishop*. During a famine H. is said to have shut up a large number of starving poor in a barn, and to have burnt them alive. When their despairing cries were heard, H. is reported to have asked the horrified bystanders whether they heard the mice squeaking. As a punishment, the cruel archbishop was so unmercifully beset with swarms of mice, that to escape them he built the so-called 'mouse-tower' (*Mäusethurm*, perhaps for *Mauth-thurm*, 'toll-tower') near Bingen (q. v.). But even here his persistent enemies found him, and ate him piecemeal.

Hau'berk, was a shirt or tunic of chain-mail, or rather of interwoven steel rings. It had a hood of one piece with it, the sleeves varied in length. See HABERGEON.

Hauch, Johannes Carsten, a great Danish poet, born at Frederikshald, in Norway, 12th May 1790. Coming to Denmark with his father in 1802, H. became a student at Copenhagen University in 1809, and graduated the year following. He became deeply impressed with the poetry of Oehlenschläger, which led to a careful reading of Shakespeare, Goethe, Tieck, Novalis, and Jean Paul, and resulted in the dramas *Contrasterne* and *Rosaura* (1816–17). In the literary war with Baggesen he was a prominent partisan of Oehlenschläger. After 1821 he travelled for six years in France, Germany, and Italy, where he wrote *Hamadryaden* and the tragedy *Bajazet*, and the dramas *Tiberius* and *Gregorius VII.* On his return to Denmark, he was erelong again at war with the poetic successor of Baggesen, J. L. Heiberg. In 1846 he became Professor of Northern Languages and Literature at Kiel; but coming to the capital during the troubles of 1848, he was appointed professor there in 1851. He died at Rome, 4th March 1872. H. is most famous for his novels *Wilhelm Zahern*, *Guldmageren*, *En polsk Familie*, *Slottet ved Rhinen Robert Fulton*, and *Charles de la Bussière*, which appeared from 1834 to 1859. He also wrote several other tragedies of great merit, *Carl V.'s Död* (1831), *Maastrichts Beleiring* (1832), *Svend Grathe* (1841), &c., and his *Lyriske Digte* (1842) is one of the choicest of Danish books. H.'s writings are everywhere tinged with the mysticism of Novalis, and marked throughout by high and pure feeling.

Hauff, Wilhelm, a popular German novelist, whose works very plainly show the influence of Sir Walter Scott, was born at Stuttgart, November 29, 1802, where he died, 18th December 1827. His principal historical romance is *Lichtenstein* (1826); his *Märchen* reached a 9th edition in 1861. H. also wrote *Phantasien im Bremer Rathskeller*, *Memoiren des Satan*, and *Der Mann im Monde* (all in 1827), together with many short tales.

Haupt, Moritz, a philologist, highly esteemed for his labours as an editor of classical texts and of the works of the early German authors. He was born 27th July 1808, at Zittau, in Saxony, studied at Leipsic, and became professor there in 1838. H.'s sympathy with the revolutionary movements in 1848 and 1849 led to his being expelled from his post; but in 1853 he was appointed to the chair in the University of Berlin, vacated by the death of Lachmann, and is a secretary of the Berlin *Akademie*. In the department of classics H. has given editions of Ovid, Horace, Catullus, Tibullus, Propertius, and Virgil. In the native field H.'s most important publications are his critical editions of *Erec* (1839), of *Armer Heinrich* (1842), and of *Guter Gerhard* (1840); he has also superintended new issues of Lachmann's text of the *Nibelungen*, of Wolfram, and of Walther von der Vogelweide. He died in 1874. The first two volumes of his philological *Opuscula* appeared at Leipsic in 1876, and in 1877 his *Französische Volkslieder*, edited by Tobler.

Hau'riant, a term applied in heraldry to the figure of a fish when represented in an upright position, as if rising to the surface to draw breath.

Hau'ser, Kaspar, a remarkable foundling, observed in the streets of Nürnberg in the afternoon of the 26th May 1828. He was then apparently sixteen or seventeen years of age, about five feet in height, and well-proportioned, had a tender skin and delicately fair complexion; he walked with difficulty, and could speak but a few words in the Bavarian dialect. He was taken in charge by the authorities and carefully educated. His intense curiosity and desire to learn, the abnormal acuteness of his sense-perceptions, and his unusual strength of memory decayed in proportion as his knowledge extended. So far as could be learned from H., he had from his infancy been reared in perfect solitude in a dark cave, whence he was never allowed to go out till the day he came to Nürnberg, and had bread and water put within his reach while he was asleep. A mysterious stranger attacked and wounded H. severely in October 1829, but he recovered. He was adopted by Lord Stanhope, and sent to Anspach to continue his education. He was here again attacked and severely wounded in the park, and died three days afterwards, 17th December 1833. By whom or wherefore H. was murdered remains as much a mystery as his parentage. See the works on K. H. by Feuerbach (1832) and Broch (1859).

Hauss'mann, Baron Georges Eugène, the rebuilder of Paris, was born in that city, March 27, 1809. He was educated at the Conservatoire de Musique, and subsequently received a legal training; but his marked administrative capacities brought him under the notice of Louis Napoleon, who in 1853 appointed him Préfet of the Seine. In this office H. displayed the utmost energy and resource; and the works which he undertook by way of developing the natural and architectural beauties of Paris completely changed the aspect of the capital. Public gardens, squares, markets, official buildings, bridges, hospitals, and asylums were all formed under his direction; and among his more important schemes may be mentioned the improvement of the Bois de Boulogne, the prolongation of the Rue de Rivoli, the construction of the Boulevard de Sebastopol, and the formation of about a score of additional boulevards in various quarters in the city. The success of his projects made H. for a time exceedingly popular; and he also stood high in favour at court, being promoted to the rank of Grand Officer of the Legion of Honour in 1856, and Grand Cross in 1862. In 1858 he was created a senator; and he

became also a member of the Academy of Fine Arts, and of the Imperial Council of Public Instruction. His magnificent notions, however, could only be realised by an enormous expenditure of money; and as one loan succeeded another, public discontent began to be manifested. After several loans had been exhausted, the Municipality of Paris, by special powers, raised a further sum of 250,000,000 francs in 1865, and another of 260,000,000 four years later. On the formation of the constitutional Ministry under Ollivier (1870), H. was requested to resign his ædileship; and on refusing to do so, was dismissed by an imperial decree. After the fall of the Empire, he left France for a time; but ultimately returned, and became in 1871 Director of the Crédit Mobilier.

Hautbois. See Oboe.

Haüy, René Just, a celebrated French mineralogist, was born at St. Just in Picardie, February 28, 1743. He studied for the Church, in which he took orders, but his life was devoted to science. About 1780-81, a lecture of Daubenton's on mineralogy, which he chanced to hear, turned his attention to crystallography; and from this time till his death he published close upon a hundred memoirs bearing upon this and allied subjects. In 1802 he became Professor of Mineralogy in the Museum of Natural History, and died at Paris, June 3, 1822. H.'s chief works are *Traité de Mineralogie* (4 vols. 1801, 2d ed. 1822-23); *Traité Élémentaire de Physique* (2 vols. 1804, 3d ed. 1821); *Traité de Crystallographie* (2 vols. 1822); besides his memoirs in the *Journal de Physique*, *Annales de Physiques et de Chimie*, *Journal des Mines*, and other scientific periodicals. See Cuvier's *Eloge* before the Académie des Sciences, June 2, 1823.

Havan'a (Span. *La Habana*, 'the haven'), the principal city in the W. Indies, and the capital of Cuba, situated on the N. shore of the island. It is the see of a Roman Catholic bishop, and has a splendid harbour, entered by a strongly fortified channel three-eighths of a mile long, and opening into a basin lined with wharves, and capable of accommodating a thousand of the largest vessels. The massive houses, like those in the S. of Spain, are of only one or two stories, with flat roofs and large windows, shaded by iron shutters or wooden blinds. H. is unsurpassed by any city in the world for its beautiful public parks, shady drives, and promenades, and numerous fountains. An excellent water supply is brought by an aqueduct from Chorrera, distant 7 miles. H. has a university, a cathedral of 1724, the palace of the governor-general, a large opera-house, spacious botanical gardens, various scientific and benevolent institutions, &c. The average temperature in summer is 87° F., in winter 85° F. There are large tobacco industries. In 1873 there entered the port 2194 vessels of 921,632 tons. The exports were chiefly sugar (796,179 tons), molasses (242,308 tons), tobacco leaf (17,442,600 lbs.), and cigars (224,765,000). The imports are codfish, flour, rice, wine, coals, oil, and timber shooks. H. is a railway centre, and communicates by weekly lines of steamers with Spain, France, England, and the United States, and by telegraph with Key West, Kingston, Aspinwall, &c. Pop. 205,676, of whom 138,895 are white, 66,781 are coloured, 29,013 being slaves. H. was founded by the Spaniards in 1511, was taken by the English in 1762, but restored to Spain in the following year.

Hav'el, The, an important tributary of the Lower Elbe, rises about 6 miles E. of Neu-Strelitz in Mecklenburg, and after a circuitous course of 180 miles, joins the Elbe on its right bank a little below Havelberg. The H. is navigable as far as Fürstenberg, and is throughout a great part of its course a chain of lakes. Its importance for the transit trade of a large district is increased by the fact that by means of the Finow Canal, the H. is connected with the Oder. The H. flows past the towns of Spandau, Potsdam, and Brandenburg, and it receives as tributaries the Rhin, the Dosse, and the Spree.

Have'lock, Sir Henry, K.C.B., a hero of the Indian Mutiny, was the son of a merchant, and was born at Bishopwearmouth, in Durham, 5th April 1795. He entered the army in 1815, and served through the Burmese, Afghan, and Sikh wars. After forty years' regimental service and slow promotion, despite his military zeal, he first received an independent command in 1857, when the tidings of the Mutiny brought him from Persia to Calcutta. He was placed by Lord Canning at the head of a movable column, and marched from Allahabad to relieve Cawnpore. He defeated the mutineers, headed by the Nana Sahib in person, in several battles, but arrived at Cawnpore too late to prevent the massacre. He then moved towards Lucknow, which was also besieged, but after eight more engagements was compelled to retire, until reinforced by his old friend and general, Sir J. Outram, whose chivalrous spirit would not allow him to take over the command. H. again advanced and fought his way into Lucknow, only to be himself surrounded until finally delivered by Sir Colin Campbell (Lord Clyde). He died of dysentery, 24th November 1857, at Lucknow, within a few days after the final relief. A pension of £1000 a year was given to his widow, and a baronetcy and a similar annuity to his eldest son, Sir H. Marshman H., who had acted as his father's aide-de-camp, and is now M.P. for Sunderland. A statue was erected by public subscription in Trafalgar Square. His campaign showed great military genius. But what has perhaps most highly exalted him in the eyes of his countryman, is his pure, severe, religious faith. See Marshman's *Memoirs of Sir Henry H.* (Lond. 1860, new ed. 1874). H. himself published histories of the Afghan and Burmese wars.

Ha'ver, a term of Scotch law denoting the holder of a writing who is called on judicially to produce it. The form of process for compelling the holder to produce the writing is by letters of incident diligence. There is no corresponding form in English law, the end being only attainable by summoning the holder as a witness, and telling him in the subpœna that he must bring the writing with him.

Hav'erfordwest, the chief town of Pembrokeshire, and a county of itself, in S. Wales, on the West Cleddau river, in a beautiful hilly district, 8 miles N.E. of Milford, and 275 W.N.W. of London. The river is navigable at spring tides for vessels of 150 tons, but the only manufacture of the town is paper. Its fine church of St. Mary was restored in 1862, and is widely noted for its richly carved timber roof and stalls. The grammar-school has two exhibitions to Oxford. H., with Fishguard and Narbeth, returns one member to Parliament. Pop. (1871) 6622.

Hav'erhill, a city of Massachusetts, U.S., on the N. bank of the Merrimac, 18 miles from its mouth, and 32 N. of Boston by railway. It has boot and shoe manufactures to the value of ten million dollars annually, and also produces hats and woollen goods. On the opposite bank of the river are the thriving towns of Bradford and Groveland, which communicate with H. by two bridges. Pop. (1870) 13,092. H. was settled in 1640, incorporated as a town in 1645, and as a city in 1870.

Hav'ersack, the canvas bag in which a soldier on the march carries his rations. It is also used for a case in which the gunner carries cartridges from the ammunition chest to the gun.

Hav're, Le, or Le Havre de Grâce, the port of Paris, and next to Marseilles the most important trading place of France in the department of Seine-Inférieure, at the mouth and on the N. side of the Seine's estuary, which has here a breadth of 9 miles. It is 54 miles W.N.W. of Rouen, and 135 N.W. of Paris by rail, and lies at the base of a slight range of chalky hills commanding beautiful views of the sea, the slopes of which are clad with foliage and dotted with elegant villas. A project was announced in 1875 to construct a boulevard along the seashore (1919 métres) from the pier to the picturesque suburb of St. Adresse. The town is regularly built, has several squares, fountains, and tree-shaded streets, and now extends far beyond the old walls. Among the principal buildings are the sombre church of Notre Dame, dating from the 15th c., the church of St. François, begun under Henri II., the modern Hôtel de Ville, the arsenal, the museum and library (34,000 vols. in 1876), the Palais de Justice, a theatre, new law courts (1875), an English episcopal church of the Holy Trinity, opened 1876. Other institutions are schools of navigation and of [illegible]ied geometry, a chamber of commerce, a lyceum, an observatory, and an English institute and reading-room. The harbour is very accessible, and consists of an *avant-port* of 52 acres, the entrance to which has a depth of 31 feet at spring tides and of 26 at neap tides, and is protected by two long jetties. It has seven wet docks, with a total area (1876) of 126 acres, and 8320 métres of quays. In 1871 a dry dock, 515 feet long and 112 broad,

was opened for the repairing of large steamers. The basin of L'Eure covers 53 acres. In 1876 the works in progress, besides the Eure and Vauban docks, were the large half-tide basin, and the substitution of pivot-bridges for the old-fashioned draw-bridges between the various docks, at an estimate cost of £560,000. In 1875 there entered the port 2728 vessels of 1,408,780 tons; of these, 1211 were British vessels of 565,919 tons. In 1876 there entered 1343 British vessels of 635,291 tons, and the customs receipts were £1,068,455. The imports, chiefly coal, pig-iron, cement, woollens and cottons, machinery, colonial produce, and metal wares, amount in value to £25,000,000; the exports, mainly Paris and Lyon manufactures, wines, spirits, flour, oil, seeds, fruits, chalk, and flints, to £27,000,000 H. transacts one-fifth of the foreign commerce of France, and has direct lines of steam-navigation with New York, Havana, Brazil, La Plata, and all the chief ports of Europe. It has a large Government tobacco factory, much shipbuilding (in 1875 seven steamers of 3284 tons), sugar-refining, papermaking, cotton-weaving, and engineering. Many visitors are attracted in summer by the sea-bathing. Pop. in 1872, 81,785, and in 1876, 92,068. H. was a fishing village in 1509, when Louis XII. began to convert it into a harbour of refuge for the navy. The subsequent silting up of Harfleur determined its importance. It was bombarded by the English in 1694, 1759, and 1794-95, and under Louis XIV. was made the entrepôt for the E. India, Senegal, and Guinea companies. An International Maritime Exhibition was held here in 1868.

Hav'restraw, a town of New York, U.S., on the W. bank of the Hudson River, 38 miles N. of New York by railway. It has extensive brickmaking, large printworks and papermills, and a rolling-mill for copper. Pop. (1870) 6412.

Hawai'i (formerly spelled *Owhyhee*), the largest and most southerly of the Sandwich Islands (q. v.), to which group it gives an alternative name. It lies in the N. Pacific Ocean, and has a length of 800 miles, an area of 4500 sq. miles, and a pop. of 21,480. It is generally mountainous, and attains in Manna Kea an altitude of 13,953 feet, in Manna Loa of 13,760 feet. The sides of the mountains are densely clad with forests, and send down numerous streams to water the rich arable plains. There are two active volcanoes, Kilanea (3970 feet) and Manna Loa, the latter of which erupted destructively in 1868. The centre of the island is occupied by a lava plain, but the coast is encircled by many towns and harbours. The chief town and port is Hilo.

Ha'wash, a river of Abyssinia, rises in the S.W. of Shoa, of which it forms part of the boundary. It has a general north-easterly direction, and enters Lake Aussa, after a course of 350 miles. Habesh, the Arab name of Abyssinia, is probably derived from that of the river.

Haw'finch (*Coccothraustes vulgaris*), a species of Insessorial birds, belonging to the group of grosbeaks. The H. inhabits Britain, and is gregarious. The average length is about 7 inches. The back and upper parts are of a chestnut-brown colour, the wing coverts and tail variegated with black and white, the under parts and breast a light brown, the head of a fawn colour, the chin and throat black. The food consists of berries of all kinds, and the nest is constructed of twigs and mosses. The eggs number from four to six, and are of an olive-green hue, spotted with black. The H. also occurs on the Continent, and on the European borders of Asia.

Haw'ick, a town of Scotland, in Roxburghshire, at the confluence of the Teviot and the Slitrig, 10 miles S.W. of Jedburgh, and 52½ S. of Edinburgh by railway. It is a thriving town, with many fine mansions and villas, and has a handsome exchange built in 1865, several other good buildings, a parish church of 1767 (now St. Mary's), fourteen other churches, part of an old fortress of the barons of Drumlanrig, now built into the Tower Inn, and a moat or mound, supposed to have been the judicial rendezvous of the neighbouring chiefs. H. is one of the great centres for the manufacture in Scotland of tweeds, yarns, hosiery, and plaids. It has (1877) over 650 power looms, 180 hand looms, 88 carding engines, and 900 stocking frames, of which 86 are power frames. The water supply is brought from the Allan, distant 5 miles. Pop. (1871) 11,355. H. is one of the three Border burghs that together send one member to Parliament. Near it rise the towers of Goldielands and Branxholm, the former a unique old Border castle, the latter the ancient ducal seat of the Buccleuchs. On the opposite side of the Teviot lies the manufacturing village of Wilton, which is practically part of H.

Hawi'za, a town in a fertile district of Khuzistan, Persia, 60 miles N. of Bassora, is the principal place under the sway of the Vali of Arabistan. The river Kerkah used to pass through H., but has been diverted thence by a canal; so that H., once a populous town, has decayed till it contains only about 500 houses, occupied chiefly by Arabs.

Hawk, a very general term applied indiscriminately to many members of the family *Falconidæ* or Falcons (q. v.), and to other kinds of raptorial birds. The various species and chief genera of H. are described in special articles, such as GOSHAWK (q. v.), SPARROW-HAWK (q. v.), &c.

Hawk.

Hawk'ers and Ped'lars. Hawkers are itinerant traders. A pedlar is a hawker who deals in trifling commodities. The Pedlars' Act, 1870, now regulates the trade. No one is allowed to act as a pedlar without a certificate, nor is any one to act in any district in which his certificate does not authorise him to act, under a penalty of 10s. for the first offence, and £1 for every subsequent offence. A certificate is to be granted by the chief officer of police of the district to any applicant of good character residing in the district. The certificate is not to cost more than sixpence, and is to be in force for a year. Its authority may be extended by endorsement by other chief officers of police to their respective districts, at a charge of not more than sixpence for each endorsement. An appeal against refusal of certificate can be made to a Justice of the Peace. The license of a H. who uses beasts of burden is valid over the kingdom. The cost is £4 a year for each beast used. He may sell tea and coffee, but not spirits. He must not sell by auction without an auctioneer's license, nor may he sell plated goods without special license. Commercial travellers, sellers in fairs or markets, and book agents, require neither license or certificate.

Hawkes'bury, a river of New South Wales, formed by the junction of the Grose and Nepean rivers. After a very tortuous course of 330 miles it falls into the S. Pacific, 14 miles N. of Port Jackson (q. v.). The H. is liable to tremendous floods, and has been known to rise 97 feet above its usual level. It is navigable by vessels of 100 tons for 140 miles.

Haw'kins, Sir John, one of the 'sea lions' of the Elizabethan period, was born at Plymouth about 1520. The relative of Drake, he was frequently associated with him in naval enterprises, particularly against the Spaniards in 1555; while he fought so well against the Armada that he was knighted in 1558. Magnanimous and generous in many things, as in founding a hospital at Chatham for the relief of poor and disabled seamen, he made a blunder in maintaining, if not initiating, the slave trade. His death took place November 21, 1595.

Hawk'weed, the name given to species of *Hieracium*, a genus of plants belonging to the natural order *Compositæ*. They are perennial hairy herbs with yellow heads of flowers, and are natives of temperate and Arctic regions. Much doubt prevails as to the number of true species, owing to the difficulty of distinguishing them from one another. For the most part they are mere weeds. *H. pilosella* is the common mouse-ear H., and *H. aurantiacum* with orange flowers is called *Grim-the-collier* in England. Formerly birds of prey were imagined to employ H. to strengthen their powers of vision, hence the name.

Hawse (Old Eng. *hals*, 'the neck'), the space directly ahead of a ship, between her anchors and her bow. A ship has a *clear H.* when she is riding with two anchors out and their cables are not crossing; when the cables cross, a ship is said to have a *cross in her H.* To *freshen H.* is to veer out fresh rope at the H.-holes—apertures at the bows through which the cables run.

Haw'thorn (Old Eng. *hagathorn*, 'hedgethorn;' comp. Ger. *hagedorn*), or **White'thorn**, is the *Cratægus oxyacantha*, belonging to the natural order *Rosaceæ* (q. v.). It is a small branching tree or hedge-shrub. The plant is covered in early summer with numerous corymbs of white scented flowers. The fruit, which is usually produced in abundance, consists of small red drupes called 'haws.' It is common in Britain, where it is used principally for Hedges (q. v.). It is found throughout Europe, in Northern Africa, Siberia, Western Asia, and India, and has been introduced into N. America, where there are several other species. H. is the badge of the Clan Ogilvie.

Haw'thorne, Nathaniel, the most subtle and original of American writers of fiction, was born at Salem, Massachusetts, July 4, 1804. He graduated at Bowdoin College in 1825, and then resided at Salem, writing tales and articles for magazines, until 1836, when he became editor of the *American Magazine* in Boston. The first series of his *Twice-Told Tales* appeared in 1827, the second series in 1842 and in 1843. He married, and settled in an old parsonage at Concord, Massachusetts, in 1843, where he associated with Emerson, Channing, Ellery, and Thoreau. From 1846 to 1850 he was surveyor of Salem port, and from 1853 to 1857 United States consul at Liverpool. He then travelled in Italy, returned to Concord in 1860, and died at Plymouth, New Hampshire, May 19, 1864. His works include *Twice-Told Tales* (1837 and 1842), *Mosses from an Old Manse* (1846), *The Scarlet Letter* (1850), *House of the Seven Gables* (1850), *True Stories from History* (1851), *The Wonderbook* (1851), *The Blithedale Romance* (1852), *Life of Franklin Pierce* (1852), *The Snow Image* (1852), *Tanglewood Tales* (1853), *Transformation* (1860), *Our Old Home* (1863), *Notebooks* (1868–72), *Septimius Felton* (1872). His tales are marvels of daring, fantastic, and subtle imagination, abounding in wild and occasionally ghastly incidents, wrought out with the most vivid realism and keen analysis of character—H. being unexcelled for the skill with which he blends the supernatural and the commonplace—while the thrilling gloom of the narrative is relieved by the poetic beauty of the descriptive setting. He shares with Washington Irving the praise of being the most exquisite of American prose-writers, his style having scarcely been surpassed for purity, sweetness of cadence, and delicate touches of colour.—**Julian H.**, son of the above, was born in Boston, June 22, 1846, studied at Harvard College and at Dresden, and was an engineer in New York during 1870–72. He has written novels for periodicals, and published *Bressant* (1873), *Idolatry* (1874), *Saxon Studies* (1876), sketches of German life, and *Garth* (1877), an American story.

Hay (Old Eng. *heg*, Fr. *hea*, Pl. Deut. *heu*, *hau*, Dut. *hooi*, Dan. *höe*, Swed. *hö*, Icel. *hey*—perhaps from the same root as the verb to 'hew' or cut down), an important fodder for horses and cattle, consisting of dried grasses frequently mixed with clover or other allied plants. Two kinds of H. may be distinguished in the agriculture of Great Britain: natural or meadow-grass H. and artificial-grass H. In England and Ireland the first of these is the most important, but in Scotland the second is far more common. In the preparation of meadow-grass H., the points to be attended to are the cutting of the grass at the particular stage in its growth when it contains the largest proportion of nutritive matter in a soluble condition, and the drying of it so as to retain and preserve for use the nutritive principles it contains. It is found that the nutritive value of native grasses generally is much greater at the period of flowering than when the seed has ripened and the culm become hard and woody; and in several of the most important species the difference in value is as much as 3 to 1. It is therefore of great importance that the condition of the grasses in this respect should be understood, and that the mowing should take place when the grass is at its richest stage. The weather has a most important bearing upon the drying of H. in fine condition, and it is only with bright sunshine that it can be properly made. In dry sunny weather the H. is tedded or turned in the swathe, then gathered into windrows (in Scotland into small mounds called 'coles' or 'cocks'), and when it is so thoroughly dry that there is no fear of it fermenting or heating when pressed together in bulk, it is ready for forming the haystack or 'sow.' The artificial-grass H. made in Scotland consists generally of Italian ryegrass (*Lolium Italicum*), or perennial ryegrass (*L. perenne*), combined with clover or sanfoin, which latter plants yield an abundant 'aftermath,' generally consumed in the green state. The ryegrass is allowed almost or altogether to ripen its seed before the H. is cut, and, indeed, many farmers thrash out a certain proportion of their H. for the sake of seed for sowing. H., of recent years, has become a very valuable article, and a large quantity, in compressed bundles, is now annually imported from the Continent, especially from the meadow lands of Holland. According to Dr. Lyon Playfair, 100 lbs. of ordinary H. contain 76½ lbs. of dry organic matter or real food, 16 lbs. of water, and 7½ lbs. of ash. New H. contains a much larger proportion of water than old H.

Hay'bote, in English law, is the right which a tenant of land has to take wood 'from it to repair the hedges, gates, and fences upon it.' It also denotes the wood which may be taken to make implements for gathering the hay.

Hay'dn, Franz Joseph, a great German composer, was born at Rohrau, in the duchy of Austria, of poor parents, March 31, 1732 At the age of eight he entered the choir of St. Stephen's Cathedral, Vienna, where he remained till his sixteenth year, when his voice broke, and he lost his situation. He now began to give lessons in music, and in his leisure hours mastered theoretical works by Fux and Mattheson. After a nine years' struggle with poverty, Prince Esterhazy made H. his private chapel-master in 1760. Meanwhile H. had made the acquaintance of the singer Porpora, Wagenseil, and the poet Metastasio. He now lived with the Prince, partly in the country and partly at Vienna, diligently composing for orchestra, opera, and chapel. After Esterhazy's death in 1790, H. visited London twice, viz., in 1791 and 1794, where his genius received an enthusiastic recognition. He died at Gumpendorf, a suburb of Vienna, 31st May 1809. H. wrote 83 string quartets, 118 (published) symphonies, of which 12 were composed for Salomon's concerts in London, 24 concertos for various instruments, 24 trios, 44 sonatas, 163 pieces for the 'baryton' (a sort of violoncello), 19 operas, 15 masses; *Tobia*, an oratorio (1775); *The Creation* (1797–98); *The Seasons* (1801); and various other compositions, sacred and secular, such as the *Seven Last Words of Christ* (1785), and the English canzonets. His greatness appears chiefly in his quartets and symphonies, and in *The Creation* and *The Seasons*. A brilliant joyousness and a happy humour marked both his character and his music. See the *Life of H.* (Lond. 1818), abridged from Carpani's work (Padua, 1812–23), and Griesinger's *Biographische Notizen*.

Hay'don, Benjamin Robert, an English historical painter, was the son of a bookseller, and was born at Plymouth, January 23, 1786. Much against his father's will he resolved to be a painter, and in 1805 entered as a student the Royal Academy, where he was taught by Fuseli and became intimate with Wilkie. In 1807 his 'Joseph and Mary Reposing' was exhibited and sold for a high price, and in 1809 the Academy awarded a first prize to his 'Dentatus,' but H.'s idea that the picture was unfairly hung led to his lifelong rupture with the Academy. He afterwards opened independent exhibitions, began a school of painting—in which Landseer and Eastlake studied—in 1815, and was largely instrumental in inducing the English Government to buy the Elgin Marbles in 1816. He became involved in pecuniary difficulties, and his life was embittered by his excessive ambition, vanity, irritability, and sensitiveness. In 1840 he delivered lectures on painting, which were published in 1844–46. The failure of an exhibition of two of his pictures in 1846 wounded him so poignantly, that, added to his other troubles, it led to his suicide, June 22, 1846. His difficulties were mainly due to himself, as many of his pictures were sold for large sums. Among his works are 'Curtius Leaping the Gulf,' 'Uriel and Satan,' 'Nero Watching the Burning of Rome,' 'The Judgment of Solomon,' 'The Maid of Saragossa,' 'Alexander and Bucephalus.' His works are generally disproportioned and exaggerated, but impressive in design, and warm though somewhat coarse in colour. See *Life of H.* by Tom Taylor (2d ed. 1853), and *B. H., Correspondence and Table-Talk* (1876), edited by his son.

Hayes, Augustus Allen, M.D., an American chemist, was born at Windsor, Vermont, February 28, 1806. H. studied chemistry under Dr. Dana, devoted himself absolutely to that science, and filled various important posts. Among his discoveries is that of the organic alkaloid sanguinaria, which produces most brilliant salts. He has also investigated the proper-

ties of chromium, and written on chemical differences in varieties of guano, and the action of sea-water below the surface.

Hayes, Rutherford Birchard, President of the United States, is a descendant of New England Puritans, was educated at Harvard, became a successful lawyer and a vigorous Abolitionist. He served with distinction in the Civil War, rising to the rank of brigadier-general, and was subsequently thrice made governor of Ohio, and twice returned by the state to Congress. A prominent Republican, he strongly favours national education, the friendly pacification of the South, civil service reform, and the resumption of specie payments. After nearly four months' delay in attesting the votes, which was finally done by a joint convention of the two legislative Houses, H. was held to be duly elected President, 2d March 1877. See Howell's *Life and Character of H.* (1876).

Hay-Fever, or **Hay-Asthma** (*Catarrhus æstivus*), consists in excessive irritation of the eyes, nose, and the whole of the air-passages, causing paroxysms of sneezing, with a copious defluxion from the nostrils; pricking sensations in the throat; cough and difficulty of breathing, with or without mucous expectoration. H.-F. attacks certain persons only, and always at the same period of the year (and only then), when the grass comes into blossom or when hay-making is going on. If such persons avoid meadows and hayfields, and the neighbourhood of haystacks they escape the malady. It is supposed that the irritation is due to parasites of animal or vegetable origin. The powder of ipecacuanha and the odour of cats produce, in some persons, similar bronchial irritation. The only remedy consists in removal from the exciting cause, by going to those parts of the coast that are barren of grass, or by remaining within doors, and shutting out as much as possible the external air during the hay crop. Excessive symptoms may be relieved by *Belladonna, Camphor, Indian hemp, Lobelia inflata,* and *Stramonium* (q. v.).

Hay'nau, Julius Jakob, Freiherr von, an Austrian general, was a son of the Elector of Hessen, and was born at Kassel, 14th October 1786, entered the Austrian service in 1801, served in the campaigns of 1805 and 1809, but was not conspicuous till 1848, when he held a command in Italy, and crushed the revolt in Brescia (1849) with bloody severity. In May of that year he commanded the artillery of the army in Hungary, stormed Raab, besieged Szegedin, and had a share in the concluding battle of Temesvar. But the wholesale executions ordered by him in Pesth and Arad excited such horror, even in Austria, that he was removed from his command in 1850, and on a visit to London in 1851 he was severely handled by a London mob. He died at Vienna, 16th March 1853. See Schönhals' *Biography of H.* (1853).

Hay'ti (Carib. 'mountainous'), **Hispaniola,** or **Santo Domingo,** next to Cuba the largest of the W. Indian islands, in the Greater Antilles, lies to the S. of the Bahamas, in lat. 17° 36'–19° 59' N., and long. 68° 20'–74° 38' W. Area, 28,000 sq. miles; pop. 850,000, comprising whites, creoles, mestizos, and creole negroes. The Mona Passage, 58 miles broad, separates it on the E. from Puerto Rico, and the Windward Channel on the W. from Cuba and Jamaica, distant 43 and 107 miles respectively. It is 405 miles long from Cape Engaño in the E. to Cape Tiburon in the W., and 165 miles broad from Cape Isabella in the N. to Cape Mongon in the S. Its shape, though irregular, is that of an acute angle with its base in the W., where it is indented by an immense bay, enclosing the island of Gonaive. Other inlets are Samana Bay in the N.E., of great importance to shipping, and the bays of Neyva and Ocoa in the E. The island has a coast-line of 1500 miles, and is traversed by the Cibao mountains, which reach a height of 9000 feet in the peak of Yaque, and with their lateral spurs cover great part of the surface. The mountains, which are clad with virgin forest, descend abruptly on the N., but have a gentle southern slope. Among the characteristic trees are the oak, mahogany, cedar, walnut, ebony, satin-wood, fustic, and wax palm. Everywhere the forests are richly festooned with the twining vanilla, and with a wild vine that yields a muscadel wine. Along the coast and in the valleys are many rich tracts, watered by voluminous streams, as the Yuna, Great Yaque, Artibonite, Ozoma, and Neyva. The rivers are generally swift flowing, turbid, and alive with caymans. Enriquillo, near Neyva Bay, is one of several salt lakes, and has a length of 25 miles. The season of rain and tempests extends from May to July, and in August the heat increases in the daytime to 104° F. in the plains, and to 77° in the mountains. Changes from the dry to the wet season are sudden, accompanied sometimes by hurricanes and earthquakes, and the rivers often overflow, causing great destruction in the cultivated parts. The products are coffee, sugar, cacao, maize, rice, cotton, tobacco, indigo, cochineal, figs, &c. There is no mining enterprise, but H. is rich in minerals, including coal, copper, iron, gold, silver, mercury, salt, tin, jasper, marble, &c.

The island is divided into the republics of H. in the W., and of Santo Domingo in the E. (see DOMINICAN REPUBLIC), the former of which has an area of 1024 sq. miles, and a pop. of about 572,000, of whom three-fourths are negroes and the rest mulattoes, with the exception of 600 Europeans. The constitution of H., dating from 1867, vests the legislative power in a national assembly of two houses, and the executive in a president, to be elected for a term of four years by the people. The language is French, and the state religion is Roman Catholicism. Port-au-Prince (q. v.) is the capital. The finances are sadly entangled by previous misgovernment, and there is besides large foreign loans a vast floating debt, chiefly in depreciated paper money. In late years the estimated revenue has been £1,100,000, and the expenditure £1,700,000. The custom receipts amounted to £893,353 in 1874, and in 1875 the value of the exports, chiefly coffee, raw cotton, mahogany, and logwood, was £1,820,000, and of the imports, mainly manufactured goods from Britain and the United States, £1,250,000.

The island of H. was the second place in the New World visited by Columbus, and received a Spanish colony, which took the name of Isabella, in 1492. To the whole island was given the name Hispaniola, and the new colony of San Domingo, founded in 1496, became a bishopric in 1511. The colonies prospered immensely, but at the reckless sacrifice of the natives, who were made to toil like beasts in the mines, and who only rebelled to incur a swifter death. Although at their entrance the Spaniards had found some 2,000,000 natives, negro slaves had to be introduced as early as 1522; by 1711 there were only 21,000 natives. French buccaneers began to appear on the N. coast of the island in 1630, and formed an independent settlement in 1714. By the treaty of Ryswick (1697) Spain ceded the W. part of H. to the French, under whom it prospered rapidly, having a population in 1792 of 780,000, comprising 40,000 whites, 40,000 half-breeds, and 700,000 slaves. But the conflicting diversity of race, and monopoly of political power by the whites, led to a rupture on the outbreak of revolution in the mother-country. After fierce revolts of the mulattoes and negroes, and inroads of the English and Spanish, all the inhabitants of the colony were declared free and equal in 1793, and the command of the army was given to Toussaint l'Ouverture, who expelled the hostile intruders, and once more restored peace. In 1795, by the treaty of Basel, the Spanish territory was ceded to France. Napoleon I. attempted unsuccessfully to reinstitute slavery in 1801, and San Domingo declared itself an independent republic, 30th November 1803. Dessalines (q. v.), who was chosen governor for life, assumed the fantastic title of Emperor of H., and consequently brought about a long, wasting civil war, ending in almost complete anarchy. On his assassination in 1806 the E. part of the island returned to Spanish rule, while the W. part remained divided between various rival chiefs till Boyer (q. v.) succeeded in bringing the whole island under his government in 1822. France in 1825 acknowledged the independence of the republic. But in 1842 the negroes rose in insurrection, and the E. portion formed itself into the republic of Santo Domingo, while H. was again split into petty rival states. Soulouque (see FAUSTINUS I.) assumed the imperial title in 1849, but was deposed in 1858. Of its later presidents, Geffard fled in 1867, and Salnave was expelled in 1870. General Boisrond-Canal was elected for four years in 1876. See Jordan's *Geschichte der Insel H.* (Leips. 1846); Madion, *Histoire d'H.* (Port-au-Prince, 1855); Ardouin, *Etudes sur l'Histoire de H.* (10 vols. Par. 1853–61); Bonneau, *H., ses Progrès, &c.* (Par. 1862); and Hazard, *Santo Domingo, with a Glance at H.* (Lond. 1873).

Hay'ward (lit. 'Hedgeward'), the keeper of the herd of cattle belonging to a town or manor, who prevents them from injuring the hedges. H. is also an officer who impounds strayed cattle.

Hazard (Fr.; Sp. *azar;* Ital. *zara*), a game of chance played with the Dice (q. v.) for money. The thrower of the dice is called the *castor*, his opponent the *setter*, and the throw itself a *main.*

Hazaribagh' ('thousand gardens'), the chief town of the district of the same name, Province of Bengal, British India, 239 miles N.W. of Calcutta, 1750 feet above the sea; pop. (1872) 11,050. It has a military cantonment, but the European troops were removed in 1874 on account of an outbreak of typhoid fever; a few are left to guard the European penitentiary, which contains about forty prisoners. The town has frequently been chosen as the residence of dethroned native chiefs. The *district* of H. has an area of 7021 sq. miles; pop. (1872) 771,875, chiefly Sonthals and other aborigines. It is very hilly and covered with jungle; but the heads of the valleys are dammed up, wherever possible, for rice cultivation. There are many coalfields, of which the Kurhurbari mine, the best in India, is profitably worked by the railway company. The output in 1874 was 105,000 tons, and the consignments are despatched as far as Madras and Scinde. There are also copper and mica mines, and four tea-gardens, which yielded an outturn in 1874 of more than 100,000 lbs.

Haze'brouck, a town in the department of Nord, France, on the H. canal, 25 miles W.N.W. of Lille, at the junction of the Dunkirque and Calais Railways. Its church of St. Eloi dates from the 15th c. Linen is manufactured, and there are several breweries, limekilns, soapworks, and dyeworks. Pop. (1872) 9435.

Ha'zel (Pl. Deut. Dan. and Sw. *hassel;* Ger. *hazel;* Dut. *hazelaar*), the English name for *Coylus avellana*, a small tree or coppice-shrub frequent throughout Britain and the Continent. The small flowers, which are produced before the foliage, are in long pendulous catkins. The fruit consists of the well-known nut surrounded by a large spreading husk. Filberts and cob-nuts are cultivated forms of the H. Besides this one British species, there are five others found within the temperate region of the northern hemisphere. The long flexible tough shoots of H. are used for making crates and fishing-rods.

Haz'litt, William, a great English critic and essayist, of Irish descent, was born at Maidstone, Kent, April 10, 1778. His father was a Unitarian minister at Wem, Shropshire, and H. was trained for the same profession at the Unitarian College, Hackney. At the age of seventeen he abandoned theology and devoted himself to painting. Disappointed with his artistic efforts, he went to London in 1803, published his *Principles of Human Action* in 1805, and thenceforth lived by literature, publishing an abridgment of Tucker's *Light of Nature* in 1807, the *Eloquence of the British Senate*, a collection of parliamentary speeches, in 1808; *English Poets* in 1818; *English Comic Writers* in 1819; *Dramatic Literature of the Age of Elizabeth* and *Characters of Shakespeare's Plays* in 1821; *Table-Talk* in 1821-22; *Spirit of the Age* in 1825; *Plain Speaker* in 1826; *Life of Napoleon* in 1828-30. He contributed to the *London Magazine*, *Edinburgh Review*, *New Monthly*, and various political, literary, and theatrical journals. H. died September 18, 1830. His *Literary Remains* (Lond. 2 vols. 1836) were published by his son. The genius of H. never found full expression in his works. He was a man of intense feelings, warm-hearted, excitable, aggressive, and capricious. His criticism is generally passionate and eloquent, often acute and nobly sympathetic, often wayward, intemperate, and paradoxical. His style is fluent, rich, and graceful, sparkling with epigrammatic terseness, but sometimes overstrained and flowery beyond the limits of good taste. The best edition of his works is that edited by his grandson, W. C. Hazlitt, published by Bell & Daldy, London. See Bulwer Lytton's *Quarterley Essays* (1875) and L. Stephen's *Hours in a Library*, 2d series (1876).

Head. See CRANIUM, BRAIN, and ENCEPHELON.

Head, Sir Edmund Walker, son of the Rev. Sir John H., Bart., was born near Maidstone, Kent, in 1805, stood first in classics at Oriel College, Oxford, in 1827, succeeded to the baronetcy in 1838, and was successively appointed poor-law commissioner in 1841, lieutenant-governor of New Brunswick in 1847, and governor-general of Canada in 1854. He is author of *Painting* in the *Penny Cyclopædia*, of a *Handbook of the Spanish and French Schools of Painting* (a sequel to Kugler's *Handbook*), &c. He returned to England in 1861, and died in London, 28th January 1868.—**Sir George H.**, born in 1782, served as an officer of commissariat in Spain and Canada, and was knighted in 1831. His *Forest Scenes and Incidents in N. America* appeared in 1829, and he translated Cardinal Pacca's *Memoirs* (1850), and the *Metamorphosis of Apuleius* (1851). He died 2d May 1855. —**Sir Francis Bond H.**, brother of the preceding, was born near Rochester in 1793, entered the Royal Engineers, undertook in 1825 to work a gold and silver mine in Rio de la Plata, and described a ride of 6000 miles in *Rough Notes of Rapid Journeys Across the Pampas* (1826). He was appointed lieutenant-governor of Upper Canada in 1835, and suppressed an insurrection, for which he was created a baronet in 1838. Among his many works are *Bubbbes from the Brünnen of Nassau* (1833), a *Life of Bruce the Traveller* (1844), *The Emigrant* (1847), *The Defenceless State of Great Britain* (1850), *Descriptive Essays* (1856), *The Horse and his Rider* (1860), *The Royal Engineer* (1860). He died 23d July 1875.

Head'ache, or Cephalal'gia, a pain referred to the head, or to the front, side, or back thereof, varying in intensity according to its cause. H. very frequently depends upon or is connected with deranged digestion. During attacks of *Indigestion* (q. v.) there are, together with a violent H., frequently nausea and vomiting, the complaint being popularly known as *sick H.* or *bilious H.* *Hemicrania* (q. v.) is simply headache confined to one side, and occupying generally the brow and forehead, but sometimes affecting very exactly half of the head. *Tic Douloureux* (q. v.), another neuralgic disease, is frequently situated in the facial branches of the fifth pair of nerves, nerves of sensation. Neuralgic H. has a tendency to recur at regular intervals. H. is a frequent, and, in many cases, an unvarying symptom of disease processes within the cranium, and also in other parts of the body. Violent attacks of H. may thus be caused by disease of the bony structure, as necrosis and exostosis; by abnormal growths, as fungous tumours of the dura mater; by inflammatory action in the membranes of the brain, as Meningitis (q. v.), or in the brain substance itself, as Cerebritis or Encephalitis (q. v.), and by increase or diminution of the contents of the serous cavities, H. is also a frequent accompaniment of such diseases as Chorea, Hysteria, Catalepsy, Epilepsy, Apoplexy, and Sunstroke (q. v.); and of exanthematous and malarial fevers, as Small-pox and Ague (q. v.). H. is also frequently caused by congestion of the vessels of the brain, depending on relaxation of the coats of the vessels themselves, or on an abnormal quantity of blood being present owing to obstruction of the circulation in other parts of the body. In such cases, depletion, gentle purgatives, and restriction in diet afford relief, and may obviate, in some cases, an attack of apoplexy.

Headborough was anciently the head of the Frankpledge (q. v.) in boroughs. The word now denotes a kind of constable or peace-officer.

Healds, or Heddles, in weaving, the name given to that part of the *harness* of a loom which alternately raises and depresses the warp threads for the passage of the weft, and which consists of vertical lines of plaited yarn or wire with loops or eyes in the centre through which the warp threads pass. H. were formerly made by hand-knitting, but both yarn and metallic kinds are now made by machinery, by which uniformity and durability—points of great importance—are attained.

Health (Old Eng. *hælth*, from *hælan*, 'to heal;' connected with 'whole'), is that state of an animal or living body in which all the parts are sound, well organised, and developed, performing freely their natural functions without pain. Every deviation from this condition of the system constitutes Disease (q. v.). Absolute bodily H., although possible, must be one of the rarest endowments. Life may be divided into three periods, viz., growth or development, maturity and decay, terminating in Death (q. v.). In absolute bodily H. the form of death is euthanasia, the final result of gradual decay. The absolute and extreme duration of human life is uncertain, but the physiological limit is certainly much greater than that attained by the longest livers within historical times. There is probably no individual born in a state of perfect H., without any hereditary predisposition or taint; and no one passes through the stages of development, maturity, and decay without having suffered from derangement of H., necessarily shortening life. Hereditary taint varies in degree, and so also diseases depending on an almost infinite variety of causes. In point of fact,

no community of human beings can be said to fulfil all the conditions of a healthy existence, and it is notoriously the case that the laws of H. are flagrantly violated by nearly all. That department of medical science which embraces a consideration of the means of preventing disease, or, in other words, of preserving H., is called Hygiene (q. v.). The means of preserving H. are in a great measure, but not altogether, at the command of each individual of the community. In every condition in which human beings may be placed there are agencies at work which operate injuriously on their H., and which can be removed or guarded against by the joint action of the community only. Such agencies are numerous and varied, some depending upon atmospheric and telluric influences, capable, nevertheless, of being removed or guarded against; while others may originate in the various modes of life of other members of the community who violate the laws of H. From the remotest antiquity, and in all civilised countries, laws have been made with the intention of removing conditions which injure the H. of the people. The growth of the population in town and country necessitates a code of sanitary regulations for the preservation of the public H., and such regulations, based upon sound hygienic principles, constitute Sanitary Science (q. v.). The necessity for such regulations is obvious from a view of the phenomena of the death-rate as affecting the calculation of premature mortality; for even where adults are more than commonly long-lived, and while there is no reason why a healthy child, the offspring of healthy parents, should not survive to a good old age, there is always a considerable mortality at very early ages, more especially under the age of five, which tends to reduce the *Vital Statistics* (q. v.) of the whole community. These departments of science, *hygiene, sanitary science*, and *vital statistics*, have assumed great importance of late years, and constitute the object of the 'public H.' movement in this country, a movement which has accomplished many valuable practical results. See DISEASE, ACTS RESPECTING.

Health, Bill of. See BILL.

Health, General Board of. The G. B. of H. has ceased to exist, its powers having been transferred by 21 and 22 Vict. c. 77, s. 1 to the Local Government Board (q. v.). See also SUPERVISION, BOARD OF.

Health, Medical Officer of. After the invasion of Great Britain by cholera in 1831, attention was directed to the existence of certain duties in reference to health, the observance of which, in the public interest, required to be enforced; and from time to time, by various statutes, these were consigned to certain authorities. Just as in questions of law and procedure the need of legal advisers soon appeared, so in reference to health and medicine the necessity for public medical advisers became apparent. In the Towns' Improvement Clauses Act, 1847, power was first given to appoint medical officers of health. Under the Metropolitan Management Act, 1855, every vestry might make such an appointment—an extension to the metropolis of the provisions of the Public Health Act of 1848. Although in all the important cities and towns, either under this or local Acts, medical officers were appointed, no appointments were made, in the country generally, until after the passing of the Public Health Act, 1872, by which such appointments were made *compulsory* upon all authorities, urban and rural. In Scotland, under the Nuisance Removal Act (1846 and 1848), the sanitary authority, such as it was, was vested in parochial authorities, and, consequently, poor-law officers performed such duties in connection with public health as received attention, chiefly in matters referring to epidemic diseases and the like. Under the Burgh Police Act, 1862, the commissioners were empowered to appoint 'a person of competent skill and experience who shall be styled the "Officer of Health."' In the same year, under a local Act, the city of Glasgow obtained similar power. The Public Health Act, 1867, was the first general Act applicable to Scotland constituting local authorities for health purposes in every locality who have power to appoint medical officers of health. This power is *not* compulsory, as it is in England. The difference between the duties of the officer in the two countries is well stated by Sheriff Spens as follows:—'Under the English system the M. O. of H. discharges the duties of Sanitary Inspector (q. v.) and medical officer of the Scotch local boards *minus* those of the inspector of nuisances.' This is well shown by comparing the byelaws recommended by the Board of Supervision for regulating the duties of medical officers with those of the local government board. They agree with the omission of rules 5, 8, 10, 14, and 16, under section iv. It is noteworthy that the M. O. of H. in England can be removed from office by the central board only, whereas in Scotland he is not so protected. In Ireland, the public health has always been conjoined with the poor-law service. In 1844 the hospital treatment of all persons suffering from contagious diseases, whether paupers or not, devolved on the unions. By the Medical Charities Act of 1851 the country was divided into above seven hundred dispensary districts, with dispensaries numbering above one thousand, and medical officers in proportion. These were parochial officials, and, although not so designated, performed the duties of medical officers of health, in so far as such were performed. The first statutory recognition of this fact was made by the Public Health Act (Ireland) of 1874, by which every dispensary doctor was appointed a M. O. of H. for his district. In 1875 the Irish Local Government Board reports as follows:—'We are now in a position to state, that the whole surface of Ireland is, for sanitary purposes, divided into districts, as nearly as practicable uniform in regard to population and area, each district being served by one or more sanitary officers—in other words, dispensary officers with both medical and surgical diplomas—whose annual official emoluments amount to an average of £147, 16s. per annum each.' The official designation is not M. O. of H., but 'sanitary officer,' the person corresponding to the sanitary inspector of Scotland and England being the 'sanitary sub-officer.' Their respective duties are similar, but are apportioned more after the English than the Scotch practice. There are three classes of medical officers of health:—(1) Those in cities and combined districts, whose whole time is devoted to the office; (2) those who are also in general practice, their salary not being sufficiently remunerative; and (3) union and parochial medical officers, who receive a paltry annual fee for the nominal performance of nominal duties. See *Dictionary of Hygiène and Public Health*, by Alexander Wynter Blyth (Lond. 1876); *Sanitary System of Scotland*, by Sheriff Spens (Edinb. 1876).

Hear'ing. See EAR.

Hearing of a Cause is the phrase used in English law to denote the argument on the merits of a case before the chancery division or before a magistrate. 'The trial' is the corresponding term at common law in a jury case in England and in Scotland. In the latter country, before a judge, it is called 'the debate.'

Hearing in Presence, in Scotch law, means the debating of a case before all the judges of the Court of Session (q. v.). It is only resorted to in difficult and important cases.

Hearne, Thomas, an English antiquary, born at White Waltham, Berkshire, in 1678, studied at Edmund Hall, Oxford, became assistant librarian in the Bodleian in 1701, and lived in Edmund Hall till his death, June 10, 1735. His chief works are editions of Justin, Eutropius, Livy, Spelman's *Life of Alfred; Leland's Itinerary; Lelandi de Rebus Britannicis Collectanea;* Langtoft's *Chronicle; Aluredi Beverlacencis Annales,* &c. He also wrote *Ductor Historicus*, and *The History and Antiquities of Glastonbury.*

Hear'say Ev'idence is the name given by lawyers to evidence in which the witness tells what he has heard said by another. H. E. is usually inadmissible, but there are exceptions to the general rule. For the most important one see DECLARATION, DYING. When a witness depones to a conversation, he must give the exact words if he can, and an opposing counsel will probably ask him to repeat them on cross-examination. If the exact words cannot be given, the substance must, as a witness is not allowed to give his impression of a result apart from words or substance. See EVIDENCE.

Hearse, or Herse (Fr. *herse*, Old. Fr. *herce*, Ital. *erpice*, from Lat. *hirpex* or *irpex*, 'a harrow'), a pyramidal candlestick, or a triangular iron frame resembling a harrow, set with spikes for holding candles tier above tier; a decorated carriage for conveying the dead to the grave. The transition of meaning is curious, and is thus traced: The candlestick called *hercia* in the 12th c., being part of the furniture of a church, was used at funeral solemnities. In course of time, the light wooden frame for sup-

porting the pall over the bier during the service for the dead was called H., from the arrangement of H. lights around it. Later, the name was applied to a lofty structure or canopy, draped with black hangings, and decorated with waxen figures, tapers, and banners, which was erected temporarily in a church for holding the bier. At times such herses were allowed to remain for months in honour of the dead. From meaning a funeral canopy the transition was easy to a decorated car mounted on wheels, which was introduced in the 16th c. for carrying the dead to burial. See Wedgwood's *Dictionary of English Etymology.*

Heart. See CIRCULATION OF THE BLOOD.

Heart, Disease of the. Like all other organs of complex structure, and formed of different tissues, the heart is subject to a variety of diseases of more or less serious import; for the office of the heart is as essential to life and health as is that of the brain or of the lungs. It seldom happens that the whole heart is affected; the component tissues and different portions of the organ being more frequently separately diseased. The left side is more liable to disease than the right, and when both sides are affected, the morbid changes are more conspicuous in the left than the right chambers. The inflammations of the heart embrace *pericarditis*, an inflammation of the *Pericardium* (q. v.),—the fibro-serous membrane containing the heart, and investing it on its external aspect; *endocarditis*, a similar affection of the *Endocardium* (q. v.) covering the valves and lining the chambers of the heart; and *carditis* or *myocarditis*, an inflammation of the muscular structure of the heart, occasionally terminating in suppuration, ulceration, rupture, ramollissement, and induration. The pathological conditions and changes dependent upon inflammations of the heart are identical with the morbid appearances induced by the inflammatory process affecting similar structures in other parts of the body, so that the gravity of the symptoms depend more upon the important nature of the organ affected than upon the gravity of the disease *per se.* All serous membranes are liable to Inflammations (q. v.), acute or chronic, which may terminate by resolution, or in an increased effusion of serous fluid, which may become purulent, or may coagulate upon the opposed surfaces, become vascular and glue them together. Lymph, which is generally formed in much greater quantity from the serous membrane of the heart than from any other serous membranes, may render the serum turbid, or may float in it in flakes; but it is more frequently disposed as a membrane, measuring from two to several lines in thickness. When the result of inflammation is a purulent exudation, the pus is generally of a healthy character. It occasionally happens that blood, as well as serum, is effused within the cavity from the highly congested vessels, or from the new formed vessels, which, being tender, give way. In chronic forms of the disease the effused lymph is commonly found organised, forming adhesions, and frequently it becomes converted into cartilaginous and even osseous patches. D. of the H. is diagnosed by constitutional and local symptoms, the latter being chiefly elicited by auscultation and percussion. Although the disease processes in Pericarditis and Endocarditis (q. v.) are precisely the same, the symptoms are markedly dissimilar; but in the early stages there may be some difficulty in diagnosis. In acute pericarditis there is pain in the præcordial region, radiating over the sternum, often extending to the brachial plexus and the left arm; disturbance of the heart's action, a sensation of constriction over the chest; pain on inspiration, during coughing, and on pressure; inability to lie on the left side; dulness on percussion, and generally an exocardial friction sound. In endocarditis the impulse of the heart is more extensive, forcible, and abrupt than is natural. There is much discomfort and uneasiness at the heart, but no special sensation of dyspnœa unless there be valvular disease. The greatest ease is obtained by lying on the back, and there is frequently an inclination to toss about the arms. As the disease advances endocardial sounds are apparent. The exocardial friction murmur, soft and bellows-like, accompanies both the diastole and the systole; it is limited to the region of the heart, varies over different parts of the heart, and is not constant; it precedes and follows the impulse of the heart, but does not correspond with its rhythm. Pressure over the region of the heart intensifies the murmur, and converts the sound into a rustle or rub. In all these respects the exocardial are distinguished from the endocardial or valve murmurs, which may depend upon aortic or mitral obstruction and regurgitation, or upon both combined. Both diseases may coexist in the same subject, so that the friction sound, pathognomic of pericarditis, must be looked for in the heart's region, and the endocardial murmurs beyond the region of the heart. Chronic endocarditis almost invariably results in valvular lesions, which tend to thicken the walls and enlarge the cavities of the heart, owing to the great increase of the heart's action necessary to propel the blood through the valves. Aortic regurgitation induces dilatation of the left ventricle, enlargement of the left auricle and the right ventricle and auricle. Disease of the pulmonic valves causes dilatation of the right cavities, and mitral disease leads to enlargement of the left auricle, dilatation of the pulmonary veins, congestion of the lungs, enlargement of the right ventricle and auricle, and of the *venæ cavæ*, engorgement of the liver, and enlargement of the left ventricle itself. So long as the muscular tissue of the heart is sound, valvular disease has but little influence on health, but the persistence of the disease implies (1) *an enlarged heart, or simple hypertrophy*; (2) *hypertrophy with dilatation of one or more of the cavities*; and (3) *simple dilatation with or without attenuation of the walls of the cavities.* Atrophy is an abnormal wasting and loss of the muscular substance of the heart, and may be general or partial, and is generally associated with enlargement of the cavities; but the whole heart may be atrophied and reduced in size, as is often seen in phthisis. Carditis (q. v.), or inflammation of the heart, is extremely rare as an idiopathic disease, and has been seldom met with unless complicated with pericarditis. The arteries supplying the heart itself are also liable to disease, and diseases of the aorta and thoracic aneurism are intimately associated with D of the H. Hydatids or 'echinococcus' cysts have been found between the walls of the heart, beneath the inner membrane, and such parasitic cysts abound in sheep and oxen. The heart is also subject to degeneration of its minute tissues, the muscular fibres being replaced by fatty or fibrinous molecular particles, as in Fatty Degeneration (q. v.), tending to sudden death from syncope or rupture of the heart. *Breast-pang*, or *Angina Pectoris* (q. v.), ought to be regarded rather as a symptom of organic D. of the H. than as a distinct form of disease. *Cyanosis* (q. v.) is symptomatic of various malformations of the heart and great vessels, so that only a small portion of the blood is aërated in the lungs. Cyanosis may depend upon obstructions in the pulmonary artery and systemic venous circulation, a patulous condition of the ductus arteriosus, an open foramen ovale, a deficiency in the septum of the ventricles, or a heart formed of one ventricle and one auricle only, depending upon arrestment of development during fœtal life.

There are also various functional derangements of the heart, unconnected with organic mischief, but which simulate organic disease, such as palpitation, and fainting (q. v.), spasms, and meta tatic gout (q. v.), but all such derangements are apt to terminate in organic D. of the H.

The causes of D. of the H. are various and numerous. Pericarditis and endocarditis are frequently associated with rheumatic affections, pleurisy, and inflammation of the lungs. Endocarditis is frequently caused by abnormal conditions of the blood, as in exanthematous or zymotic diseases, or when the blood is habitually impregnated with alcohol. Functional derangement is frequently associated with hysteria and dyspepsia, and is traceable to excessive mental exertion, sedentary occupations, strong mental emotions, and nervous exhaustion from various causes. The medical literature of D. of the H. is peculiarly rich. See the works of Corvisart, Lænnec, Stokes, Graves, Walshe, Sibson, Latham, Fuller, and *Clinical Lectures on Diseases of the Heart and Aorta*, by Dr. G. W. Balfour (Lond. 1876).

Heart-Urchin, the name given to certain genera of *Echini*, or 'Sea-urchins,' from their heart-like or cordate shape. These 'urchins' are called 'irregular,' on account of their difference in form from the Common Echinus (q. v.), which is spherical. The purple H.-E. is the *Spatangus purpureus* of the naturalist; the common species, the *Amphidotus cordatus.* A curious form is the 'Fiddle H.-E.' (*Brissus lyrifer*), so named from a mark of that shape on the shell or 'test.'

Heat. The familiar terms *hot* and *cold* are used to express certain well-known sensations, which are experienced on touching certain objects. They are understood also as descriptive of a certain state in which the object is—any given body containing

more or less H. according as it is hotter or colder. This agent, H., if it has an existence at all, must be either matter or energy, for excepting the inevitable *time* and *space*, these are the only elementary notions which are recognised in the physical universe. Till far on in the present century the *material* hypothesis was generally adopted; but the discoveries of Rumford (1798), Davy (1799), and Joule (1843) have for ever overthrown it, and established on the most unequivocal evidence that H. is *energy*—energy of motion. The history and development of this branch of science bears intimately upon the *theory* of H., or Thermodynamics, and to that article accordingly we refer the reader, purposing here only to enter upon what might be termed the truly experimental portion.

It is of the greatest importance to have a clear conception of the true scientific meaning of the word *temperature* as distinguished from *heat*. When two bodies at the same temperature are placed in contact, neither parts with H. to the other. This is the first great principle upon which the science of thermometry is based. The second principle is, that when two bodies at different temperatures are placed in contact, the one which is at the higher temperature parts with H. to the other, until both are reduced to the same temperature. In other words, the hotter body cools, and the colder becomes warm. The temperature of a body is then simply its thermal state considered with reference to its power of communicating heat to other bodies, and bears exactly the same relation to H. which pressure bears to fluid in hydrodynamics. Practical methods for measuring temperature depend in all cases upon other *effects* of H. which occur simultaneously with the changes which temperature undergoes; and to the consideration of these effects we will now turn.

As a general rule, when a substance, whether solid, liquid, or gaseous, is raised in temperature, it expands in volume. The expansion of a solid under the action of H. is measured in two ways, according as it is the *linear* or *cubical* expansion which is considered. In the former case the *co-efficient* of linear dilatation for any substance is measured by the ratio which the increase in length, due to the rise of temperature by one unit, of a long narrow rod formed of that substance bears to the original length. For instance, if the original length of the rod be L, and its length after having its temperature raised by one unit L + *l*, the co-efficient of linear dilatation is *l* : L. If the substance, instead of being in the form of a thin rod, is cubical in shape, then it is the cubical dilatation that is considered; and for all solid substances, which increase equally in all directions, the co-efficient of cubical dilatation is practically three times the co-efficient of linear dilatation. Certain crystalline solids, however, do not expand equally in all directions; and Mitscherlich has shown that this peculiarity is closely connected with the optical properties of the crystals. Thus simple regular crystals which do not cause double refraction (see LIGHT) dilate uniformly in all directions; uniaxal crystals have two co-efficients of dilatation, one along the principal axis, and the other along each of the three secondaries; and biaxal crystals have a different co-efficient for each of the three axes. The heating of a solid is then accompanied by a rise of temperature, and in general an increase of volume. But at a certain stage the solid begins to alter its physical state, in other words, to melt; and as long as this change of state is taking place, little if any alteration is produced in the temperature. As soon as the solid is wholly transformed into liquid, the temperature again begins to rise as the heating is continued, the liquid at the same time dilating. This dilatation of liquids when heated is the phenomenon upon which the common practical method for measuring temperature depends. (See THERMOMETER.) The mercuric thermometer is that which is used for all common purposes; and the temperature is indicated by the height at which a column of mercury stands in a narrow glass tube, which has been made as perfect a vacuum as possible. Mercury is especially convenient, because for usual temperatures it expands very uniformly, and having a low specific H., does not lower the temperature of the body with which it is in contact by an appreciable amount. Throughout this article the thermometer scale chosen is the *centigrade*, which has for its zero the freezing-point of water, and for its hundredth degree the boiling-point. We have seen how a substance may exist in both the solid and liquid state at the same temperature and pressure, the only difference being that the liquid contains more H. The H. which disappears while the substance is changing from solid to liquid is called the *latent H. of liquefaction*. It has really, of course, no existence, but is the thermal equivalent of the mechanical work required to be done to effect the physical change. The latent H. of water is in thermal units 79·25, where a thermal unit is the amount of H. required to raise the temperature of 1 lb. of water 1° C.,—*i.e.*, it requires 79·25 units of H. to be expended in order to transform one pound of ice at 0° C. into one pound of water at the same temperature and pressure. Now, exactly as H. disappears, when the solid is melting, without an accompanying rise of temperature, so H. disappears in converting the liquid into gas. All liquids which do not chemically decompose under the operation are convertible into the gaseous form if sufficiently heated, and the temperature at which this occurs is called the boiling-point of the liquid. The quantity of H. which disappears during the conversion of unit mass of the liquid into gas is called the *latent H. of vaporisation*, and is measured in the same way as the latent H. of liquefaction. Thus the latent H. of steam is 537 units of H. Regnault, Andrews, and others, have made numerous experiments on this subject, and their results indicate that of all vapours, steam has the greatest latent H., and of all liquids, water. The effects of H. upon gaseous substances are simply stated in the laws of Boyle and Charles. (See GASES.) These are—(1) That at constant temperature the density of a gas is directly proportional to the pressure; and (2) that under constant pressure, and for a given rise of temperature, the volume of a gas expands by a fraction of itself, which is the same for all gases. All gases tend to expand when heated, but amongst liquids and solids there are some which contract when heated. Thus water at 0° C. contracts when heated till it reaches a temperature of 4° C., when it begins to expand. India-rubber, again, when heated under tension, contracts—a phenomenon which has an important bearing upon the theory of Energy (q. v.).

If there is no change of physical condition, heating is accompanied by rise of temperature; and the number of thermal units necessary to raise the temperature of unit mass of a given substance by one degree is called the *specific H.* of the substance. The specific H. of a substance in its liquid state is greater than the specific heats in its solid or gaseous states; thus water has twice as great a specific H. as ice, and more than twice as great as steam. Experiments show that for solids and liquids, the specific H. is greater for a higher temperature. Of all known substances, water has the greatest specific H., and it is this phenomenon upon which depends the important climatic effects of water. The specific heat of gases may be measured in two ways; or, rather, every gas has two specific heats—the specific H. at constant pressure, and the specific H. at constant volume. Their determination is one of excessive difficulty, but Regnault has made a successful series of experiments, and deduced the curious relation, that for the non-condensable gases (air, hydrogen, oxygen, &c.) the ratio of the specific H. at constant volume to that at constant pressure is about 1·408 : 1. This result is closely concordant with theory. There are other effects of H., which can be merely indicated here. Of these, we may cite the electric polarity acquired by Tourmaline (q. v.), the whole subject of Thermo-Electricity (q. v.), the demagnetising effect upon a magnet, and the chemical effects as evidenced in dissociation.

The *transference* of H. from one substance to another may be effected in three different ways: by radiation, convection, or conduction. *Radiation* consists in the transmission of H. from one body to another by propagation through the intervening medium. Radiant H. is of precisely the same nature as Light (q. v.). Both are wave motions due to transverse vibrations; both travel in straight lines and with the same velocity; both are reflected and refracted according to the same laws; and both can be polarised. Radiant H. differs from light only in its wave length, which is too long to affect our retinas. The difference is therefore only one of degree, and is precisely the same as the difference between a low musical note and a high musical note. Now, let a number of bodies, all at the same temperature, be placed in a chamber the walls of which are maintained at that temperature and are besides impervious to H. In such a state of affairs no change of temperature will occur, and the whole system will be in thermal equilibrium. But if a colder body be introduced into the chamber, all the other bodies as well as the enclosing walls will begin to part with H. to the colder body. Now, it is quite out of the question to suppose that the mere introduction of the colder body should suddenly cause the surrounding bodies to begin to emit radiations; and

accordingly we conclude that a body is always radiating H., but that, if there be no colder body in the vicinity, it receives from radiation by the surrounding bodies exactly what it radiates towards them, so that its temperature remains constant. If two bodies are at the same temperature, the H. radiated by the first and absorbed by the second is equal to the H. radiated by the second and absorbed by the first. Further, the higher the temperature of a body the greater the radiation, so that if the bodies be at different temperatures, the hotter will radiate more than the colder, and the colder will absorb more than the hotter; and, consequently, H. will be lost by the hotter and gained by the colder, till both are at the same temperature. This is Prevost's famous *Theory of Exchanges;* and it has been extended and fully verified by the researches of Stokes, Balfour Stewart, Kirchhoff, and De la Provostaye. (See SPECTRUM ANALYSIS.) If a part of a fluid be heated so as to expand or contract, the hydrostatic equilibrium will be destroyed; and the heated fluid, if acted on by gravity, will ascend or descend, giving rise to a current. Such currents are called *convection* currents, and they are seen on a large scale in the operation of winds and ocean currents. If a liquid, which expands when heated, is heated from below, the lower strata, becoming lighter than the upper, must ascend and give place to the heavier (because colder) liquid. By this means H. is conveyed from one portion to another; and considering the great mobility of gases, it is evident that convection currents must play in them a most important part. If the liquid were heated from above, of course there would be no convection currents; but the H. would be transmitted solely by *conduction.* This means of transmitting H. is easiest studied in solids, which are quite free from the effects of convection. All substances conduct H. more or less easily; and according to their power of conduction they are relatively termed good and bad conductors. The metals are the best conductors—silver, copper, gold, brass, tin, and iron, ranking the highest; woollen materials, india-rubber, &c., are bad conductors. See CONDUCTIVITY.

The production of H. is an action which is constantly going on in the universe. Wherever there is a transformation of Energy (q. v.), or whenever *work* is done, H. is necessarily evolved—and all forms of energy tend ultimately to take the form of H. This part of the subject, which treats more especially of the nature of H. and of its economical uses, is best studied under Thermodynamics.

The best works on the subject are Tyndall's *H. Considered as a Mode of Motion* (1863); Balfour Stewart's *Elementary Treatise on H.* (1866, 2d ed. 1876); Tait's *Thermodynamics* (1868, 2d ed. 1877); and Clerk Maxwell's *Theory of H.* (1871). All these are written on totally different plans. Tyndall's is specially intended for the non-scientific public; Stewart's enters more fully into the methods of experimentally determining the various thermal constants and co-efficients; Tait's is chiefly an historical sketch of the subject, with an accompanying account of the development of the modern theory of energy; while Clerk Maxwell's touches only upon those portions which bear intimately upon the theory. See also Rankine's *Steam-Engine and other Prime Movers* (1859).

Heat, Animal. See ANIMAL HEAT.

Heath (so called from where it grows), the common name for the species of *Erica*, a genus of plants belonging to the natural order *Ericaceæ.* They are wiry, much-branched shrubs, with rigid narrow leaves. About 400 species are distributed throughout Europe, N. Asia, and the Cape of Good Hope. The chief British species is the ling, *E.* (*Calluna*) *vulgaris,* so common on the moors. It is also found sparingly in N. America. On the Scottish mountains it is met with from their base to 3300 feet above the sea; it forms the food and shelter of the grouse and other birds. 'Heather honey,' which is much sought after, has received its name from the bees having been fed from the flowers of this plant. In the Highlands, H. is much used for thatching cottages, making besoms, and for tanning; it also yields a yellow dye. *E. tetralix* and *E. cinerea,* although less frequent than the ling, are still abundant, and are occasionally found with white flowers. The former is the badge of the Clan Macdonald, and the latter that of the Clan M'Alister. The numerous species of Cape H. are well-known ornamental greenhouse plants.

The Law Regarding H.—In England the malicious burning of H. is felony by statute. For Scotch law, see MUIRBURN.

Heaven (Old Eng. *heofon* and *heofen,* 'what is lifted up,' from pp. of *hebban* 'to lift up,') means originally the sky, which was popularly conceived as a solid expanse raised above the earth. The Hebrew terms used to express the idea of H., in its various shades of meaning, are—1. *Shamaim* (*lit.* 'height,' 'elevation'), Gen. i. 8, &c. 2. *Marom,* 'heights,' 'high place' or 'places,' Ps. lxviii. 18 (*on high*), xciii. 4, cii. 19. 3. *Galgal* (*lit.* 'a wheel'), Ps. lxxvii. 18. 4. *Shchakim* (*lit.* 'something beaten out'), 'the sky' or 'skies,' Deut. xxxiii. 26, 2 Sam. xxii. 12, and 'clouds,' Job. xxxv. 5. 5. *Rakia,* 'firmament,' Gen. i. Three regions are distinguished in the Hebrew Scriptures under the name of H.:—1. The region of the clouds or the air, Gen. vii. 3, 23; 2. the region of the stars, Gen. xxvi. 4; and 3. the region inhabited by the angels and God himself, which last is variously expressed as (1) 'the heaven of heaven' (Deut. x. 14); (2) 'the third heaven' (2 Cor. xii. 2); (3) 'the high and holy' [place] (Isa. lvii. 15); (4) 'the highest' (Matt. xxi. 9). This threefold distinction was adopted by Latin theologians, who spoke of Cœlum Aqueum, C. Sidereum, and C. Empyreum. A twofold division is also referred to in the Bible—into 'the heaven,' and 'the heaven of heavens' (Deut. x. 14, 1 Kings viii. 27, Ps. cxv. 16). The Rabbinical writers divided H. into *seven* regions, in the highest of which was the throne of the Eternal, and of which the throne of King Solomon, with the six steps leading up to it, was regarded as a symbol (1 Kings x. 18–20). This classification was followed by some of the Fathers and in the Koran.

Besides the meanings of H. in the Old Testament enumerated above, in the New Testament it sometimes means (1) a state answering to 'the kingdom of H.' (Eph. ii. 6, where 'heavenly places' stands for H.; *cf.* Phil. iii. 20). (2) It means also the place where God dwells (Matt. vi. 9), where the angels and the spirits of the just are congregated, whence Christ came, and to which he has returned (John xiv. 2).

Hebb'el, Friedrich, a dramatic poet of great originality, but with a tendency towards the unnatural and monstrous. He was born at Wesselburen in Ditmarsh, 18th March 1813, and died at Vienna, where since 1842 he had been resident, on the 13th December 1863. Of his tragedies, *Judith* (1841), *Genoveva* (1843), *Maria Magdalena* (1844), *Herodes und Mariamne* (1850), *Die Nibelungen* (1862), deserve mention; of his comedies, *Der Diamant* (1847) and *Der Rubin* (1851). His *Gedichte* went through a second edition in 1848, and his *Werke* were published 1866–68 in 12 vols. See Emil Kuh's *Life of F. H.* (1876).

He'be, in Greek mythology, the goddess of youth, daughter of Zeus and Hera, and sister of Ares. She was the cup-bearer of the gods, and the wife of Heraclês. She was worshipped at Rome under the name Juventas.

He'ber, Reg'inald, Bishop of Calcutta, was born at Malpas in Cheshire, England, 21st April 1783. He distinguished himself greatly at Oxford, gaining at the age of nineteen the university prize poem on the subject of *Palestine.* In 1808 he graduated as M.A., and next year was presented to the family living of Hodnet. In 1810 appeared his *Hymns,* some of which are exquisitely musical, tinged with Oriental hues, and inspired with the sweetest devotion. In 1822 he published his *Life of Jeremy Taylor,* accompanying an edition of his works, and was elected preacher to Lincoln's Inn. Shortly afterwards he was appointed Bishop of Calcutta, and landed there 10th October 1823. But his arduous labours and the Indian climate soon proved too much for a constitution never strong, and H. died at Trichinopoly, 2d April 1826, in the forty-third year of his age. Besides the works already mentioned, H. was author of sermons published at various dates, and of an Indian *Journal,* published after his death in 1828. His Life, by his widow, appeared in 1830 in 2 vols. 4to.—**H., Richard,** brother of the above, born at Westminster, January 5, 1773, studied at Oxford, became a well-known collector of rare and curious books, and died at Pimlico, October 24, 1833. He was the 'dear H.' whom Scott addresses in the Introduction to the sixth canto of *Marmion.*

Hébert, Jacques René, nicknamed the **Père Duchesne,** was born at Alençon in 1755. Almost without education, he came to Paris in early youth, lost two situations through embezzlement, and lived in misery till the Revolution, when he published some savage and outrageously expressed pamphlets, and also became known as a blatant speaker at various clubs (chiefly

the Cordéliers). He now started a radical newspaper called the *Père Duchesne*, in opposition to Lemaire's Royalist journal of the same name. Thiers says it was even more violent and vile than Marat's *Ami du Peuple*. H. constantly preached the sacred right of insurrection, and advised death on all occasions. He thus became a considerable person in the municipality, and was deputy-procureur under Chaumette. He was arrested for a while by the moderate Commission of Twelve. This provoked an insurrection, and H. was presented with a civic crown (an oak garland), which he placed on the bust of Rousseau. It was he who suggested the summary process which led to the conviction of the twenty-two Girondins, who denounced the Revolutionary tribunal for hesitating about the execution of Custine, who brought the disgusting accusation of incest against the queen, and who along with Chaumette and Clootz invented the worship of Reason. He was, in fact, the black soul of the ultra-revolutionary party. On the withering denunciation of St. Just, he was finally brought to trial with eighteen others (including Clootz, Vincent, Mamdro, Kock, &c), and executed 24th March 1794. He showed great cowardice at the end, and no man was more hooted at the scaffold. While pretending in public to purity of republican principle, he lived privately in ill-gotten luxury. His widow, Jacqueline, the ex-nun of the Convent of the Conception, was executed along with Lucile Desmoulins.

He'brew is an appellation first applied to Abram (Gen xiv. 13), and afterwards to his descendants (Gen. xl. 15; Exod. ii. 6). It is derived either from Eber, the great-grandson of Shem (Gen. x. 21, 25), which indeed seems to be applied in the narrative, or from Heb. *abar*, 'to pass over or through,' so that 'Abram the H.' would mean either, 'he who had come across' (the Euphrates), or 'he who was passing through,' or merely a sojourner in the country (*cf.* Heb. xi. 13). See JEWS, JEWISH LANGUAGE AND LITERATURE.

Hebrews, The Epistle to the, has been assigned to many authors: to Clement of Rome; to Barnabas, the friend of Paul; to Luke; to Silas, to Apollos; and, according to the received opinion, to Paul. For the Pauline authorship the external evidence is divided and conflicting. In the Western Church the Epistle was not considered canonical till the 4th c., when it was assigned to Paul; in the Eastern Church tradition was from an early period (in Syria not till the 3d c.) almost uniformly in favour of the Pauline authorship. The weight of internal evidence is now considered to be against it: *e.g.*, 1. The absence of a title and the name of the writer is contrary to Paul's practice. 2. The writer appears to know the Old Testament only in the LXX., and to betray an imperfect acquaintance with the Temple. 3. The statement in chap. ii. 3 seems inconsistent with Paul's claim to apostleship in the Epistle to the Galatians. 4. The doctrine of the Epistle seems to differ from that of Paul, *e.g.*, in (1) the relation of Judaism to Christianity, (2) the Christology, (3) the atonement, and (4) the relation of *faith* to *law*, &c. 5. The language and style are unlike Paul's. The opinion which seems to find most support from good critics in recent times is that the author was Apollos. The 'Hebrews,' to whom it appears the Epistle was written, were the Jewish Christians either at Jerusalem or at Alexandria. All that can be known as to the time when it was written is that it was probably before the destruction of Jerusalem (70 A.D.), otherwise the writer would not have failed to refer to that event in connection with his argument. The object of the Epistle was to warn those to whom it was addressed against relapsing into Judaism. It is shown that the Jewish economy was preparatory and typical of the Christian, and that the shadow has given place to the substance.

Heb'rides, or Western Islands, the name of the great island group stretching along the W. coast of Scotland, and belonging to the counties of Ross, Inverness, and Argyle, and comprising some 490 islands, of which only about 90 are inhabited. Estimated area, 3000 sq. miles; pop. 150,000. They are divided by Tiree Passage, Little Minch, and N. Minch into the Outer H., chief of which are Lewis, Harris, N. and S. Uist, Benbecula, Barra, Coll, Tiree, and the isle of St. Kilda, 'placed far amid the melancholy main;' and the Inner H., of which the most notable are Skye, Rum, Eigg, Mull, Iona, Staffa, Ulva, Lismore, Kerrera, Easdale, Scarba, Colonsay, Jura, and Islay. It is inaccurate to reckon the islands in the Firth of Clyde (Arran, Bute, &c.), as part of the H. The H. are generally wild, rocky, and picturesque, rising in jagged peaks, or extending in bleak moors studded with gloomy tarns. A mild, moist climate, due to the presence of the Gulf Stream, clothes the valleys and hill-sides with finest verdure. The industries are chiefly the rearing of cattle and sheep, fishing and fowling. Among the principal towns are Stornoway in Lewis, Portree in Skye, and Tobermory in Mull. The H. are much visited by tourists, and have regular communication with Glasgow by several steam lines. They are the *Hebudes* of Pliny, their present names being a corruption, some say a misprint. The Norwegians, who fled hither from the tyranny of Harald Haarfager and to a great extent supplanted the Celtic inhabitants, called them the *Sudreyjar*, or 'S. isles,' as distinguished from the *Orkneyjar* or 'N. isles.' The H. were brought under the rule of Norway about 870, but were transferred to Scotland in 1266. In 1346 they fell under the sway of the chief of the Macdonalds, who took the title of the 'Lord of the Isles.' They were finally annexed to the Scottish crown by James V. in 1540. See, besides the works of Martin, Sir Joseph Banks, Pennant, and Dr. Johnson, Macculloch's *Geological Account of the H.* (2 vols. 1819); Professor Munch's *Chronica Regum Manniæ et Insularum* (Christiania, 1860); Hugh Miller's *Cruise of the Betsey* (new ed. 1875); and W. A. Smith's *Lewisiana, or Life in the Outer H.* (Lond. 1875).

Hebrides, New. See NEW HEBRIDES.

He'bron, a town of Palestine, 18 miles S. of Jerusalem, is one of the oldest cities of the world (*cf.* Gen. xii. 18; Num. xiii. 22). Its original name was Kirjath-Arba ('city of Arba:' Gen. xxiii. 2; Josh. xiv. 15, xv. 13), but it was also called Mamre (Gen. xxiii. 19). H. was the headquarters of Abraham, Isaac, and Jacob, while they lived, and here they were buried, in the cave of Machpelah. On the return of the Israelites from Egypt, it was taken by Joshua and given to Caleb (Josh. x, 36, 37, xiv. 13, 14), and was afterwards made one of the cities of refuge (Josh. xx. 7). During David's reign of seven and a half years over Judah, H. was the royal residence. It was rebuilt after the Babylonish captivity (Neh. xi. 25), but soon fell into the hands of the Edomites, from whom it was rescued by Judas Maccabæus (1 Macc. v. 65; Josh. *Ant.* xii. 8, 6). The modern city, *El-Khulil* [Arab. 'the friend' (of God), *i.e.*, Abraham], contains about 5000 inhabitants.

Hecatæ'us (Gr. *Hekataios*), one of the early Greek historians and geographers, was born of a noble and rich family at Miletus, about 550 B.C. He visited Greece, Thrace, the Euxine coasts, and perhaps Spain and Libya; opposed Aristagoras, who prompted the Ionians to rise against Persia, and, after the insurrection was quelled, won more lenient terms for his countrymen from the satrap Artaphernes. He seems to have died about 476 B.C. His works include *Periodos Gēs* ('Tour of the World'), which consists of two books, one relating to Europe, the other to parts of Asia, Egypt, and Libya; and four books of *Histories*, containing a number of the old Hellenic legends. The extant fragments of his works are collected in Klauser's *Hecatæi Fragmenta* (Berl. 1831). See Mure's *History of Greek Literature*.

Hec'ate (Gr. *Hekatē*), a mystic goddess in Greek mythology, mentioned by Hesiod as the daughter of the Titan Perses and Asteria, the bringer of good and averter of evil fortune. Later, she appears in connection with Persephone as a dreadful infernal deity, in possession of the magic forces of heaven, earth, and sea. In the Eleusinian and Cabiric mysteries of Samothrace and Lemnos she played a prominent part, and her worship was generally diffused throughout Hellas; offerings to her were placed in front of the houses, in public meeting-places, at cross-roads, &c. As an infernal goddess she is represented in a terrific form, with snakes in her hair, torches and a sword in her hand, snake-footed, and accompanied by a long-haired dog. Afterwards, when a magic influence was more and more commonly attributed to the moon, H. became identified with it. From her many-sided character, the myths of H. are very different, and artistic representations of her display a corresponding variety.

Hec'atomb (Gr. *hekaton*, 'a hundred,' and *bous*, 'an ox'), literally, the sacrifice of a hundred oxen, signified among the Greeks any sacrifice of numerous victims. In a H. the whole of each victim was sometimes burned, but more often the thighs

legs, and hides were alone consumed, while the flesh was eaten by the worshippers.

Heck'er, Friedrich Karl Franz, born 28th September 1811, at Eichtersheim in Baden, became in 1838 public prosecutor at Mannheim. In 1842 he sat as a member of the opposition in the Lower Chamber of Baden, and was soon one of the leaders of the republican movement. He organised a rising on the Swiss frontier, but had to flee in September 1848 to the United States. Here he settled as a farmer in Illinois; and in the civil war commanded a regiment.

Heck'les, or **Hack'les** (Dut. *hekel*, Fin. *hakylar*, 'a comb'), are instruments with sharp-pointed steel teeth from one to two inches in length, through which flax, hemp, or jute fibre is drawn, in order to split it up into parallel filaments and separate the tow. The fibre is drawn repeatedly through H. of increasing degrees of fineness till the required quality is obtained. Heckling-machines with various arrangements of combing apparatus have now almost entirely displaced hand-H.

Heck'mondwike, a town of Yorkshire, England, 2 miles N.W. of Dewsbury, and 10 S.W. of Leeds by railway. It is a centre of the blanket trade, and has carpet factories, breweries, &c. In the vicinity are many collieries. Pop. (1871) 8300.

Hec'la, or **Hek'la,** a famous volcano in Iceland, 60 miles E. of Reykiavik, is an irregular cone about 20 miles in circumference, rising from a mountain mass 420 sq. miles in extent. Its height, which has hitherto been over-estimated, is 5282 feet. Of its five craters, the largest is over a mile in diameter, and from 200 to 300 feet deep. Since 1104 A.D. there have been 19 eruptions, of which the most violent continued from September 1845 to April 1846, and the latest, 24th March 1878. On the former occasion, at a distance of 2 miles, the lava torrent was from 40 to 50 feet deep, and the dust was carried as far as the Orkney Isles.

Hectare'. See ARE.

Hectic Fever (Gr. *heptikos*, 'habitual'), a peculiar type of Fever (q. v.), frequently depending upon inflammation or suppuration of an internal organ, as the lungs; or associated with some analogous wasting of the bodily substance, as in prolonged lactation. H. F. is distinguished from inflammatory and typhoid forms of fever by its periodical intermissions, &c., and excessive waste of the tissues. The symptoms of H. F. are heat of skin during the paroxysm, quick and short respiration, *hectic flush* of the cheek, limited to a spot in the centre, gradual wasting and loss of strength, terminating often in mild delirium and death. See PHTHISIS.

Hec'tor (Gr. *Hektōr*), the bravest hero in the Trojan army, was the son of King Priam and Hecabe, and husband of Andromache, by whom he had the son Astyanax, and, according to others, also Laodamas and Amphinous. When in battle with the Greeks, he had killed Achilles' friend Patroclus. Achilles became reconciled to Agamemnon, again entered the war, and avenged his friend's death by the slaughter of H. H. is one of the noblest characters of the Iliad, and his leave-taking of Andromache is one of the finest episodes in that poem.

Hec'uba (Gr. *Hekabē*), the Trojan king Priam's wife, mother of Hector and Paris, was, after the capture of Troy, carried off as a slave by the Greeks. For blinding Polymestor, who had killed her youngest son Polydorus, she was changed to a dog, and cast herself into the sea. Euripides paints her in the tragedy bearing her name as the unfortunate victim of destiny, but a noble princess, a good wife, and an affectionate mother.

Hed'era, the generic name of the Ivy (q. v.).

Hedge (Old Eng. *hege*, *haeg*, Ger. *hage*, Dan. *hekke*, Sw. *hage*) is something planted either to make fences round enclosures or to part off and divide the several parts of an enclosure. When designed as outside fences, hawthorn or quick is most frequently used, but blackthorn (sloe), crab, elm, beech, holly, and briars are often employed, singly or in combination. Inner hedges of gardens are made of various sorts of plants that will bear clipping, according to the fancy of the owner, as privet, yew, holly, hornbeam, &c. Before forming the H., it is proper to consider what sort of plants will thrive best in the soil, whether it be clay, gravel, sand, &c. The extent to which hedges are used for the division of land into fields and to bound roads, differs very much in various countries, and in different parts of the same country; the local surroundings and local prejudices generally establishing the custom. Nowhere do they form such a factor of the scenery as in England, yet there are large districts where all the required divisions are effected by stone walls or watercourses, and not a H. to be seen. Planting trees in hedgerows is commonly adopted, the result being a wooded appearance of the country. Modern farming has much reduced the wild hedgerows of the old farmers, and the H. is becoming more and more supplanted by the iron fence. Hedges are stated to have been introduced into Scotland and Ireland during the Commonwealth.

Hedge'bote, in English law, is the same as *Haybote* (q. v.).

Hedge'hog (*Erinaceus*), a well-known genus of *Insectivorous* mammalia, has the hairy covering of the upper part of the body modified to form spiny-fluted hairs. The feet are not adapted for burrowing. The common H. (*E. Europæus*) has five toes on each foot, the entire sole being applied to the ground (*plantigrade*). The nose is prolonged to form a flexible snout; the eyes and rounded ears are small. The vertebræ of the back number fifteen, those of the loins six; and fifteen pairs of ribs exist, eight being attached to the breastbone. The teeth number thirty-six; no canines are developed; six incisors and six molars occur in each jaw; also six premolars in the upper and four in the lower jaw. The milk-teeth number twenty-four, and fall out seven weeks after birth (*Rousseau*). The power possessed by these animals of rolling themselves up into a ball-like form as a means of defence is effected through the action of a special muscle, the *orbicularis panniculi*, which literally surrounds or encircles the body. The muscle acts in bringing the head and tail together only when the tail and head are first flexed; while, when the head and tail are extended, the action of the muscle erects the spines. The brain of the H. is almost entirely smooth, or destitute of convolutions, like that of other insectivora. The testes of the male are abdominal, and do not leave the cavity of the abdomen; and the *cornua* or horns of the uterus are long. The food consists of slugs, earthworms, and insects. The average length is 10 inches. The long-eared H. (*E. auritius*) occurs in N. Asia and N. Africa, and is of smaller size than the common H. The Tenrec (q. v.) (*Centetes*) is sometimes named the 'Madagascar H.'

Hedgehog Plant is applied to species of *Medicago* (more particularly *M. intertexta*) on account of the prickly legume being spirally twisted into a sort of ball. In like manner *Caucalis daucoides*, belonging to the *Umbelliferæ*, is called *Hedgehog Parsley* from its spiny fruit.

Hedge Mustard, a common name for species of *Sisymbrium*, a genus of cruciferous plants. The common H. M. (*S. officinale*) occurs abundantly as a weed in waste places. *S. Irio* is called *London wild rocket*, on account of its having sprung up in great profusion immediately after the great fire in London in 1666. There are about eighty species of S. distributed in the northern hemisphere. They are of no economic importance.

Hedge Sparrow, or **Accen'tor** (*Accentor modularius*), a common species of Insessorial birds, belonging to the *Dentirostres*, has narrow nostrils, the first quill short, and the fourth and fifth longest. The tarsi have broad scales in front, and the claw of the hind-toe is long and compressed. The bird derives its name from its habit of frequenting hedges. Its colour is a bluish or slaty grey variegated with brown; the back and wings are brown, the under parts grey and white. The average length is 5 or 6 inches. The nest is built near the ground, and the eggs, five in number, are of a bluish-green. The Alpine accentor (*A. Alpinus*) is an allied species, attaining a length of 6½ inches, and found in France, Italy, and Germany.

Hedjas', a maritime district of the W. coast of Arabia, was ceded to the Ottoman Empire in 1867, since which time it has formed a vilayet or general government, of which the seaport Jidda is the capital. Its soil is unproductive, and besides the seat of government, the only port is Yambo. It contains the cities of Mecca and Medina, the birthplace of Mohammed and his place of sepulture. It is therefore the Holy Land of the Mohammedan world, and attracts crowds of pious Moslems annually.

Hedj'rah, or **Hegira** (a contraction from the Arabic *Hedjrat-al-Nebi*, 'the prophet's departure'), the era fixed by the Calif Omar, and since adhered to among Mohammedans, for the computation of time. The first day of the era was July 16, 622, on which date Mohammed fled to Medina from Mecca, where the Koreish sought his life.

Heem, Jan David de, the greatest of the Dutch fruit and flower painters, was born at Utrecht in 1600. His life was uneventful, honourable, and exceedingly prosperous. His pictures of flower-filled vases in gold, silver, or crystal standing on tables strewn with fruit are marvels of freshness, truth, and strength of colour. During his lifetime they commanded almost unheard-of prices, and since his death, which took place at Antwerp in 1674, they are only to be seen in the more celebrated galleries. See Descamps' *La Vie des Peintres Hollandais.*

Hee'ren, Arnold Herman Ludwig, a noted German historian, was born at Arbergen near Bremen, 25th October 1760, studied at Göttingen, and became lecturer in classics there in 1785. He attracted notice by editing the texts of some less-known classical authors; was made, after a sojourn in Italy, Professor of Philosophy at Göttingen in 1787, and Professor of History in 1801. He died 7th March 1842. His best-known works are *Ideen über Politik, den Verkehr und den Handel der Alten* (Gott. 1793-96, 4to ed. 1824); *Geschichte des Studiums der Classichen Literatur* (1797-1802); *Geschichte der Staaten des Alterthums* (1799, 5th ed. 1826); *Geschichte des Europäischen Staatensystems und seiner Colonien* (1809, 4th ed. 1822). His *Historische Werke* (15 vols. 1821-26) are mainly a reprint of these and other smaller publications.

Hef'ele, Karl Joseph von, an ecclesiastical historian, was born 15th March 1809 at Unterkochen, in the E. of Würtemberg, became in 1840 professor in the Catholic theological faculty of the university at Tübingen, and in 1870 Bishop of Rottenburg. He was known before and at the Vatican Council as a zealous opponent of the dogma of infallibility, but has since tacitly accepted it. H. published an edition of the *Patres Apostolici* (1839, 4th ed. 1855); *Der Cardinal Ximenes* (1844, Eng. trans. 1860); but is best known by his great work the *Konciliengeschichte* (vols i.-vii. 1855 to 1874), of which an English translation is at present (1877) appearing.

He'gel, George Friedrich Wilhelm, one of the greatest of German metaphysicians, was born at Stuttgart, August 27, 1770. When eighteen he went to the University of Tubingen, where he was a fellow-student of Schelling. After having been a private tutor for some years, he qualified as privat-docent at Jena in 1801. Here he joined Schelling for a time in editing *Das Kritische Journal für Philosophie*, but shortly after the battle of Jena went first to Bamberg, where he edited a political journal, and then to Nürnberg, where he became rector of the academy. In 1816 H. was made Professor of Philosophy at Heidelberg, and in 1818 accepted a call to Berlin, where, for a dozen years, he reigned supreme in philosophical, and exercised a very great influence in political, circles. He died of cholera in 1831, not long after his election to the rectorship of the university. A collected edition of H.'s works was published at Berlin in 1832-41. See Rosenkranz, *Hegel's Leben* (Berl. 1844).

In H.'s system are to be found elements drawn from all quarters. Plato, Aristotle, and the Neoplatonists, Jacob Böhm and Spinoza in more modern times, and Kant, Fichte, and Schelling among his immediate predecessors, seem to have influenced him more than any others. In the main, however, he may be directly affiliated to Kant, provided we bear in mind the immense aid he derived from the systems of Fichte and Schelling. Kant maintained that there was a system of absolute acts of thought, constitutive of not merely all experience or nature (by ordering the vague chaos of given sensations in definite relations in the forms of time and space), but also, by means of nature, of all individual minds, which are thus so far absolutely identical, being but the one absolute reason, which is realised in a plurality of self-conscious individuals. H. followed out this conception. He showed that the supposed necessary causes of sensations, things in themselves, were meaningless fictions, and that space and time, which Kant supposed to belong to a faculty different from the categories, were in reality intelligible relations logically derived from them, and constituted by thought. Sensations he showed also to derive their whole existence from the categories, to be as it were *potential* thought. H. was accordingly left with pure thought or reason as creative (not *in time*, for time belongs to that very sphere of nature which thought constitutes, but *logically*), and the problem was how to discover the intelligible system of reason which manifests itself in the categories. These Kant had deduced from the empirical classification of formal judgments afforded by ordinary logic; but H., seeing that this inductive procedure, which involved the conception of experience as given to instead of built up by thought, was futile, invented a presuppositionless dialectical method for the discovery of their mutual relations. To illustrate this we may take the simplest and emptiest of all abstractions, the category of being. But this has no meaning save as the correlative of the category of non-being, and the two are only realised by their union in the notion becoming, of which they are the logical constituents. This category is in its turn only real as the correlative to fixed determinate being, the two notions mutually involving each other. By following out this dialectical process, passing through on our path the categories of substantiality, causality, and many others, we reach a point where the region of pure thought terminates, and the logically implied sphere of nature is entered, where reason finds its correlative in irrationality or contingency. The antithesis of reason and nature is finally reconciled in the higher notion of self-consciousness, which includes all personal and individual relations, psychological, ethical, and religious. It must be borne in mind that this dialectical development of reason is not evolution in time, but pure logical explication of notions implicated in one another, in which each higher category presupposes and is yet presupposed by two lower correlatives, itself forming one of a higher pair of correlatives. Accordingly, the crowning notion of the Hegelian system, self-consciousness, is that which is logically last, since it is also logically first, as being that in which all the lower ones attain reality. This point was foreshadowed in the doctrines of the active reason of Aristotle and the Arabian Averroes. Self-conscious knowledge is thus the one fact in which all else finds its meaning and existence (*cf.* Berkeley's *New Question*, leading to the result that *esse* means *percipe*), and the categories with their derivative nature, while constituting, only become real in the plurality of individual *egos*. Shortly after the death of H. there appeared divisions among his disciples, at first principally in connection with the doctrines of the personality of the absolute, the immortality of the individual consciousness, and the person of Christ, but afterwards to a great extent in the region of politics also. The so-called 'Hegelians of the Left' may be said, speaking generally, to have denied the empirical reality of the three first-mentioned conceptions, and to have maintained Radicalism in politics. Of this school, Michelet, Ruge, and Strauss may be taken as representatives. Those of the 'Right' (Erdmann, Göschel, &c.) maintained for these conceptions empirical reality, in addition to their admitted position in the dialectical development of the notion. There was also a school (represented by Rosenkranz) which sought to adopt a position midway between the two extremes.

The Hegelian metaphysic, once the almost unanimous creed of philosophical Germany, has, since the great movement of 1848, almost died out in that country, where the tendency is at present towards materialism in so far as it is reconcilable with Kant's theory of perception. Hegelianism has of late, however, taken root in England, its psychological side, as dealing with the problem of the origin of knowledge, receiving the chief share of attention. This tendency first assumed adequate shape in Dr. Stirling's *Secret of H.*, and has reappeared in Mr. Green's *Introduction to the Works of Hume*, two books which, combined with a thorough study of Kant, form, perhaps, the best introduction to Hegelianism for the English student of philosophy.

Hegesipp'us (Gr. *Hēgēsippos*), a Christian writer of Asia Minor, who about the middle of the 2d c. composed a collection of historical traditions drawn from the apostolic period, of which a few fragments are now all that remain. See Grabe, *Spicilegium*, tom. ii., Fabricius, *Bibl. Græca*, vii. 156.

Hegi'ra. See Hedjrah.

Hei'de, a market-town in the province of Slesvig-Holstein, Prussia, 25 miles W.S.W. of Rendsburg. It lies in the Ditmarsh district, and has some trade in agricultural produce. Pop. (1875) 6772.

Hei'delberg, a town in the grand duchy of Baden, Germany, magnificently situated at the mouth of the Neckar valley, where the river forsakes the richly wooded hill country for the great plain of the Rhine. H. is 45 miles distant by rail from Frankfurt. The glorious ruin of the castle, for 500 years the seat of the electors palatine, stands on the hill behind the town. The castle was begun in the 13th c., was partially blown up by the French in 1689, and wholly destroyed by fire in 1769; but its cellars still preserve the enormous H. wine-cask. The University of H. is one of the oldest in Germany, having been founded in 1356. In 1875 it had 99 teachers in its staff, and 534 students. The library contains about 175,000 vols. and 2000 MSS. Pop. (1871) 19,983.

Heights, Measurement of, may be effected in four different ways, viz., by levelling, by trigonometrical survey, by the temperature of the boiling-point, and by barometrical observations. The last two methods depend upon the same phenomenon, the rarefaction of the atmosphere, and consequent diminution of pressure, as the distance from the earth's surface is increased. By both methods the difference of pressure at the sea-level and at the height can be calculated, and from this, by means of a formula, the height can be obtained. On account of the non-homogeneous nature of our atmosphere, this formula is complicated, and, as given by Clerk Maxwell, is as follows, where h is the height in feet, P the pressure at the bottom, p that at the top, and t the temperature in Fahrenheit degrees :—

$$h = \log. \frac{P}{p} \times \left\{ 60360 + (t - 32^\circ) \times 122{\cdot}68 \right\}$$

Roughly, the difference of the logarithms of the heights of the barometer multiplied by 10,000 gives the difference of the heights in fathoms. The other methods will be considered under the articles LEVEL and TRIGONOMETRY.

Heijn, or **Heyn, Peter Petersen**, a famous Dutch naval commander, was born in 1577 at Delftshaven, and by his own bravery and skill rose from a cabin-boy to be admiral of Holland. In the services of the Dutch West India Company he, in 1626, defeated a Spanish fleet, and captured forty-five vessels at one stroke; and in 1628 made a prize of a flotilla of Spanish galleons, carrying silver and jewels to the value of 12,000,000 of Dutch gulden. Made Admiral of Holland in 1629, he fell in an action with two Dunkirk vessels that same year.

Heilbronn (originally *Heligbronn*, 'holy well'), a town of Würtemberg, on the Neckar, 23 miles N. of Stuttgart by rail, was once a free imperial city, and still possesses monuments of its former grandeur. Its Gothic church of St. Kilian dates from the 11th c. It is now the most important commercial and industrial town in the kingdom, manufacturing beet-sugar, tobacco, paper, woollens, machinery, iron goods, silver wares, and chemicals. Pop. (1871) 18,995.

Heil'igenstadt ('holy town'), a town of Prussian Saxony, on the Leine, 60 miles N.W. of Erfurt by railway. It has manufactures of woollen and paper, and some dyeing, a former Jesuits' college, and a pop (1875) of 5201.

Heils'berg, a town of E. Prussia, on the Alle, 43 miles S. of Königsberg, has manufactures of cloth, yarn, thread, beer, &c. Its castle was the residence of the former Bishops of Ermeland, in Poland. Pop. (1875) 5770.

Heils'bronn, or **Klos'ter Heils'bronn**, a market-town of Bavaria, in Middle Franconia (pop. 996), formerly the seat of a Cistercian abbey (suppressed in 1555), still a church, containing the tombs of the Hohenzollern Burggrafs of Nürnberg and of the Markgrafs of Ansbach, restored by Friedrich Wilhelm IV. of Prussia. See Hocker's *Heilsbronnisches Antiquitätenschatz* (2 vols. 1731-40).

Hei'ne, Hein'rich, one of the greatest lyrical poets of any country, was born of Jewish parents, at Düsseldorf, in Rhenish Prussia, December 12, 1799. In his youth he was sent to Hamburg to learn business, but, disliking a commercial life, began to study law in 1819 at Bonn, and afterwards proceeded to Göttingen and Berlin. He produced a volume of poems in 1822, which was almost unnoticed, and his two tragedies *Almansor* and *Radcliff*, issued in 1823, were even more signally unsuccessful. In 1825 he was baptized a Christian. After residing at Munich and visiting Italy, he published *Reisebilder* (1826-31), a description of his travels, which was at once favourably received, and in which his characteristic vivacity of ridicule and lucid elegance of style were first clearly visible. In 1827 appeared his *Buch der Lieder*, a volume of lyrics which captivated the German public by their wondrous melody, thrilling sadness, and faultless simplicity. He resided partly at Munich, where he edited the *Politische Annalen*, and at Berlin until 1831, when he removed to Paris. There he spent an erratic life among a congenially brilliant, gay, and careless society until 1848, when he became paralysed in the spine, and thenceforth seldom left his couch until his death, February 17, 1856. He forbade that his remains should be carried to Germany, and was buried in Montmartre cemetery at Paris. His character showed a strange mingling of fickleness, sensuality, and reckless scepticism, with intense susceptibility, wayward playfulness, and ideal intensity of passion. His poems are French in their sprightliness and lucidity, German in their rhythmical sweetness and deep simple feeling; and while they move to old ballad forms, and their cadences seem to have floated up from bygone times, they are intensely modern in spirit, and are especially marked by a pathos which again and again effervesces into mockery. His prose works are beautifully written, and abound in fantastic and scathing wit, in sunny, sportive, and mellow humour. 'On H.,' says Matthew Arnold, 'of all German authors who survived Goethe, incomparably the largest portion of Goethe's mantle fell.' The best edition of H. is his *Sämmtliche Werke* (18 vols. 1867-68). See Strodtmann's *Biographie* (2 vols. 1869); Stigand's *Life, Work, and Opinions of H.* (1875).

Heinec'cius, Johann Gottlieb, a learned German jurist, was born at Eisenberg in Sachsen-Altenburg, studied theology and law, became Professor of Philosophy at Halle in 1713, and was afterwards Professor of Law there, at Franeker, and at Halle again, where he died, 31st August 1741. H.'s special departments were those of German and Roman law; and his text-books (*Elementa Juris Civilis Secundum Ordinem Institutionum*, 1725; *Elementa Juris Civilis Secundum Ordinem Pandectarum*, 1728; *Historia Juris Romani et Germanici*, 1733), were long classical works, not merely in virtue of their completeness, but by reason of their logical method and excellent Latin. The *Opera Omnia* of H. were published by his son at Geneva, in 9 vols. (1771).

Hein'rich I., 'the fowler,' King of the Germans, was born in 876, succeeded his father, Otto I., as Duke of Saxony in 912, and was chosen king in 919. He repelled the Magyars and Wends, won back Lotharingia, and by his energetic but conciliatory policy greatly strengthened German monarchy. Until his reign there was no civic life in Germany, but he founded numerous towns both as fortresses against the Hungarians and as centres of industry. H. died at Mansleben, July 2, 936. He was never made Holy Roman Emperor, and only bore the imperial title because his soldiers hailed him as *Imperator*.—**H. II.**, Saint, was born May 6, 972, became Duke of Bavaria in 995, King of the Germans in 1002, and Holy Roman Emperor in 1014. He warred with the Poles, and with France and Italy, and died July 14, 1024. He was canonised in 1154 from his favours to the Church.—**H. III.**, surnamed the Black and the Pious, succeeded Konrad II. in 1026, and was elected Emperor in 1046. Under him the imperial power came to its zenith. He suppressed intestine feuds, and placed the great duchies, the constant rivals of the kingly power, in the hands of his relatives. He forced Hungary to pay tribute, and no emperor ever wielded such authority over Rome. He compelled the Roman priesthood to receive German pontiffs, and gained the right of always appointing the Pope. But when, owing to his sudden death in 1056, a child, **H. IV.**, inherited his dominions, the great fabric of imperial power which he had reared broke down. H. IV. was born November 11, 1050, was elected King in 1054, and succeeded H. III. in 1056. During his youth Germany was rent by feudal discord, and in 1074 he appealed to Pope Gregory VII. (q. v.) to decide between him and his unruly vassals, whereupon Gregory forbade H. to sell and grant benefices until the quarrel was ended, a command which H. ignored after defeating the insurgents at Hohenburg. A long struggle ensued between the Pope and Emperor, the details of which are given in the article GREGORY VII. The central incident was the humiliation of H. at Canossa in 1077, when the Emperor remained three days and nights barefooted on the snow until Gregory deigned to absolve him, and 'Christendom saw her greatest and most venerable

institution dishonoured and helpless' (Bryce's *Holy Roman Empire*). After protracted wars with Saxon vassals stirred up by the Pope, H. entered Italy and besieged Gregory in the castle of St. Angelo, but was recalled to Germany by the news that Heinrich of Luxenburg had been elected King. Having crushed the rebellion, he again carried on a successful war in Italy from 1090 to 1096, when he heard that his son Konrad had joined the revolt against him at home. Returning to Germany, he ruled with great popularity until 1105, when his son, H. V., deposed him and flung him into prison, whence, however, he escaped. H. died at Liége, when preparing to oppose his son, August 7, 1106.—**H. V.**, son of the above, was born in 1081, elected King in 1099, and dethroned his father in 1106. He was a firm foe of the Papacy. At his coronation as Emperor at Rome in 1106, he flung Pope Paschal II.—who resented his claim to all the rights over the Church which any emperor had held—into prison, and only freed him on the pontiff accepting his terms. A long strife with the Pope immediately began, and when it ended at the Concordat of Worms in 1122, the imperial power was greatly shaken, and H. retained only half of his former rights of investiture. Besides civil dissensions, H. had wars with Flanders, Poland, and Hungary. He married Matilda, daughter of Henry V. of England, died at Utrecht, May 23, 1125.—**H. VI.**, the Cruel, son of Friedrich Barbarossa, was born in 1165, and began to reign in 1190. His marriage with Constance, the heiress of the Norman rulers, by making him master of Sicily and Naples, gave him a strong influence over the Pope, as these countries had formerly been held by the chief papal adherents. His efforts to build up a centralised system of government were cut short by his death, which some attribute to his wife's poisoning him, at Messina, September 28, 1197.—**H. VII.**, son of Heinrich, Count of Luxembourg, was born in 1262, was made King of the Romans in 1308, and Emperor in 1312. Although the struggle between the Empire and the Papacy had now ceased, H. interfered between the Italian factions, which still bore the names of Guelphs and Ghibellines, invaded Italy, and died on his march against Naples, at Buonconvento, August 24, 1313. Some say he was poisoned by a Dominican while taking the eucharist.

Heinrich the Lion, Duke of Saxony, a famous German prince, son of Heinrich the Proud, was born in 1129, and began to rule in 1146. When Konrad III. set out on the second crusade, H. carried on war against the Wends, and on Konrad's enterprise ending in gloom, claimed all Bavaria as his own. Konrad shortly returned, and H. was reduced to submission, but Bavaria was given up to him by the next Emperor, Friedrich Barbarossa. In 1154 he accompanied Friedrich into Italy, and courageously saved the Emperor's life in a tumult at Rome. H. now strove to swell his dominions by cruel wars against the Slavs, and in 1171, to avoid aiding Friedrich in his Italian campaigns, made a pilgrimage to Jerusalem. On his return he set up a lion as a symbol of his power in the market-place of Brunswick, whence arose the legend of his being accompanied on his pilgrimage by a lion. In 1154 he entered Lombardy with the Emperor, whom he deserted before the battle of Legnano. On Friedrich's return from Italy, H. was assailed by the Emperor and all the German nobles save those of Saxony. He resisted bravely, and won a great victory in 1180, but was finally forced to yield, and stripped of all his dominions except Brunswick. He died at Brunswick in 1198. He was a bold, ambitious, and able prince, and at one time ruled dominions spreading from Lombardy to the Black Sea. He gave great privileges to his towns, which clung firmly to him in his struggle with the Emperor. He was twice married, his second wife being Matilda, daughter of Henry II. of England.

Heinrich von Veldeke, one of the chief of the Minnesänger, and founder of the medieval German court poetry, flourished during the 12th c., resided at the court of Hermann, Landgraf of Thuringia, and took part in the wars of Wartburg. His works include *Eneid*, a love story, partly based on Virgil's *Æneid*, but drawing its inspiration mainly from French sources; *Herzog Ernst von Baiern*, and various love songs. A legend of St. Gervais is also ascribed to him. Gervinus says he was the first who gave German verse cadence and melody, and subjected it to fixed laws. See Ettmüller's *H. von V.* (Leips. 1854).

Heir, in English law. The person next in the line of succession to the holder of real estate is called the H. *apparent* or the H. *presumptive*. The former is one whose right of inheritance is certain, if he outlives his predecessor; the latter is one who would succeed to his predecessor under existing circumstances, but whose right may be defeated by birth of a child. The only H. apparent is an eldest son, or one holding his right. Any relative may be an H. presumptive. In English law, see INTESTACY. In Scotch law, SUCCESSION, HEIR, and HEIRS-PORTIONERS. In both, see HEIR AND EXECUTOR, HEIRESS, HEIRLOOMS.

Heir, in Scotch law. The word denotes the H. at law, and the H. *by destination*, that is, the person named in the deed of conveyance, failing the person to whom the estate is conveyed. A series of heirs is sometimes named in general terms, as to *A. B.*, and the heirs male of his body. The word is also sometimes loosely applied to the person who succeeds to the movable (English, personal) estate. To displace the legal H. to any subject or estate, the testator must convey the estate or subject to the person whom he wishes to succeed to it, and he may call to the succession a series of strangers.

After an H. has completed his title every right possessed by his predecessor is vested in him. Heirs are liable for the debts of their ancestor in a certain order. The H. at law—sometimes called the heir of line—is primarily liable; next is the H. of conquest (see CONQUEST); then follows the H. male, the H. by destination, and lastly the H. under a marriage contract. This is the order in which those heirs must be discussed. See DISCUSSION.

Heir and Exec'utor, a phrase denoting the legal distinction between two kinds of property which may be left by one deceased, *i.e.*, *real* and *personal*, in Scotland *heritable* and *movable*. Real property goes to the heir, personal property to the executors or administrators. Some property is heritable in Scotland which in England is personal. See EXECUTOR, EXECUTOR IN SCOTLAND, EXECUTRY, HEIRLOOMS.

Heir'ess. Sisters having a joint right of inheritance are called *coparceners* in England (see COPARCENERY), in Scotland, *Heirs-Portioners* (q. v.).

Heir'ess, in heraldry, a lady whose brothers leave no issue is an H. Alliance with an H. is expressed by quartered arms; if her husband bear her arms upon a shield of pretence upon his own shield, their descendants would quarter her quartered shield. See MARSHALLING.

Heir'looms are certain chattels (see CHATTELS) which by custom go to the heir at law, such as family pictures, plate, jewels, &c. The extent of the right is very vague. In Scotch law, *heirship movables* is a similar but much more comprehensive term. They consist of the best of certain kinds of movable (personal) goods belonging to the predecessor. The right to inherit them only arises under peculiar circumstances.

Heirs-Por'tioners a term of Scotch law. Failing male issue and their issue, succession to heritage opens in favour of the female issue. Females, or their representatives in the same degree of relationship to the deceased, inherit equally and *pro indiviso* with H.-P. The eldest heir-portioner has a right to the mansion-house of a country estate, without compensation to her sisters. She is also entitled to any peerage or dignity not otherwise destined.

Hel, in the Scandinavian mythology, the daughter of Loki and the giantess Angarbodi. Allfödr cast her down to Niflheimr, and gave her power over nine worlds as a place of maintenance for those sent to her, that is, those who died of age or sickness. There she had great mansions within courts of excessive height, fenced with massive gratings. Her threshold was a devouring abyss, her hangings threatening sorrow, her dish famine, her knife hunger, her bed a sick-bed, and her slaves sluggish. She was half of a bluish-black and half of human complexion, and had a head bent down, presenting a fierce aspect.

Hel'denbuch (Ger. *Book of Heroes*), a famous collection of old German heroic poems dealing with events which happened in the time of the barbaric invasions of the Empire. It includes the tales of Dietrich of Bern (q. v.), of the famous rose-garden of Worms, of the dwarf Elberich, and the emperor Otnit, &c. These were written at various times, but mostly in the 13th c.,

and among their authors were Heinrich von Ofterdingen and Wolfram von Eschenbach. The first printed edition of the H. appeared in 1491 (new ed. by A. Von Keller, 1867). A modernised edition was issued by Von der Hagen (Berl. 1811), and again by Simrock (6 vols. 2d ed. 1851); the original was published by Von der Hagen and Prunissier (Berl. 2 vols. 1820–24).

Hel'der, a fortified seaport of the Netherlands, in the province of N. Holland, on the Texelgat or Marsdiep, 4 miles broad, separating the island of Texel from the mainland, and uniting the German Ocean with the Zuider Zee. Lying at the N. end of the peninsula of N. Holland, where the sand dunes are most enfeebled, the H. is protected by massive works, including a dyke of Norwegian granite and Belgian limestone 6 miles long. It was made a naval station by Napoleon I., and since the N. Holland Canal was constructed to avoid the difficult passage of the Zuider Zee (1820) has been the out-port for the larger vessels with cargo for Amsterdam. In 1874 there entered the port 463 vessels of 243,038 tons, and cleared 473 of 264,684 tons. Pop. (1875) 21,328.

Hel'en (Gr. *Helena*), daughter of Zeus and Leda, and sister of Castor and Pollux, was the fairest of all women, and the cause of the siege of Troy. At the age of ten she was carried off by Theseus and Pirithous, but was rescued by her brothers. She was sought in marriage by noble suitors from all Greece, who by the advice of Odysseus bound themselves to support the husband whom she might choose, should any strive to carry her off. She chose Menelaus, King of Sparta, and when Paris bore her away to Troy, the Greek princes set out to recover her, which led to the great war of Troy. Legend varies as to her fate after the taking of Troy. She returned with Menelaus to Sparta, bore him a daughter Hermione, and lived in wealth and happiness until his death, when, according to one story, she was driven from Sparta and slain by the queen of Rhodes. Another legend says that both Menelaus and H. were sacrificed by Iphigenia in Tauris to Artemis. H. figures very largely in ancient poetry, and is depicted by Greek artists as the perfection of female loveliness, while modern poets, *e.g.*, Marlowe, Goethe, Landor, and Rossetti, have recurred again and again to the story of her surpassing beauty.

Hel'ena, the name of various Christian saints, of whom the most famous is the Empress Helena Flavia Julia, mother of Constantine the Great. She was of lowly origin, and was born most probably in Bithynia in 247, though some assert that she was a native of Gloucester in Britain. She was married to Constantine Chlorus, who, when he was made Cæsar by Diocletian in 292, was forced to divorce her in place of the step-daughter of Maximinius. After Constantine became Emperor in 306, H., who was treated with great honour, and had received the title of *Augusta*, embraced Christianity, and, according to the Christian legend, made a pilgrimage to Jerusalem, where she discovered the holy sepulchre and the wood of the true cross. H. died at an advanced age in 328.

Hele'na, St., a solitary island in the Atlantic, belonging to Great Britain, 863 miles S.E. of Ascension Island, and 1140 W. of the African, and 1800 E. of the American shore, in lat. 15° 55′ S., and long. 5° 49′ W. Area, 47 sq. miles; pop. (1871) 6241. It is 10½ miles long, 7 broad, and presents to the sea a line of cliffs from 600 to 1200 feet high, broken only by an occasional fortified gorge. The only good harbour is James's Bay, on which is situated James's Town, a port regularly visited by vessels bound for the Cape. St. H. is of volcanic origin, and rises in Diana's Peak to a height of 2700 feet. It has a delightful climate, and some agriculture and goat-breeding, but provisions have to be imported. The island was discovered by Juan de Nova Castella on St. H.'s Day, 22d May 1502. It was subsequently occupied by the Dutch, who ceded it to the English East India Company in the 17th c. It was the islet-prison of Napoleon from 1815 till his death in 1821. See *St. H., a Physical, Historical, and Topographical Description*, by J. C. Melliss (Lond. 1875).

Hel'ensburgh, a pretty watering-place in Dumbartonshire, Scotland, on the right side of the Firth of Clyde at the entrance to Gair Loch, opposite Greenock, and 23 miles W.N.W. of Glasgow by rail. It has a promenade, a new hospital (1876), and some weaving and fishing. In the vicinity are many fine mansions. Pop. (1871) 5975.

Heli'acal (*hēliakos*, 'belonging to the sun'), an expression in astronomy, formerly used with reference to the rising of a star which rose just a sufficient time before the sun to be visible in the early dawn.

He'liand (Ger. *heiland*, 'saviour'), a Low German poem of the 9th c., which narrates the life of Christ in alliterative verse, in a style derived from the old heathen ballads. It contains some interesting traits of the times when it was composed, and is said to have been written by command of the Frankish King Hhlodwig, or Ludwig the Pious (the *Louis le Débonnaire* of French historians). There are two manuscripts of the H., one in the British Museum, London, and one at Munich. It was published by A. Schmeller, Munich (1830–40).

Helian'thus, a genus of herbaceous composite plants, chiefly natives of North America. *H. tuberosus*, the Jerusalem Artichoke (q. v.) and *H. annuus*, the Sunflower (q. v.), belong to the genus.

Helianthus annuus.

Heli'cidæ, (from Gr. *helix*, 'a spiral,' the family of *Gasteropodous* Mollusca, including the snails. The shell is external, and contains the whole animal when it is withdrawn. No *Operculum* (q. v.) exists for the closure of the shell aperture. See Snail.

Hel'icon, a mountain of Bœotia, Greece, between Lake Copais and the Gulf of Corinth. It may be considered a continuation of the range of Parnassus, and its topmost summit (now *Paleovuni*) is about 5000 feet high. Its western slopes are bare and rugged, but its eastern are fertile and woody. It was famed as the chosen abode of the Muses, who had a sacred grove here, near which were the sacred wells of Hippocrene and Aganippe, which inspired all who drank of them. The village of Ascra, at the foot of H., was the seat of the early Hesiodic school of poets.

Helig'oland, or **Hel'goland** (*i.e.*, 'holy land'), the smallest of the British possessions, and an islet in the North Sea, about 30 miles from the mouths of the Elbe, Weser, and Eider. Area, one-fifth of a sq. mile; pop. 1913. It is formed of hard red clay and marl, and on three sides rises nearly perpendicularly from the sea to a height of 150 feet. On the S.E. side there is a low, flat bank of sand called the Unterland, on which stands the principal group of houses, restaurants, a theatre, &c., and from which a flight of 190 wooden steps leads to the Oberland, or plateau, where, on the margin of the cliff, is the village of Falm. The pastures of the Oberland support goats and some 300 sheep, and there is some cultivation of potatoes. Opposite the Unterland, and separated from it by a strait half a mile wide, is the *Düne* or *Sandinsel*, appropriated to the bathers who flock hither in the holiday season from Bremen and Hamburg. The inhabitants, who are mostly Frisians, are occupied as pilots and lobster-fishers, and have peculiarities of dialect and costume. The maintenance of batteries and a lighthouse costs the Government £1000 yearly. H. has been greatly diminished by the action of the sea. It was anciently the residence of the chief of the Sicambri, and the seat of the worship of the Saxon goddess Hertha. Its old name of Fosetisland gave place to that of H. when it received Christianity in the 7th c. from St. Williberond. It belonged to Slesvig till the English seized it in 1807. During the blockade of 1812 it was a great resort of smugglers, and more recently of gamblers.

Heliocen'tric, an astronomical term, used with reference to the positions or motions of a planet or other body, which is supposed to be viewed from the sun. See Geocentric.

Heliodo'rus, the author of the earliest Greek romance, was born at Emesa, Syria, and flourished about the end of the 4th c.,

becoming Bishop of Trikka, Thessaly. His tale, named *Æthiopica*, which describes the loves of Theagenes, a youth of Thessaly, and Charicleia, daughter of an Æthiopian king, is full of romantic interest, and is told with delightful art in a sweet, simple, and poetical style. The *Æthiopica* was imitated by Tatius and other Greek writers of fiction, and had a great influence on the heroic romances and poems of Italy and France, Tasso in particular confessing himself much indebted to H. It has been translated into most modern languages. The best editions are in the *Scriptorum Græcorum Bibliotheca* of Didot; the *Scriptores Græci Erotici* of Mitscherlich (Strass. 1798); and that by Coraes (2 vols. Par. 1805).

Heliogab'alus. See ELAGABALUS.

Heliom'eter was originally a small telescope with a divided object-glass, used for determining the diameter of the sun; but the name now denotes any instrument which has its object-glass constructed on the same peculiar principle, and which measures with great accuracy small angular distances, such as the distance between the individual members of a multiple star system. Frauenhofer was the first to construct a H. of any size; and his instrument was productive of most valuable results in the hands of Bessel. Merz and Repsold have successfully followed up Frauenhofer's example; and the fine instrument at Oxford observatory is the work of the latter. The principle is explained in Herschel's *Outlines of Astronomy*. See also Bessel's memoir on the *Königsberg Observations*, and Professor Johnston's paper in the *Radcliffe Observations* (Oxford).

Hēlios, the Greek name for the sun and the sun-god. H., the god, was the son of Hyperion and Theia, and the brother of Selēnē, the moon, and Eōs, the dawn. Homer describes him as rising in the morning from a marsh formed by the ocean stream, and as sinking in the ocean at evening. The later poets represent him as sailing nightly under the earth, back to the E., in a golden boat, or while slumbering in a golden bed, and as dwelling in a gorgeous palace in the E. and W. The eastern palace is splendidly described in Ovid's story of Phaethon (Met. ii.). H. was partly identified with Phœbus Apollo, and was widely worshipped, Rhodes being his chief seat. The cock was peculiarly sacred to H., and white rams, boars, lambs, and especially white horses were sacrificed to him. The myth of H. is certainly of Hindu origin. See Cox's *Manual of Mythology* (Lond. 1867).

He'liostat, an instrument for keeping a celestial object constantly in the field of view of the telescope. It effects this by throwing a reflected image of the object into the tube of the telescope from a plane mirror, which is kept in the necessary position by clockwork.

He'liotrope, a name given to species of *Heliotropium*, a large genus of herbs or under-shrubs belonging to the natural order *Boraginaceæ* (q. v.). They occur chiefly in warm countries, only a few being met with in Central and Southern Europe. *H. Peruvianum* is cultivated in gardens for its sweet-scented flowers. Some authors place H. in the natural order *Ehretiaceæ*.

Heliotrope, or **Bloodstone**, a deep green uncrystallised variety of quartz, faintly translucent, with bright red spots, as if intermixed with carnelion. The red colour is due to iron. H. is pretty widely distributed, but the most valuable specimens are obtained in the S. of Asia.

Hell, in modern language, means the place of torture which is the abode of the wicked after death. The word itself is Teutonic, and primarily in its heathen usage denoted the realm of Hel (q. v.), the Scandinavian goddess of the dead or the under world. Even in the rude Northern myth we can discern some faint perception of H. as not merely an abode of misery but a place of punishment, but the word did not acquire its dread import till the perfervid ethics of Christianity had obtained dominion over the Teutonic mind. Then, from denoting 'thrilling regions of thick-ribbed ice,' it passed to signify a realm of scorching flame such as appalled the fancy of Oriental nations. In the Old Testament the word occurs thirty-one times as the equivalent of the Heb. *sheol*. In the New Testament it occurs twenty-three times, twelve times standing for Gehenna (q. v.), and eleven times for Hades (q. v.). The meaning to be attached to H., therefore, depends on the meanings of these three words. 1. *Sheol* (1) in many passages means simply the *grave*, in the general sense in which it is co-extensive with death, and in fact it is so translated thirty-one times, or as often as by H. It is also thrice translated *pit*, in much the same sense. (2) Even when the idea of retribution is connected with it, as when it is translated H., the reference is more to the danger of a sudden and terrible death, than to a place of infernal anguish (Ps. ix. 17; Prov. v. 5, ix. 18, xv. 24), for until a late period of their national existence the Jews had no vivid apprehension of a future life at all (*cf.* Isa. xxxviii. 9–20; Ps. vi. 5; Eccles. ix. 10). 2. *Hades* in the New Testament means also the abode in the region of the dead of good and bad, or of happy and miserable alike. The separate condition of the happy is indicated by Paradise (q. v.), which has a threefold meaning—the Garden of Eden, 'the Hades of departed saints, and the heaven of their glorious rest,' or by the peculiar phrase, 'Abraham's bosom.' 3. *Gehenna* denotes both Tartarus (2 Pet. ii. 4), and the final condition of the lost (Matt. xxiii. 33).

Helladothe'rium, a remarkable extinct genus of *Ungulate* (q. v.) or 'hoofed' quadrupeds, allied to the existing Giraffe (q. v.). The H. fossils occur in the Upper Miocene (Tertiary) rocks of Attica. No horns were developed in these singular beings, and as regards their dentition they appear to have resembled the antelopes. Fossil giraffes occur in the tertiary deposits in the Siwalik Hills of India.

Hell'as is an ethnological rather than a geographical term, signifying the abode of the Hellenes or ancient Greeks, and thus varying in application with the changing distribution of the Hellenes throughout parts of Europe and Asia. In the time of Homer H. was applied to a small region in the S. of Thessaly, while in the time of Herodotus it included not only the greater portion of modern Greece, but also Hellenic colonies in Italy, Sicily, Africa, and Asia Minor. H. was, however, sometimes restricted to the district bounded by the Peneus and the Corinthian and Ambracian gulfs, while after the Roman conquest the name was extended to Macedonia, Illyria, and Epirus. The Romans gave the name of Græcia to the Peloponnesus (q. v.), and the districts immediately N. of it, which are now comprised in modern Greece and the S. of Turkey, the name being probably derived from the Græci, a tribe of Epirus. From the earliest times the centre of H. was the peninsula now known as Greece, where the whole population was Hellenic, the Hellenes, one of the first Aryan peoples who entered Europe, having settled there probably about the 14th c. B.C. The situation of Greece was peculiarly favourable for colonising and maritime adventure when the Levant was the chief commercial highway, as it had a very wide seaboard, was separated from Italy by a channel in parts only 38 miles wide, lay opposite a fertile part of Africa, and was connected with Asia Minor by clusters of islands. The Hellenes early took to seafaring, placed most of their great cities near the coast, and began to found colonies in Italy and Asia Minor. (See IONIA and MAGNA GRÆCIA.) During the heroic age, reflected in the poems of Homer, they seem to have been a warlike, adventurous, and even piratical race, of considerable artistic skill, and possessing the institutions common to the Aryans. When they first appear in semi-historic times, they are divided into cities, each of which is ruled by a king. The royal office is generally hereditary, but its power is limited by the *Boulē*, or council of chiefs, and the *Agŏra*, or assembly of the people. The *Heroic Age* is the period when the mythical heroes, of whom the chief were Heraklēs or Hercules, Theseus, and Jason, are supposed to have performed their exploits, which probably symbolise the gradual triumph among the Hellenes of order over lawlessness. The chief legends of the heroic age gather round the siege of Troy (q. v.), the Homeric account of which is in all likelihood a poetic rearrangement of some historic fact, it being certain that the early Hellenes had wars on the Asiatic shores of the Hellespont, and that Mycene, of which Homer makes Agamemnon the king, was the great city of the Achæans, the leading Hellenic people before the 12th c. B.C. In that century the Dorians passed from Thessaly to the Peloponnesus, and overcame the Achæans, and ruled in their cities of Sparta, Argos, and Corinth. In the heroic age the Ionians also settled in Attica and along the Corinthian gulf, while the Æolians occupied the W. of the Peloponnesus. In the 8th c. B.C. myth begins to disappear before history, and the Hellenes are seen clearly subdivided into

numerous small states, which never, even up to the time of their final subdual, united into a compact federation. The intense passion of the Hellenes for town-autonomy was favoured by the configuration of Greece, which is broken up into plains isolated from one another by rugged mountains, and frequently open only to the sea. Thus Attica was cut off from the neighbouring states by high ridges, and the Peloponnesus was divided into several states separated by the lofty ranges branching out from the central 'mountain-vase' of Arcadia. Moreover, even the cities in a district such as Phocis or Bœotia were generally independent of each other, and while the half-barbarous regions of Macedonia, Molossis, and Ætolia preserved kingly government and a rude federation of towns, the cities of the true H. clung to their cardinal principle of the independence of every city. The result of this ineradicable passion for town-autonomy was to produce an intensely keen and brilliant life, both intellectual and political, which was doomed to swift disappearance from the want of national unity. There was, however, an enduring Pan-Hellenic feeling among the Hellenes, who applied the word *Barbarians* to all non-Hellenic peoples; who had language, religion, and many political and intellectual tendencies in common; and who were loosely bound together by the Pan-Hellenic institutions of the Olympic, Pythian, Isthmian, and Nemean games—open to all Hellenes, and to none but Hellenes—the central oracle of Delphi (q. v.), and the Amphictyonic Council (q. v.). The last consisted of deputies from the various states, who met twice a year to check dissensions and protect the Delphic oracle; but during the palmy age of Hellenic history the council wielded no real power, and the fact that the votes were counted by tribes, not by cities, proves it to have been mainly an empty survival from a past age. In the 7th c. we find bits of genuine history in the poetry of the time, *e.g.*, the war-songs of Tyrtæus, relating to a struggle in which Sparta crushed Messene. After this triumph Sparta defeated the Arcadians and Argives, and became the leading power in H., Athens being as yet insignificant. Before the 7th c., monarchy, the Hellenic form of government during the heroic age, had been superseded by various aristocracies, which in their turn gave way to government by *tyrants*, the name applied by the Hellenes to those who had illegally won royal power, whether they ruled well or ill. From about 650 to 600 is the age of the tyrants, after which democratic and aristocratic governments prevail, till the rise of a new brood of despots in the age immediately before H. yielded to Rome. The tyrants had mostly vanished before 500 B.C., and in the 5th c. B.C. began the most glorious war in all history—the struggle between H. and Persia—a contest of epical grandeur, from the splendid heroism of the Hellenes, the overwhelming disproportion of strength between the antagonists, and the mighty issues involved. In the 6th c. Cyrus raised Persia into a vast empire which absorbed the Hellenic colonies in Asia Minor. These rebelled against the Persian king Darius, and were aided by the Athenians, whose forces burned Sardis (500 B.C.). The Athenians, refusing to take back their expelled tyrant at the demand of the Persian king, Darius sent a force of 110,000 men against them, but this vast host was routed at Marathon (q. v.) in 490 by an army of 10,000 Athenians. After this victory—the greatest of all the 'decisive battles of the world'—Athens rose rapidly to the head of Hellenic affairs. A successful war with Ægina laid the foundation of her maritime power, and under the wise administration of Themistoclês she became mistress of the most powerful fleet in H. In 480 the Persian wars were renewed, Xerxes, son of Darius, setting out against the Hellenes with a motley army of, it is said, about 3,000,000. Thebes and other Hellenic cities sided with Xerxes, while others succumbed to him; but Sparta and Athens, though almost deserted by the rest of H., resolved to withstand the barbarians. The first battle was at Thermopylæ (q. v.), where King Leonidas and the three hundred Spartans fell. Xerxes then burnt Athens, which had been deserted by its citizens. But his fleet, after being severely handled off Artemisium, was defeated with terrible carnage at Salamis (480 B.C.), whereupon he fled to Asia, leaving Mardonius with 350,000 men to continue the war. Mardonius was decisively beaten at Platæa (q. v.) on the same day that the Hellenes won the sea-fight of Mycalê (q. v.), on the coast of Asia Minor. The glory of Salamis rests mainly with the Athenians under Themistocles, the glory of Platæa with the Spartans under Pausanias. Athens now rose swiftly to the zenith of her power. Her naval superiority over Sparta made her the fitting head of the confederacy of Delos, a Hellenic league against Persia; and she received contributions in ships and afterwards in money from the other states, whom she protected against the common foe. From 490 B.C. to 431 B.C. is the most brilliant epoch in Hellenic history—the time of the Athenian supremacy in literature, art, and war—Athens becoming under the rule of Pericles the most flourishing of Hellenic cities. (See PERICLES.) But jealousy and discontent were excited by her somewhat arbitrary application of the common fund raised by the Hellenic confederacy, and by her haughty and aggrandising policy; and in 431 the Peloponnesian War (q. v.), which lasted about twenty-seven years, broke out. It was waged between Athens and Sparta, the latter having for allies most of the Peloponnesian cities. It was a war of races and principles, between Ionians, represented by Athens, and Dorians, represented by the Peloponnesians; between democracy, represented by Athens, and aristocracy, represented by Sparta, neither party being entitled wholly to engross our sympathies. After the first ten years of the struggle neither had gained a decisive advantage, the Spartans being stronger by land, the Athenians by sea. But in 415 the Athenians sent an expedition against the Dorian colony of Syracuse, and besieged that city for two years. The Spartans took the part of their kinsmen, and the Athenians were signally beaten—a blow from which they never recovered. Their allies began to revolt, while the friends of Sparta clung to her firmly; and finally, in 405, Lysander the Spartan defeated their fleet at Ægospotamus in the Hellespont, and took Athens in 404. But the oligarchy of the Thirty Tyrants, by which the Spartans supplanted the Athenian democracy, was driven out in 403, and Athens won back freedom. The Spartans were now supreme in H. Numbers of them went to support Cyrus the Younger against Artaxerxes, and in 401 began the famous march known as the Retreat of the Ten Thousand. (See XENOPHON.) In 396 the great Spartan Agesilaus overthrew the Persian armies in Asia, and the Spartan power continued to increase until it suddenly paled before Thebes, which, under the control of Epaminondas (q. v.) and Pelopidas, now began to play the leading part in Hellenic politics, the Thebans defeating the Spartans, who had never before lost a pitched battle, at Leuctra in 371. Athens, siding first with Thebes and then with Sparta, regained much of her old influence, and after the death of Epaminondas, who fell at Mantinea, fighting against the Spartans and Athenians, the Theban power swiftly collapsed, and Macedonia emerged as the dominant state. Philip, the Macedonian king, engaged in the Sacred War, beat the allied Athenians and Thebans at Chæronea (338), and had himself elected captain-general to lead the Hellenes against Persia—the Spartans alone holding sullenly aloof. Alexander, son of Philip, in 334 led the Hellenes into Asia, and advanced in a line of dazzling conquest to the Indus. Although, after his death in 323, his vast empire crumbled away, the effects of his expedition remained. Hellenic culture was diffused through the east, Hellenic colonies were planted in Egypt, Persia, and Bactria, and Alexander's generals became rulers of half-Hellenised kingdoms whose history cannot strictly be included under that of H. (See PTOLEMY and SELEUCIDÆ.) The career of Alexander gave a vast outlet to Hellenic influence, through which there arose peoples of naturalised Hellenes, the history of the modern Greek nation beginning, according to Mr. Finlay, with Alexander's conquests. The Macedonians, who now ruled H., though not pure Hellenes, were closely akin in blood and language, besides having a capacity for receiving a Hellenic impress wanting to the other semi-Hellenic peoples who bordered on H. proper. They never sought to absorb H. in Macedonia, but to make Macedonia the leading Hellenic state. The history of the Macedonian period will be treated under MACEDONIA. It is a time of bloody, chaotic, and selfish strife. The power of the Macedonians over the Hellenes fluctuates greatly; Epirus springs into sudden power under Pyrrhus; and Ætolia and Achæa become rivals of Macedonia and Sparta. During the 3d c. tyrants began to snatch power, and leagues were formed—the most famous being the Ætolian and Achæan, which embraced all H. except Sparta, now flourishing vigorously and freed from its old oligarchy. But the Achæans, instead of uniting with Sparta, which might have enabled them to repel Macedonian and even delay Roman aggression, treacherously supported the Macedonians, against whom Rome began war on behalf of Athens in 200 B.C. After subduing Macedonia, the Romans crushed the Achæans in 146, when Mummius destroyed

Corinth, and the independence of Greece passed away, though Athens and several other cities continued to be nominally free. Until the time of the Roman empire, however, the republics of Byzantium, Rhodes, and the Lycian federation, though they held no external dominions, were internally free, and Cherson, on the Black Sea, the 'last of the Greek republics,' remained until the 9th c. practically independent, and to the end partly Hellenic. See the histories of Herodotus, Thucydides, Polybius, Thirlwall, Grote, Curtius, Cox, and Finlay; Donaldson's *Dorians*, Freeman's *Essays* (1st series), and *History of Federal Government*.

Hell'ebore, applied properly to species of *Helleborus*, a genus of plants belonging to the natural order *Ranunculaceæ* (q. v.). Nearly all the species have long been noted for their irritant qualities. Many of them act as drastic purgatives, hence their use in ancient times in cases of mania. They are natives chiefly of Southern Europe and Asia. Several species are grown in gardens, such as *H. niger* or Christmas-rose, which blooms in midwinter, and *H. officinalis* or black H., which was used by the Greeks as a medicine. *H. fœtidus* or stinking H., and *H. viridis* or green H., are natives of Britain. H. has also been applied to species of *Veratrum*, a genus of plants belonging to *Melanthaceæ* (q. v.).

Helleborus niger.

Hellen'ic Literature. In Hellas, as has been the case in all nations, poetry was the earliest birth of literature. Indeed, if we were to judge solely from the poems of Homer and Hesiod—the most ancient works which remain to us—we should be tempted to believe that it burst forth at once, as did Minerva from the brain of Jupiter in the highest perfection. Long, however, before Homer's time, the wandering rhapsodist sang the stories of gods and heroes, the tender tale of love, and the 'pomp and circumstance of war;' and long ere the art of writing was practised, the records of the past were imprinted on the tablets of memory by aid of the rhythmic flow and recurrent chime of verse. Of the earliest lays of the Hellenic bards nothing has come down to us. Linus, 1280 B.C., the father of mythic hymnology, the minstrel Orpheus, 1260 B.C., and Musæus, the founder of the religious epic, 1180 B.C., are to us names only—names, however, which their followers in the realm of song ever delighted to honour. The earliest extant Hellenic poems, and certainly the greatest, are the *Iliad* of Homer (962-927 B.C.), an epic which has for its subject the siege of Troy and the contests of the gods and heroes that took part in the struggle; and the *Odyssey*, which contains a charming account of the wandering of Odysseus (Ulysses). This period, which also includes the Homeric hymns and the writings of the Cyclic bards, closes with the name of Hesiod (flor. 850 B.C.), author of the *Theogony*, a genealogy of the gods; the *Works and Days*, an agricultural poem; and an epyllion entitled the *Shield of Hercules*. The century 950-850 B.C. may be said to have witnessed the dawn, the noon, and the sunset of epic poetry in Hellas. Next in order came the lyric, elegiac, and iambic poets (800-530 B.C.), chief of whom were Archilochus, celebrated for his keen iambics (708 B.C.), and Simonides of Amorgus (693-662 B.C.), who disputes with Archilochus the invention of iambic verse; Tyrtæus (685 B.C.), and Callinus (678 B.C.), writers of martial elegy; Alcman of Sparta (670 B.C.), inventor of love elegy; Mimnermus of Smyrna (629 B.C.), writer of mournful elegy; Arion, dithyrambic poet (625-610 B.C.), Stesichorus of Himera (612 B.C.), esteemed by Quintilian the equal of Pindar in sublimity, harmony, and beauty of language; Sappho (610 B.C.), and Alcæus (604 B.C.), with whom the Æolian Melic attained its highest perfection; Anacreon of Teos (560 B.C.), the gay, luxurious, and festive lyric bard; Theognis of Megara (541 B.C.), gnomic poet; and Ibycus (540 B.C.), lyric poet.

In the tragedians Æschylus (524-456 B.C.), Sophocles (495-405 B.C.), and Euripides (480-406 B.C.), Hellenic literature reached the highest pitch of excellence; while in Simonides of Ceos (flor. 490 B.C.), and Pindar the Theban (522-442 B.C.)—the latter incomparably the greatest of all the lyric poets of Hellas—lyric poetry attained the greatest perfection. About this period we have the dawn of history in the Ionic logographers Hecatæus of Miletus, Charon of Lampsacus, Pherecydes of Scyros, Xanthus the Lydian, and Hellanicus of Mitylene. These were followed by the historians, whose claim to the title is paramount, and who in their respective styles are unequalled—Herodotus, called the 'Father of History' (484-408 B.C.), the concise, vigorous, and energetic Thucydides (471-402 B.C.), and the smooth and graceful Xenophon (444-362 B.C.). Between 450 B.C. and 380 B.C. flourished Magnes, Cratinus, Eupolis, and Aristophanes—all famous in the old Attic comedy. To this period—the golden age of Attic prose—belong the celebrated orators, Pericles (499-429 B.C.), Antiphon (480-411 B.C.), Lysias (459-380 B.C.), Andocides (440-390 B.C.), Isocrates (436-338 B.C.), Isæus (420-350 B.C.), Æschines (389-314 B.C.), Demosthenes (382-322 B.C.), and Hyperides (flor. 346 B.C.). The years 400-336 B.C.—the age of Spartan and Theban supremacy and of Philip of Macedon—produced the middle comedy, which numbered a long list of writers whose works have perished. After 336 B.C. the new comedy flourished. The two most important names connected therewith are those of Menander and Philemon, of whose works only fragments remain. Aratus of Soli (or Tarsus), poet and epistolary writer (flor. about 270 B.C.); the bucolic poets Theocritus (280 B.C.), Bion and Moschus (270 B.C.); the elegiac poet Callimachus and the epic poet Apollonius Rhodius (238-188 B.C.), with a number of what are known as the learned poets of the Alexandrine school, adorn the period immediately preceding the Roman age. Nor must we omit the epigrammatists who flourished greatly at this time; the historians Polybius (207-122 B.C.) and Zeno (160 B.C.); the grammarians Aristarchus (flor. 156 B.C.) and Apollodorus (146 B.C.), and the geographers Strabo (66 B.C. to 22 A.D.) and Pausanias (174 A.D.). The Hellenic prose of Polybius and the Alexandrine prose of Philo were succeeded by the revived Atticism of Lucian, satirist and sceptical wit (120-200 A.D.); Plutarch (40-120 A.D.), whose biographies of eminent men possess an enduring charm; the historians Dionysius of Halicarnassus, Appian, Arrian, and Dion Cassius, with the Erotic (q. v.) writers complete the list of later names worthy of notice.

Hellenic Mythology. The H. M. or religion was from various historical causes, as well as from the geographical isolation of the people, essentially unique. It was, moreover, at once poetical and humane. Though made up of apparently heterogeneous elements, it was not therefore inharmonious, as a brief survey of it will show. From the instinct of the Hellenes to explain everything through the medium of their emotional nature, their divinities were only human beings in a more exalted and refined condition. They invested their deities with the passions, desires, and feelings of humanity, and the worship which they accorded to them was regulated accordingly. Moreover, the creed of every individual district was framed to suit the natural dispositions and religious instincts of the people, and to accord with their aims and aspirations. This is the prime point in the creeds of all the nations of antiquity. The Hebrew Jehovah was worshipped at Jerusalem, Zeus at Olympia, Aphrodite had her shrine at Cyprus, so had Astarte in Phœnicia.

By Hesiod, the earliest genealogist of the divinities, and by the epic poets of his time, the theogony was framed, and a hierarchy of gods, similar in every respect to a conclave of human potentates, received the adoration of man. Through the medium of poesy various genealogies were promulgated, but all of these were based on *human character*, and all of the deities were clothed in *human shape*. These features pervade the H. M. Another characteristic trait is its purely *national* character. Special cultus there might be, but the religion as a whole was *national*. The gods were classed as celestial, earthly, maritime, and infernal. Each deity was held supreme in his own domain. To such an extent did the idea of local godship pervade the Hellenic mind.

The H. M. presents at least three dynasties of gods. Their periods are, however, ill defined, and at times they seem to merge in such a way that only one—the third—remains as the genuine product of the mythographers. The earlier dynasties

may have been merely commentaries by an ancient priesthood actuated by heroic sympathies or national pride. In those times the profession of a genealogist, if not a lucrative one, must have been a favourite occupation of bards and seers. The earliest Hellenic account of the creation which we possess is by Hesiod. It runs thus:—(1) Chaos, from which were fashioned Gæa (*earth*), and Erōs (*love*); (2) Erebos (*darkness*), and Nux (*night*). By virtue of love Erebos and Nux produced Aithēr (*clear sky*), and Hemera (*day*). Then Gæa of herself produced Ouranos (*heaven*), Pontos (*sea*), &c.; and again from her union with Ouranos she brought forth the giants, Cyclops, and Titans. Ouranos was then god supreme. He was dethroned by Kronos, who in turn was dethroned by Zeus.

Of the third dynasty of Olympian gods, twelve or more (the number is indefinite) were esteemed in power and privileges superior to the others. The chief were (1) Zeus, father of gods and men, dethroner of Kronos and the Titans (earlier dynasty); (2) Hēra, sister and wife of Zeus, worshipped especially at Samos and Argos; (3) Apollōn, worshipped with great pomp at Delos and at Delphi in Phocis, and esteemed by the Dorians the greatest of all the Hellenic gods; (4) Poseidōn, brother of Zeus, god of the sea; (5) Athēnē, proctectress of Athens; (6) Arēs, the god of war; (7) Aphroditē, the goddess of love and beauty; (8) Erōs, the personification of desire; (9) Artemis, the goddess of the chase, twin sister of Apollōn, and, like him, specially worshipped at Delos; (10) Dēmētēr, the goddess of the soil, worshipped at Eleusis with mysterious rites along with her daughter; (11) Cora (*Persephonē*); (12) Ploutōn, brother of Zeus and husband of Persephonē, king of the nether world; (13) Hermēs, the messenger of the gods and conductor of the dead. It remains to mention (14) Hestia, the goddess of the domestic hearth; (15) Hephaistos, the god of fire; (16) Dionusos, the god of wine—a purely national god—whose marriage with Ariadnē is immortal, and the festive rejoicings in honour of which were celebrated when fruits were ripe. Hēraklēs, Hēbē, and Ganymede, translated to Olympus, almost complete the catalogue of the *Dii Majores*, or Olympian gods.

The marine deities, Amphitritē, the personification of the sea in all its phases, called also wife of Poseidōn; Nereus, father of the ocean-nymphs, and Tritōn, the horn-blower of the sea-god; and the earthly deities, including Pan, the Oreads, dryads, &c., were all duly honoured in their sphere.

The catalogue of Chthōnian or infernal deities, under which terms are comprised Ploutōn, Persephonē, and Hermēs, already mentioned among the Olympiads, comprehended the heroes and the ancestors of those who had altars assigned to them. These were the *Dii Manes* of Roman mythology.

Apart from the deities above mentioned, an infinite variety of divine beings claim notice. Such are the personifications (1) of the fertility of nature:—Pan, the Satyrs, Mænads, Silvanus, Priapus, &c.; (2) of the visible beauty of nature:—The Charites, Hōrai, and Hesperides; (3) of the vocal beauty of nature:—The muses and nymphs; (4) of the ætherial spirits:—Winds, &c.; (5) of the veiled mysteries:—Thanatos, Hypnos, &c. In addition to all these and many other divinities, the Greeks recognised in an eminent degree Themis, the goddess of justice; Nemesis, the avenger of wrong; the Furies (Erinues), and the Fates (Moirai). The last, who were beyond the control of even Zeus, are, according to Plato (*Rep.* 317), seated on thrones, white-robed and chapleted—Lachesis singing the past, Clōthō the present, and Atropos the future, touching and turning the spindle of necessity.

Hellenic Philosophy. Hellas, so famous for her poets, historians, orators, and statesmen, was no less distinguished for her schools of philosophy. Thales of Miletus (644-548 B.C.), one of the 'seven sages,' is justly considered as the father of Hellenic speculation, and his name marks an epoch in H. P. The distinctive characteristic of his system and that of his followers —known as the Ionian School—was an inquiry into the origin and constitution of the universe. He taught that water was the beginning of things. Anaximander of Miletus (611-547 B.C.), the first to use the term *arche* for the fundamental principle, asserted that the infinite (*to apeiron*) was the origin of things, and that water, air, earth, and fire were generated thereby, and thereinto again resolved—the parts of the whole constantly changing while the whole was unchangeable. Anaximenes, by Ritter and Lewes placed next to Thales, mainly on the ground that the doctrines of the former are a development of those of the latter, declared that air was the first principle. Pythagoras (flor. 531 B.C.), one of the great founders of mathematics, whose life is enshrouded in myth and legend, taught that number was the cause of the material existence of all things; in other words, that while individual things change, the numerical attribute—the One—is indestructible. The infinite, therefore, must be one. This involved the belief that numbers were real, not merely symbolical. A notable feature in the teaching of Pythagoras was the doctrine of the transmigration of souls (*metempsychōsis*). Xenophanes of Colophon (538 B.C.) was distinguished as an opponent of the polytheism of the time, and as an asserter of the unity and perfection of the Godhead. The one, the infinite, philosophy taught him could not be infinite, nor yet finite; could not be moved, nor unmoved. Though neither a clear nor an exact thinker, Xenophanes nevertheless greatly influenced the progress of H. P. He was followed by Parmenides of Elea (flor. 505 B.C.), a man of great logical acumen. He evolved the theory of the duality of human thought and asserted the doctrine of the one—the *ens* (Gr. *on*), self-existent—to satisfy the reason, and of the many to accord with the testimony of sense. He admitted, however, the uncertainty of knowledge, but maintained the certainty of reason. Contemporary with him was Heracleitus of Ephesus, 'the weeping philosopher,' who took his stand on the principle of flux or ceaseless change, as exemplified in fire—ever self-kindled, ever self-extinguished. 'All,' said he, 'is and is not'—an enigmatical expression of his theory that nothing *is* but is always *becoming*. About this time Leucippus originated his famous Atomic (q. v.) theory. Anaxagoras (500-428 B.C.) treated the universe as composed of an indefinite number of elements (Gr. *homaiomeriai*); but at the same time held to the Pythagorean and Eleatic principle of the one. While he saw that things were many, he saw also the necessity for the one. He thus admitted both sense and reason. Diogenes of Apollonia (flor. 468 B.C.) adopted in a modified form the tenet of Anaximenes that all things have their origin in air; but gave to it a broader and deeper signification. In air he saw that there was not only life but intelligence, and that intelligence must have been the first of things. Next in point of time came Zeno of Elea (flor. 464 B.C.), one of the most distinguished of the ancient philosophers. He was the inventor of that system of logic called *Dialectics*—a method which produced the Sophists and Sceptics, and which became an instrument of terrible power in the hands of Socrates and Plato. Democritus of Abdera (flor. 460 B.C.), 'the laughing philosopher,' whose system was an expansion of the atomic theory of Leucippus, received the universe as a congeries of atoms, and attributed the formation of all things to destiny (or necessity); but whether by that term an intelligent cause is to be understood or not, it is impossible to say. Empedocles of Agrigentum (flor. 444 B.C.) in his philosophy has something in common with all the schools before his time; but the cardinal point in his system is his assuming the four elements as the primary principles from which all things proceed by the action thereon of love, the mingler or creator, and hate or discord, the destroyer. Meanwhile the uncertainties incident to all yet promulgated philosophical theories, and the proved insufficiency of all attempts towards a solution of the great problems of existence and human knowledge, produced an intellectual crisis; and a class arose under the name of Sophists, who by objections and counter-arguments sought to overthrow the systems of the past. From the nature of the case it will be evident that the Sophists formed not so much a philosophical sect as a school of rhetoricians. Their avowed object was 'to make the worse appear the better reason.' For their instruction they exacted enormous fees, which were ungrudgingly paid by the rich. But hereby they incurred the odium of the poor and the contempt of the philosophers. By many authors they are said to have corrupted the public morality. One eminent modern historian, Mr. Grote, takes, we think with good reason, an opposite view. At all events, they were the natural outgrowth of the age. Their scepticism, however, in the main was shallow— the shadow without the substance; and with Socrates (468-399 B.C.) H. P. again asserted her rightful reign. With this second dawn Hellenic speculation assumed a new phase. The great problems affecting the end of life, human happiness, social duty, &c., were to be solved with regard to new and deeper considerations. Virtue and vice were no longer to be looked at from a utilitarian point of view, but to be determined by fresh canons

and reconciled with man's religious convictions. Socrates proclaimed his ethical creed. Virtue was enthroned by him as the supreme guide of life; justice was declared the sole passport to happiness. Ethical terms, such as justice, injustice; piety, impiety; nobility, baseness; temperance, intemperance; citizenship, government; and the like, were rigidly defined. And for this grand and noble work, for which every succeeding age has done him honour, the saintly sage suffered martyrdom. But the seeds he had sown were to blossom in his pupils Xenophon and Plato—the former of whom in his *Memorabilia* of the sage has left us a tender and graceful tribute to his memory, the latter a splendid exposition of his philosophy. The conflicting sects represented by Euclid of Megara (flor. 400 B.C.), Antisthenes the Cynic (426–371 B.C.), with his more famous pupil Diogenes (419–324 B.C.), both 'imposing blasphemers,' according to Mr. Lewes, and Aristippus of Cyrene (400–362 B.C.), whose abstract conception of the good was reduced to the concrete pleasure, were more or less influenced and moulded by Socrates, and partially adopted his method. In Plato (q. v.) (429–347 B.C.), as we have indicated, we have a complete and clear adoption and application of the Socratic method. But Plato was more than a mere exponent of the Socratic philosophy. He was the inheritor of all the wisdom of the past, and added largely to it. The Socratic school was succeeded by that of Aristotle (q. v.) (384–322 B.C.), the founder of the Peripatetics, for twenty years pupil of Socrates, but no servile follower of his philosophy. To the region of speculation he restored physics and metaphysics, in great measure neglected during the reign of ethics inaugurated by Socrates—a restoration that was succeeded by a second crisis in H. P. In 350 B.C. flourished Pyrrho the Sceptic; in 366–264 B.C., Zeno the Stoic; in 341–270 B.C., Epicurus; in 300–241 B.C., Arcesilaus of Pitane; and in 213–129 B.C., Carneades of Cyrene. Pyrrho was the natural successor of the Sophists; Zeno and Epicurus were but modifications of the leaders of the Cynic and Cyrenaic schools respectively; Arcesilaus and Carneades evolved a form of scepticism totally different from that of Pyrrho. With these names H. P., properly so called, ends; for the genius of philosophy no longer dwelt in Hellas. Speculation, however, again appeared at Alexandria under the name of Neo-Platonism, in the companionship of faith; and after a protracted struggle for life, the old philosophy expired with Proclus, 485 A.D.

Hell'enists (Gr. *Hellenistai*), a general name for those learned in matters of Greek antiquity, especially the language and literature. More particularly the name is applied to the great numbers of Jews who immigrated into Egypt, and there became nationalised, adopting the Greek language and philosophy, and gradually establishing a new epoch of Græco-Jewish culture, which from its more prominent element received the name Hellenistic. The chief of these Jewish-Hellenistic philosophers was Philo (q. v.). An important memorial of the literary diligence of these Alexandrian Jews is the Greek translation of the Old Testament (Septuaginta). The name H. was often given to the Jews who lived among the Greeks, and Hellenistic to the Greek spoken by them, always more or less betraying the influence of the Hebrew idiom.

Hell'espont. See DARDANELLES.

Hellevœt'sluis, a strongly fortified seaport of the Netherlands, in the province of S. Holland, on the island of Voorne, and on the Haring Vliet, 17 miles S.W. of Rotterdam. It is an important naval station, with an artillery magazine, an arsenal, an hospital, a vast sluice, &c. Through the Voorne Canal, which here enters the Haring Vliet, comes much of the Rotterdam trade. Pop. (1873) 4284. William of Orange sailed hence to England, with 50 vessels and 14,000 men, on 11th November 1666. H. was taken by the French in 1795 and besieged by the English in 1813.

Hell Gate (originally Dutch, *Helle Gat*), a narrow part of the East River, United States, between New York city (nearly opposite Croton Reservoir, beyond Central Park), Ward's Island and Hallet's Point on Long Island, and within the corporate limits of New York and neighbouring cities. It receives strong tides from Long Island Sound in the E. and Sandy Hook in the W., and is rendered dangerous by its violent currents and its formidable reefs of thinly stratified gneiss. Since 1851 works have been carried on for the removal of the rocks by means of engine-drilling, tunnelling, and blasting by electricity. It is surmised that by opening up the channel the eastern trade of Sandy Hook will be diverted hence, while New York will have the advantage for defence of an additional outlet to the sea. But the Sound, though 12 miles shorter, is foggy, tortuous, and shoaly. Many of the reefs, including Pot Rock, Frying Pan, Shelldrake, Bald-headed Billy, have been removed at a cost, at the end of 1875, of over 14,000,000 dollars. The last explosion was that off Hallet's Point, on the 24th October 1876, when were used in charges 28,901 lbs. of dynamite, 9061½ lbs. of 'rendrock,' and 14,244 lbs. of 'vulcan' powder, an aggregate of 52,206½ lbs. of preparations of nitro-glycerine. The cartridges were disposed in 4462 cavities, inter-connected by 100,000 feet of telegraph wire, and placed in communication with the batteries by 120,000 feet more. Nearly three acres were undermined by 7600 feet of tunnels, so as to give a uniform depth of 30 feet, and the explosion dislodged 43,000 cubic feet of gneiss rock, weighing 90,000 tons, and supporting the pressure of 143,000 cubic yards of water. The work of opening H. G. is, however, not more than one-third done.

Hellin' (the ancient *Illunum*), a town in the province of Albacete, Spain, on the Menedo, 52 miles N.W. of Murcia. It has a fine old church, several Roman remains, and is well built and paved. Near it are rich sulphur mines, and sulphurous springs used for bathing. Pop. 10,200.

Helm (Icel. *hialmun*, perhaps from its being the *helve* or handle which guides the ship), is the steering mechanism of a ship, consisting of the wheel, tiller, and rudder. In boats and small vessels the wheel, which is used to give greater leverage to the steersman, is dispensed with. To *put the H. up* is to put the tiller to the weather side and allow the vessel to fall off before the wind; to *put the H. down* is to put the tiller to the leeside and so throw the ship's head into the wind. See STEERING and RUDDER.

Hel'met (Goth. *hilms*, Old Norse, *hialmr*, Ger. *helm*, Fr. *heaume*), the metal or leather covering for the head worn by soldiers. The Greek and Roman helmets carried plumes, but left the face exposed. In the middle ages the helmets, which were formed of steel, and often richly inlaid, covered the face by a part called the *visor* or *vizor*, which lifted up by a pivot over each ear. The introduction of gunpowder has led to the general disuse of helmets, though they are still worn, chiefly as ornament, by heavy cavalry.—**H.**, in heraldry. The form of H. came to vary with the rank of the wearer, and, consequently, in heraldry, representations of helmets were placed above the chief part of the shield, to carry the crest and to indicate its bearer's rank. There are four forms of H. in heraldry—(1) The sovereign's, of gold, full-faced, and six-barred; (2) the noble's, of steel, in profile, and five-barred; (3) the knight's and baron's, of steel, garnished with silver, full-faced, with the visor raised and without bars; (4) the esquire's, of steel, in profile, and with the visor closed.

Helm'holtz, Hermann Ludwig Ferdinand, the German physicist and physiologist, was born August 31, 1821, at Potsdam in Brandenburg. He began his career in 1842 as an army surgeon, and in 1849 became Professor of Physiology at Königsberg. In 1855 he removed to Bonn, and in 1858 to Heidelberg. In 1870 he gave up his physiology chair for that of physics at Berlin, a position which he now (1877) occupies. As a physiologist he has specially directed his attention to the organs of sense, and the results of his researches are embodied in his *Beschreibung des Augenspiegels* (1851), *Über das Sehen* (1855), and *Handbuch der Physiologischen Optik* (1867), the last a most exhaustive treatise. In pure physical and mathematical science he is widely known through his valuable paper on the conservation of energy (*Die Erhaltung der Kraft*, 1849), his *Populäre Vorträge* (1865 and 1870), and his splendid mathematical memoirs in Crelle's *Journal* on *Vortex Motion in Liquids and Air-Vibrations in Open Pipes*. Under his direction also was the German edition of Thomson and Tait's *Natural Philosophy* published. His most original work has been in connection with the physiology and physics of musical sounds; and his masterly treatise on the sensations of tone, *Lehre von den Sonempfindungen* (1862, 3d ed. 1870, Eng. trans. 1875), has thrown a flood of light upon the whole science of acoustics.

Hel'mont, Jan Baptista van, the great chemist, was born of a good family at Brussels in 1577. Educated at Louvain, he became a mystic, had visions of God, and felt called on to resign his property to his sister. He now began the study of medicine that he might serve Christ in ministering to the poor. Appointed a professor of surgery, he soon found out the absurdity of the old-world system then in vogue in medicine, a stupid commentary on the crude notions of Hippocrates and Galen. Like Paracelsus, he resolved to travel, and spent ten years in Italy and Germany. A voice in a dream bade him take up the science of chemistry. He experimented on fossils, on animal and vegetable substances, thought he had confounded the 'humorist' school by the discovery of a panacea, adopted the title *medicus per ignem*, and attended the sick gratuitously. His opinions were attacked by the orthodox philosophy and medicine of the day, and also by the Church. He, however, enjoyed the favour of Rudolf II. and of the Elector of Köln. He died at Vilvorde, December 30, 1644. In spite of an overheated imagination, H. made some steps on the road of true science. He introduced the word 'gas,' applying it to the 'woody spirit,' the product of the combustion of wood, fermentation, putrefaction, &c. The different kinds of gas he classified as inflammable and non-inflammable. Hydrochloric acid he called 'gas of salt.' Coal-gas he considered to be water, which he held to be the real food of plants and vegetables, 'the blood of the earth.' All his theories and speculations are, however, tainted by the uncertainty which then prevailed with regard to the question of ultimate chemical elements. Sometimes he leans to the alchemistic view of 'salt, sulphur, and mercury,' at another time to the ancient 'water, air, and earth.' In his measurements of heat, he used melting ice and boiling water as fixed points. He introduced the word 'saturation' to express the combination of an acid with its base, which it had previously been said to destroy. Several diseases he traced to the excess of a specific acid, the gastric juice. His system of *archai*, or spiritual forces presiding over the kingdom of nature, was taken from Paracelsus. The *archē* of the animal kingdom was the *aura vitalis*, called *janitor stomachi*, because its seat was the cardiac orifice. The *spiritus vitalis*, a gas produced in the left heart, originates respiration, circulation, muscular contractility, and nervous force. The soul resided in the stomach. The centre of the earth he regarded as full of hot water, and the interstellar spaces as full of an ether which penetrated the atmosphere of the earth. H.'s chief work is the *Ortus Medicinæ* (Amst. 1648). See the sketches of Elmotte, Crasso, and Frænkel, and Hœfer's *History of Chemistry*.

Helm'stedt, a town in the duchy of Brunswick, 20 miles E. of the town of Brunswick by rail. It is known mainly as the seat of a former university, founded in 1575 and suppressed in 1809. A little iron and coal is found in the neighbourhood of H., and pottery is manufactured. Pop. (1875) 7783.

Hel'mund, a considerable river of Afghanistan, which rises in the mountains of Paghman, and after a S.W. course of over 700 miles, falls into the lake of Seistan. It is never without a plentiful supply of water, which is used for irrigation, though not to such an extent as in former times. Navigation is not practised anywhere.

Heloise'. See ABELARD.

He'lots (*i.e.*, either 'captives,' from Gr. *helein*, 'to capture,' or 'inhabitants of Helos,' a town of Laconia), the lowest of the four classes into which the population of Sparta was anciently divided, appear to have been the original inhabitants of Laconia, who were reduced to serfdom on the Dorian invasion of the Peloponnesus. They were treated with great cruelty and indignity by the Spartans, who made them serve in war, till the soil, wait at meals, and massacred them when their numbers seemed to grow dangerously great—companies known as *Crypteiai* being formed to secretly slay them. The H. were occasionally rendered drunk as a warning to the Spartan youth, and the name Helot has become synonymous with a degraded slave.

Helps, Arthur, an English essayist and historian, was born about 1817, and educated at Trinity College, Cambridge, where he graduated in 1838. He became private secretary to Lord Monteagle, Chancellor of the Exchequer; commissioner of French, Danish, and Spanish claims; and in 1859 clerk of the Privy Council. H. died in London, March 7, 1875. His works include *Thoughts in the Cloister and the Crowd* (1835); *Essays Written in the Intervals of Business* (1841); *Henry II.; Catherine Douglas; The Claims of Labour* (1845); *Friends in Council* (1st series, 1841; 2d series, 1859); *Companions of my Solitude* (1851); *Conquerors of the New World* (1852); *The Spanish Conquest of America* (1855–61); *Life of Pizarro* (1869); *Brevia* (1870); *Casimir Maremma* (1870); *Life of Cortes* (1871); *Thoughts upon Government* (1871); *Ivan de Biron* (1874); *Social Pressure* (1874). His essays, which are mainly in the form of dialogue, are full of ripe sober reflection, occasionally lightened with mellow humour; and as a historian he excels both in thorough mastery of his subject and in lucid picturesque narration. His style is admirably pure and graceful, abounding in quiet beauties of diction. He composed several plays, but was almost wholly lacking in dramatic variety and fire.

Hels'ingborg, a bathing-place and port of Sweden, in the län of Malmöhus, on the Sound, opposite Elsinore. It has frequent steam communication with Copenhagen, and carries on a trade in iron wares and pottery. Pop. (1874) 8103.

Hels'ingfors (Fin. *Helsinki*), the strongly fortified capital of Finland, in the government of Nyland, on the peninsula Estnäs ('east nose'), in the Gulf of Finland, 190 miles West of St. Petersburg. It is the finest town in Finland. It originally rose around the old palace *Helsingfors* (*fors* meaning a waterfall or 'force'), and has now extensive foreign commerce. It is the seat of the governor-general of Finland, has a university (fifty-two professors, 500 students, and a library of 100,000 vols.), transferred hither from Aabo in 1828, a church of St. Nicholas (1830–52), a hospital, and a large theatre in a beautiful park. Visitors come in great numbers from St. Petersburg in summer for bathing. In 1874 the imports amounted in value to £2,054,338. The trade is chiefly with England, Germany, Russia, America, and Scandinavia. About half of the imports were cotton and yarn; the staple export is timber. In 1874 there entered 880 vessels (559 Finnish) of 85,332 lasts. To the S. of H. lie the seven fortified islets of Sveaborg (Viapori), called the northern Gibraltar; pop. (1867) 32,130. H. was made the capital of Finland in 1812. Sveaborg was bombarded in vain by a French and English naval force in August 1855.

Helst, Bartholomaus van der, one of the greatest portrait painters of the Dutch school, was born at Haarlem in 1613, and afterwards removed to Amsterdam, where he died in 1678. His 'Feast of the Town Guard of Amsterdam,' is a portrait composition, astonishing for its freedom, truth, and beauty of colour, and vividly recalling the masterpieces of Van Dyck. His draperies are masterly, his figures firmly modelled, and even in minor details he follows nature with unswerving fidelity and invariable success.

Hel'stone, a market-town of England, county of Cornwall, in the beautiful valley of the river Cobre, 12 miles E. of Penzance. It has a corn trade, but greatly depends on the many mines and quarries in the vicinity. The mouth of the Cobre, 3 miles distant, is obstructed by a sandbank that forms the Loe Pool. May-games are still celebrated here. Pop. (1871) 8760. H. was made a borough in 1201, and returns one member to Parliament.

Helvell'a, a genus of *Fungi* (q. v.), allied to the morels. Six species are found in woods in Britain, several of which are esculent, such as *H. crispa*, *H. lacunosa*, on *H. esculenta*. The last of these is now referred to the genus *Gyromitra*.

Helvell'yn, a mountain of Cumberland, England, towering 3055 feet over Ulleswater, on the road between Keswick and Ambleside. It is associated with the poetry both of Wordsworth and Scott.

Helvet'ic Confess'ion is the name given to two distinct documents: the first presented to the assembled divines at Wittenberg (1536) by Martin Bucer (q. v.) in his attempt to settle the controversy between the Lutherans and Zwinglians. The second was drawn up by Bullinger (q. v.) at the desire of Friedrich III., Elector of the Palatinate, published 1566, and adopted in Switzerland, the Palatinate, Poland, Hungary, France, and Scotland.

Helvet'ii, a Celtic people who, in Cæsar's time, held the lands between the Rhône and the Lake of Geneva on the S., the Rhine on the E. and N., and the Jura on the W., a district cor-

responding loosely to modern Switzerland. In B.C. 58 they sought to migrate to the S. of Gaul, but were turned back at Geneva by Cæsar, who, when they endeavoured to follow another route, fell upon them at Bibracte, the modern Autun (?), Burgundy, and routed them with dreadful slaughter, only 110,000 returning of the 368,000 who had quitted Switzerland. The H. suffered another severe defeat in 70 A.D. from Vitellius.

Helve'tius, Claude Adrien, a French writer of Swiss extraction, was born at Paris in 1715. He was sent to business at Caree, but occupied himself wholly with literary criticism. In philosophy he became a disciple of Locke. The Queen, Maria Leczinska, knowing his father, gave him the post of fermier-général, worth 100,000 dollars per annum. Out of his large income he managed to pension several less fortunate literary men. In 1751 he resigned his post, and married Mlle. de Ligneville, with whom he retired for eight months of the year to his estate of Voré, spending the other four in Paris. His country life was one of unwearying benevolence, sometimes carried to the point of absurdity. In 1758 he published his chief work, *De l'Esprit Humain*, in which he tries to prove that men praise actions just as they tend to their own advantage, a position which he illustrates by tracing the variations in private, municipal, national, and international equity. Character was an affair of education, and religion was a dangerous perturbing force, which should be repressed in the interests of society. This brilliant and beautifully-written book was inspired by a love of reputation rather than of science. It, however, contained some bold thoughts on the basis of political authority and the need of social reform. This roused the fears of the court, while the Church denounced the sceptical tendencies of the work. The license for publication was withdrawn; Pope Clement XIII. and the Sorbonne, the Jesuits and the Jansenists, combined against H., and he was forced to publish a miserable retractation. It is curious to compare the tone of depreciation with which H.'s French contemporaries spoke of his book, with the praise of Hume, Robertson, and other foreigners. The truth is, that H., while throwing out many valuable suggestions and some paradoxes, had not a really scientific mind. 'The well-fed farmer-general enlivening his Sybaritic life with metaphysic paradox.'—*Carlyle.* In 1764-65 H. was the guest of George III. and Friedrich the Great. After writing a frigid poem called *Le Bonheur*, and a development of his philosophy called *De l'Homme, d. ses Facultés, et de son Éducation* (2 vols. 1772), H. died, September 17, 1775. See St. Lambert's *Essai sur la Vie et les Ouvrages d'Helvetius.*

He'mans, Felicia Dorothea, *née* **Browne,** a popular English poetess, was born at Liverpool, September 25, 1793. Her first volume of poems was published in 1808, when she was only fourteen years of age. It was followed by another, entitled *The Domestic Affections*, in 1812, and in the same year the authoress married Captain Hemans of the 4th Regiment. This marriage did not prove a very happy one, and when the failing health of her husband induced him in 1818 to take up his residence at Rome, Mrs. H. remained in England. After this she lived for the most part at her brother's seat, Bronwylfa, near St. Asaph, Flintshire, occupied in literary work and the education of her children, of whom she had five, all sons. *Lays of Many Lands*, a volume of translations, was published in 1818, followed by *Tales and Historic Scenes*, and in 1820 by the poem of *The Sceptic; The Vespers of Palermo*, produced at Covent Garden Theatre under Mr. Kemble's management in 1823, *The Siege of Valencia* (1823), *The Last Constantine*, *Belshazzar's Feast*, *The Forest Sanctuary* (1826), and the *Songs of the Affections* (1830). In 1831 Mrs. H. went to reside in Dublin, where she died, May 16, 1835. A memorial has been erected to her memory in the Cathedral of St. Asaph. Her poetic genius was pure, tender, and delicate. A womanly sweetness everywhere breathes through her verse. Some of her lyrics are permanently enshrined in the memory of the English nation, as *The Graves of a Household*, *The Voice of Spring*, *The Homes of England*, *The Treasures of the Deep*, and *The Palm-Tree*. The most complete edition of her writings is that published by the Messrs. Blackwood, Edinburgh (6 vols. 1840, new ed. 1859), accompanied by a *Memoir of the Life and Writings of Mrs. H.*, by her sister. —Her son, **Charles H.**, author of a *History of Medieval Christianity and Sacred Art in Italy*, *Historic and Monumental Rome*, &c., died at Rome, 26th October 1876.

Hemicra'nia (Gr. *hēmi*, 'one-half,' and *kranion*, 'the skull'), sometimes called *megrims* (Fr. *migraine*, a corruption of H.), a variety of Headache (q. v.), affecting only one side of the head at a time, and generally intermittent. H. is often connected with a hysterical diathesis, with pregnancy, or occurs during the debility brought on by suckling. Treatment—Quinine, arsenical solution, sarsaparilla, and bromide of potassium.

Hemides'mus, a genus of plants belonging to the natural order *Asclepiadaceæ* (q. v.). The fragrant roots of *H. Indicus* are what are known as Indian sarsaparilla in Madras, where they are also called country sarza, nannári or ananto-múl.

Hemio'pia (Gr. *hēmi*, 'one-half,' and *ōps*, 'the eye'), a peculiar variety of Amaurosis (q. v.) signifying a partial blindness obscuring about half of the field of vision. See Dr. Wollaston's paper *On Semi-Decussation of the Optic Nerves*, *Philosophical Transactions* for 1824.

Hemiple'gia (Gr. *hēmi*, 'one-half,' and *plēssō*, 'I strike'), a form of Paralysis (q. v.), limited to one side of the face and body, depending upon disease of the brain, or Embolism (q. v.), opposed in signification to Paraplegia (q. v.).

Hem'ipode (*Hemipodius*), a genus of *Grallatorial* or wading birds, in which the hinder toe is wanting. They are allied to the Quails (q. v.), and are all of small size. The common species is the *H. tachydromus*, occurring in Spain, Italy, and other parts of the Continent, and also in the N. of Africa. Its average length is 5 or 6 inches.

Hemip'tera, an order of insects, in which the mouth is suctorial, and consists of a *rostrum* or *beak*, formed by the modified *labium* or under-lip, which exists as a protective sheath for the mandibles and maxillæ. These are adapted for piercing the skins of animals, and for sucking blood from the wounds thus made. The eyes are of the compound variety, but simple eyes or *ocelli* are developed in addition. The wings may be absent altogether (as in the plant-lice and cochineal insects), but two pairs of these organs are more usually developed. The order derives its name from the fact that the first pair of wings in one section at least possess horny bases, the remainder being membranous. The H. are divisible into (1) *Homoptera*, in which the wings are wholly membranous; the parts of the mouth turned backwards, and the wings folded over each other when at rest; (2) *Heteroptera*, in which the bases of the wings are horny, the beak springing from the front of the head.

Hem'isphere. See SPHERE.

Hem'lock (Old Eng. *hemleac*—*leac* means a plant), is the name used in connection with two genera of the order *Umbelliferæ*, respectively represented in Britain by common H. (*Conium maculatum*) and water-H. (*Cicuta virosa*). Both are highly poisonous, though not unfrequently deaths have been attributed by non-botanical medical men to H. which have arisen from persons eating the root of Water-Dropwort (q. v.) in mistake for the wild parsnip. Common H. is a widely-distributed plant through Britain, generally growing in waste places and about hedgebanks. Without entering minutely into its botanical characteristics, yet, on account of its poisonous qualities and its common occurrence around the outskirts of towns, &c., the following points may be prudently mentioned:—Height, 2 to 5 feet; stem quite smooth, and more or less sprinkled (as with a brush) with purple spots; leaves finely divided into numerous deep-green segments, which when bruised emit a peculiarly nauseous odour. The partial umbels or umbellules (q. v.) have only a half circuit of bracts at their base; and each half of the somewhat globular fruits bears five wavy crenate ridges. There is no other plant of the order that combines these different points of structure. The active principle of H. is conia, which pervades the whole plant, but, as is usually the case, exists especially in the fruit. (See CONIINE.) It acts as an irritant poison, subsequently causing muscular paralysis, convulsions, and death; and there is a general impression that it was employed to carry into effect the sentence of death decreed against Socrates by the Athenian law courts. The water-H. is most frequently found along the margin of lochs, ponds, &c., but is much rarer than common H. Instances are on record of its occasioning human death; there can, however, be little temptation for any one to gather it except the botanist. Its poisoning

attributes have not unfrequently been exemplified upon cattle, hence its more generally recognised name of Cowbane. These losses having usually been noted to take place in the early part of the year, it is suggested that in spring, when cattle enter their pasturage, they in eagerness make a raid upon all before them without that appreciation of quality which is afterwards developed. Consequently it behoves farmers to see that the water-H. is not within the limits of their pasture grounds.

Medicinal Properties of H.—The active ingredients are contained in the leaves of the *conium maculatum*, collected when the fruit begins to form, and thereafter dried. H., a powerful narcotic, is anodyne, antispasmodic and deobstruent, and is chiefly used in chronic enlargements of the liver, rheumatism, syphilis, neuralgic affections, and to allay irritation in bronchial affections, pertussis, and phthisis. H. acts as a *direct sedative*, especially on the spinal cord, and in very large doses causes paralysis or stupor, coma, and slight convulsions. Antidote in cases of poisoning: According to Pereira, an infusion of galls may be serviceable.

Hemp (Old Eng. *hænep*, Ger. *hanf*, Lat. *cannabis*, Sansk. *kana*). As commonly employed, H. designates various fibres used for manufacturing purposes, as also the plants that supply them. Strictly speaking, its limit is *Cannabis sativa*, the only species of the genus that is the type of the natural order Cannabaceæ (q. v.). The plant is valued for two widely separate reasons. In India, where it is indigenous, and in other hot countries, the yield from it held highest in estimation is a peculiar resin. This resin is used to produce intoxication, and gives rise to native synonyms for H.—such as 'increase of pleasure,' 'leaf of delusion,' 'cementer of friendship,' &c. The resin itself is termed *churrus*, whilst the drink of which it is the stimulant is known as *bhang*, and a preparation for use with tobacco is sold in the bazaars under the name *gunjah*. (See HASHISH.) But it is a far different product that renders H. appreciated with us, and has caused its wide-spread cultivation through the temperate regions of the northern hemisphere. The thin bark of the plant yields a fibre that has been of high recognised merit from the earliest historic times to the present day, when its import value into Great Britain is yearly more than a million sterling. The chief supplies are drawn from the Russian empire, but Italy produces the finest quality. For successful cultivation the soil must be rich, and the seed should be sown close, so as to produce straight stems without branches. Harvesting, in the generality of cases, takes place at two periods, the male individuals being pulled as soon as the pollen is shed, and the female when the seeds are ripe. After the leaves are removed, the stems tied in bundles are subjected to the 'retting' process as with flax, and are then spread out to dry and bleach. The fibre is removed either by hand labour or machinery. The fruit, for which the female plant is allowed to remain to maturity, is commonly known as 'hemp seed,' and is largely sold for pet birds, &c.; by pressure an oil is also obtained from it.

Hemp.

The principal other fibre-yielding plants to which the name H. is loosely applied are Manilla H. (*Musa textilis*) (see ABACA), Canadian H. (*Apocynum Cannabinum*), Ambaree-H. (*Hibiscus Cannabinus*), Sunn H. (*Crotalaria juncea*), Bowstring H. (*Sansevieria guineensis*, &c.). The Indian H. (*Cannabis Indica*) is simply a climatological variety of common H. (*C. sativa*).

Hemlock Spruce, the common name for *Abies Canadensis*, N. American fir-tree. See FIR.

Hemp Palm, a species of Chamœrops (q. v.) from the fibre of which a coarse cordage is made in China, &c.

Hems, the *Emesa* of the Romans, a city of Syria, Asiatic Turkey, near the right bank of the Orontes, 65 miles N.E. of Baalbec, and 48 N. of Damascus. It was formerly celebrated for its splendid temple of the sun, and the elevation of its priest Bassianus or Elagabalus (Syr. *Elagabal*, 'high-priest') at the age of fourteen to the imperial dignity. Here the Emperor Aurelian repulsed Zenobia in 273 A.D. The Arabs, who seized the city in 636, revived the old Semitic name that it has since borne. It is still a busy trading place, with a pop. of 23,000, of whom 6500 are Greek Christians.

Hem'sterhuis, Tiberius, one of the chief philologers of the 18th c., was born at Groningen, 9th January 1685, and educated at Leyden University. After filling for some years the mathematical professorship of Amsterdam, H. became in 1740 Professor of Greek at Leyden, where he died, April 7, 1766. H. was, perhaps, next to Bentley, the most distinguished Grecian of his day. Ruhnken and Valkenaer are his most famous pupils. His chief works are the completion of Lederlin's edition of the *Onomasticon* of Pollux (Amst. 1706); the *Dialogues of Lucian and Timon* (1708); the *Plutus* of Aristophanes (1744); *Observations on the Homilies of Chrysostom* (1784); and various Latin *Orations*, published by Valkenaer in 1784. See Ruhnken's *Elogium Hemsterhusii* (Leyd. 1768). His son, **Franz H.** (born 1722, died 1790), acquired distinction as a writer on philosophy and art. His collected works were published in 1792.

Hen'bane, the name in common use for a genus of *Solanaceæ* (q. v.), of which the most important species is *Hyoscyamus niger*, or common H., a plant found growing spontaneously in Great Britain in the vicinity of old ruins, on rubbish heaps, and not unfrequently on sandy ground near the coast. Covered with a woven felt of sticky hairs, and rendered further unpleasant by its heavy-smelling exudation, and bearing dingy yellow flowers veined with purple—in the very plucking of a specimen the narcotic poisonous qualities of the plant are suggested. Medicinally, the alkaloid extracted from it is used where the administration of opium is undesirable. To some extent common H. is cultivated in Southern England, but the crop is an uncertain one, and the price of the leaf varies considerably in consequence. Other species of the genus possess more or less the same qualities as the above. The name H. expresses an early knowledge of the baneful effects of the seed upon poultry. See Matthioli, b. iv. c. 64.

Hen'derson, Thomas, a Scottish astronomer, was born at Dundee, December 28, 1798. In 1831 he was appointed director of the royal observatory at the Cape of Good Hope. Here he made those observations which resulted in the calculation of the parallax of a *Centauri*—the nearest fixed star to our system, and the first whose distance was calculated. In 1833 his health compelled him to return to England, and the succeeding year he was appointed Astronomer-Royal for Scotland, and Professor of Astronomy in the University of Edinburgh. H. died November 23, 1842.

Hen'gest and Hor'sa. See ANGLO-SAXONS.

Heng'stenberg, Ernst Wilhelm, the foremost representative of recent German orthodoxy, born at Fröndenberg in Westphalia, 20th October 1802, studied at Bonn, and, after a short residence at Basel, settled at Berlin in 1824 as a privatdocent, where he soon became known as the leader of a band of youthful champions of orthodoxy. In 1826 he was appointed a Professor of Theology in the Berlin University, an office he held till his death, 28th May 1869. Though bred in the Reformed Church, H. adopted Lutheranism; and since the union of the two creeds in Prussia, he was the chief advocate of Lutheran Confessionalism within the national Prussian Church. As editor of the *Evangelische Kirchenzeitung*, H. was unwearied in lifting up a vehement testimony against all innovations or defections, and in treating all views differing from his own as anti-evangelical. He has the credit of having done much to reawaken zeal for a pious and profound study of the Old Testament, and showed much acuteness in defending almost all the portions of the Old Testament of which the genuineness or authenticity had been disputed. His principal works are *Christologie des A. T.* 1829, 2d ed. 1854); *Beiträge zur Einleitung ins A. T.* (1831–39); *Die Bücher Mosis und Aegypten* (1841); *Geschichte Bileams* (1842); *Die Opfer der Heiligen Schrift* (1852); *Geschichte des Reiches Gottes unter dem Alten Bund* (1869–70); and commentaries on the Psalms, the Apocalypse, the Canticles, Ecclesiastes, Ezekiel, and the Gospel of John.

Hen'ley-on-Thames, a picturesque town of England, in Oxfordshire, on the left bank of the Thames, under shelter

of the Chiltern hills, 23 miles S.E. of Oxford, and 35 W. of London by railway. It is a favourite summer resort, and has an inn of high repute. Its trade is in flour, malt, beech-wood, grain, &c. The river, which here abounds with pike, perch, and eels, is crossed at H. by a bridge of five arches. Pop. (1871) 4523. H. was incorporated in the reign of Elizabeth as *Hemleygang* or *Hanneburg*.

Henn'a (Arab. *Al-hinna*, 'the cypress,' hence the Span. *Alcaña*), a pigment made from catechu and the powdered leaves of the *Lawsonia inermis* or *L. spinosa*, shrubs of the order *Lytheraceæ*. It is much used in Eastern countries, especially in Egypt and Persia, for staining the nails and finger-tips of an orange colour. In dyeing the hair with H., the dye is converted into a deep black by a subsequent application of indigo. The leaves are used in Europe for dyeing leather, and are obtained chiefly from moist places in the N. of Africa, Arabia, Persia, and the E. Indies.

Henri, the name of four French kings.—**H. I.** of France, son of King Robert and Constance of Provence, came to the throne in 1031. His reign was at first disturbed by civil wars with his brother Robert, who was supported by the Counts of Champagne and Flanders, and afterwards he had actual control only over a comparatively small part of central France. H. died in 1060.—**H. II.** was born in 1518, and succeeded his father, François I., in 1547. In 1552 he sided with the Elector of Saxony against Karl V., and armed Metz, Toul, and Verden, under the pretence of assisting the German Protestants. But the troops were defeated at St. Quentin in 1557 and checked by Alva in Italy, and peace was made by the treaty of Cateau-Cambresis in 1559, when Philip II. of Spain married II.'s daughter. At a tournament held amid other rejoicings to celebrate the union, H. was accidentally wounded in the ribs by the broken spear-shaft of the Comte de Montgomery, and shortly afterwards died, July 10, 1559.—**H. III.**, last of the Valois line, was the third son of H. II., and was born at Fontainebleau, September 19, 1551. He served against the Huguenots from 1569 to 1573, taking part in the battles of Jarnac and Moncontour; was made King of Poland in 1573, and in 1574 succeeded his brother Charles IX. on the French throne. During his reign France was convulsed by the wars of the three Henris. H. was a miserable sensualist, who spent his life in a round of costly orgies, while the Spanish Catholic party of the League, headed by the Duc de Guise, who aimed at the succession to the throne, sapped the royal influence and inflamed the Parisians at once against the imbecile sovereign and the Huguenot Henri of Navarre. H. was surrounded by a host of licentious parasites known as the 'Mignons,' who frivolously squandered the revenues and violated the liberty of the people. Guise at length becoming virtual king of France, H. had him assassinated at Blois in 1588, and was forced by the rage of the Catholics into a reconcilement with Henri of Navarre. The two Henris then marched on Paris, which they would probably have seized, when H. was stabbed by a Dominican, Jacques Clément, and died August 2, 1589. See Adrien de Valois, *De Vita Henrici Valesii* (Par. 1677); Sauvigny, *Histoire de H. III.*; and the histories of Mézeray, Sismondi, Martin, Michelet, and Kitchin (Lond. 1877).—**H. IV.**, surnamed 'the Great' and 'the Good,' and known as H. of Navarre, was the third son of Antoine de Bourbon and Jeanne d'Albret, daughter of Henri, King of Navarre and Béarn. H. was born at Pau, December 14, 1553, was brought up as a Protestant, and was trained in hardy exercises among the mountains of Béarn. In his youth he took a prominent part in the wars of the Huguenots, and after the peace of St. Germain was drawn into marriage with Marguerite of Valois, sister of Charles IX. To avoid being murdered he now proclaimed himself a Catholic, and was kept a prisoner at court until 1576, acquiring consummate diplomatic skill amid the Medicean schemes and conspiracies. Escaping to the Huguenots, he renounced Catholicism, and the death of the Duc d'Anjou made him legitimate heir to the French crown. After the murder of H. III. (1589), the Catholic party, abetted by Philip II. of Spain, forced him to retire to the fastnesses of the S., and his position was for a time full of peril. But his cause was strengthened by the dissensions in the League, and in 1590 he won a great victory over Mayenne at Ivry, a fierce cavalry fight, where H. showed the most splendid chivalry and alert generalship. He then besieged Paris, and reduced its citizens, who held out with misguided heroism, to dreadful straits, when the Duke of Parma advanced to relieve the siege and out-generalled H. Unable to end the protracted conflict in 1593, he embraced the Catholic creed, whereupon Paris and the other great cities surrendered, and H. became King of France. In 1598 peace was made between France and Spain, and H. signed the Edict of Nantes (q. v.). He now ruled with admirable wisdom and patriotism, rooted out the confusion engendered by the long wars, practised strict economy, developed the resources of his kingdom, and showed an anxiety for order, justice, and the welfare of his subjects which endeared him to his people—Catholics and Protestants alike. The finance reforms of his reign were carried out by his able minister Sully (q. v.), and France was raised to a state of unexampled prosperity. On May 14, 1610, the great king was assassinated by one Ravaillac, a tool of the Jesuits, and the whole country mourned his death, his old foes the Parisians in particular becoming frenzied with rage and grief. H. is by far the most fascinating character in the roll of French kings. He possessed a dazzling courage, the most sanguine confidence, the most winning amiability, careless mirthfulness, and flashing wit, allied to keen Gascon shrewdness, far-seeing statesmanship, and iron tenacity of purpose. He seems to have had the good of France seriously at heart, but to have regarded religion mainly as a diplomatic instrument. The great stain on his temperament was his licentiousness; he was all his life the slave of one mistress or another. He is said to have been present in seven distinct wars, a hundred pitched battles, and two hundred sieges. See Reboul, *Les Fortunes et Vertus de Henry, Roy de France et de Navarre* (Par. 1604); Matthieu, *Histoire de France durant sept Années de Paix du Règne d'H. IV.* (Par. 1605); Peleus, *Histoire de la Vie et Faits de H. le Grand*; Poirson, *Histoire du Règne d'H. IV.* (Par. 1857); MM. Haag, *La France Protestante* (1847-59); the histories of Michelet, Martin, Ranke, and Kitchin (Lond. 1877).—**H. V.** is the title assumed by the Comte de Chambord (q. v.).

Henry. For French kings of this name, see HENRI; for German kings, see HEINRICH.

Henry I., King of England, the youngest son of William the Conqueror and Matilda of Flanders, was born at Selby, Yorkshire, 1068. On the 2d August 1100, his brother William II. having been pierced with an arrow while hunting in the New Forest, H. speedily took possession of the royal treasures, and was crowned at Westminster, thereby forestalling Robert, Duke of Normandy, his elder brother, who was returning from a crusade. To conciliate the baronage, he granted a charter of liberties, exchanging the exactions under which they laboured for customary fees, and thus removing the old system of plundering the Church. He recalled Archbishop Anselm, who had been driven from court during the previous reign, and took the strongest step towards popularity by marrying Matilda, daughter of King Malcolm of Scotland and of Margaret, the sister of Eadgar Ætheling. The nobles remained unfriendly, and at their invitation Robert landed with his followers at Pevensey (July 19, 1101). Through the influence of Anselm the dispute was at that time made up, but it broke out again, and in 1106, at Tenchebray, H. gained a decisive victory over his brother on Norman soil, captured and kept him a prisoner until his death (in 1134), and added the dukedom to his own possessions. The king having sternly suppressed his rebellious baronage, gave grants of their estates to new men, whilst charters and the foundation of trade-guilds were allowed to create in the towns a counterbalancing force to feudalism. The whole system of justice and finance was reorganised. A great grief overtook the king (1129) when his son William was drowned in the Channel. He, however, settled the crown upon his daughter Matilda, widow of the Emperor Heinrich V., and married her to Geoffrey, eldest son of the Comte d'Anjou, making the nobles and priests on these occasions swear allegiance to her and her son. H. died in Normandy, December 1, 1135, owing, it is said, to a surfeit of eels. The central aim of his policy was to depress the nobles through an alliance with the people, to whom, though he treated them as slaves, he was always sternly just. See Stubbs's *Select Charters and other Illustrations of English Constitutional History* (1870), Freeman's *History of the Norman Conquest*, and Green's *Short History of the English People* (1875).—**H. II.**, son of Geoffrey Comte d'Anjou and Matilda, was born at Le Mans, Normandy,

1133. He was recognised by H. I. as his successor directly after his birth, but Stephen of Blois, Comte de Boulogne, disregarding his oath to Matilda, seized the crown for himself. H. was brought to England when eight years of age, and trained to the use of arms. In 1151 he succeeded to Normandy, Anjou, and Maine, and a year later he married the Duchess Eleanor of Aquitaine, who had been divorced from Louis VII. By this connection he gained the county of Poitou and the Duchy of Aquitaine. H. landed in England (January 1153) in order to recover the kingdom, for which his mother had long fought with varying degrees of success; and many friends gathering round him, he began negotiations at Wallingford which were concluded at Westminster (in November) with the result that Stephen recognised him as his heir. On the 19th December 1154, H. was crowned, and Thomas à Becket (q. v.) became his chancellor. H. at once began to demolish the castles, which had become the strongholds of feudal lawlessness. The administration of justice was restored upon a stronger footing, and he set himself to the study of law, holding numerous councils. He altered the conditions of scutage, under which every freeman was bound to serve in arms for the defence of his country, taking money instead of service from the whole of his dominions. Circuits were made by itinerant judges, and the supreme court was rearranged so as to secure easy justice to all. H. got his chancellor elected to the Archbishopric of Canterbury in June 1162, and Becket in this capacity immediately began to oppose him. In January 1164 the Council of Clarendon was held, and the clergy were brought under the criminal jurisdiction of the ordinary courts, but Becket refused to set his seal to the acceptance. At Northampton he was tried, and went into voluntary exile for six years. Through fear of the Pope, H. recalled him (1170), but his first acts were so irritating that a hasty speech of the king's incited some private enemies of the archbishop to seek him at Canterbury, where they slew him in the cathedral, December 29, 1170. With Ireland, Wales, Scotland, and France, H. at different periods engaged in hostilities. The Earl of Pembroke, Robert Fitzstephen, and Maurice Fitzgerald, having obtained royal permission to join Dermot of Leinster with an army (1169), carried everything before them; and in 1171 H. crossed to Ireland, and received a general acknowledgment of supremacy. In 1163 the Welsh princes did homage to him at Woodstock. His relations with the King of France were extremely complicated, not only through the geographical extent of his dominions, but owing to the difficulties of the feudal relationship between them. The last years of H. were embittered by the revolts of his sons, who were stirred up against him by their mother. His eldest son, Henry, joined (1173) a confederation of the French lords and English barons, who were aided by Louis of France, Philippe of Flanders, the Comte de Champagne, and the King of Scots, William the Lion. An incident of this revolt was the capture of King William, whom (1175) H. compelled to do homage and to acknowledge the supremacy of the English crown and Church over the Scottish. His sons were again at war (1183), and, after the death of Henry and Geoffrey, Richard, who had received Aquitaine, intrigued with Philippe, King of France, and their allied forces drove H. to Chinon, where he died (July 6, 1189). H. was strong in the sterling qualities of kinghood. He was a great soldier, mingling caution and prudence with rapidity and determination in his movements. Though restless and passionate in disposition, he was a consummate man of business, both in law and finance. As a politician, his aims were ambitious but definite. All that he possessed through marriage and inheritance he determined to keep, while he intended his family by similar means to add to his territory, and to form an imperial federation under himself. He understood that the well-being of his people was the strongest basis upon which to build his own power, and in all his relations with them he was firm, politic, just, aiming at subjugation through order. His constitutional ideal was a strong personal government unembarrassed by church or baronage. See *Life of Henry II.* by Lord Lyttleton; Stubbs's *Constitutional History of England* (1875); Freeman's *Essays* (1st series, 1871); *Select Charters* and *Early Plantagenets* (1877), and Green's *Short History of the English People* (1875).—**H. III.**, son of John by his second wife, Isabel of Angoulême, was born at Winchester in 1207. In the ninth year of his age he was crowned at Gloucester, and for fifty-six years he reigned over England. At the time of his accession Prince Louis of France was in England, at the head of the English baronage, prosecuting a claim to the crown, but when John was removed a disruption of the party took place. After the battle of Lincoln (1217), and the dispersion of his fleet at Thanet, Louis withdrew, and Alexander, King of Scots, and Llywelyn, Prince of N. Wales, both acknowledged H. Until 1219 William Marshal, Earl of Pembroke, was the king's guardian; he was succeeded by Peter des Roches, while Hubert de Burgh acted as Prime Minister. In 1220 a second coronation took place, and in 1228 the great charter was confirmed for the third time. H. came of age in 1227, and, according to Professor Stubbs, 'the history of the thirty-one years (1227 to 1258) which form the period of his personal administration is one long series of impolitic and unprincipled acts. They may be divided,' continues the same writer, 'into the three heads of internal misgovernment, a mischievous foreign policy formed under the guidance of the Popes, and the unfortunate line adopted with regard to the French provinces on which the king still retained his hold.' In 1236 H. married Eleanor of Provence, and two years later he gave his sister Eleanor in marriage to Simon de Montfort. Meanwhile a struggle about taxation was kept up in the assembly of barons and bishops until, in 1244, the lay and clerical estates acted together, and chose twelve representatives to demand confirmation of the charters. From the time of his marriage H. was surrounded by foreigners, upon whom he lavished estates, and to whom a sixth of the royal revenue passed in pensions. The administration of justice became debased, forced loans were exacted, and (1255) H. brought matters to a climax by accepting a papal offer of the kingdom of Sicily for his son Edmund, which occasioned immense expense. At the Parliament of Oxford, held 11th June 1258, where his son was presented as King of Sicily, H. had to consent to certain conditions known as the Provisions of Oxford, by which it was stipulated that there should be a permanent council of fifteen, three annual parliaments, and the representation of the community of the realm through twelve representative barons. But the members of this government quarrelled among themselves, and Louis IX., having been called to arbitrate, annulled the Provisions (1264). The result was the Barons' War, in which Simon de Montfort (q. v.) led the nobility. The battle of Lewes, fought May 14, 1264, threw the King into their power. A new constitution, entitled the Mise of Lewes, was formed, and on January 20, 1265, the first Parliament, in which representatives of the borough towns sat, was called. Dissensions again sprung up among the nobles, and at the battle of Evesham, Simon de Montfort, who led the King in his train, fell, and his fall restored peace. H. died November 16, 1272, England being then at peace. Though not wanting in personal bravery, H. was in every important respect a weak king. He lacked firmness and fibre. His actions were the outcome of no abiding purpose, and his tastes were satisfied by empty ostentation. As a husband and father he shows improvement upon his predecessors, but his falseness of character was unrelieved by any touch of the greater qualities exhibited by them as warriors. His vanity was excessive, and the hatred of his people towards him cordial and sincere. See Matthew Paris's *Chronicle*, Stubbs's *Constitutional History of England*, and *Early Plantagenets*, Freeman's *English Constitution*, Green's *Short History of the English People*, Pearson's *History of England*, and Hallam's *Middle Ages*.—**H. IV.**, eldest son of John of Gaunt and Blanche, daughter of Henry, Duke of Lancaster, was born at Bolingbroke, Lincolnshire, 1366. In 1387 H. acted with the party which exiled the favourites of Richard II. He was banished the kingdom in 1398, but during Richard's absence in Ireland he returned, and was joined by Archbishop Arundel and the Percy family. Richard, who was betrayed into his hands, resigned the crown, and on September 30, 1399, H. claimed it as being a descendant of H. III. A conspiracy was detected (January 4, 1400), which resulted in the beheading of the Earls of Kent, Huntingdon, Salisbury, and Lord Spenser. Next month Richard II. was either starved or assassinated in prison, and his body was exposed in London. In the same year H. invaded Scotland, but famine compelled him to withdraw from Edinburgh. Troublesome rumours that Richard was still alive began to be disseminated, and intrigue entered the very palace. Wales, which had ceased to give trouble since the time of Edward I., rose in rebellion (1402) under Owen Glendower (q. v.). At the same time the Scots invaded Northumberland, but were defeated at Homildon Hill, and their leader, Earl Douglas, taken prisoner by the Earl of

Northumberland and his son Henry Percy. Owing to the refusal of H. to allow Sir Edmund Mortimer to be ransomed from Glendower, the Percys revolted, but at Shrewsbury (July 21, 1403), they were intercepted by the King, Hotspur slain, and his father ordered into confinement. Yet the Welsh maintained their independence of England during the whole reign. An incident occurred in 1405 which laid H.'s mind to rest concerning Scotland. Prince James of Scotland (q. v.) was taken prisoner on his road to France, and detained in England. A new confederacy sprung up (1405), in which the liberated Earl of Northumberland, Mowbray, the Earl Marshal, the Lord Bardolf, and Richard Scroop, united to advance the pretensions of the Earl of March, who was descended from Lionel, Duke of Clarence, elder brother of John of Gaunt. By the year 1408 the chief actors in this revolt had all disappeared. H. died 20th March 1413. See Lord Brougham's *England under the House of Lancaster*, James Gairdner's *Lancaster and York*, and Green's *Short History of the English People*.—**H. V.**, son of the preceding and Mary de Bohun, was born at Monmouth, 1388. H. was distinguished in youth for his excess of animal spirits and his dislike to the restraints of court-life, and his love of frolic and practical joking are immortalised in Shakespeare's *Henry IV.* At the battle of Shrewsbury, by the exercise of courage and prowess he showed himself possessed of sterner stuff, and when he came to the throne he dismissed the companions of his pleasures and took into confidence the councillors of his father. At the outset his reign was troubled by the importunity of the Lollards, who were encouraged by Sir John Oldcastle. Proceedings were taken against Oldcastle, though he was a favourite, and belonged to the royal household, and a conspiracy of the Lollards was put down promptly (January 27, 1414) at St. Giles's Fields. H. revived the claims of Edward III. to the French crown, and followed up his unreasonable demand (1415) by crossing from Southampton to Harfleur. Though dysentery broke out in his army and reduced it from 30,000 to 9000 men, he fought a great battle at Agincourt (October 25, 1415) against overwhelming odds, routed the French, and slew the flower of their nobility. In 1417 he again invaded France; and at the beginning of 1419, Rouen having capitulated, he became master of Normandy, Maine, and Isle of France. H. married (June 2, 1420) Princess Catherine, daughter of the French king, and (1421) entered Paris in triumph. A third invasion of France had to be made after the battle of Beaugé, in which H.'s brother, the Duke of Clarence, was defeated. King James of Scotland, still a prisoner, accompanied H. on this campaign. The N. of France was brought under subjection (by 1422), but H. was struck down with dysentery, and died at Vincennes (August 1422). He was one of the most popular of English kings, and possessed a very high genius for war and diplomacy. His splendid military achievements dazzled the nation, and his death at so early an age contributed to the estimate of his greatness. His policy in reference to France though not to be justified, is easily explicable. His title to the throne being but indifferent, he was compelled to divert public attention from his own descent, and to create a right by virtue of his own deeds. See Lord Brougham's *England under the House of Lancaster*, James Gairdner's *Lancaster and York*, and Green's *Short History of the English People* (1875).—**H. VI.**, son of the preceding and of Catherine of France, was born at Windsor, December 6, 1421, and two months after his father's death, when yet an infant, was declared King of France. John, Duke of Bedford, was appointed Regent of France for his nephew, and Humphrey, Duke of Gloucester, received the title of Protector, with the care of defending the kingdom of England. For the first twenty years of H.'s reign all interest centres in the struggle to preserve the French kingdom against the claims of the Dauphin, who reigned at Bourges as Charles VII. For some years the Duke of Bedford succeeded in maintaining the English conquests; but in February 1429, Jeanne D'Arc (q. v.) appeared to Charles at Chinon, and declared she was sent from Heaven to conduct him to Rheims for his coronation. Under her leadership the English were compelled to raise the siege of Orleans. At Patay she defeated Lord Talbot and took him prisoner, but on May 25, 1430, she was captured by the Burgundians at Compiègne, and handed over to the English, who had her burnt as a witch at Rouen. The Duke of Bedford died in 1435, and bit by bit the inheritance of Henry II. and the conquests of his successors in France were lost beyond recovery. Cherbourg, the last English stronghold, was surrendered (1450), and though the people of Bordeaux revolted (1452) against Charles, and sought to return to the English Government, they were forced to yield. From this event dates the end of the Hundred Years' War between the two countries. During these years in England a great struggle for power had been going on between Humphrey, Duke of Gloucester, and Henry Beaufort, Bishop of Winchester, who became Cardinal. On the rise of William de la Pole, Earl of Suffolk, to power, he recommended to H. the policy of a match with Marguerite, daughter of René, Duc d'Anjou, titular king of Naples and Jerusalem. H. married her (1445), but Suffolk was disliked by the people as negotiator of the match, and blamed for the military losses in France. Suffolk was, therefore, impeached, banished, and murdered on his passage to Calais (1450). Complaints at this time arose concerning the extortions of the king's officers who collected the revenue, and culminated in Jack Cade's rebellion (1450), which was rapidly quelled. Cade was an Irishman, and professed to be cousin of the Duke of York. Two rival factions now began to show among the nobility, headed by the Dukes of York and Somerset. York was made Protector (1454), the king having lost his faculties. When H. recovered, Somerset, the representative of an illegitimate branch of the House of Lancaster, and a favourite of the King, was recalled to power. York raised an army, and met his rival, whom he slew at the Battle of St. Albans (1455). In 1459, the struggle became the Wars of the Roses, so called from the family emblem of a white rose affected by the Lancastrians, and a red rose by the Yorkists. With varying fortune battles were fought (see Edward IV.) between the families and their adherents—at Northampton, where H. was captured and compelled to recognise York as his successor; at Wakefield, where York was slain; at Mortimer's Cross, where York's son avenged his death; at St. Alban's, where the queen and her friends defeated the Earl of Warwick. In March 9, 1461, H.'s reign came to an end by the assembly of peers, prelates, and citizens, declaring Edward, Duke of York, king. H. was liberated from the Tower (1470) and reinstated in his kingdom by the Earl of Warwick, but on the 21st he died, or was murdered in prison (May 21, 1471), on the triumphant entry of Edward into London. H. was a weak and harmless king, who throughout his life was made the tool of more powerful men. He had no positive vices, was amiable in disposition, inclined to peace and the ordinances of religion. See Lord Brougham's *England under the House of Lancaster*, James Gairdner's *Lancaster and York*, and Green's *Short History of the English People* (1875).—**H. VII.**, son of Edmund Tudor, Earl of Richmond, and Margaret Beaufort, was born at Pembroke Castle, 21st January 1456. During the civil wars he was an exile in Brittany, from which he crossed August 19, 1485. Landing at Milford Haven, he met Richard III. at Market Bosworth, overpowered him, and gained the crown. H. married Elizabeth of York, January 18, 1486, and thereby united the contending houses. In 1487, a youth calling himself Earl of Warwick, having secured the support of Margaret, widow of the Duke of Burgundy, was crowned king in Ireland. This pretender, named Lambert Simnel, who was the son of a joiner, was defeated and captured at the battle of Stoke (June 16, 1487). A second claimant, Perkin Warbeck by name, professing to be the Duke of York, whom Richard III. had caused to be murdered in the Tower, appeared in 1496. He was supported by the Duchess of Burgundy and the kings of France and Scotland, but was taken prisoner (1497), and beheaded (1499). H., in his foreign policy, aimed at peace and alliance with Spain, and to this end he married (1501) Prince Arthur to Catharine of Aragon, Princess of Spain. H.'s besetting sin was avarice, and towards the end of his reign he became unpopular from the number of his exactions, which were chiefly put into effect by Richard Empson and Edmund Dudley, who revived and applied forgotten statutes, and filled the royal coffers with fines. H., who sent out Sebastian Cabot to America, was the founder of the colonial empire of England. He died April 21, 1509. H. was a hard and commonplace man, but his severe economy was not without purpose. His aim was to accumulate a treasure which would render him independent of the House of Commons, and in this he succeeded so well that at his death he left nearly two millions. See Seebohm's *Era of the Protestant Revolution*; James Gairdner's *Letters and Papers of Richard III. and H. VII.*; Lord Bacon's *H. VII.*; Hallam's *Constitutional History* (vol. i.); Green's *Short History of the English People* (1875).—**H. VIII.**, the son of Henry VII. and of Eliza-

beth of York, was born at Greenwich, 1491. Catharine of Aragon, widow of his brother Arthur, was betrothed to him in 1501. H. married her in 1509 on arriving at the throne. The opening years of his reign were full of promise, and in the midst of revelry part of his life was given up to study. H. soon found a pretext for renewing the ancient struggle with France. Allied with the Emperor-elect Maximilian, he in 1513 won the Battle of the Spurs at Guinegate (q. v.). In the same year, at the Battle of Flodden, the Scots were disastrously defeated by the Earl of Surrey, and their king slain. The King of France tried to retain H.'s friendship by an interview at the Field of the Cloth of Gold near Guisnes, but Karl V., who had become Emperor on the death of Ferdinand, tempted him to a war policy. But though France lost the Milanese and was defeated at Pavia, it was the Emperor who profited and not H. Peace was therefore made (1525), and at the end of the war H. found he could no longer rely on Karl V. and the Pope. Thomas Wolsey (q. v.), Chancellor and Cardinal, who aided a renewal of the French alliance, saw a chance of widening the breach between England and Spain. Catharine had only one child alive, her daughter Mary. The succession to the throne was uncertain, and superstitious doubts as to the validity of the marriage rose in H.'s mind. At the same time he contracted a passion for Anne Boleyn (q. v.), a young lady of his court. A divorce was asked from Pope Clement VII., who wished to gratify H., but was afraid of the Emperor. Cardinals Wolsey and Campeggio were appointed as a commission to inquire into the fact, but they delayed. In 1529 Wolsey fell from power, and in the year following he died. Cranmer (q. v.) was now Archbishop of Canterbury, and after consultation with the chief European universities, he pronounced the marriage with Catharine null and void. H. married Anne Boleyn in January 1532. Thus H., who in 1521 had received from the Pope the title of 'Defender of the Faith' for writing a Latin treatise against Luther, completely broke with Rome. Sir Thomas More (q. v.) resigned his post of Lord Chancellor, because he continued to believe that the Pope was head of the Church by divine authority, and his convictions on this point afterwards brought him to the scaffold. During the next ten years the new monarchy reached the height of its absolute power, and the revolt from the ecclesiastical empire was completed. H. became 'Protector and Supreme Head of the Church and Clergy of England' in 1531. A purified Catholicism became the religion of the country, but the Lutherans and Protestants were persecuted as heretics. Thomas Cromwell, created Earl of Essex, who had been in Wolsey's service, now aided H. in the policy of reducing the Church to a department of state. Being appointed vicegerent of the King in ecclesiastical affairs, he selected royal commissioners to make a general visitation of the religious houses, and the whole of them with an income of less than £200 a year were suppressed. In 1536 agrarian discontent and reaction in favour of the old religion stirred up a revolt in Lincolnshire, which being crushed, reappeared in Yorkshire. This insurrection, styled the 'Pilgrimage of Grace,' was put down with ruthless severity (1537). A papal bull of deposition was, at the instigation of Cardinal Pole, levelled at H. (1538), but was answered by the execution of his mother, the Countess of Salisbury, and his brother, Lord Montague. Under Cranmer and Cromwell, who were really carrying on the work set agoing by the Oxford Reformers, an English translation of the Bible was placed in all the churches. But the zeal of the Protestants and their attack on the mass roused H.'s indignation, and the law of the Six Articles was passed (1539) to check them. Meanwhile Anne Boleyn was beheaded (1536) on a charge of unfaithfulness, and H. married Jane Seymour, who died at the birth of Edward. In 1540 H.'s marriage with Anne of Cleves, which was brought about by Thomas Cromwell, was the occasion of that minister's fall and execution. After the annulment of Anne's marriage H. took Catherine Howard to wife, who being beheaded for misconduct (1542), was succeeded in 1543 by Catherine Parr, who survived him. The Earl of Norfolk filled the place of Cromwell, and carried on his policy. A Scotch army was defeated (1542) at Solway Moss, and (1544) H. carried war into France. During his reign Wales was incorporated with England, and Ireland was raised from a lordship to a kingdom. H. died June 28, 1547. His character has been variously estimated, according to the reading of the events of the period given by different historians, but under any view, he was a man of vigorous intellect, strong passions, and immense force of will. See Froude's *History of England* (vols. i.–v.); Hallam's *Constitutional History* (vol. i.); Green's *Short History of the English People*; Seebohm's *Era of the Protestant Revolution*; and *Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII., arranged and catalogued by J. S. Brewer*, of which four vols. had appeared in 1876.

Henry, surnamed 'The Navigator,' was the third son of John I. of Portugal and Philippina of Lancaster, sister of Henry IV. of England. He was born at Oporto in 1394, and showed great courage in the Portuguese conquest of Ceuta in 1417. He was from boyhood devoted to geography, and after his father's death took up his abode at Sagres on the coast of Algarve, where he constructed docks, arsenals, and an observatory, and gathered round him voyagers and men of science. Under his auspices many expeditions were sent out, which explored the W. coast of Africa, established a trading company at Lagos in 1442, and discovered the Azores in 1448. H. caused various plants and animals to be introduced into the newly discovered lands, and bore the expense of the expeditions until his nation awakened to the importance of prosecuting the W. African trade. H. died at Sagres, November, 13, 1460. He left a few works which are extant in MS. There is no prince to whom geographical discovery is so deeply indebted as to H. See *Vida do Infante Di Henrique* (Lisbon, 1758).

Henry, Matthew, an English commentator on Scripture, was born at Broadoak, near Whitchurch in Shropshire, in 1662. He at first studied law at Gray's Inn, but afterwards became a Nonconformist clergyman. H. was pastor of a congregation of dissenters at Chester from 1687 to 1712, when he removed to Hackney. He died at Nantwich, June 22, 1714. His works include *A Discourse on Schism*; *Life of Mr. Philip H.*, his father; *A Scripture Catechism*; *Family Hymns*; *A Method of Prayer*; *Exposition of the Old and New Testament*, his chief work (1710), and still highly valued in Dissenting circles. See Tong's *Life of M. H.* (1716), and Williams's *Life, Character, and Writings of the Rev. M. H.* (1828).

Henry of Huntingdon, an English chronicler of the 12th c., who became canon of Lincoln and archdeacon of Huntingdon, and wrote a Latin history of England to the death of Stephen in 1154; a treatise, *De Mundi Contemptu*, which contains many interesting anecdotes of his contemporaries; several Latin verses, partly in the manner of Martial, &c. The date of his death is not known. H.'s history is, in the early part, based chiefly on Bede—whose style he imitates—and on Geoffrey of Monmouth, but in the later books has an independent value. An edition of it was published by Sir H. Saville among the *Scriptores Post Bedam* (Lond. 1596), and there is an English version in Bohn's *Antiquarian Library*.

Henry, Patrick, a famous American politician and orator, was born at Studley, Virginia, U.S., May 29, 1736, his father being a nephew of Robertson the historian. At the age of twenty-four he was admitted to the American bar, but had no practice until, in 1765, by boldly and ably introducing in the house of burgesses resolutions against the Stamp Act, he became known as a gifted orator and ardent patriot, and shortly rose to affluence by his forensic powers. In 1774 he was the first Speaker of the General Congress at Philadelphia; and in 1775 the resolve of the Convention to resist George III. was largely due to his eloquence. After the declaration of independence he was made commander of the Virginian forces, and he was governor of Virginia during 1776–79 and 1781–86. Washington and Adams afterwards offered him several high posts, which he declined. H. opposed the formation of a Federal constitution in 1788, quitted public life in 1794, and died at Red Hill, Virginia, June 6, 1799. He was an ardent democrat and a zealous patriot, and his thrilling oratory had a most momentous influence on several critical occasions in his country's history.

Henry, Robert, D.D., a Scottish historian, born at St. Ninians, Stirlingshire, February 18, 1718. He studied at Edinburgh University, became a schoolmaster at Annan, was a minister in Carlisle and Berwick, and latterly in Edinburgh. He died in November 1790. H. wrote a *History of Great Britain on a New Plan* (6 vols. 1771–93), which goes down to the reign of Henry VIII. It is a dreary, inaccurate work, but was novel in so far as it gave pictures of the country's varying social state.

Henry, William, an English chemist and physician, was born at Manchester, December 12, 1775. He studied successively at Manchester, York, and Edinburgh, where he graduated M.D. in 1807. He then settled as a practitioner in his native town, but subsequently became the superintendent of the chemical establishment founded by his father. His papers in the *Philosophical Transactions*, and in the *Memoirs* of the Philosophical Society of Manchester, bearing for the most part upon the chemistry of gases, attest the extent of his knowledge and his admirable skill as an experimental philosopher. H. was elected a Fellow of the Royal Society in 1808, and obtained the Copley prize in 1809. His *Elements of Experimental Philosophy* (1799, 11th ed. 1829) was long the standard treatise on the science. H. died September 2, 1836, at Pendlebury, near Manchester.

Hen'ryson, Robert, one of the best of the old Scottish poets, flourished during the 15th c., but of his birth and early years nothing is known. In 1462 he was made a member of Glasgow University, and is there referred to as the 'venerable.' He spent the most of his life at Dunfermline, where he was schoolmaster, and the date of his death is uncertain, but it must have been shortly before the close of the 15th c., about which time the plague ravaged Scotland. Dunbar, in his *Lament for the Death of the Makaris*, published in 1508, says of Death that—

> 'In Dunfermline he has done roun
> Gud Maister Robert Henrysoun.'

H., as a poet, shows deep, simple feeling, rich humour, varied descriptive power, and a full command of melodious verse. His chief work is *The Testament of Cresseid*, which continues Chaucer's *Troilus and Creseide*, and tells with exquisite pathos and quaint felicity of language how Cressida was punished by leprosy for her faithlessness. His other writings comprise *Orpheus and Eurydice*, mainly interesting as a reflection of the classical learning of the time; *The Bludy Serk*, an allegorical ballad; *The Moral Fables of Æsop in Scottish Metre*, abounding in naïve vivacity and quiet humour; and *Robene and Makyne*, a delightfully natural, animated, and musical Scottish pastoral, in the form of a dialogue between a youth and a girl. See *The Poems of R. H.* edited with a memoir by Laing (Edinb. 1865).

Hep'ar Sulphuris, the term used in the U.S. Pharmacopœia for Potassa Sulphurata (q. v.).

Hepati'tis (Gr. *hepar*, 'the liver'), or inflammation of the liver, may have its seat in the fibrous covering of the liver, the sheath of the vessels in Glisson's capsule, or in the glandular parenchyma, the portal or hepatic veins, or the bile ducts, and may terminate in simple or granular induration, or in softening and acute atrophy, associated with Jaundice (q. v.) and severe febrile symptoms. In tropical climates H. has a tendency to result in suppuration, and is called *suppurative H.* Symptoms:—Deranged stomach, loaded tongue, heartburn, nausea, vomiting, flatulence, constipation, distension and tenderness of the epigastrium, pain in the right shoulder, and a yellowish colour. See LIVER, DISEASE OF.

Hepat'icæ, a section of Cryptogams (q. v.) known popularly under the name Liverworts, differ from Mosses (q. v.), to which they are closely allied, in their capsule never having a distinct lid, and consequently no trace of a peristome. Considerable difficulty has been experienced in dividing H. into satisfactory groups. Hooker, in his beautiful work (1816) devoted to these plants, placed the whole under the one genus *Jungermannia*; Gray, in his *Arrangement of British Plants* (1821), instituted numerous genera, some of which are now resuscitated; and the Belgian botanist Du Mortier, who has been a writer on H. for more than fifty years, has been continually altering his arrangement. Dr. Lindberg, as the latest reformer, adopts three sections —(1) Marchantiaceæ, for those with stem and leaves confluent in a frond; (2) Jungermanniaceæ, with stem and leaves distinct; (3) Anthocerotaceæ, consisting of species with solitary capsule, filiform, bivalved, stalked, with a free central placentation. These he again groups into sub-sections, according to whether the valves of the capsule split into pieces when ripe (*Schizocarpæ*) or remain whole (*Cleistocarpæ*). H. are world-wide in distribution, occurring under much the same condition as mosses, with which they agree in the development of the fruit and the manner of impregnation. They are also extensively propagated by gemmæ. See Hofmeister's '*Higher Cryptogams* (Ray Society), and for a description of British species Dr. B. Carrington's *British H.* (1877).

Hephæs'tus (Gr. *Hēphaistos*), the Greek god of fire, was the son of Zeus and Hera, or of Hera alone. In disgust at his being born lame, Hera threw him from Olympus, but the Nereids, Thetis and Eurynome, received him in the bosom of the sea, and kept him for nine years, after which he was restored to Olympus, and became the artist of the gods. His mother's harshness he repaid with tenderness; but one morning his interference on her behalf in a quarrel between her and Zeus so enraged the latter that he threw him down from heaven. About evening he alighted on Lemnos, where he was kindly welcomed by the Sinties. After his fall, to which later writers ascribe his lameness, he was again restored to Olympus. He had there a glorious palace of his own, which contained his tools, and where, aided by the Cyclops, he made an endless variety of wondrous works. Other workshops of H. were Hiera, Imbros, Lipara, and Sicily. Charis, Aglaia, and Aphrodite are variously given as his wife. The story of Aphrodite's intrigue with Ares, for which H. made the god of war a laughing-stock to the other Olympians, is often alluded to. In common with Athena, H. patronised artists of every kind, and most of the epithets by which the poets characterise him either refer to this or to his lameness. In artistic representations H. appears as a strong bearded man, with a hammer, an oval cap, or a chiton as attributes. For the Italian deity, with which the Romans identified H., see VULCANUS.

Hep'tagon, a plane figure enclosed by *seven* sides. It has, therefore, seven angles; and when these are all equal, the figure is called a *regular* H.

Hep'tarchy (Gr. *hepta*, 'seven,' and *archo*, 'I govern'), the name given to the seven kingdoms founded by the Teutonic settlers in Britain before the Norman conquest. At no period did these seven kingdoms exist side by side, but one was constantly gaining supremacy over the other, the kingdoms of Northumbria, Mercia, and Wessex being successively pre-eminent. The seven kingdoms consisted of—(1) Kent; (2) Sussex; (3) Essex, which corresponded roughly to the present counties of Kent, Sussex, Essex, and Middlesex; (4) East Anglia, which included Norfolk and Suffolk; (5) Northumbria, which stretched from the Humber to the Forth, being bounded on the west by the Celtic district of Strathclyde; (6) Mercia, which included the Midlands from the Thames to the Humber; (7) Wessex, which comprised at first England W. of Sussex and S. of the Thames and E. as far as Devonshire, but which afterwards embraced part of Cornwall, and finally, under Eagberht, brought the rest of England beneath its sway about 830. With this date the H. is by some said to have ended, but the old kingdoms were not thoroughly welded together until the Norman conquest. See ANGLO-SAXONS, Freeman's *Early English History and Norman Conquest*, and Green's *Short History of the English People*.

He'ra (Gr. *Hēra* or *Hērē*, 'mistress') was, in Greek mythology, the eldest daughter of Kronus and Rhea, and sister and wife of Zeus, by whom she was the mother of Ares, Hebe, and Hephæstus. Many places in Hellas claimed to be her birthplace, but particularly Samos and Argos, where were also her two finest temples. Homer says that she was brought up by Oceanus and Tethys, but the Argives believed it was by the three daughters of the river-god Asterion, near Mycenæ. Her 'sacred marriage' (*Hieros gamos*) was said to have been at Cnossus or on Mount Thornax, or in Samos or in Eubæa. On its occasion she received gifts from all the Olympians, and Ge gave her the famous tree of the Hesperides (q. v.), which bore golden fruit. As the only goddess that could be considered married, she was the patroness of marriage and child-bearing, from which she was surnamed Gamelia, Zygia, Teleia, Ilithyia, &c. In the legend of the Argonauts she is kind to Jason, but in the Trojan war her spite against Paris makes her the enemy of Troy. She is a relentless persecutor of Hercules, Dionysus, and all children of Zeus by other mothers. Though honoured with the chief confidence of her lord, and treated by the rest of the gods as on a level with him, H. is only so by courtesy, and must obey her lord implicitly, suffering chastisement if disobedient. Yet her stubborn and imperious temper breeds many quarrels, and often taxes severely the patience of Zeus. In later mythology, how-

ever, she is raised to the dignity of queen of heaven. Though some of the ancients connected H. with the atmosphere, or the stars, or the moon, it is most probable that the conception of her character originally sprang from her being the great goddess of nature, universally worshipped in the earliest times. The Romans identified H. with their Juno (q. v.). She is represented as a fully-developed woman of superhuman size, with handsome features, and an aspect of majesty. Her head, draped in a bridal veil, is crowned with a diadem. She also bears a sceptre, and is attended by a peacock.

Heracle'a (Gr. *Hērakleia*, 'Herakles's town,' now *Erekli*), a name common to more than twenty ancient Greek cities. Of greatest political importance was H. in Bithynia, on the Black Sea, hence called *Pontica*, of which ruins still remain. Founded by Megarensian colonists about 550 B.C., it stood long under an aristocratic government, then, from 364, was held by 'tyrants,' but was finally reduced under Roman dominion by Aurelius Cotta during the Mithridatic war.—**H.**, in Lucania, on the river Siris, founded in 432 B.C. by Thurian and Tarentine colonists. It became an important city, and the meeting-place of the congress of the Italiot Greeks, until this was transferred to Thurii by Alexander of Epirus. It was the scene of Pyrrhus's victory in 280 B.C., and from 278 it had a very favourable treaty of alliance with Rome. During the Social War it suffered greatly. This H. is supposed to have been the birthplace of the painter Zeuxis. Near a farm named Policoro, on the site of the ancient city, many coins and other relics have been found, but especially interesting are two bronze tables, known as the *Tabulæ Heraclienses*, presenting a copy of the Lex Julia Municipalis of 45 B.C. The inscriptions have been published by Mazocchi (2 vols. Naples, 1754–55) and by Muratori (*Inscriptionum*, vol. ii. p. 582, 1739–43). There are also valuable commentaries by Dirksen (Berl. 1820) and Savigny (*Vermischte Schriften*, vol. iii. Berl. 1850).

Herac'leum, a genus of umbelliferous plants found in Europe, America, and India. *H. giganteum*, a native of Siberia, which is cultivated in gardens as an ornamental plant, grows from 12 to 14 feet high. *H. sphondylium*, a common British species, popularly known as cow-parsnip, is used for feeding pigs. In the Caucasus, the young shoots of *H. pubescens*, which are aromatic, are used as food.

Heracleum pubescens.

Heracli'dæ (Gr. *Hērakleidai*), the general name of the sons and later descendants of Hercules generally, but particularly applied to those of them who (according to the Greek legend), with the help of the Dorians, pressed their hereditary claim on the Peloponnesus, and possessed themselves of the provinces Argos, Laconia, and Messenia, which had been seized by the Dorians. Of their five expeditions, the last, which was eighty years after the destruction of Troy, was the greatest. The first four had passed over the Corinthian isthmus, but in this Oxylus, son of Andræmon, led them over the strait from Naupactus in Ætolia to Rhium, and after they had conquered in a great battle Tisamenes, son of Orestes, they seized the whole peninsula, and divided it among their number. Argos fell to Temenos, Lacedæmon to the twin sons of Aristodemus, Procles and Eurysthenes; Cresphontes obtained Messenia by stratagem, and Oxylus was rewarded with Elis.

Heracli'tus (Gr. *Hērakleitos*), a Greek philosopher, born at Ephesus about 500 B.C. He is said to have been a great traveller, and from his sorrowful scorn of mankind was spoken of as the 'weeping philosopher,' while Democritus was surnamed the 'laughing philosopher.' He held that the world was evolved from fire 'not made by God or man,' and wrote a work *On Nature*, fragments of which are collected in Wolf and Buttmann's *Museum der Alterthums-Wissenschaften* (Berl. 1805).

Herac'lius, a famous Byzantine emperor, was the son of Heraclius, exarch of Africa, and was born about 575 A.D. Little is known of his early life, but in 610 he sailed with a fleet from Carthage, and took an important part in dethroning the Emperor Phocas, in whose stead he ascended the imperial throne. The empire was at this time torn by internal strife and barbaric invasions. Chosroes of Persia ravaged the Asiatic provinces and the Avars advanced on Constantinople. H. narrowly escaped being captured by the latter enemy, but bought them off by 200,000 gold pieces, and prepared to assail the Persians, who in 616 took Chalcedon, opposite Constantinople. After carefully disciplining his army, H. invaded Cilicia in 622, routed a Persian army near Issus, and leaving his army to winter in Pontus, returned to Constantinople, whence he sailed with a select force to Trebizonde in 623. He then marched through Armenia and along the Caspian, making an advantageous alliance with the Khasars, who lay N. of the Caucasus. After thoroughly defeating Chosroes, he re-entered Cilicia and inflicted a crushing defeat on Sarbar, the general of Chosroes, on the Sihun, displaying remarkable courage as well as generalship. He now advanced into Persia, while the Avars swept down on Constantinople, and Sarbar lay with a new army on the Asiatic shore of the Bosphorus. H., instead of flying to succour his capital, struck at the heart of the Persian empire, again beat the Persians near the confluence of the Little Zab and Tigris in 627, and seized Artemita, a royal residence near Ctesiphon, where his soldiers acquired a vast booty. Chosroes now fled to the interior of his empire, the Persians were forced to conclude peace, and H. returned in a triumphal progress to Constantinople. The fame of his wonderful victories spread over Europe, and ambassadors from Europe and Asia, from India and from the Merwing Dagobert sought Constantinople to congratulate him on his restoring the old military renown of the Roman Empire. The latter years of his reign are in striking contrast to the earlier. While the Arabs, who were recently converted to Mohammedanism overthrew his generals and occupied Syria, Palestine, Mesopotamia, and Egypt, H. remained in Constantinople, seemingly given up to lassitude and empty theological disputes until his death in 641. Some ascribe this remarkable change in H.'s character to mental derangement, others to bodily pain arising from the many wounds and hardships which he suffered while pursuing his heroic career of conquest. 'Since the days of Scipio and Hannibal,' says Gibbon, 'no bolder enterprise has been attempted than that which H. achieved for the deliverance of the empire.'

Her'ald, during the middle ages, was an officer who bore messages from one king or noble to another, laid out the lists for tournaments, looked on at combats, counted the dead after a battle, and superintended matters relating to ceremonies and the bearing of coat-armour. Heralds gradually became mainly associated with the interpretation of coats-of-arms and with blazoning devices; in modern times they have merely to perform ceremonial duties on important public occasions, and to keep records of crests and arms. There are now fourteen heralds in England, four kings-at-arms—Garter, Clarencieux, Norroy, and Bath—six heralds, and four pursuivants.

Her'aldry (lit. 'the art of a herald,' from Old Fr. *herald*, Ger. *herold*, from *haren*, 'to shout') is the science of interpreting and arranging the various devices borne on shields, banners, &c., and the art of conducting public solemnities. The present article will deal only with H. as a science. In very ancient times, though H. did not exist, distinctive badges were carried on shields and helmets. The children of Israel in Numbers (i. 52 and ii. 2) are commanded to pitch their tents 'each by his own standard,' and 'with the ensign of their father's house.' In Æschylus's drama of *The Seven against Thebes*, the shields of the leaders are described as being blazoned with distinguishing emblems. The kings of Media are said by Xenophon to have carried the representation of a golden eagle on their shields, and though the Romans did not adopt the custom of distinguishing every leader by his carrying hereditary symbols on his armour, traces of such a custom occasionally appear in Roman history. Thus Suetonius tells us that Domitian carried the representation of a golden beard as a coat of arms. Nations, moreover, as opposed to individuals, adopted various distinctive emblems in very ancient periods of history. The Athenians, for example, chose an owl as their national standard, while

the Romans bore an eagle. The first Teutonic invaders of England had a horse on their standard, and the Norse pirates adopted the raven as the device for their banner. But it was not until the middle ages that separate personal devices began to be so generally borne, that the knowledge of their various significations gradually developed into a kind of science. The date when H. originated cannot, of course, be definitely fixed, but in the latter half of the 12th c. it was beginning to develop into a system, and in the 13th c. it emerges as a distinct branch of knowledge, though the devices which it had then to interpret were very simple, generally symbolising some heroic act of the bearer or of his immediate ancestor, and being free from the complicated hereditary significance which they afterwards assumed. The use of these devices was largely due to the tournaments, in which it would have been difficult, without some such distinguishing marks, to have known one warrior from another, encased as they all were in very similar coats of mail. When a new knight appeared at a tournament, he carried the visor of his helmet shut, and the herald had to proclaim the import of the coat of arms which he bore on his shield. From this custom, the so-called science of explaining armorial bearings came to be known as H. In a tournament it was also the custom for each knight to hang up his helmet, with his shield below it, in the lists; and from this practice arose the peculiar pictorial representations used in H., and which are still to be seen on the panels of noblemen's carriages, &c. These representations consist of a shield surmounted by a helmet, the latter being generally encircled by a wreath. The distinctive colours of these shields, known in H. as *tinctures*, are said to have originated in the old German custom, mentioned by Tacitus, of marking each warrior's shield with brilliant tints. In the middle ages these colours borne on the shields were regarded as symbolising particular meanings. Afterwards it became usual to divide the shield into sections, it being the practice of any knight who had proclaimed himself the champion of more than one lady to carry all their respective colours on his armour. In the 11th c., when the crusades drew the nobles of Europe to the Holy Land, H. received a rapid development, it being absolutely necessary, in the mingling of so many warriors, that each should select bearings by which he could be recognised. Before the 11th c. we can find no tomb which is engraved with armorial bearings, the oldest tomb which carries an escutcheon being, so far as is known, that of Vormond, Count of Wasserburg, at Ratisbon. H. was mainly systematised by the French and Normans, and all the terms that are at present used in English H. are derived from the French, though it is asserted that the *ordinaries* and *metals*, as well as the *tinctures*, are of Teutonic origin, while it is said that many of the devices were brought from the East during the times of the crusades. The chief duties of the herald were (1) *Blazoning*—probably from Ger. *blasen*, to blow a horn, from the practice of blowing a trumpet when a new knight appeared at a tournament—which consisted in giving a description of a bearing; (2) *marshalling*, *i.e.*, preparing a new escutcheon; and (3) *historifying*, *i.e.*, explaining the origin of a coat of arms, and the successive modifications which it has undergone. In H., arms have many various names, according to the causes of their adoption. Thus there are *arms of dominion*, *i.e.*, arms borne by sovereigns, and appertaining to different countries—*e.g.*, the arms of England; *arms of patronage*, *i.e.*, arms borne by lords of manors, governors of provinces, &c.; *arms of pretension*, *i.e.*, arms borne by a ruler who has a claim on a territory which belongs to another, and who adds the arms of the territory so claimed to his own arms; *arms of community*, borne by cities, bishops, &c.; *arms of family*, borne by individuals, apart from their position as rulers of any territory or city; *arms of succession*, borne *quartered* on their original arms by those who inherited other than their original estates; *arms of alliance*, borne to indicate the union of families; *arms of assumption*, which are arms assumed by persons who have no legal title to them, or arms assumed with the approval of the king of arms. The shield and helmet were the parts of the armour on which these arms were borne. The shields of the knights were distinguished by various *tinctures*, *ordinaries*, and *charges*, from which all H. has developed. Tinctures are divided into metals, colours, and furs. There are two metals, gold, called in H. *or*, and silver, called in H. *argent*. The heraldic colours are blue, denoting charity; red, courage; green, youth; purple and black, called respectively *azure*, *gules*, *vert*, *purpure*, and *sable*, grief and prudence. Some writers add to these orange or tawny, *jaune*, and dark-red or blood colour, *sanguine*. These they call *stainard* colours, or colours denoting abatements of honour, which, of course, no one would ever carry on his shield. The furs are *ermine*, *ermines*, *erminois* or *contre-ermine*; *pean* and *vair*, with its derivative *counter-vair* and *vair-en-point*; *potent* and *potent-counter-potent*. *Ermine* is represented by a field *argent* sprinkled with *sable* spots and triangles; *ermines* by a field *sable* sprinkled with *argent* spots and triangles; *erminois* by a field *or* powdered with *sable*; *pean* by a field *sable*, powdered *or*. *Potent* is a field covered with figures of *potents* (*i.e.*, crutches, Fr. *potence*); while *potent-counter-potent* is distinguished from *potent* by having the *potents* of the same tincture base to base and point to point. *Vair* is distinguished by alternate shield-shaped figures of argent and azure, the figures of the same tincture being placed base to base, while in *vair-en-point* the point of one figure is placed opposite the base of another. To these furs some add *ermynites*, which is the same as *ermine* with the exception of a red mark on each side of the sable spots. The surface of the *escutcheon* (Old Fr. *escusson*, Lat. *scutum*, 'a shield') or shield is called the *field*, because it was covered with honourable emblems formerly won in the field of battle. The upper part of the escutcheon is called the *chief*; immediately below the *chief* is the *collar* or *honour-point*; the centre is variously known as the *cœur* or heart, the *centre*; and the *fesse-point*. Beneath the *centre* is the *nombril* or *navel-point*, while the lowest part of the escutcheon is termed the *base*. The side of the shield which would be the right side to its bearer is called the *dexter* side, the other side being designated the sinister; thus there is a *dexter chief* and *sinister chief*, a dexter base and sinister base. The divisions of the escutcheon, *chief*, *base*, &c., are styled the *points of the escutcheon*, and are used to distinguish coats-of-arms which, though charged with the same figures, have these figures differently placed on the shield. The escutcheon is divided into parts by lines, which are known either as *crooked* lines, which distinguish bearings, and *partition* lines, which divide the shield into two or more parts. Crooked lines are divided into *wavy*, an undulating line; *indented*, toothed like a saw; *dancette*, similar to indented, but deeper in the indentations; *crenellé*, representing a castle's battlements; *nebulé*, intended to resemble a cloud; *raguly*, representing a tree-trunk; *dove-tail*, imitating dove-tail joints; *invecked*, a line of semicircles, with the points downwards; and *engrailed*, a line of semicircles with the points upwards. The shield may be divided by partition lines, as *party per pale*, when the partition line is perpendicular; *party per fesse*, when the shield is crossed in the middle by a horizontal line; *party per bend*, when a diagonal line runs from the dexter chief to the sinister base; *party per chevron*, when a diagonal line rising from the dexter base meets at the collar point with a diagonal line running from the sinister base; *party per cross*, when the field is divided by a horizontal and by a vertical line; and *party per saltire*, when the diagonal lines running from corners of the escutcheon meet in the centre.

Figures in H. consist of *ordinaries*, *charges*, and *differences*. The ordinaries consist of the bar, bend, bend-sinister, chevron, chief, cross, pale and saltire, which are known as the *honourable ordinaries*; and the *sub-ordinaries*, which include the billet, bordure, canton, flanche, frette, fusil, gusse, gyron, inescutcheon, lozenge, mascle, quarter, roundle, rustre, and tressure. The honourable ordinaries are so called because they were added to bearings as marks of honour by emperors and kings. (For the meanings of the various classes of ordinaries see the separate article on each.) Ordinaries are figures of squares, circles, &c., while *charges* represent natural things, *e.g.*, animals, birds, fishes, trees, fruits, &c. These animals are *blazoned* (*i.e.*, described) by a peculiar and rich heraldic vocabulary. Thus animals are *blazoned* as couchant, courant, rampant, passant, sejant, gardant, saliant, dormant, &c., and again as rampant regardant, counter-saliant, counter-passant, &c. Trees are *fructed*, *raguled*, *trunked*, *eradicated*, *blasted*, &c.; birds are *displayed*, *close*, *indorsed*, *erect*, &c.; a man is *in armour*, *in robes*, *naked*, *habited*, *rustre*; a castle is *towered*, a weapon *imbrued*, a key *endorsed*, a horse *furnished*. (For the meanings of these terms see the article on each.) Beside the shield a heraldic bearing includes the Helmet (q. v.), the mantling crest, or mantle, derived from the mantle with which it was customary to cover the helmet; the crest, which represents the distinguishing crest formerly carried on the helmet in battle; the motto, the word or words adopted as a characteristic phrase

to be carried on armorial bearings; or to the *supporters*, so called because they seem to support the shield; crowns can only be borne by sovereign princes, while coronets, which are smaller and simpler, are borne by nobles.

Differences are devices which are carried on the escutcheon to indicate the branch of a family to which the bearer belongs, and his particular position in that branch. This is shown by means of small charges named *brisures*, *marks of filiation*, and *cadency*. Thus, during the father's lifetime, the eldest son was distinguished from his brothers by bearing a *label*, *i.e.*, a figure of three points; while a second son bore a crescent; a third son, a *mullet* or *mollet*, *i.e.*, a figure of five points; a fourth son, a *martlet*, *i.e.*, a representation of a swallow with long wings and without legs; a fifth son, an *amulet* or small ring; a sixth, a *fleur-de-lys*, or conventional lily; a seventh, a rose; an eighth, a *crossmoline*; a ninth, a *double quatrefoil*, *i.e.*, a double four-leaved grass. In the family of a second son these differences are repeated, added to the paternal marks of filiation. Females could not carry differences, unless they were daughters of the royal family, or unless the differences had become permanent parts of the shield, *i.e.*, that were not dropped on their bearer's position in the family changing, but became integral parts of the arms. All the marks by which members of a family are distinguished from each other are generally spoken of as marks of *cadency*, while *differencing* is applied to the distinguishing of the arms of families and individuals, who are not connected by blood, but by dependency or feudal alliance. H. also appears on certain modern flags. In the middle ages the three varieties of flags, the pennon, banner, and standard, all carried armorial bearings. The national flags of England, Scotland, and Ireland, carry respectively the crosses of St. George, St. Andrew, and St. Patrick; the Union Jack is a combination of the flag of James I., in which the English and Scotch flags were combined with the flag of St. Patrick. Heraldic devices are also seen on seals and coins. During the middle ages even the lower classes were familiar with the signification of heraldic devices. Armorial insignia were displayed not only on shields and banners, but on the sails of ships, the dresses of servants, the windows of mansions. Men were exceedingly jealous of their particular devices, and to appropriate another's heraldic insignia was regarded in much the same light as a theft of another's property is at present.

H. was, long after the fall of chivalry as an institution, a favourite study among the nobility. Gradually, however, it fell into disrepute from the stupid fancifulness and exaggerated pretensions of its upholders. Latterly it has somewhat risen in repute, as it has been recognised that it may at times shed some light upon history. See Clark's *Grammar of H.* (1776), of which fourteen editions have appeared; Parker's *Glossary of H.* (1847); Fairbairn's *Crests of Great Britain and Ireland* (2 vols., Edinb., T. C. Jack, 1876); Knight and Rumley's *Heraldic Illustrations* (2 vols., Edinb., T. C. Jack, 1876); *H. Ancient and Modern*, by Boutell and Aveling (Lond. 1873); and the works of Lowen, Planché, Porny, Berry, Lodge, and of John and Sir Bernard Burke.

Heralds' College, or College of Arms, a corporation founded 1483 by charter of Richard III., with a house assigned to its officers called Colde Arbor in All-Hallows-the-Less, London. Philip and Mary granted them Derby House, which being destroyed in the Great Fire (1666), the present building was erected by Sir Christopher Wren. The H. C. consists of three kings-of-arms, six heralds, and four pursuivants, all nominated by the president, the Duke of Norfolk. To it belongs the right of granting new arms and sanctioning their reassumption after disuse. The officers are salaried, but rely for their income mainly on fees for arms, pedigrees, &c. The Scottish H. C. is known as the Lyon Court (q. v.).

Herat', a city of Afghanistan, the chief town of a province of the same name, on the right bank of the Harri Rood, 369 miles N.W. of Candahar and 700 E. of Teheran. It lies in a fertile valley, and the bread, water, and grapes, are proverbial for their excellence. The inhabitants are mostly of Persian origin, and belong to the Shiah sect of Mohammedans. The town is strongly fortified, and contains some handsome mosques, palaces, and reservoirs. It is the great emporium of trade between Afghanistan, India, and Persia. The chief manufacture is that of carpets. Iron and lead are found in the vicinity. The climate is salubrious. H. has the reputation of having stood more assaults than any other city in Central Asia. In 1232 it was destroyed by Genghis Khan. Thirteen more assaults are counted up to 1837, when the Persians were repulsed after a ten months' siege, chiefly by the exertions of Eldred Pottinger, an Indian artillery officer, who happened to be within the walls. H. has since been the apple of discord between Afghanistan and Persia, and also between the rival members of the Afghan royal family. Some regard this town as the key of India, and the objective mark of all Russian intrigue.

Hérault, a department of France, lies between the Lower Cevennes and the Gulf of Lyon. Area, 2393 sq. miles; pop. (1872) 429,878. The chief river is the H., which rises in L'Aigonal, and has a length of 102 miles. The coast, 66 miles long, is marshy and malarious; elsewhere the climate is fine. H. is in great part covered with forest and pasture, but yields annually 4,297,000 hectolitres of excellent wine, of the value of 27,000,000 francs. There are mines of iron, lignite, zinc, coal, &c., and quarries of marble and granite. H. also yields much salt, manufactures woollens, cottons, and silks, and is traversed by three railway lines. The chief town is Montpellier.

Herba'ceous Plants or Herbs are those having a permanent woody underground stem or 'crown,' which sends up annual shoots to bear the leaves and flowers.

Her'bal, a book-title that in the early days of botany meant a descriptive account of all known plants, with a statement of their places of growth, medicinal uses, &c. Thus Gerard's well-known folio published in 1597 is entitled *Herbal, or General History of Plants.* The word has now passed into the hands of quacks and herb-doctors as a title for their worse than worthless publications. In like manner *herbalist* or *herbarist* has been degraded.

Herba'rium, a collection of plants dried for scientific purposes, and scientifically arranged, thus bearing the same relation to botany that a museum does to zoology. Preserved specimens have one great advantage over living ones—that they can be collected in infinitely greater numbers, maintained in juxtaposition and compared, however distant the time and places at which found. They are often the only materials from which the botanist can obtain a knowledge of his subject of study. The necessity of having herbaria was soon evident to those who raised botany into a science, and the collections of several of these 'fathers' still exist. The oldest in England are preserved in the Sloane Collection at the British Museum and the Sherardian Collection at Oxford. Of a later date, the most notable is that of Linnæus, now the property of the Linnean Society. During the past eighty to ninety years the exploration of the globe has led to the rapid increase of herbaria and of their contents. That at Kew is now supreme, and one of the most available for study; it contains upwards of 110,000 species of flowering plants and ferns. There are also herbaria of considerable extent at Edinburgh (Botanic Garden), Oxford and Cambridge Universities, and at Trinity College, Dublin. On the Continent there is a rich H. at the Jardin des Plantes, Paris; the valuable herbaria of De Candolle, Boissier, and Delessert at Geneva; the Imperial H. at Vienna; the Royal H. at Berlin; the Von Martius H. at Brussels; that of Webb at Florence; and a good national H. at St. Petersburg, Stockholm, Upsala, Copenhagen, and Leyden. In the United States the H. of Asa Gray belongs to Harvard University. At Melbourne is a large one founded by Mueller; and another, pretty extensive, at Calcutta Botanic Garden. For useful instruction regarding the arrangements of a H. see Dr. Greville's 'Directions' published in the *Third Annual Report of the Edinburgh Botanical Society* (1840), and *Notes on Collecting and Preserving Natural History Objects*, by various authors (Hardwicke, 1876).

Her'bart, Johann Friedrich, a German philosopher, was born at Oldenburg, 4th May 1776, studied philosophy under Fichte at Jena, became professor at Königsberg in 1809, and accepted a call to Göttingen in 1833, where he died, 14th August 1841. H. was a consistent opponent of Fichte and the main line of post-Kantian idealism, in opposition to which he called his own system *realism*. The main thought of his metaphysic is that real beings are simple qualities, and that the notion of a thing with many qualities and the notion of change contain

contradictions. H.'s chief peculiarity lies in his psychology, which he endeavoured to render an exact science by the application to it of an elaborate mathematical calculus. In ethics he is determinist, attaching much weight to the development of character through experience; and his works on pædagogic are valued by those who do not accept his philosophy as a whole. H's chief works are *Psychologie als Wissenschaft* (1824–25); *Allegemeine Metaphysik* (1828–29). His works in 12 vols. were published (1850–52) by Hartenstein. See Ziller on H. (1871).

Herbert, the name of a noble English family of great antiquity. The first who belongs to English history is **H., Comte de Vermandois**, who followed William the Conqueror to England, was chamberlain to William II., received a gift of lands, and married the Conqueror's granddaughter. Since that time the Herberts have often taken a prominent part in the public life of England. The family has very numerous untitled branches in Ireland as well as in England. The Earls of Powis (a race still surviving, though not in the male line) were of the same noble family as the Lords H. of Cherbury. The race is still represented by the Earl of Pembroke and by the Earl of Carnarvon (q. v.), though the direct representation of the main line seems to be the head of the house Muckross, in county Kerry, Ireland. Among the more illustrious or memorable persons bearing the name are—1. **Edward, Lord H. of Cherbury**, 'the father of deism,' a brave soldier and an original thinker, who was born at Montgomery Castle in 1581, and educated at Oxford. He married early, was knighted by James I., and in 1608 went to reside in France, becoming distinguished for a keen sense of honour and great intrepidity in maintaining it. In 1610 he served under the Prince of Orange, and showed extreme valour in the field. He travelled in Italy, was appointed ambassador extraordin[illegible] to the court of France in 1616, recalled, and again sent [illegible]manent ambassador to Paris, where he lived on inti[illegible] alike with the most distinguished courtiers an[illegible] scholars and wits. Created baron of Castl[illegible] in 1625, he was in 1631 made a ba[illegible] H. of Cherbury. In the civil war [illegible] Parliament, but afterwards sy[illegible] 20th August 1648. H.'[illegible]ris in 1624, though [illegible]hilosophy, is re[illegible] solve on indep[illegible]ke and of Kan[illegible] H. abided b[illegible]d in the reason [illegible]e for H. fair fundame[illegible]igione Gentilium (1645), [illegible]ll the heathen religions. Reg[illegible]religion as the only necessary doctri[illegible]aken as the earliest of the deists, though[illegible]ct attack on the revealed doctrines of Christ[illegible]so wrote a history of Henry VIII.; and his intere[illegible]*obiography* was published in 1764. —2. **George H.**, po[illegible]and divine, a brother of Lord H. of Cherbury, was born at the family seat, Montgomery Castle, April 3, 1593. He studied at Trinity College, Cambridge, in 1615 became major-fellow of his college, and was elected public master in 1619. The scholarship he displayed in this office so pleased James I. and Lord Bacon, that H. began to entertain high hopes of court preferment. All that he received, however, being a sinecure worth £150 a year, H., after the death of the king, carried out a design he had long secretly entertained, and in 1625 took holy orders. He was made prebend of Layton Ecclesia in Huntingdonshire; married in 1630; and three months after became rector of Bremerton. There he laboured with as much zeal as his feeble health permitted, and there he died in 1632. *The Temple: Sacred Poems, and Private Ejaculations* (1631) is the title of H.'s chief work in verse. It is unsurpassably quaint and fantastic, but abounds in subtle poetic conceits, and everywhere breathes that spirit of 'holiness' which was attributed to its author as a distinguishing characteristic. *The Country Parson* (1632) is a work in prose, describing the life of the ideal parish priest; it is written in a natural and unconstrained manner. H. has found in Izaak Walton an appreciative biographer.—3. **Sidney H. (Lord H. of Lea)**, a distinguished politician and statesman, son of the eleventh Earl of Pembroke by his second wife, the daughter of the Russian Count Woronzow, was born at Richmond, September 16, 1810. He was educated at Harrow, and Oriel College, Oxford, where he took a fourth in classics. Having chosen politics as a career, H. entered the House of Commons in 1832, representing South Wilts in the Conservative interest. After holding a subordinate office in Sir Robert Peel's first Ministry, he was appointed Secretary to the Admiralty in 1841, and Secretary at War in 1845; but retired for a time from public life after the defeat of his political chief on the Corn-Laws Repeal question in 1846. In that year, H. married Elizabeth, daughter of General Ashe A'Court. In 1852, H. again became Secretary at War in Lord Aberdeen's Coalition Ministry, in which arduous post he had to face much of the hostile criticism excited by the mismanagement of the Crimean war. On the resignation of Lord Aberdeen, and the formation of the Palmerston Ministry, H. became Colonial Secretary; but resigned this office immediately on the Premier accepting the Committee of Inquiry into the state of the Army before Sebastopol. When Lord Palmerston formed his second Administration, however, H. was once more appointed to the War Office; and in this department effected many important reforms—among others, the reorganisation of the militia, the organisation of the volunteer forces, the fortification of dockyards, the amalgamation of the Indian with the royal army, and the reconstitution of Sandhurst College. His health finally became impaired by these unremitting labours; he was forced to resign his seat; and in January of 1861 was called to the House of Peers by the title of Baron H. of Lea. This period of repose, however, came too late, for he died in August 2d of the same year. Lord H. was heir-presumptive to the earldom of Pembroke, and to this his eldest son succeeded in 1867.

Hercula'neum was, in ancient times, one of the most important cities of Campania; it lay on the coast between Naples and Pompeii, was founded by Oscans, but afterwards chiefly inhabited by Greeks. During the reign of Titus H. was, with the neighbouring towns Pompeii and Stabiæ, overwhelmed by an eruption of Vesuvius (79 A.D.), and so deeply buried in ashes (68–100 feet) that afterwards its site was not recognised, and the villages Portici and Resina were built where it stood. Earlier excavations (*e.g.*, in 1689) were as good as forgotten, when in 1720 three statues were discovered in digging a well. Excavations were renewed in 1738, and Pompeii and Stabiæ found in 1750. More systematic exertions were made from 1806 to 1815, and, after ceasing awhile, were again begun in 1828. Besides the remains of buildings, which are not so important at H. as at Pompeii, there have been found many fine frescoes, numerous statues, and a large number of papyrus rolls. Reference may be made to *Delle Antichità d'Ercolano del Museo Borbonico*; Roux Ainé et M. L. Barré, *H. et Pompeii*; Finati, *Manuale per Ercolano, Pompeii e Stabia*; Selvatico, *Le Arti del Disegno in Italia* (Milan, 1874); Beulé, *Le Drame du Vesuve* (Paris, 1872). See POMPEII.

Hercula'no de Carval'ho, Alesandro, a well-known Portuguese novelist and historian, was born in 1796 at Guimaraes, and received his education at Paris. Having there imbibed liberal ideas in politics, H. took part in those revolutionary measures which aimed at securing a constitutional government for Portugal, and which in 1820 effected this result. The earliest writings of H. were poetical, but he published in 1828 a volume of poetry called *A Voz do Propheta* ('The Voice of the Prophet'), in which he predicted a most unhappy future for his country, then distracted by civil war. This work produced a great sensation, and was followed in 1832 by *A Harpo do Crente* ('The Harp of the Believer'), a volume of romantic verse. H.'s next literary production was a novel, *Eurich, Priest of the Goths*, which proved less successful than his poetry, and from this time the author gave himself up to historical writing, his chief work, *Historia de Portugal*, appearing between 1845 and 1853. It shows great industry and erudition, is written in a pure and attractive style, and is marked by general fairness and moderation. Another important work of H.'s is *Da Origem e Estabelecimento da Inquisição em Portugal* (1854).

Her'cules (Gr. *Hēraklēs*), surnamed **Alci'des**, from his grandfather Alcæus, was the son of Zeus and Alcmene. He was renowned for his immense strength, and was the ideal hero of the heroic age. Never had Hera been so jealous of her husband as then; even before his birth H. was persecuted by her,

and as Zeus had sworn that the child to be born that day should rule the whole race of Perseus, she, by delaying the birth of H., and hastening the labour of the wife of Sthenelus, son of Perseus, secured the supremacy to her son Eurystheus. We are told by Homer and Hesiod that he grew so strong and confident as to challenge the gods themselves, and, but for the favour of Zeus and Athena, would have felt the wrath of Hera, whom, with Ares, he had wounded. Later writers tell of his strangling in his cradle two serpents sent against him by Hera, of his being instructed in every manly exercise by the first masters, of his killing Linus with a lyre, and being sent away by Amphitryon for safety's sake to feed cattle. He was thus occupied till his eighteenth year. During his shepherd life he slew for Amphitryon and Thespius of Thespiæ the huge lion of Mount Cithæron, which had devoured part of their flocks, and afterwards wore its skin as a covering. Returning to Thebes, he fell in with the messengers sent by Erginus, king of Orchomenus, to claim the yearly tribute of 100 oxen extorted from the Thebans. He sent them back mutilated to Erginus, who then took the field against Thebes, but was slain by H., who imposed on Orchomenus a tribute twice as great as that paid before by Thebes. According to the legend, Amphitryon fell in the battle, though in the tragedians he appears still alive after the campaign. As the reward, H. received from Creon, king of Thebes, his daughter Megara in marriage; from Hephæstus, a golden cuirass; from Apollo, a bow and arrows; from Athena, a peplus; and from Hermes, a sword and brazen club. Another account makes the club of wood be cut by H. in Nemea. Being after this struck mad by Hera, he killed his own children by Megara, as well as two of his half-brother Iphicles, but remorse drove him into exile, where he was purified by Thespius. The Delphic oracle, calling him for the first time 'Herakles,' bade him live twelve years at Tiryns subject to Eurystheus, for that thereby he should become immortal. Neither in Homer nor Hesiod do we find any account of twelve labours as specially imposed on him by Eurystheus. Homer mentions the descent to Hades in quest of Cerberus, his adventure with a sea-monster, his expedition to Troy to revenge himself on Laomedon, and his war against the Pylians; but the following works are commonly called 'The Twelve Labours of H.':—(1) He strangled with his hands the great lion of Nemea, and took its skin (which, and not that of the Cithæron lion, another account makes him wear); (2) killed the Lernæan hydra; (3) caught the swift-footed stag of Artemis; and (4) the wild boar that ravaged the district about Mount Erymanthus; (5) cleansed in one day the stables of Augeas, king of Elis, in which 3000 oxen had stood for thirty years, by leading through them the rivers Alpheus and Peneus; (6) killed the birds of Lake Stymphalus, which devoured human flesh; (7) captured the Cretan bull, famous for its strength and beauty; (8) brought to Eurystheus the man-eating horses of the Thracian king Diomedes; and (9) to his daughter Admete the girdle of Hippolyte, queen of the Amazons; (10) captured the oxen of the giant Geryones; (11) fetched the golden apples from the garden of the Hesperides; and (12) brought up Cerberus from Hades. While roving through the world engaged in these works, he did many other exploits ('Parerga'), such as joining in the war with the Centaurs, and in the Argonautic expedition, erecting the 'Pillars of H.,' freeing Prometheus, and bringing up Theseus from Hades. To expiate the killing of Iphitus, he followed the command of the oracle by becoming for three years slave to the Lydian queen Omphale ('H. at the spinning-wheel'), after which he did many great feats, and finally married Dejanira, daughter of Œneus. She became the innocent cause of his death, for, fearing his infidelity, she sent him a robe that the Centaur Nessus had given her, and which he had said would preserve her husband's love to her. No sooner was it put on by H. than he suffered fearful agony, amid which he ordered a funeral pile to be placed on Mount Œta, and placed himself in its flames. A cloud carried him to Olympus, where, being reconciled to Hera, he married Hebe. His worship, though general throughout Hellas, was most prevalent amongst the Dorians, and the usual victims offered to him were lambs, rams, bulls, and boars. At the feasts held in his honour he was celebrated in songs as a hero, and thus arose a class of longer poems, the so-called *Heraclea*, the subject of which was his life and exploits. The dramatic poets set off his life with many comic additions. Representations of H. at every stage of life abound, all characterised by energy. The most famous is the 'Farnese' H. of Glycon. Roman traditions make H. on his expedition against Geryones visit Italy, where, abolishing the Sabine custom of sacrificing human beings, and establishing fire-worship, he destroyed a monster named Cacus, who had plundered some of the oxen taken from Geryones by H. Evander paid him especial honour, and H. gave two great families, the Pinarii and Potitii, the task of seeing to his worship. There were two temples of H. at Rome. Those who wish to see what becomes of a Greek myth in the hands of a solar mythologist may consult Max Müller's *Comparative Mythology* in the *Oxford Essays* of 1856. Several other heroes of this name are mentioned by ancient writers:—(1) the **Cretan H.**, one of the Dactyli of Mount Ida, who founded the temple of Zeus at Olympia, and was believed to be a magician; (2) the **Phœnician H.**, worshipped at Carthage, Gades, and all the other Phœnician colonies till the 4th c.; (3) the **Egyptian H.**, a son of Nilus or Amon, and otherwise called Dsom, Chon, and Maceris; (4) the **Indian H.**, or Dorsanes, believed by the Greeks to be their own H., and the founder of the Indian royal race; and (5) the **Celtic and Germanic H.**, founder of Alesia and Nemausus.

Hercules Beetle (*Dynastes Hercules*), a genus of Lamellicorn beetles, attaining a length of 5 inches, and distinguished by large mandibles, the upper being very large and projecting. This beetle occurs chiefly in S. America.

Hercules, Pillars of, the ancient name of the two opposing promontories, Calpe (Gibraltar) and Abyla (Ceuta), at the entrance to the Mediterranean Sea. They were fabled variously to have been rent asunder or forced together to serve as a bridge by Hercules. In the Spanish arms they are supporters; the national motto, *Ne plus ultra*, refers to the ancient belief that the pillars marked the end of the earth. The pillars appear on Spanish coins, and it is conjectured that with a fillet for the motto they form the sign $ for dollars.

Hercyn'ian Forest (Lat. *Hercynia Silva*; the root appears in Harz and Erz), a common name by which the Romans in the time of Cæsar denoted the several mountain masses ranging from the Rhine to the eastern Carpathians, and which are generally called the Mid-German Mountains. Later writers, such as Tacitus and Pliny, use the name specially for that range between the Carpathians on the E. and the Thüringerwald on the W.

Her'der, Johann Gottfried von, one of the most original, many-sided, and influential thinkers of Germany, at once poet, philosopher, and theologian, was born 24th August 1744, at Mohrungen, in E. Prussia, and at an early age showed rare gifts, in spite of the narrow-minded limitation of his studies by his father. He studied philosophy and theology in Königsberg, coming more under the influence of Hamann than of Kant, but read with avidity in all realms of literature. In 1764 H. became, with marked success, a teacher and preacher in Riga, but in 1767 went on a lengthened tour. In 1771 he was called to be court preacher at Bückeburg, and in 1776 accepted an invitation to fill a like post at Weimar, where he lived, increasing in honour and in power to mould the minds of his contemporaries, till his death, 18th December 1803. A sacred enthusiasm for all that is truly and nobly human, for what he himself called *humanität*, breathes through his numerous works. As poet and critic he purified taste and inspired life into the hearts of his time, seeking out especially all that is characteristic of peoples and periods in the literature of the world, and finding materials in popular legends, in Homer, Ossian, Shakespeare, and the national poetry of the South, as well as in old German poetry. But though of enormous importance in the æsthetic development of Germany, H. cannot rank as a great creative poet. H.'s spirit is seen in his *Geist der Hebräischen Poesie*, where a thoroughly sympathetic attempt is made to appreciate the Hebrew Scriptures as a monument of human genius apart from their inspiration or theological significance. H.'s conception of God and the divine shows in the main a leaning towards an unsystematic pantheism. In *Metakritik* he maintains a vigorous but bitter polemic against the sharply defined and radical dualism of the Kantian philosophy. Throughout, H. contends for the close communion and sympathy of nature and man, of matter and spirit; and his greatest work, the unfinished *Ideen zur Geschichte der Menschheit*, the earliest consistent scheme of a philosophy of history, regards all history as a continuous and connected development towards a great end.

H.'s *Schriften*, in 45 vols., were published at Stuttgart in 1806–20; the *Gedichte*, the *Volkslieder*, and the *Cid* being given in a separate form. See *Erinnerungen aus H.'s Leben* (1820), by his widow; *H.'s Lebensbild* (1841), by his son; and several collections of his letters.

Heredit'ament, a term of English law denoting all property which goes to the heir-at-law. Hereditaments are divided into *corporeal* or *incorporeal*. Houses and lands are of the former class; rents and annuities of the latter.

Hered'itary Right means, in law, the right of the heir-at-law to succeed on the death of his predecessor. See BIRTHRIGHT, PRIMOGENITURE, INTESTACY, BROTHERS, LAW OF SUCCESSION AMONG, HEIR, and articles referred to under these.

Hereditary Transmiss'ion. By this term is understood the transmission of peculiarities from parents to offspring. Thus children are like their parents, and any special peculiarity in the parent may be transmitted to the child. Sometimes the peculiarity may be transmitted by the father and sometimes by the mother. Many strange examples of transmission have been in recent years carefully observed, and it has been ascertained that if the individuals possessing the hereditary peculiarity are permitted to inter-breed, the peculiarity may become constant. The laws regulating H. T. are quite unknown. For details see Huxley (*Westminster Review*, 1860) on Darwin's *Origin of Species*, Huxley *On our Knowledge of the Causes of the Phenomena of Organic Nature*, *Six Lectures to Working Men*, 1863, pp. 95–97; *Philosophical Transactions*, vol. xiv., No. 160, 1730, and vol. xlix., part I for 1755; Galton's *Hereditary Genius* (Lond. 1869); Ribot's *Heredity* (Eng. trans. Lond. 1875); and *The History of Creation* by Hæckel (Lond. 1876).

Her'eford ('the ford of the army,' or a mistranslation of the original Celtic name *Caer-ffawydd*, 'the town of the beech-trees'), capital of the county of the same name, on a gentle eminence rising from the N. bank of the Wye, 144 miles W.N.W. of London by railway. It is the see of a bishop, and has a beautiful cathedral, with a tower 160 feet high, partly built about 1115 on the site of an older building, and restored by Sir G. G. Scott in 1863. There is also a fine church of St. James (1868), slight industries in gloves, hats, and flannels, and important cattle and cheese fairs. H. returns two members to Parliament. Pop. (1871) 18,347. The city received its charter from Richard I. in 1189. It was among the last places that surrendered to the Parliamentary forces (1643), in token of which it was granted a new charter, with the motto *Invictæ Fidelitatis Præmium*, from Charles II. H. is the birthplace of Nell Gwynne and David Garrick.

Her'efordshire, a western county of England, lying between Worcester and Gloucester on the E., and S. Wales on the W., and bordered by the Black Mountains and the Malvern Hills. Area, 833 sq. miles; pop. (1871) 125,370. It contains some of the most richly diversified scenery in England, is watered by the Wye, Lugg, Arrow, Teme, &c., all finding their way to the Severn. Its soil is a red well-cultivated loam, yielding wheat, barley, oats, beans, peas, rye, &c. In 1875 there were 111,965 acres under corn crops, 37,647 under green crops, 231,569 in permanent pasture, exclusive of mountain and heath. Other products are oak-bark, apples, and excellent cider (20,000 hogsheads yearly). H., almost entirely of Devonian formation, has a good climate, and celebrated breeds of sheep and cattle. H. was conquered by the Romans about 73 A.D., for a time was included in Mercia, and later formed part of the Welsh borderland or 'marches.' It sends three members to Parliament.

Heren'cia, a town in the Spanish province of Ciudad Real, is situated on the river Gigucla, a tributary of the Guadiana, and is about 42 miles N.E. of the capital of the province. Pop. 7317.

Her'esy (Gr. *hairesis*, 'choice'), in the New Testament means a sect or party distinguished by holding certain opinions, as the sect of the Pharisees (Acts xv. 5; Gr. *hairesis*; *cf.* Jos. *Ant.* xiii. 5, 9). Hence it was applied to the Christians themselves (Acts xxiv. 5, 'Nazarenes'), and then, within the Church, to dissension produced by party spirit (1 Cor. xi. 19). It also has the meaning of the opinion which one chooses to hold (2 Peter ii. 1), and in the early Christian writers indicates those opinions which deviated in any particular from the true Christian faith, or even systems which adopted any Christian element whatever. According to the canonical definition, which has regulated the practice of the Church, H. consists (1) in a departure, not from the implied belief of Christianity, but from that which the Church through her creeds and canons has declared to be a matter of faith; (2) the error must be persistent and wilful, and after admonition; and (3) it must not only be suspected, but detected and adjudicated upon.

The position of heretics as regards the Church was the same as that of Jews or pagans; they were not regarded as Christians at all. The penalties, both ecclesiastical and civil, to which they were liable were very severe. (1) By ecclesiastical law they were excommunicated, prevented from being present at public worship, at least, during the more sacred ceremonies, and their evidence against a Catholic refused in the ecclesiastical courts, and social intercourse with them was prohibited. (2) Of the civil penalties (comprised in the Theodosian code, *De Hæreticis*), eleven distinct kinds have been enumerated, besides the laws against their teachers, aiders and abettors, and meetings. They were styled generally infamous persons, and special names of reproach were attached to particular sects; all commerce was forbidden to be held with them; they were deprived of all offices of profit or dignity in the state; they could neither receive nor bequeath property, nor give or receive donations; no contract with them was binding; they were fined, banished, subjected to corporal punishment, and even sentenced to death. In this country many persons were imprisoned and burned for H. at the time of the Reformation. Nowadays all civil penalties have fallen into desuetude, although there are yet unrepealed laws to inflict them. The worst that is now inflicted on a heretic is the penalty of excommunication, and social ostracism.

Her'ford, a manufacturing town in the province of Westphalia, Prussia, is situated on the Werre, and on the railway from Köln to Minden, 15 miles from the latter town. It has manufactures of cotton, flax, and carpets. H. was formerly a free city, and possessed a great nunnery, secularised in 1803. Pop. (1871) 10,974.

Her'iot, in English law, signified originally a tribute to the lord of the manor on his preparing for war. It now denotes a fine payable to the lord on the death of a copyholder. It is usually the best beast which he dies possessed of. The right can be enforced by action, or the subject may be forcibly taken. The corresponding Scotch law term is *Herizeld*, but the exaction has long been obsolete in Scotland, though what is called Relief (q. v.) may still become due from the vassal's heir to the superior on the vassal's death.

Her'iot, George, a descendant of the Heriots of Trabroun, and son of a wealthy goldsmith, was born in Edinburgh, June 1563. He was bred to his father's occupation, entered the Edinburgh incorporation of goldsmiths in 1588, became jeweller to James VI. of Scotland about 1597, and removed to London as banker and court-jeweller when James succeeded to the English throne in 1603. He was twice married; first to burgess Marjoribanks's daughter, Christian (1586), and then to Alison, daughter of James Primrose, ancestor of the Earls of Roseberry, but died without issue, February 12, 1624. H. amassed a fortune, and was a great favourite with the king, who familiarly nicknamed him 'Gingling Geordie.' The bulk of his riches he bequeathed to the town-council and ministers of Edinburgh, that they might found an hospital for the maintenance and education of sons of poor or deceased burgesses. The building, a grand Gothic quadrangle, is said to have been designed by Inigo Jones in 1628, but was not completed till 1659. So immensely have the funds increased, that in addition to Heriot's Hospital, with 300 boys and twelve teachers, they support eighteen day-schools and ten evening-schools also in Edinburgh, for the gratuitous education of poor children, attended by upwards of 4000 boys and girls. In connection with the hospital there are (1876–77) thirty-nine university bursaries. See *Heriot's Hospital, with a Memoir of the Founder*, by Dr. W. Steven (3d ed. revised and enlarged by Dr. Bedford, Edinb. 1874).

Her'istal, or **Herstal**, a town of Belgium, in the province of Liège, on the Meuse. It has large coal-mines, and steel and iron works, and is now almost a suburb of Liège. It was the birthplace of Pippin, the founder of the Karoling dynasty. Pop. 9326.

Her'itable and Mov'able are Scotch law words denoting the classes of property which respectively fall to the heir-at-law and to the executor or administrator. *Real* and *Personal* are the corresponding words of English law, and the distinction is similar to that indicated by the phrase 'Heir and Executor' (q. v.) in England.

Heritable Bond. See BOND, in law.

Heritable Jurisdic'tions were, in Scotland, grants from the crown of criminal jurisdictions to great families. They were abolished after the Rebellion of 1745 by statute. The abolition was followed by the appointment of sheriffs on a proper footing.

Heritable Secu'rity, in the law of Scotland, corresponds to Mortgage (q. v.) in English law. See also for English law, EQUITY OF REDEMPTION. The bond must be recorded in the Register of Sasines. (See SASINES.) It is assignable.

Her'itor, the Scotch law term for a landowner in connection with parochial law.

Hermandad', The, (Span. 'brotherhood'), a confederation of the chief cities of Aragon and Castile to maintain order and defend their liberties. The first H. was founded in Aragon about the middle of the 13th c., and the H. of 1315 embraced 100 Castilian and Aragonese cities. The cities united in a H. were bound together by 'a *solemn* covenant,' to remit the aggression of the nobles, to revenge any injury to any of their members, and to kill any one trying, even by the king's orders, to collect an unlawful tax, the decisions of their councils being carried out by armed forces. In 1496 their power was greatly increased, and they did good service in suppressing brigandage until 1498, when they were lowered to the condition of a police force. They were generally known as the *Santa Hermandad*, or Holy Brotherhood, and were occasionally spoken of as 'Cortes Extraordinary.' See *Quaderno de las Leyes nuevas de la H.* (Burgos, 1527), and Prescott's *History of Ferdinand and Isabella.*

Her'mann, or **Herman,** the German name erroneously conferred on the warrior called by Latin authors Arminius, who, in the days of Augustus and Tiberius, asserted the freedom of Germany against Rome. The tribes of the N.W. had for the most part accommodated themselves to the Roman supremacy, when H., son of a prince of the Cherusci, and born in 16 B.C., commanded a battalion of his fellow-countrymen in the Roman service, and learned the arts of war from Roman generals. But when Quintilius Varus replaced the forbearance of former governors by the insolence of a conqueror, the Latin yoke galled German shoulders. Seeing the hopelessness of open rebellion against a force of 50,000 veterans, H. secured the co-operation of numerous allied tribes, contrived that the Roman forces should be scattered, and then, in the autumn of 9 A.D., attacking the reduced main body in the Teutoburger forest, after three days' fighting wholly annihilated it. Germanicus, appointed commander in the Lower Rhine in 14 A.D., had to use all his skill in coping with H., and was assisted by the hostility of H.'s father-in-law, who delivered Thusnelda, his wife, into the hands of Germanicus. A great battle was fought near Hameln in 16 A.D., when the Germans were defeated with the loss of a third of their number, but even after again joining battle unsuccessfully, remained unbroken in spirit. Germanicus was withdrawn by his jealous uncle ere the supremacy of Rome could be secured. H. was subsequently victorious in war with Marbod, a prince of the Marcomanni, but fell in an intestine struggle in 21 A.D. Thusnelda had in 17 been made to grace the triumph accorded to Germanicus. See Wietersheim, *Der Feldzug des Germanicus* (1850); Massmann, *Arminius* (1839); Reinking, *Die Kriege der Römer in Germania* (1863). On the 16th of August 1875 a monumental statue, 40 feet high, in honour of H., by Ernst von Bandell (q. v.), was unveiled near Detmold by the German Emperor in presence of the princes of the empire, senates of the Hanse towns, and an audience of 40,000 persons.

Hermann, Johann Gottfried Jakob, a scholar who gave a great impulse to classical learning in Germany, was born at Leipsic, 28th November 1772. He became a lecturer at the university there in 1794, was made Professor of Philosophy in 1798, and of Eloquence in 1803, with which the chair of Poetry was conjoined in 1809. In this congenial work he spent the rest of his days, dying 31st December 1848. H.'s lectures were powerfully attractive by their vivacity, clearness, and completeness. His efforts as an academical teacher to awaken independent thought in his pupils were indefatigable; and to all his work H. brought the support of a vigorous and truth-loving character. He first signalised himself by works on the metres of the classics, as *De Metris Græcorum et Romanorum Poetarum* (Leips. 1796); *Epitome Doctrinæ Metricæ* (1818); *De Metris Pindari* (1817). By his *De emendanda Ratione Græcæ Grammaticæ* (1801) and *De Græcæ Dictionis Idiotismis* (1802) he sought to reform the treatment of the Greek grammar. The acuteness and accuracy of his scholarship are further displayed in his editions of Sophocles, Euripides, *The Clouds*, the Homeric hymns, the *Trinummus* of Plautus, Aristotle's *De Arte Poetica*, &c.; and by those of Bion and Moschus, and of Æschylus, published after his death. The seven vols. of his *Opuscula* (1827–30) contain numerous essays and short treatises, with poems, in excellent Latin. See Jahn, *Gottfried H. eine Gedächtnissrede* (Leips. 1849).

Her'mannstadt (Magyar, *Nagy-Szeben;* Ruman, *Sibenin*), the capital of Transylvania, Austro-Hungaria, on a hill overlooking the Zibin, 60 miles S.S.E. of Klausenburg by railway. It consists of a walled upper and lower town and three suburbs, is the seat of a Greek archbishop, and of the governor of Transylvania; has a Gothic Lutheran church with a high tower, a townhouse containing Saxon archives, and national museum, a theatre, &c. The manufactures are woollens, linens, leather, tobacco, and pottery. Pop. (1869) 19,000, mostly German Protestants, but also including many Rumanians, Magyars, and Gypsies. H. is said to have been founded in the 12th c. by a German colony from Nürnberg, led by a citizen named Hermann.

Hermaph'rodite, the name given to such animals as possess, in each individual of their species, distinct male and female generative organs. The term *monœcious* (Gr. *monos*, 'single,' *oikos*, 'house') is also employed synonymously with H. Very many lower animals are H. Thus the snails exemplify familiar examples of this condition; but it is also a curious fact that the mutual sexual congress of *two H. individuals* is necessary to ensure the fertilisation of the eggs. In the tapeworm, again, H. are met with; each segment or joint of the tapeworm being provided with a complete set of male and female reproductive organs. The vertebrata or highest animals never—save abnormally—exhibit hermaphroditism; this condition being occasionally met with in the human subject.

Hermaphrodite (in botany). When a flower contains sexual organs of both kinds it is called H. or bisexual; if it contains only male or only female sexual organs, and is, therefore, unisexual, it is termed *diclinous;* when flowers of both sexes occur on the same individual plant, the species is *monœcious;* when on different individuals, it is *diœcious.*

Her'mas, one of the Christians at Rome to whom St. Paul sent a greeting in his epistle (Rom. xvi. 14), is the reputed author of a work entitled *The Shepherd* or *Pastor of Hermas* (although, according to the Fragment of Muratori, H., the author, was the brother of Pius I., Bishop of Rome, in the 2d c.), which many Christians from the 2d to the 4th c. placed, along with the epistle of Barnabas, side by side with the inspired writings of the New Testament. It was included in the MS. of the New Testament discovered (1859) by Tischendorf in the convent of Mount Sinai. The contents have been divided into three books: the first containing four visions, the second twelve commands, and the third ten similitudes. The name is derived from the author asserting that he wrote the 2d and 3d books to the dictation of the angel Repentance in the guise of a *shepherd.* The work is accessible to English readers in Clark's *Ante-Nicene Fathers* (vol. containing the 'Apostolic Fathers').

Hermeneu'tics (Gr. *hermeneutikē*, (sc. *technē*, 'art'), from *hermeneuō*, 'I interpret') stands to exegesis in the relation of theory or principles to practice. Strictly to distinguish between the two is purely arbitrary. See EXEGESIS.

Her'mes (Gr. *Hermēs*, *Hermeias*), identified by the Romans with their Mercurius (q. v.), was a son of Zeus and Maia, daughter of Atlas, and born on Mount Cyllene in Arcadia. In the *Iliad* and *Odyssey* he is described as thievish, and in a 'Homeric' hymn it is said that, escaping from his cradle, four hours after his birth, he stole from Pieria some of the oxen of

Apollo's herd, which he drove to Pylos, and concealed in a cave there, after slaughtering two of them, his feet being covered with sandals during the journey that his footsteps might not be traced. Thereafter returning to Cyllene, he found a tortoise, whose shell he took and formed into a lyre by placing strings across it. Apollo then went to Cyllene to demand his oxen, but Maia showed him H. in his cradle, whereupon Apollo seized and carried him before Zeus, who bade him restore them. H., persistently denying the theft, was disbelieved, and compelled to accompany Apollo to Pylos, where he so charmed the god with the sound of the *chelys* that he was allowed to keep the cattle. His next invention of the *syrinx* or pipe further cemented their good relations, which Apollo confirmed by teaching him how to divine with dice, and by presenting him with his own shepherd's staff of gold. He became the herald of Zeus and of the gods of Hades. Though H. seems originally to have been an Arcadian god of nature, whose special function was to make the soil fruitful and bless the efforts of husbandmen, it is mainly as herald of the Olympians that he appears in the legends and in the poets. Hence he was considered the god of eloquence, and the tongues of victims were held sacred to him. He was also the god of shrewdness in affairs, as well as of deceit and theft, always, however, set off with a foil of gracefulness, through which the 'vice itself lost half its evil, by losing all its grossness.' He was further credited with the invention of the alphabet, music, numbers, and astronomy, with the introduction of weights and measures, olive culture, &c., and with imparting skill in these to his favourites. Of his many missions, chiefly undertaken at the command of Zeus, the abduction of Io, with the slaying of the hundred-headed Argus (q. v.), is oftenest alluded to, and from this feat he had the surname *Argeiphontes*. With most versatile activity H. appears also as the charioteer and cupbearer of Zeus, the bringer of dreams and sleep, of wealth, luck, and sudden gain, the promoter of trade and social courtesy, the preserver of peace and protector of wayfarers, and the conductor of the shades of the dead from earth to Hades. The Athenian generals sacrificed to H. before starting on any expedition, and shepherds paid him special reverence, as he was thought to promote the fertility of their flocks. His first temple was believed to have been built by Lycaon, king of Arcadia, from whence his worship spread to Athens, where he was first invoked as the patron of athletic exercises. Festivals called *Hermæa* were celebrated there, and in various other parts of Hellas. It is probable that the first statues of any god that presented the likeness of a head above the more primitive square block of stone were those of H., whence the name *Hermæ* grew to be applied to the whole class of tetragonal torsos, of which one stood before every door in Athens, and the mutilation of which caused consternation there just before the Sicilian Expedition. (See ALCIBIADES.) The usual sacrifices to H. were lambs, pigs, goats, honey, cakes, and incense, and the number four, the palm-tree, the tortoise, and some kinds of fish were sacred to him. He is usually represented as a youth with finely formed limbs, bearing a herald's staff (*skēptron*), and wearing a broad-brimmed hat (*petasos*), and beautiful golden sandals (*pedila*), winged at the ankles.

Her'mes, Trismegis'tus (Gr. *Hermēs Trismegistos*, or 'thrice-great,' *cf.* Milton's *Il Penseroso*), the name applied by the Greeks to the Egyptian Thoth as early as the 4th c. B.C. He was believed to be the origin of everything formed and produced by the human mind, and was therefore the inventor of all arts and sciences; hieroglyphics, astronomy, arithmetic, geometry, music, agriculture, law, medicine, worship, &c., being instituted by him. The sacred books of the Egyptians were attributed to him, and were called by the Greeks after him the *Hermetic Books*. They were inaccessible to all but the priests, and were shown to the common people only from a distance on great festivals. The Neo-Platonists regarded H. as the embodied Logos, and it was in their age, when theosophy, alchemy, and magic developed themselves, that he received the surname 'Trismegistus.' All secret knowledge was believed to be propagated by a series of wise men called the 'Hermetic chain.' Of the writings attributed to H., the chief now extant are *Pœmander sive de Potestate ac Sapientia Divina* (Lat. trans., ed. princ. Treviso, 1471; Gr. original by Hadr. Turnebus, Par. 1554; Germ. trans. by Tiedemann, Berl. 1781); *Æsculapii Definitiones, Iatromathematica, Horoscopica* (collected in Patricius, *Nova de Universis Philosophia*, Venice, 1593). Later, H. and his reputed writings were held in great esteem by all kinds of enthusiasts, who called themselves from him 'Hermetici.' Thus originated the 'hermetic medicine' of Paracelsus, 'hermetic freemasonry,' and the expression 'hermetically sealed,' applied to whatever is so securely closed as to prevent the entrance of air, as the magic seal of H. was thought to have the power of making anything whatever inaccessible.

Her'mit. See EREMITES.

Hermit Crab, a name applied to several genera of Crustacea (q. v.) belonging to the *Decapoda* (q. v.)—the order including the lobsters, crabs, &c.—and to the section *Anomura* of that order. This section is distinguished by the soft and comparatively rudimentary nature of the abdomen. The best-known H. C. is the common species—the *Pagurus Bernhardus*—commonly found round the British coasts, inhabiting the cast-off shells of whelks and other molluscs. In this genus the abdomen is perfectly soft, and destitute of appendages, but has terminal suckers, and a few rudimentary feet, adapted for enabling the animal to retain a hold of the whorls of the shell. The carapace or shell covering the body is membranous, and has little calcareous or limy matter in its composition; one of the great *chelæ* or pincer-like claws is much more developed than the other, and is used by the animal for closing the entrance to the shell when it has withdrawn into its abode. These crabs are also named 'soldier crabs,' from their pugnacious habits. A curious instance of that form of animal association named *commensalism* occurs in the invariable association of a species of sea-anemone (*Adamsia palliata*) with the H. C., the anemone adhering persistently to the exterior of the shell in which the crab dwells. The crafty H. C. (*P. calidus*) is found in the Mediterranean Sea, and is of larger size than the common species. The Diogenes H. C. (*Cenobita Diogenes*) of Brazil and the W. Indies is a well-known tropical species, and appears, like the land crab, to inhabit damp places inland.

Her'mitage, the cell of a hermit, or several cells close together.

Hermosill'o, a town of Mexico, in the state of Sonora, 90 miles N. of Guaymas, a port on the Gulf of California. It is an entrepôt for the produce of the interior, and carries on a large trade in wine and brandy. Pop. 14,000.

Her'nia, in its widest sense, means the protrusion of any organ from its natural cavity through an abnormal or accidental opening in its walls. There may be thus H. of the brain, of the cornea, of the iris, of the lungs, &c.; but the term chiefly designates protrusions that occur in the abdomen. H. most frequently occurs at parts where the muscular and tendinous structures are weakened by natural passages, as the spermatic cord in the male, the round ligament in the female, and the large vessels to the lower extremity, constituting crenal and inquinal H. The umbilicus, the thyroid pramen, the sciatic notch, the vagina, the perineum, the muscular parietes of the abdomen, the diaphragm, &c., may be the seat of H., which is invariably composed of a *sac* and its *contents*, the sac being the prolongation of the Peritoneum (q. v.), which overlies the aperture through which the H. protrudes, and the contents being, most frequently, a portion of the small intestine, more particularly of the ileum, constituting the form of H. called *enterocele*. When intestum and Omentum (q. v.) are found in a H. it is called *entero-epiplocele*, but when omentum alone, *epiplocele*. Intestinal H. is smooth, gurgling on pressure, and conveys a well-marked impulse on coughing. Omental H. is soft, doughy, irregular in outline, and conveys no impulse on coughing. H. may be congenital, and in Africa, where no artificial support by bandage is afforded, umbilical H. is almost universal. H. generally appears in consequence of some forcible effort, and men are more liable to the disease than women. When a H. may be readily pushed back into the abdomen it is called *reducible*; otherwise it is *irreducible*, and may be *strangulated*. A reducible H. is best treated by the application of a truss to retain the protrusion within the abdomen, and various means have been adopted for the radical cure of H. Irreducibility of H. may depend on its shape, on the existence of adhesions, or on the nature of its contents. Strangulation is probably, in all cases, the result of congestion of the protruded parts, induced by the constriction to which they have been subjected, which, unless speedily removed, may terminate in gangrene. Irreducibility is a serious affection; but strangulation is of the gravest import, and frequently necessitates a

surgical operation. In such cases purgatives should never be administered by the mouth, but enemata often afford relief, and so also the hot bath, inhalation of chloroform, and, in certain cases, blood-letting to the verge of faintness.

He'ro, according to the famous Greek story, was a priestess of Aphroditê in Sestos, on the coast of Thrace, and was beloved by Leander, a youth of Abydos. As his union with H. was forbidden by her parents, he nightly swam the Hellespont to visit her, guided by a torch which H. held on the top of a tower. One stormy night the light was extinguished, and Leander was drowned. Next morning, when his body was washed ashore, H. saw it, and in despair threw herself from her tower into the sea. The legend has been told by Musæus, Statius, Virgil, and Ovid, but the most beautiful version of the tale is that in Marlowe's *H. and Leander*. Schiller has a fine ballad on the same subject.

Hero, or **Heron**, of Alexandria, a Greek mathematician, was a pupil of Ctesibius, and flourished from 284 to 221 B.C. He displayed a remarkably inventive genius, and constructed several philosophical toys. The most interesting were his *fountain*, in which a jet of water was projected upwards by the action of air, itself compressed under water; and his *eolipyle* or steam-engine, which consisted of a spherical vessel filled with boiling water, and perforated in such a way that the escaping steam forced it to rotate exactly like a Barker's Mill (q. v.). His most valuable extant work is his *Pneumatica*, which describes the above and other inventions; but besides that, there have come down to us fragments upon the construction of darts, military instruments, and automata. H.'s works are published in the *Mathematici Veteres* (Par. 1693).

Her'od the Great, the second son of Antipater, an Arabian, was made Governor of Galilee at the age of fifteen (B.C. 47), and soon after of Cœle-Syria. In B.C. 41, H. and his brother Phasael were appointed by Antony tetrarchs of Judæa. But next year, on the invasion of the Parthians, he had to flee to Rome, where he was appointed by the Senate King of Judæa, a dignity in which he was established by Octavian (B.C. 31) after the conclusion of the civil war. His reign was on the one hand distinguished by great magnificence, and on the other disgraced by innumerable acts of horrid cruelty. He built a temple at Samaria, and a number of new towns altogether, and adorned Jerusalem with many fine buildings. His great work, the restoration of the temple there, which was begun B.C. 20, although the mere temple was finished in a year and a half, was not completed at his death B.C. 4. All this munificence was but a poor offset to his bloodthirsty jealousy, through which a vast number of the people—high and low, young and old—lost their lives. His own relations even—*e.g.*, his wife Mariamne, her grandfather and two sons, and his own son Antipater—were not spared. The Evangelist Matthew gives an instance of his cruelty not recorded by Josephus, of the slaughter of the boys in Bethlehem under two years of age (Matt. ii. 16).—**H. Antipas**, son of the above, succeeded on his father's death to the tetrarchy of Galilee and Peræa. He married first a daughter of Aretas, King of Arabia Petræa, but afterwards Herodias, the wife of his half-brother, Herod Philip. In A.D. 38 he went to Rome to try to get for himself the title of king, but instead he was condemned to perpetual banishment at Lugdunum (Lyon), and died in Spain. See also AGRIPPA HEROD.

Herod'otus, the most ancient Greek historian, properly so called, hence styled the 'Father of History,' was born at Halicarnassus in Caria, 484 B.C. According to Suidas he was the son of Lyxes and Dryo. Regarding his youth and upbringing we have no certain information; but it seems that he early formed the idea of travelling and of writing history. Unable to bear the tyranny of Lygdamis, ruler of Halicarnassus, he is said to have emigrated to Samos, where he acquired the Ionic dialect. After a time he returned to his native place, and assisted in delivering it from the rule of the tyrant. H. afterwards withdrew to Thurii in Italy, where he finally settled. This fact is one of the best attested in the life of H., but the date of it is uncertain. Where H. composed his great work is also a disputed point. According to Lucian—an untrustworthy authority—he wrote it at Halicarnassus; according to Suidas, in Samos; according to Pliny, at Thurii. Lucian says that H. read his history during the Olympic games, and that it was received with unbounded applause. He adds that Thucydides—then a mere boy—was present, and was moved to tears by the recital. This would fix the time at about 456 B.C. H. would then be about twenty-eight years of age. Now, it is simply incredible that H. could have finished his travels and his history at that early age. Moreover, the historian alludes to events of much later date than the year referred to. Lucian's account, as has been ably shown by Dahlmann, must, therefore, be treated as a mere invention. Plutarch, moreover, would not have ignored the fact. The statement of Dio Chrysostom that H. read his history to the Corinthians is probably equally groundless. The averment of Suidas rests on no better foundation. The only reasonable theory is that the work was written, as Pliny says, at Thurii, during the old age of H. The abrupt termination of the work, moreover, goes to prove that it was the production of the writer's later years, and that death alone prevented its completion. The preparations which H. made in order to write his great work were enormous. He visited Greece proper and the coasts of Asia Minor. Samos, Athens, Corinth, and Thebes were surveyed by him with special attention. The great battlefields of Greece were visited and studied, and the route of Xerxes and his army from the Hellespont to Athens closely followed and mastered. He visited the isles of Greece—in the Ionian and Ægean alike—sailed through the Hellespont, Propontis, and the Euxine, and visited Thrace and Scythia. He traversed Lydia, Phœnicia, and Egypt. Indeed, his contributions to the history of the last-mentioned country are beyond anything done in ancient times, and even now they rank with the achievements of modern explorers. From Egypt he made excursions to Arabia and Libya. Whether or not he went to Carthage is not clear. He visited Palestine, saw the Euphrates and the Tigris, and the city of Babylon, and pushed northward to Ecbatana. Susa was perhaps the limit of his travels in this direction. The Greek settlements in Italy and Sicily seem to have been pretty well known to him, but, on the whole, his knowledge of Western Europe was meagre. But not from his travels alone did H. draw his inspiration. He knew Homer and Hesiod by heart. He was acquainted also, though perhaps in a less degree, with Alcaeus, Sappho, Æschylus, Pindar, and others. From these he drew his literary culture; the sources of his knowledge and actual humanity were his own observations and experiences.

The object of the great work of H. was to relate the struggle between the Greeks and Persians. Had this been the sole ground covered by his writings, the achievement would have been great indeed; but the value of his work is immeasurably enhanced by the interesting digressions and episodes which he has interwoven into his narrative. For these the reader must go to the history—the nine books of which bear the names of the nine Muses. The dialect in which H. wrote is Ionic intermixed with Epic, Doric, and Attic forms. The simplicity, vigour, and charming style of his narrative have never failed to delight his readers, while his reverent spirit has ever secured their admiration and respect. As an observer he was quick and shrewd; as a historian, thoroughly honest and faithful; and many of his statements that have been scouted as absurd have been shown, by the light of modern travel and discovery, to be strictly accurate and true. According to Suidas, H. died and was buried at Thurii, 408 B.C. The first edition of his history appeared in a Latin translation by Laurentius Valla at Venice (1474). The first Greek edition is that of Aldus Manutius (fol. Venice, 1502). The editions of Schweighäuser (6 vols. Stras. and Par. 1806), of Garsford (4 vols. Oxf. 1824), of Bähr (Leips. 1830–34), and of Müller (Par. 1844) may be mentioned; but the best English edition, with copious notes, is the conjoint work of Canon Rawlinson, Sir H. Rawlinson, and Sir G. Wilkinson (4 vols. Lond. 1858–60).

Hero'ic Verse is a name given by the ancients to their Hexameter (q. v.) verse, because it was used to celebrate the deeds of heroes, as in the *Iliad* of Homer and the *Æneid* of Virgil. The phrase has been transplanted into English, where it denotes decasyllabic or Iambic pentameter verse, in which most of the great English poetry, dramatic and non-dramatic, has been written.

Her'on' (*Ardea*), a genus of *Grallatorial* or Wading birds included in the sub-family *Ardeinæ*, the members of which have a long, sharp bill, the gape extending to beneath the eyes, and the nostrils, guarded by a membranous scale, existing in a lateral groove. The tail is short, and the legs extend behind in flight to compensate for the want of the tail, and thus act as an

aerial rudder. The second and third quills are the longest, and the outer toe is longer than the inner. The common H. (*Ardea cinerea*), also named the grey H., is now scarcer than it used to be. It inhabits swampy places, and feeds on slugs, snails, frogs, and lizards. Its colour is a slaty grey on the upper parts, the primary quill-feathers being black. The breast and under parts are of a lighter tint, the throat and neck white, while the long plume of feathers extending behind the head is grey. The average length is 3 feet. The egret or white H. (*A. egretta*) is found in the New World. It attains a length of 4 feet, and is pure white in colour, the tail being of a yellowish tint. The long feathers are much in request for the manufacture of plumes. The purple H. (*A. purpurea*) is a rare species. The night herons belong to the genus *Nycticorax*, the familiar species being the *N. Gardeni*; others are the *N. Europæus*, and the Australian or Nankeen night H. (*N. Caledonicus*). The latter is of a cinnamon-brown hue.

Heroph'ilus, a Greek physician, was a native of Chalcedon in Bithynia, and settled at Alexandria under the first Ptolemy (q. v.). Physiology and anatomy were his favourite pursuits, and the latter he prosecuted with such ardour as even, it is said, to dissect criminals alive. Of the works of H., who was one of the chief founders of medical science in Alexandria, only a few fragments remain, which have been published by Marx, *De Herophili Vita*, &c. (Gött. 1840).

Heros'tratus, an Ephesian who, through desire to make his name immortal, set fire to the renowned temple of Artemis (Diana) at Ephesus in 356 B.C. He was put to death; but one of the Ionian cities, decreeing that he should be consigned to perpetual oblivion, thereby only gave rise to the proverb 'Herostratic celebrity.' On the night of the deed Alexander the Great was born, and the ancients believed that Artemis had been unable to defend her temple only because her presence as Lucina was necessary at Alexander's birth.

Her'pes is an affection of the skin, characterised by an eruption of clusters of vesicles on an inflamed base, rarely lasting more than two or three weeks, and generally unaccompanied by constitutional disturbance. Each vesicle runs a course of about ten days, and terminates in desquamation. The varieties of H. depend on the form and arrangement of the clusters, or on their locality; thus the *phlyctenoid* group is irregular in the form and distribution of its clusters, while the *circinate* group has its clusters disposed in a circular form. The itching, pricking, smarting, and intense burning heat is relieved by emollient ointments, as the benzoated oxide of zinc, glycerine, or a weak lotion of acetate of lead, and by the internal use of ferri arsenias. According to Dr. Tilbury Fox, *H. circinatus* is a parasitic disease, the fungus being the *Trichophyton tonsurans*. See *Parasitic Skin Diseases* (Lond. 1863).

Herre'ra, Antonio, a Spanish historian, was born at Cuellar in 1549, passed his youth as secretary to Gonzalo, viceroy of Navarre, was appointed by Philip II. 'historiographer of the Indies and Castile,' and died at Madrid, 29th March 1625. The historical writings of H. are numerous and important; and his fairness, accuracy, and industry render him a valuable authority on a most interesting period of Spanish history. Chief among his works is the *Historia General de los Hechos de los Castellanos en las Islas y Tierra Firme del Mar Oceano* (Mad. 1601-15). The first two volumes contain the famous *Descripcion de las Indias*. Besides these may be mentioned his *Historia del Mundo en el Reynado del Rey D. Felipe II.* (3 vols. Mad. 1601-12), and also the *Historia de Portugal* (Mad. 1591).—**Ferando de H.**, a Spanish poet, was born at Seville in 1534, and died in 1597. He was in orders, but that did not prevent him from writing much poetry of a decidedly amorous character. His countrymen conferred on him the title of 'Divine,' and his odes, founded on the Pindaric model, display undoubted genius; that on the *Battle of Lepanto* and the *Ode to Sleep* being particularly fine. His *Obras en Verso* were published at Seville in 1582, and republished in the *Coleccion* of Fernandez (Mad. 1786, new ed. 1808). H. was also the author of a historical work, the *Relacion de la Guerra de Chipre* (Seville, 1572).—**Francesco H., El Viejo** ('the elder'), the most distinguished painter, with the exception of Pacheco, of the school of Seville, was born in that city in 1576. He speedily became noted both for frescoes and easel pictures, excelled also as a graver in bronze, and probably from this circumstance was accused of having coined false money. In 1650 he left Seville for Madrid, and lived there in high repute till his death in 1656. Among his great works, of which there are many specimens both at Seville, Madrid, and in the Louvre, may be named the gigantic 'Last Judgment' in the church of San Bernardo, Seville; the 'Descent from the Cross,' 'Effusion of the Holy Spirit,' and 'Holy Family,' in the church of Santa Inez, Seville; and his decoration of the convent of La Merced. His style is marked by boldness of execution, freedom in colouring, and a thorough mastery of technique.—**Francesco H., El Mozo** ('the younger'), son of the preceding, was born at Seville in 1622, studied under his father, and worked as an architect and fresco-painter at Rome. After the death of his father H. returned to Seville, and followed his art till his death at Madrid in 1685. His chief paintings are at Seville, Madrid, and the Escorial. Among them are the 'St. Francis' in the Seville cathedral, and the 'Ascension of the Virgin' at Atocha.

Herr'ick, Robert, an English poet of good family, was born in Cheapside, London, in August 1591, and educated at St. John's College, Cambridge. After spending a wild youth in his native city, he took orders in 1629 at the mature age of thirty-eight, and was presented to the living of Dean Prior in Devonshire, from which he was ousted by the Puritans in 1648, but replaced at the Restoration. He died 15th October 1674. The work which will keep green the memory of H. is the *Hesperides*, so called because it was composed in the *West* of England. It is a medley of love-lyrics, epigrams, pictures of rural scenery, pastimes, &c. There is a vast deal of rubbish in the collection, and at times a low sensuality defiles the verse, but some of the songs for dainty tenderness of sentiment, artless beauty of language, and joyous music with an undertone of sadness, have no peers in the English tongue. The pieces entitled *Noble Numbers* show that H. was not unvisited by higher emotions than those that spring from love or wine. See *The Complete Works of Robert H.*, by the Rev. Alex. B. Grosart (Lond. 1876).

Herr'ing (*Clupæa harengus*), a well-known species of *Teleostean* fishes, forming the type of the family *Clupæidæ*, which is included in the *Malacopterous* ('soft-finned') sub-order of the class. In this genus the ventral fins are abdominal in position, the body being covered with very large and distinct scales. One dorsal fin only exists, and the abdomen is sharply ridged or 'keeled.' The body is much compressed and of elegant shape, and the teeth are of very small size. The H. is one of the most valuable of fishes, and affords employment to large numbers of men and boats in its fishery. It appears to inhabit deep water during the greater part of the year, but in autumn and winter approaches the shore to spawn. Vast shoals visit the British coasts at the spawning season, and are caught with nets. The H. cannot live out of the water; it dies almost immediately on being taken from its native element. It has, however, been kept in confinement in the Brighton and other aquaria. The flesh is inferior to that of no other fish in delicacy, but the herrings of different localities undoubtedly vary greatly in their quality. Those of Loch Fyne on the W. coast of Scotland have perhaps the finest delicacy and flavour, and certainly the highest reputation. The H. is a somewhat uncertain fish in its movements; occasionally shoals appear round the British coasts in such numbers that the beach has been strewed with them; in other years, again, the H. almost vanishes from British shores. Probably the cause of the plenty or scarcity of the H. depends very greatly upon the prevailing *temperature*. The facilities for railway transport have largely extended the sale of the H., and herrings caught in the N. of Scotland now reach the London market twelve or fourteen hours later.

The name H. is given to fresh-water fishes such as *Coregonus* (q. v.); and an allied species, the *C. Leachii*, is common in winter round the coasts of Britain.

Herring Fishery is by far the most important maritime industry, yielding a much greater addition to human food than any other, and probably not much less than the whole produce of the other sea-fisheries. Although the herring does not appear to have been known to the Greeks and Romans, there is evidence that the fishery was prosecuted in the 10th c. At particular seasons in the year the herring approaches in vast shoals certain coasts of the N. Atlantic, over which it is found widespread. Thus the H. F. is prosecuted off the Newfoundland and Nova Scotian

coasts of America, off the coasts of Norway, in the North Sea, and around the shores of the British Islands. In Norway the H. F. has been regarded as an important source of national wealth for many centuries, and among the Dutch, who prosecute the fishery in the North Sea, it is distinguished as the 'great fishery,' while whaling is spoken of as the 'little fishery.' In the early part of this century the Dutch fishery was most injuriously affected by the Revolutionary wars, and at that period the H. F. sprung into great importance as a British industry. In Scotland especially it has continued to grow in importance with great steadiness and rapidity, till it now annually yields an inconceivably great amount of human food. The whole quantity cured in Great Britain in the year 1811 was 91,827 barrels; in 1875, around the Scottish coasts alone, there were cured 942,980 barrels, while in the preceding year the barrels cured slightly exceeded 1,000,000. Allowing a low average of 750 fish to each barrel, there were thus cured in Scotland alone, in 1874, more than 750,000,000 herrings, but that number probably does not represent half the total catch, as immense quantities were sold and consumed fresh, or otherwise disposed of.

H. F. is carried on during the night by means of drift nets, which are 'shot' out from the boats, in situations where the shoals are supposed to be. The nets depend from the surface downwards, like long meshed walls, being kept afloat by cork floats attached to the upper edge. The legal size of mesh for herring nets is one inch from knot to knot, but beyond the three mile coast-line a smaller mesh may be used. The herrings in their progress through the water push their heads through the meshes, but are unable further to squeeze through, and the twine catching in their gill-covers prevents them from drawing back. Trawling, or the use of the seine net, is common in the sea lochs of the W. coast, and is the occasion of much controversy. The fish taken, according to their condition, are classified as 'maties,' or herring with milt and roe not fully developed, 'full' fish, and 'spents.' The H. F. is open all the year round, but the great Scottish harvest begins about Stornoway in June, and gradually it comes round and southward on the N.E. coast from the early part of July. It does not reach Yarmouth till October, and on the S.W. English coast it begins in December. As the fishery thus occurs at different dates at the various stations, the boats and various classes of persons employed follow it from station to station, and thus secure more than one herring harvest. The great Scottish centres of the industry are Stornoway, Wick, Fraserburgh, Peterhead, and Aberdeen, at which 1200, 730, 900, 730, and 300 boats respectively are employed during the season. Further statistical and other information will be found under FISHERIES.

Herrings, King of the. See CHIMÆRA.

Herr'ison (Fr. *hérisson*), in heraldry, the hedgehog borne as a charge by the families of Herres, De Heriz, or Harris, and Speechly.

Herrn'hut, the cradle and the headquarters of the *Herrnhuter* or Moravian Brethren, founded by them in 1722, is a village of nearly 1000 inhabitants in Saxony, about 35 miles E. of Dresden. The cleanliness and orderliness of the place are remarkable. Noteworthy among the larger buildings are the two meeting-houses and the four institutions in which widowers, widows, unmarried brethren and sisters are respectively lodged. The articles made by the brethren are sent far and near, being chiefly cloth, leather-work, paper, and candles. See MORAVIANS.

Her'schel, Sir William, D.C.L., F.R.S., &c., a famous astronomer, was born in the town of Hanover, Germany, November 15, 1738. His father was a musician, and he and his four brothers were trained to the same profession. Towards the close of 1757 he came to England as an oboe-player in the band of the Hanoverian Foot-guards, which he soon left for more lucrative appointments. In 1766 he became organist at Halifax, and later in the Octagon Chapel at Bath. From his early years his mind had a philosophical turn, and astronomy was ever a favourite study. About 1770, not having the means to purchase a telescope of sufficient power, he set to work to construct one. In 1776 he completed a Newtonian telescope five feet in focal length, with which he observed Saturn's rings and Jupiter's belts and satellites. In 1781 he discovered the planet Uranus (q. v.), which he at first mistook for a comet. This discovery carried his fame far and wide, and obtained for him a Government salary of £400 per annum. Thereafter he devoted himself wholly to astronomical research, settling for the remainder of his life at Slough, near Windsor. He catalogued double, triple, and multiple stars, nebulæ and clusters, and investigated the motion of our system among the fixed stars and its position with respect to the Milky Way. On January 11, 1787, he discovered the second and fourth satellites of Uranus, and sighted the rest of the six between 1790 and 1800. His great 40-foot telescope was begun in 1785, and completed August 27, 1789, on which evening H. by its aid discovered the *sixth* satellite of Saturn, and the discovery of the *seventh* followed in a few weeks. It is impossible here to give even a catalogue of his researches and discoveries, which were published in the *Philosophical Transactions*, and in the *Transactions of the Astronomical Society*, of which he was elected the first president in 1822. Perhaps his most remarkable labours are his *star-gauging*, his investigations into the motions of binary stellar systems, his researches among nebulæ, his observation of the revolution of Saturn's ring and of Jupiter's satellites, and his discovery of spots in the polar regions of Mars. He was a member of numerous scientific societies both at home and abroad, was knighted in 1816, and died at Slough, August 25, 1822.—**Caroline Lucretia H.**, sister of the preceding, was born at Hanover, March 16, 1750. In 1772 she came to England, followed for the first ten years the profession of a singer and player at concerts, and proved throughout a most valuable assistant to her brother in his life-labours. At his death, in 1822, she returned to Hanover, where she died, January 9, 1848. She drew up a *Catalogue of Stars* (1798), discovered eight comets, and wrote several memoirs, which appear in the *Proceedings of the Royal Society* of London. She received a pension from George III., and was elected an honorary member of the Royal Society—an honour which has been conferred on only one other lady, Mrs. Somerville. The *Memoirs and Correspondence of Caroline H.*, edited by Mrs. John H. (Lond. 1876), give an almost complete biography of Sir William himself.—**Sir John Frederick William H., Bart., F.R.S.**, the only son of the eminent astronomer, and himself one of the foremost of European scientists, was born at Slough, March 7, 1792. He graduated at Cambridge in 1813, coming out as Senior Wrangler and first Smith's Prizeman. During the years 1821-23, he worked with Sir James South in making observations of the positions and distances of stars, and published his results in the *Philosophical Transactions* for 1824. For the next eight years he followed in the footsteps of his father, and drew up a catalogue of 2300 nebulæ, 525 of which he had himself discovered. In 1834, he established, at his own expense, an observatory at the Cape of Good Hope, and began a regular course of 'sweeping' the heavens, which he continued till 1838. His valuable results were published in a separate form in 1847. On his return to England he was received with every possible honour, was created a baronet at the Queen's coronation, made a D.C.L. of Oxford in 1839, and elected an honorary and corresponding member of almost every scientific association on the Continent. In 1848 he became President of the Royal Astronomical Society, and two years later he was appointed Master of the Mint, a post which he resigned on account of failing health in 1855. He died at Collingwood, near Hawkhurst, Kent, May 11, 1871. As an author he ranks high among men of science. He wrote the articles *Isoperimetrical Problems* and *Mathematics* in the *Edinburgh Encyclopædia*, *Meteorology* and *Physical Geography* in the *Encyclopædia Britannica* (8th ed.), and *Sound* in the *Encyclopædia Metropolitana*. The last three have been published separately. Of his larger works, we have a *Treatise on Light* (1831); *Preliminary Discourse on the Study of Natural Philosophy* (*Lardner's Cyclopædia*, 1835); and for the same series, a *Treatise on Astronomy* (1836), which grew into the larger and more complete *Outlines of Astronomy* (1849); *Instructions for Making and Registering Meteorological Observations at Various Stations in Southern Africa* (1844); and *A Manual of Scientific Inquiry, prepared for the Use of Her Majesty's Navy, and adapted for Travellers in General* (1849).

Hers'feld, a town in the province of Hessen-Nassau, Prussia, on the Fulda, in a hilly region, 40 miles S.S.E. of Kassel by railway. It has manufactures of woollen stuffs, serge, &c. Its cathedral of the 12th c. was partly destroyed by the French in 1761. Pop. (1875) 6537.

Hert'ford ('the hart's ford'), the chief town of the county of the same name, England, on the Lea, 26 miles N. of Lon-

don by railway. In its castle, now a residence of the Marquis of Salisbury, Queen Elizabeth several times held her court, but only a small part of the original building exists. H. has a branch of Christ's Hospital, a large county-hall, a corn-exchange, an infirmary, besides iron-foundries, malt-houses, breweries, flour and linseed mills, &c. In the vicinity are brickfields, limekilns, rose-gardens, and nursery grounds. Pop. (1871) 7896. A national synod was held here as early as 673. The town sends two members to Parliament.

Haileybury College, a large classical structure 3 miles from H., was formerly a training college of the East India Company, but is now converted into a public school with about 500 pupils.

Hert'fordshire, or **Herts**, a county of England, lying between Middlesex and Cambridge. Area, 611 sq. miles; pop. (1871) 192,725. It has an undulating, well-wooded surface, and is sheltered in the N. by low offsets of the Chiltern Hills. The Lea and Colne, its chief waters, are branches of the Thames. Its formation is mainly Cretaceous, except in the S., where it is Tertiary. The climate is mild, and the soil a fertile loam mixed with flints. In 1875 there were 152,011 acres under corn crops, 44,337 under green crops, and 93,568 in pasture; 13,625 horses used solely in agriculture, 32,442 head of cattle, 188,040 sheep, and 30,650 pigs. The chief products are wheat, barley, turnips, hay, straw, apples, pears, and cherries. H. sends fruit, flowers, and vegetables to the London market, and its roses are seldom surpassed in the great horticultural shows. Among its industries are malting, strawplaiting, and papermaking. It returns three members to Parliament.

Herto'genbosch ('the duke's forest'), or simply **Den Bosch**, the Dutch name of Bois-le-Duc (q. v.).

Hertz, Henrik, born of Jewish parents, 25th August 1798, at Copenhagen, one of the greatest of recent Danish poets, who from his earliest years showed a love for poetry. Becoming a student at Copenhagen in 1817, he greatly distinguished himself in æsthetics and law, and graduated in the latter in 1825. In 1827 appeared his first work, *Hr. Burckhardt og hans Familie*, a comedy, followed by *Kjærlighed og Politi*, *Flyttedagen* (1828), *Arvingerne* (1829), *Amors Genistreger* (1830). In 1830 he also wrote *Gjengangerbrevene*, whose ripe and tasteful criticism decided the controversy between Heiberg in 'Soranerne,' in favour of the former. In 1832 he cast off anonymity for the first time, and the year after travelled at the public cost in Germany, Italy, Switzerland, and France. From 1836 to his death, 25th February 1870, H. wrote with great activity a large number of character-comedies, which have essentially contributed to form Danish taste and strengthen a love for the stage. *Kong Renés Datter* (Ger. trans. by Leo, 10th ed. 1869), *Scheik Hassan* (Ger. trans. by Baudissin, 1861), *Sparekassen* (1836), the great romantic tragedy *Svend Dyrings Huus*, *Svanehammen*, *Indqvarteringen*, *Ninon*, *Tonietta*, *De Deporterede*, *Den Yngste*, and *Besöget i Kjöbenhavn* are best known. In poetry H. is a master of the erotic lyric. His narrative poems, and his larger novelistic pictures in verse, *Stemninger og Tilstande*, *De Frifarvede*, *Eventyr og Fortællinger*, *Johannes Johnsen*, have been very popular. In 1850 he collected his *Digte fra forskjellige Perioder*, and in 1853 his *Dramatiske Værker*.

Her'uli, or **Er'uli**, a Teutonic people, who seem originally to have dwelt in Scandinavia, and who, along with the Goths, invaded the Roman empire in 262 A.D. Numbers of them afterwards joined Attila's host, and they formed the greater part of the armies with which Odoacer founded a kingdom in Italy in 476 A.D.

Herz, Henri, a distinguished pianist, born at Vienna, January 6, 1806, settled at Paris in 1816, and won considerable reputation by his *Air Tyrolien* and *Rondo alla Cosacco*. His execution as a pianist is marked by exquisite lightness and elegance, and his compositions for the piano have had a remarkable popularity. His fantasies on *Othello*, *Norma*, *Euryante*, &c., are very widely known.

Herzegovi'na, formerly a sanjak in the S.W. of the vilayet of Bosnia, European Turkey. Area, 6420 sq. miles; pop. 71,954. It is bounded W. by Austrian Dalmatia, and at two points by the Adriatic, N. and E. by Bosnia, S. by Montenegro, and contains the three divisions of Mostar, Trebinje, Plevlje. The surface is broken by the ramifications of the Dinaric Alps. In the E. the Dormitor rises to a height of 8000 feet. Along the W. there are stretches of waste and swamp, but the climate is warm, and Southern fruits flourish, while in the E. the woods and Alpine meadows resemble those of Bosnia. The chief river is the Narenta. Among the products are grain, tobacco, honey, wine, and figs. The pop., mostly of Slavic origin, comprised at the last census 29,472 Mohammedans, 23,492 Greek Catholics, 18,289 Roman Catholics, 459 Jews, and 677 Gypsies. The capital is Mostar, and other towns are Trebinje, Fotsha, Stolatz, and Kolashin. H. first appears in the 9th c. as a Servian dependency, the principality of Zachlum. It passed to the Ban of Bosnia in 1154, to Andreas of Hungary in 1197, and again to Bosnia in 1326. In 1440 the Emperor Friedrich conferred on Prince Stephen (*Kosaca*) the title of duke, and henceforth the territory was known as H. (or 'Duke's Land'), also as H. Sancta Saba, in recognition of its patron, St. Sebastian. H. was conquered by Mohammed II. in 1466, was long the battlefield of Moslem and Christian, and was finally ceded to Turkey by the treaty of Carlovicz in 1699. After being united to Bosnia since 1483, H. was made a separate division of Turkey in 1832. It revolted against the Porte unsuccessfully in 1737, 1851, and 1861, and was the original seat of the insurrection of 1875, which has ended in the emancipation of all Bosnia (q. v.) from Turkish rule. The Treaty of Berlin (July 1878) placed it under the military administration of Austria. See Forsyth's *Slavonic Provinces S. of the Danube* (Lond. 1876); and Evans's *Through Bosnia and the H. on Foot* (Lond. 1877).

Herz'en, Alexander, a Russian novelist and journalist, was born at Moscow, 25th May 1812. Hostility to the Imperial Government was the motive power of H.'s life; it brought about his exile to Siberia in 1854 while yet a student, and though suffered five years later to return to St. Petersburg, he did not renounce his Socialistic opinions. In order to remove him from the capital, H. was created member of the Council at Novgorod; but becoming possessed of considerable fortune in 1846, on the death of his father, he requested permission to travel. Obtaining this in the next year, he visited Italy, France, Switzerland, and England, and returned no more to his native country. At Geneva he established a free Russian press, from which issued translations into his native tongue of the writings of the chief European democrats, such as Mazzini and Louis Blanc, and also a newspaper advocating similar political views. H. died at Paris, January 21, 1870. Among his chief works are *Dilettantism in Science* (1842), *Whose is the Fault?* (1847), and *From the Other Side* (1850), *On the Development of Revolutionary Ideas in Russia* (1854), and *My Exile* (Lond. 1855).

He'siod, one of the earliest Greek poets, supposed to have flourished about the middle of the 8th c. He tells us in his *Erga kai Hemerai* ('Works and Days') that he was born at Ascra in Bœotia, and that his father was an emigrant from the Æolian Cyme, in Asia Minor. From a passage in his *Theogonia* he seems to have been a shepherd on Helicon, and to have won a first prize in a poetic competition at Chalcis. On his father's death he removed to Orchomenus, and there probably ended his days. The *Works and Days* is the earliest instance of Greek didactic verse, and marks the transition from heroic to ethical poetry in Greek literature. It resembles Homer's works in dialect, is homely in style, and paints the life of the *thetes* or common people. It abounds in doleful and even fretful lamentations, but contains several rural pictures touched with quiet soothing beauty. The *Theogonia* gives a genealogy of gods and heroes, and is much less interesting than the *Erga kai Hemerai*. Its genuineness as a work of H.'s was questioned by the Greeks. In all likelihood H. has been accredited with parts of the compositions of a school of poets who lived near Mount Helicon, and the works attributed to him consist partly of his own writings, partly of alterations from earlier and of interpolations from later writers. The *Katalogoi Gynaikōn* ('Catalogues of Women'), now lost, is ascribed to H., but the extant fragment, the *Aspis Hēraklēos* ('Shield of Hēraklēs'), was probably part of it. The best edition of H. is by Göttling (Gotha and Erfurt, 1843).

Hesper'ides, the daughters of Night, or of Zeus and Themis, who inhabited, according to Hesiod, an island of the ocean on the western edge of the world. Their number is variously given as three (Ægle, Erytheis, Hesperia), four, and seven. They

were gifted with the faculty of song, and, along with the hundred-headed dragon Ladon, watched over the golden apples that Hera had as a wedding-present from Ge. The apples were brought by Hercules to Eurystheus, who gave them back to him, whereupon Hercules presented them to Athena, by whom they were restored to the *Garden of the H.*

Hess, the name of several distinguished painters.—1. **Karl Adolf Heinrich H.**, known chiefly for his success in painting horses, left many proofs of his skill in military subjects. He was born at Dresden in 1769, and died near Vienna, 3d July 1849.—2. **Peter von H.**, a painter of battle scenes, born at Düsseldorf, 29th July 1792, was the son of a famous engraver. He died 5th April 1871.—3. His brother, **Heinrich von H.**, devoted himself chiefly to historical subjects in his art. He was born 19th April 1798, became Professor in the Academy at Munich in 1827, and died 29th March 1863.

Hess'en, the name of an old German stock, in ancient times called the Catti or Chatti, which now peoples Ober-H. and Nieder-H., the land between the Neckar, Rhine, Main, Lahn, and Fulda, as far as the Grabfield in the S. and Thuringia in the E. Germanicus, the first who speaks of the Catti, destroyed their chief settlement of Mattium, near the present Gudensberg, in 15 A.D. In the following century the tribe lost its separate identity among the Franks, and after the general emigration to Belgium and Gaul, the Saxons, from Thuringia, pushed into part of the country subsequently called Sächs-Hessengau. In Frankish Hessengau and Oberlahngau several abbeys were established by St. Boniface (q. v.), and these portions were governed by grafs till the extinction of the direct Karling line, when Konrad, Graf of Franconia and H., and nephew of the Emperor Arnulf, was elected King of the Germans in 911. Through marriage, H. and Thuringia were subsequently united, but the death of Heinrich Raspe (1247) was followed by a succession-war that led to the separation of the two principalities in 1263. Sophia, wife of Heinrich of Brabant, obtained H., and her son Heinrich I., surnamed the Child, became landgraf, with his residence at Kassel, and founded the Hessian dynasty. One of his descendants, Philipp I., the Magnanimous, introduced the reformed faith, applied the convent revenues to the establishment of Marburg University, and divided H. among his four sons at his death in 1567. Two of the sons died leaving the whole territory, divided as H.-Kassel (q. v.) and H.-Darmstadt (q. v.), to Wilhelm IV. and Georg I. See Landau, *Beschreibung des Hessengaues* (Kass. 1856; Teuthorn, *Ausführliche Geschichte der H.*, 11 vols. Frankf 1777–80); and Rommel, *Geschichte von H.* (10 vols. Gotha, 1820–58).

Hess'en-Darm'stadt, a grand duchy of Germany, consisting of two large and eighteen small parts detached from each other, and lying between Prussia, Bavaria, and Baden, and partly within the Prussian frontier. Area, 2963 sq. miles; pop. (1875) 882,349. H. is divided into three provinces, Starkenburg, Ober-Hessen, and Rhein-Hessen. It is rough and hilly in the N., where it is traversed by the Vogelsberg, and offsets of the Westerfeld and Taunus. In the S. the fertile valleys open on extensive plains, stretching away in the E. to the base of the Odenwald mountains. The principal rivers are the Rhine, Neckar, Main, Nahe, Lahn, Nidda, Edder, and Wetter. The soil is rich and well cultivated, yielding heavy crops of maize, wheat, flax, hemp, tobacco, and poppies, as well as the vine, figs, almonds, chestnuts, &c. H. produces about 120,000 hogsheads of wine yearly, of which the chief kinds are grown near Mainz, and Worms, and Bingen. Among the mineral products are iron, salt, coal (£138,300 yearly). Mainz and Offenbach are the great industrial centres, and the manufactures comprise machinery, cottons, linens, hosiery, paper, papier-maché, oil, chemicals, snuff, leather, carriages, &c. H. has one university (at Giessen), six gymnasia, ten *real-schulen*, two teachers' seminaries, and 1760 *volks-schulen*. In 1875 the pop. comprised 584,391 Protestants, 239,088 Roman Catholics, and 25,373 Jews. H. is, by the constitution of 1820, a hereditary monarchy, and the legislature is vested in two chambers of representatives. But a council of state, and the four ministers of the administration, really transact the government business. The troops, forming the twenty-fifth division of the imperial army, are included in the eleventh army corps. The budget for 1876–78 gave the revenue at £1,127,206, and the expenditure at £1,014,728. In 1876 the public debt, chiefly for railways, amounted to £1,443,968. Besides the supreme court of appeal at Darmstadt, the capital, there are inferior tribunals at Mainz, Giessen, Offenbach, and throughout the country.

History.—Georg I., youngest son of Philipp the Magnanimous, founded H. in 1567, having received the upper grafship of Katzenellenbogen, including the town of Darmstadt, and later (1583) one-third of the dominion of his brother. His patrimony was divided among his three sons at his death (1596), the main line being continued in Ludwig V., while the youngest son, Friedrich, founded the junior line of Hessen-Homburg (q. v.). H. suffered severely during the Thirty Years' War, but prospered on the whole during the 17th and 18th centuries, gaining various additions of territory. Its debt was paid off by Ludwig IX., who left to his son, Ludwig X., a dominion with a pop. of 300,000 at his death in 1790. Ludwig X. joined the Confederation of the Rhine, and obtained from Napoleon large accessions of territory, and the title of grand duke (Ludwig I.) in 1806. He followed the fortunes of Napoleon consistently till after the battle of Leipsic, when he luckily changed to the side of the allies just in time. In 1814 he joined the German Confederation, and, by decision of the Congress of Vienna, made large cessions of his newly-acquired territory on the right bank of the Rhine (pop. 185,000) to Prussia, Hessen-Kassel, and Bavaria, but was granted as indemnity part of the old French department of Mont-Tonnère (with Bingen and Mainz), and most of the principality of Isenberg (total pop. 203,854). From the latter accession he assumed the title of Rhenish grand duke. The original constitution of 1820 was met by a storm of opposition, and as year by year the clamour went up for reforms, they were granted tardily. Ludwig I. died in 1830, and his grandson, Ludwig III., who ascended the throne in 1848, concluded a special military convention with Prussia in 1867, by which the army of H. became part of that of the N. German Confederation. As such it took part in the Franco-Prussian war of 1870. See Walther, *Handbuch für Geschichte und Landes-Kunde von H.* (Darms. 1841); Steiner, *Geschichte des Grossherzogthums H.* (5 vols. Darms. 1833–34); Buchner, *Das Grossherzogthum H. in seiner Polit. und Socialen Entwickelung* (Darms. 1850).

Hess'en-Hom'burg, a former langrafdom of Germany, was founded by Friedrich, grandson of Philipp the Magnanimous, in 1596. It lay in the basin of the Rhine, and was divided into the provinces of Homburg and Meisenheim, having an area of 105 sq. miles, and a pop. (1861) of 26,817. It received the addition of Meissenberg from the Congress of Vienna, and was admitted to the German Confederation in 1817. On the failure of the direct line, it reverted to Hessen-Darmstadt, March 24, 1866, and was ceded to Prussia, September 3, 1866.

Hess'en-Kass'el (*Kurhessen*, 'Electoral Hessen'), a German principality till 1866, with an area of 5943 sq. miles, and a pop. of 738,500, and since then part of the Prussian province of Hessen-Nassau. It belonged to the older line of the house of H., having been founded in 1567 by the landgraf Wilhelm IV., 'the Wise,' the eldest son of Philipp the Magnanimous. Moritz, son of Wilhelm, adopted the Reformed faith, and abdicated (1627) in favour of his son, Wilhelm V., who began the practice of hiring out Hessian troops, and was placed under the ban of the empire by siding with Sweden in the Thirty Years' War. Friedrich I. having succeeded to the Swedish throne as husband of Ulrike Eleonore, sister of Karl XII. (1720), he resigned H.-K. to his brother, Wilhelm VIII., who fought valiantly along with England and Hanover in the Seven Years' War. His son, Friedrich II., is chiefly remembered for joining the Romish Church, and for having hired to England, at a cost of £3,161,516 sterling, 22,000 of his mercenaries to fight in the American War of Independence (1776–84). He lived splendidly, and amassed an immense treasure. Wilhelm IX., his son and successor, frequently changed sides during the Napoleonic wars, and procured the elevation of H.-K. into an electorate in 1803. First acting as an ally of Great Britain and of Prussia, he then threw in his lot with Napoleon, but after the battle of Jena the French Emperor expelled him from H.-K., and merged his dominion in the new kingdom of Westphalia. In 1813, when the French power in Germany was overthrown, he returned with many fair promises of reforms, which were cancelled in the first moment of security. At the Congress of Vienna, to the great indignation of existing crowned heads, he strove hard to be made king, like the Electors of Saxony and Bavaria. He died in

1821, and in the reign of his son, the Elector Wilhelm II., the discontent of the Hessians increased, till it broke out in open revolt in 1830. The Elector abdicated (1831) in favour of Prince Friedrich Wilhelm, who only plunged H.-K. deeper into the quagmire of oppressive taxation and political intrigue. The French Revolution of 1848 frightened him into liberal concessions, part of which were carried out, but soon matters drifted back into the old channel; the hated Hassenpflug drew on himself the charge of treason; the Elector had to fly along with the Minister to Hanover and then to Frankfurt. The military intervention of the Frankfurt Diet procured the restoration of the Elector in 1850, but the conflict was resumed on the introduction of a new constitution in 1852. H.-K. was now little better than a despotism, and from 1834 to 1861 its population decreased nearly 7 per cent. In the Austro-Prussian war of 1866 it took the side of Austria, and was, according to the policy of Bismarck, incorporated with Prussia. Friedrich Wilhelm was carried as a prisoner to Stettin, but was set at liberty in 1867. See Röth, *Hess. Geschichte* (2 vols. Kass. 1855); Wippermann, *Kurhessen seit den Freiheitskriegen* (Kass. 1850).

Hess'en-Nass'au, a province of Prussia (since 1866), embracing old Hessen-Kassel, the duchy of Nassau, the landgrafdom of Hessen-Homburg, and the city of Frankfurt. Area, 5943 sq. miles; pop. (1875) 1,467,898. It lies between Bavaria and the province of Saxony, Hanover, Rhenish-Prussia, and Westphalia, and encircles the large northern portion of Hessen-Darmstadt. It is partly bounded in the W. by the Rhine, in the S. by the Main, and in the E. by the Weser, and has an extreme length from S.W. to N.E. of 175 miles. The surface is much diversified, is broken by the Westerwald, Taunus, Rhöngebirge, and other ranges, and is watered by the Lahn, Fulda, Kinzig, &c. The soil is fertile, and there is much agriculture, cattle-rearing, and vintaging. H. yields about 45,000 hogsheads of wine yearly; among the kinds specially famous are Rüdesheimer, Johannisberg, and Hochheimer. Its manufactures are cloths, yarn, iron, jewellery, pottery, leather, chemicals, brandy, &c.; and its minerals are iron, coal, silver, copper, and marble. H. is the richest part of Germany for mineral springs, having 125, of which the most celebrated are those of Wiesbaden, Kronthal, Ems, Schlangenbad, Schwalbach, and Nieder-Selters. The chief town is Kassel.

Hess'ian Fly (*Cecidomyia destructor*), a dipterous insect inhabiting the United States, the larvæ of which are exceedingly destructive to corn crops. Wheat in particular suffers from its attacks. The adult fly is black, with dusky wings. Two broods are produced each year.

Hes'ychasts (from Gr. *hēsychazō*, 'I am quiet'), a community of monks at Mount Athos in the 14th c., who sought the extinction of all the passions by means of contemplation. A charge was brought against them before the Patriarch of Constantinople by Barlaam, an abbot there, who applied to them the epithets of Messalians (Aram. 'those who pray,' Ezra vi. 10), or Euchites (Gr. from *euchē*, 'a prayer'), the name of a mystical sect in the 4th c., and designating generally those who laboured to elevate the soul to God by prayer and contemplation, and of *Omphalopsychoi* (Gr. 'navel-souls'), from their practice of sitting a long time every day with their eyes fixed on their belly. In this posture, they boasted, a divine light, the same as that seen by the disciples at the Transfiguration on Mount Tabor, beamed forth upon them. They found an advocate in Gregory Palamas, and when the cause was tried in a series of councils from 1337 to 1351, the H. were acquitted and the Barlaamites condemned. See Mosheim's *Eccl. Hist.* (Reid's ed.).

Hesy'chius, a Greek grammarian of Alexandria, who lived about the end of the 4th, or, according to others, in the 6th c., author of a Greek lexicon, chiefly compiled from earlier writers, but of great value for literary and archæological information. The best edition is Alberti's, by Ruhnken (Leyden, 1746-66). —**H. of Miletus** lived about the beginning of the 6th c., and wrote *Onomasticon*, an alphabetical synopsis of the greatest learned men of Greece (ed. of Orelli, Leips. 1820); and a *Chronicon*, or universal history, from the Assyrian Belus to the year 518, which is now lost.

Heterocer'cal Tail, the name given by Agassiz to the tails of such fishes as possess the upper lobe greatly developed over the lower. Such a conformation is seen in the sturgeon, shark, dogfish, skate, &c. In these the spine extends into the upper lobe of the tail, to a greater or less extent. In the opposite condition—*homocercal*—in which the lobes of the tail are equal, as in the salmon, herring, &c., the spine does not extend to the tail-fin, but terminates with the body.

Heterogangliа'ta, Professor Owen's term for the sub-kingdom *Mollusca* (q. v.), suggested by the fact that the nervous masses or *ganglia* are scattered or disposed through the body in an irregular manner. Thus typically in molluscous animals one ganglion (*cephalic*) exists in the head, a second in the foot (*pedal*), and a third (*branchial*) in the neighbourhood of the heart and gills; these being connected by nervous or *commissural* cords. The term is employed by Owen in contradistinction to *Homogangliata*, applied to the *Articulate* or *annulose* animals, in allusion to the regularly-disposed nature and form of the nervous system.

Heterogen'esis, a name used synonymously with *Abiogenesis* or *Archebiosis*, and therefore indicating a belief in the origin of living organisms from non-living or inorganic matter, without the pre-existence of parent germs or organisms. See GENERATION, SPONTANEOUS.

Heterop'oda, a division of *Gasteropoda* (q. v.) represented by the genera *Carinaria*, *Firola*, *Atalanta*, &c., in which the shell is rudimentary or absent, the 'foot' being converted into a flattened ventral fin-like organ, while the animals are free-swimming and oceanic in habits. The H. are also known by the name *Nucleobranchiata*, the two included families being the family *Atalantidæ* and *Firolidæ*.

Het'man, or **At'aman**, the general of the Cossacks (q. v.), was anciently elected by the whole people, and possessed an absolute power of life and death. After the submission of the Cossacks to the Russian Government (1654), the office was left untouched, until in 1708 the effort of Mazeppa (q. v.) to make himself independent led Peter the Great largely to curtail its privileges. From that date the post remained unfilled till the election, in 1750, of Count Rasumowski, who received, however, a yearly sum of 500,000 roubles in place of the lands and taxes of his predecessors. The Ukraine hetmanship was finally abolished by the Empress Catherine; the H. of the Don Cossacks still retaining vestiges of authority. In Poland, also, there was (from 1581) an officer called *great H.*, appointed by the king. His power over the army was ordinarily unbounded, but wholly ceased when the king took the field. To him the army swore allegiance, and all prisoners and ransoms fell to him; but he might take no part in the national assemblies or kingly elections. His subordinate was called *field-H.* Both offices were abolished in 1702.

Heve'lius, Johannes, or **Johann Höv'elke**, a German astronomer, born at Danzig, January 28, 1611, studied at Leyden, and travelled from 1630 to 1634 through Holland, England, and France. In 1641 he built an observatory at his own house, where he observed a transit of Mercury in 1661, the first observed after Gussendi. He died January 28, 1687. H.'s chief works are *Selenographia* (1647); *Cometographia* (1668); and *Machina Cœlestis* (2 vols. 1673 79). His life was written by Westphalen (Königsberg, 1820), and by Seidemann (Zittau, 1864).

Heves', a village in the comitat of the same name, Hungary, 60 miles E. of Pesth, with a trade in hemp and flax. Pop. (1869) 5703.

Hex'achord, a series of six musical tones, having some historical, but no practical importance in music.

Hex'agon, a geometrical figure of six sides and six angles. The *regular* H. has its sides and angles equal, and if it is inscribed in a circle, each side is equal in length to the radius of the circle. This gives a simple method for describing a H. See Euclid's *Elements*, book iv. Of all figures which, when placed contiguously, completely occupy space, the H. contains the greatest area with a given perimeter.

Hexahe'dron is a solid figure bounded by six faces, and therefore includes the cube. The term is very much restricted to crystallography.

Hexam'eter (Gr. *hex*, 'six,' and *metron*, 'a measure'), the chief form of verse among the Greeks and Romans. It comprises six feet, which may be either dactyls or spondees, the last

being always a spondee, or at least a trochee, which the *arsis* or stress of the voice at the end of the verse makes virtually a spondee. When the fifth foot is a spondee, the verse is called *spondaic*. The H. was the verse in which the great classical epics—the *Iliad*, *Odyssey*, and *Æneid*—were cast. It has been employed in modern times in German and English poetry. Goethe, Klopstock, Eberhard, and Voss have written German hexameters with considerable success, but it is totally incompatible with the structure of English diction. The so-called English hexameters are slovenly, cumbrous, and unmusical; a 'tumbling metre,' having a totally different rhythm from that of Greek and Latin verse. The least unsuccessful attempt in recent English poetry to use the measure is Kingsley's *Andromeda;* Longfellow's *Evangeline* being neither truly dactylic nor spondaic, while Clough's *Vacation Ramble* can hardly be regarded as a serious attempt to obey the laws of the H.

Hexap'la (Gr. 'the sixfold') was an edition of the Septuagint (q. v.) prepared by Origen (q. v.) for the use of Christians unacquainted with Hebrew, so that they might know how far that translation, as it then existed, differed from the Hebrew text. The six columns of the work were occupied as follows:—(1) The Hebrew text in Hebrew characters; (2) the same in Greek characters; (3) the translation of Aquila (q. v.); (4) that of Symmachus (q. v.); (5) the Septuagint; (6) the translation of Theodotion. Passages in the LXX. not in the Hebrew he marked with an *obelisk*, and passages in the Hebrew not in the LXX. he supplied from the other translations, and marked them with an *asterisk*. Fifty years after Origen's death (beginning of 4th c.) this work was discovered by Eusebius and placed in the library of Pamphilus at Cæsarea. As there is no further trace of it, it probably perished when Cæsarea was destroyed by the Arabs, 653.

Hex'ham, a town of England, in the county of Northumberland, on the Tyne, 20 miles W. of Newcastle by railway. It is surrounded with orchards, nursery grounds, and market-gardens, and has beautiful remains of St. Wilfrid's monastery (674); a cruciform abbey church of 1113, rich in stone and wood carving, with a tower 100 feet high; and a townhall and exchange in Italian style, built in 1866. Besides glovemaking there is some tanning, brewing, and iron and brass founding. The Tyne is here crossed by a bridge of nine arches. Pop. (1871) 5331. H. is the *Hagustald* or *Hestaldesham* ('the place of priests'?) of the Angles. It was made a bishopric by St. Wilfrid in 674, was joined to Lindisfarne in 883, and eventually became part of the see of Durham. The Scots frequently plundered it, and in the vicinity was fought the battle of H. between Yorkists and Lancastrians in 1463.

Hey'lin, Peter, D.D., was born in Burford, Oxfordshire, November 29, 1600, and educated at Oxford, became (1629) chaplain-in-ordinary to Charles I., and was appointed to a number of livings, which, with his personal property, he forfeited on the King's execution. At the Restoration he was made subdean of Westminster, and died May 8, 1662. His works include an *Ecclesia Vindicata, or a Defence of the Church of England, Life of Bishop Laud, History of the Sabbath, Examen Historicum, Microcosmos,* a once popular description of the globe, &c.

Hey'ne, Christian Gottlob, a great German scholar, was born of very poor parents at Chemnitz, Upper Saxony, September 25, 1729. With difficulty he obtained an elementary education, and poverty still hampered him at Leipsic University. Appointed (1753) under-clerk in Count Brühl's library at Dresden, he was again unsettled by the Seven Years' War (1756–63). During his Dresden residence, however, he managed to publish an edition of *Tibullus* and of the *Enchiridion* of Epictetus, which at once placed the humble official in the front rank of German scholars. In 1763 he was made Professor of Eloquence at Göttingen University, chiefly on the recommendation of Ruhnken, who had recognised the high merit of his *Tibullus* and *Epictetus*. Here he remained till his death, July 14, 1812. Among his editions of the classics, in addition to the two mentioned, the chief are those of *Virgil* (1767–1803), *Pindar* (1774–98), and *Apollodorus* (1787–1803). Besides this, he accomplished an enormous amount of work, literary and academic. H. is regarded as the founder of a new epoch in classical study, from his penetrating insight and lucid exposition. See Heeren, *H.'s Biographie* (Gött. 1813), and Carlyle's eloquent and appreciative essay on the work.

Hey'se, Johann Christian August, a German grammarian, born 21st April 1764 at Nordhausen, Prussian Saxony, studied at Göttingen, and after holding various scholastic offices, finally became director of the gymnasium and girls' school in Magdeburg, where he died, 27th June 1829. He was author of *Theoretisch-praktische Deutsche Grammatik* (5th ed. 1838–49), *Deutsche Schulgrammatik* (21st ed. 1868), &c.—**Karl Wilhelm Ludwig H.**, a philologist, son of the preceding, born 15th October 1797 at Oldenburg; from 1819–27 was tutor in the family of Mendelssohn-Bartholdy (q. v.); in 1829 was appointed Professor of Philosophy in Berlin University; and died there, 25th November 1855. He wrote *Handwörterbuch der Deutschen Sprache* (3 vols. Magd. 1838–49), *System der Sprachwissenschaft* (Berl. 1856), &c.—His son, **Paul Johann Ludwig H.**, a favourite poet and novelist, was born 15th March 1830, at Berlin, and educated there and at Bonn. After a lengthened tour in Switzerland and Italy, H. settled (1854) at Munich, where he married, and has since resided. Among his numerous works may be mentioned *Ulrica* (1852) and *Thekla* (1858), epics; *Ludwig der Bayer*, *Colberg*, and *Die Sabinerinnen* (1859), tragedies; and *La Rabbiata* (1858) and *Mexaner Novellen* (1864), romances. A beautiful novelette of Ligurian coast-life by H. appeared in the *Rundschau* (Berlin) of January 1877.

Hey'wood, an industrial town of England in Lancashire, on the Roach, 8½ miles N. of Manchester by railway. It has extensive manufactures of cotton goods, iron, boilers, machinery, &c., and in the vicinity are large coal-mines. The town has grown rapidly. Pop. (1871) 12,824.

Hey'wood, John, surnamed the 'Epigrammatist,' was born (it is supposed) at N. Mims in Hertfordshire, and was educated at Oxford. He obtained the friendship of Sir Thomas More and of Queen Mary, but left England on the accession of Elizabeth, and died at Mechlin in 1565. H. is remembered in English literature as a writer of interludes or dramatic pieces of a satirical nature, intermediate both in point of time and character between the *Moralities* and the Elizabethan Plays. The best-known are *A Mery Play between the Pardoner and the Frere, the Curate, and Neybour Pratt* (1532), and *The Foure P.'s, a very Mery Enterlude of a Palmer, a Pardoner, a Potecary, and a Pedlar,* the date of which is unknown. Besides interludes, H. wrote some 600 epigrams, none of which exhibit a very deadly wit. H. was an ardent Catholic, and his two sons **Ellis** and **Jasper** both joined the Society of Jesus. Before entering on an ecclesiastical career they had given evidence of literary talent. Jasper became Provincial of the Jesuits of England, and died at Naples in 1598. He contributed to the *Paradise of Dainty Devices.*—**Thomas H.**, an Elizabethan dramatist, was a native of Lincolnshire, and was educated at Cambridge; becoming a Fellow of Peterhouse. We find him writing for the stage in 1596, and for upwards of forty years he was a most industrious and prolific author. He died about 1641. Twenty-three of his pieces are still extant. Among others may be mentioned *A Woman Killed with Kindness, The English Traveller, A Challenge for Beauty, Lancashire Witches, Rape of Lucrece, Love's Mistress, Joan as Good as my Lady,* &c. H. has a fine poetic fancy, enriched with classic memories that are sometimes too much for him; his humour is genuine, and his songs have a true lyric flow and dainty sweetness of sentiment.

Hezeki'ah (Heb. 'strength of Jehovah'), the son and successor of Ahaz, king of Judah, reigned twenty-nine years in Jerusalem (B.C. 726–697, 2 Kings xviii.–xx., 2 Chron. xxix.–xxxii.). Immediately on his accession he set himself to carry out a religious reformation, to abolish the idolatry which had been introduced by his father, to restore the true worship of Jehovah, and to restrict it to the temple at Jerusalem. As regards his foreign relations, the best critics are of opinion that the invasion in the fourteenth year of his reign (2 Kings xviii. 13, Isa. xxxvi. 1) was not made by Sennacherib, but by his father, Sargon, who in the tenth year of his reign (the fourteenth of H.) sent an expedition into Palestine and Egypt (Isa. xx. 1, Nah. iii. 8–10). Now, as H. was unmolested by this expedition, it is probable that he had not yet thrown off his allegiance to the king of Assyria. His famous illness (2 Kings xx., Isa. xxxviii.) must have taken place at this time also, as he was promised fifteen years to his life, and he only reigned twenty-nine

years. On his recovery ambassadors were sent by Merodach-Baladan, king of Babylon, and vassal of the king of Assyria, ostensibly to congratulate the king on his recovery, but also probably to form an alliance with H. for throwing off the Assyrian yoke. After Sargon was succeeded by Sennacherib (B.C. 702), H. made a league with Egypt (Isa. xxx., xxxi., *cf.* xxxvi. 6–9), and refused to pay the tribute which his father had agreed to pay to the king of Assyria in the time of Tiglath-Pileser (2 Kings xvi. 7). Sennacherib thereupon led an army against him, and took 'all the fenced cities of Judah' (2 Kings xviii. 13–16, Isa. xxxvi. 1), Jerusalem being saved only by H. giving him 'all the silver that was found in the house of the Lord, and in the treasures of the king's house.' After a futile expedition into Egypt, Sennacherib a second time invaded the dominions of H. (2 Kings xviii. 17, xix. 37, 2 Chron. xxxii., Isa. xxxvi., xxxvii.), in the twenty-eighth year of his reign (B.C. 698). Jerusalem was saved on this occasion by the death of 185,000 of the Assyrians in a single night (explained by some as caused by an attack of Tirhakah, king of Ethiopia, who had shortly before obliged Sennacherib to raise the siege of Pelusium in Egypt; by others ascribed to the pestilence), in consequence of which Sennacherib fled to Nineveh. At what period of the reign of H. his defeat of the Philistines (2 Kings xviii. 8) ought to be placed, we have no means of determining.

Hi'bernation is the state of torpor in which many animals—such as bats, bears, dormice, &c.—pass the colder months or season of the year. In addition to the mammals or warm-blooded animals just mentioned, almost all reptiles and amphibia pass the colder months in a hibernating condition, whilst some fishes (*e.g.*, the Lepidosirens, q. v.) may exemplify this habit. Some molluscs (*e.g.*, snails), and many insects appear to hibernate; the beetles presenting not a few examples of hibernating forms. According to Dr. Marshall Hall, hibernating animals present us with 'an ultimate faculty of assuming an augmented degree of irritability of the muscular fibre, a power possessed by all animals within certain limits, but by the hibernating animals beyond the usual limits.' Dr. Hall regards sleep as the physiological counterpart of H. H. according to him is a state of profound sleep; and ordinary sleep presents us with the initiatory stage of H. The influence of cold in inducing H. has been in all probability greatly exaggerated; this condition simply exercising an effect in producing sleep. H., although generally occurring during the winter season, is not absolutely confined to that portion of the year. Cuvier remarks that the Teurecs (q. v.) or Madagascar hedgehogs pass three months of the year in a lethargic condition, even although these animals inhabit the torrid zone. As regards the *physiological* or *functional* relations of the hibernating state, it may be noted that the respiratory movements, or those of breathing, are diminished from their general number and force. This result is just what physiology would lead us to expect. Frequency of respiration depends on, and at the same time contributes to, the maintenance of animal heat; and as the temperature sinks in H., the respirations must be less frequent in consequence. The *temperature* in hibernating animals usually sinks to within a few degrees above that of the surrounding media; and, with decreased respiration and temperature, we may reasonably believe that the blood becomes 'more and more venous,' and aids in inducing within the brain and nerve centres a state of torpor. In the hibernating animal the vital processes of the body sink to the minimum degree of activity, while some—such as digestion and sanguification in their ordinary aspects—may be entirely suspended. The *circulation*, as observed in the wing of the bat, is slow and inert; while the functions of the nervous system are limited to those *automatic* or *excito-motor* acts connected with respiration, &c. An interesting fact connected with the *nutrition* of the bodies of some hibernating animals is that these animals retire to their winter quarters provided with a due supply of fatty matters, while they appear in spring, after their sleep, in a meagre and lean condition. The body in such a case has been feeding on the nutritive stores laid up within its tissues.

Hiber'nia, Ibernia, Ivernia, Ierne, various forms of the ancient name of Ireland. *Hibernia* first occurs in Cæsar, the oldest form of the name being *Ierne*, which is found in Aristotle and in an old poem on the Argonautic expedition, which dates, probably, from about the 5th c. B.C. Pomponius Mela uses the form *Iverna*, Pliny *Hibernia*, Strabo *Ierne*, and Ptolemy *Ivernia*. All these are varieties of the native Celtic or Erse, *Erin* or *Eri*, the similarity of which to the Greek *hiera* led Avienus to describe it as the 'sacred isle.' Ptolemy alone of ancient authors gives an account of H., which he describes minutely and with tolerable accuracy. Many of the geographical names mentioned in Ptolemy, survive, *e.g.*, *Oboca*, Avoca, *Bargus*, Barrow, *Liboius*, Liffy, *Senus*, Shannon, *Eblana*, Dublin, *Nagnatae*, Connaught, &c. Although Agricola projected an invasion of H., the Romans never sought to conquer the island. Its inhabitants, the ancestors of the modern Irish, were Gaelic Celts, with probably an infusion of Iberians from Spain. The occurrence of the Teutonic name *Cauci* and the British *Brigantes* on the W. coast suggests the early presence of colonies from Britain and Germany. The *Scots*, who migrated from H. to what is now called Scotland, are first mentioned by Claudian.

Hibis'cus, a very large genus of *Malvaceæ*, the majority of which are natives of the tropics, though a few are found in temperate regions, and one species occurs in the S. of Europe. On account of their showy flowers, they are favourites with the gardener, *e.g.*, the variable *H. Rosa Sinensis* is a well-known ornament of our hothouses, and *H. Syriacus*, with its profusion of flowers, has long been cultivated as a hardy shrub in many parts of Britain. All possess the mucilaginous properties common to the order, and several are eaten in their native countries as potherbs, while their inner bark yields more or less fibre. Ambaree hemp or bastard jute is obtained from *H. cannabinus*.

Hicc'up, or Hicc'ough, consists of a convulsive catch of the respiratory muscles, attended with a peculiar sonorous sound, produced in the larynx, and followed by expiration. It most commonly occurs in paroxysms of varying duration, repeated at short intervals; the movements concerned in its production being spasmodic contraction of the diaphragm and constriction in the glottis. H. may be caused by irritation of the glottis, as from peppers; by gastric derangement, as from the prolonged use of alcohol, excessive acidity, and the ingestion of cold water; by emptiness or over-distension of the stomach, as in the case of infants during suckling; and is a frequent accompaniment of hysteria, dyspepsia, and certain diseases attended with great debility. A paroxysm of H. may sometimes be cut short by a strong mental effort, or by having the attention withdrawn from it by some other object; or the irritation, if slight, may be removed by swallowing cold water or small pieces of ice. In some cases opiates, antimonials, or diffusible stimulants, as ammonia or camphor, may be necessary.

Hickes, George, D.D., an English scholar and divine, was born June 20, 1642, at Newsham in Yorkshire, entered St. John's College, Oxford, in 1659, and in 1664 became Fellow of Lincoln College. Two years later H. took holy orders, and after travelling for some time on the Continent, was appointed in 1676 chaplain to the Duke of Lauderdale. In the next year he accompanied the Duke to Edinburgh, and in 1678 received the degree of D.D. from the University of Glasgow, the same honour being conferred on him by Oxford University in 1679. H. subsequently obtained considerable preferment; but refusing to take the oath of allegiance to King William at the Revolution of 1688, he lost his Deanery of Worcester and other benefices. He died December 15, 1715. H. was the author of numerous pamphlets and polemical writings which are now forgotten; his reputation for scholarship rests on the *Thesaurus, or Treasury of the Northern Tongues* (3 vols. Oxford, 1705), a work displaying much antiquarian and philological knowledge.

Hick'ory, a N. American genus of large forest trees, of which the scientific name is *Carya*, belonging to *Juglandaceæ*, and closely related to the walnuts. Their timber is of great strength, weight, and toughness, and is much used for the manufacture of barrel-hoops, axe and whip handles, handspikes, &c., where toughness and elasticity are necessary. It will not stand exposure, and is liable to the attacks of insects, consequently is not suitable for building purposes. The nuts of some of the species are eaten, that of the peccan or Illinois H.-nut being the best, next to it that of the shag-bark H. (*Carya alba*).

Hidal'go, the name given to a Spanish nobleman of inferior rank. The word is derived either from *hijo del Goto*, 'son of

the Goth,' that is, of noble descent, of Gothic, as opposed to Moorish blood, or from *hijo de alguno*,' son of somebody.'

Hiera'cium, a large genus of plants of the natural order *Compositæ* (q. v.). See HAWKWEED.

Hi'erarchy (from Gr. *hierarchēs*, 'a steward or president of sacred rites, a bishop') means properly the order of bishops, and then the whole series of the orders of ministry in the Christian Church. The H. embraces the power of *jurisdiction* and of *order*, considered as a principality. The H. of order, which pertains to all clergy, according to the measure of their power, by ministration of the sacraments and preaching the gospel, aims at elevating and hallowing the spiritual life; the H. of jurisdiction, which pertains to prelates alone, is for the promotion of exterior discipline. In the one, the clerical characters or the ecclesiastical office only is regarded; in the other, the degree or rank in jurisdiction of a prelate is alone considered. The first form of a Christian H., in the modern sense, was bishop, presbyter, and deacon. This was gradually developed both upwards, by the creation of metropolitans, archbishops, and patriarchs, and downwards, by the creation of sub-deacons, acolytes, &c. The ultimate development of the H. in the Western Church was into a pure monarchy or papacy; in the Eastern Church it has always remained aristocratical and patriarchal. (See BISHOP.) See Blunt's *Dict. of Doct. and Hist. Theology* (1872).

Hierat'ic Writing. See HIEROGLYPHICS.

Hi'ero (Gr. *Hieron*), tyrant of Syracuse, succeeded his brother Gelon in 478, warred against Theron of Agrigentum, and afterwards against Theron's son Thrasydæus, whom he utterly defeated, gained a great victory over the Etruscan fleet off Cumae in 474, and was repeatedly successful in the Olympic and Pythian games. H. was a famous patron of literature and philosophy, and Æschylus, Pindar, Bacchylides, Xenophanes, Simonides, and Epicharmus resided at his court. His victories in the Greek games were sung by Pindar, and Xenophon's *Hieron* is an imaginary dialogue between H. and Simonides. H. died at Catana in 467.—H., King of Syracuse, son of Hierocles, a descendant of Gelmond, a slave, distinguished himself in the Sicilian wars of Pyrrhus, was made general of the whole Syracusan forces, and after winning a signal victory over the Mamertines, became King of Syracuse in 270 B.C. He allied himself with the Carthaginians against the Romans, but after suffering defeat in 263 was the faithful supporter of Rome even amid the victories of Hannibal. He ruled with justice and clemency, gave great care to finance, and embellished Syracuse with many fine buildings. H. died in 216. Theocritus celebrates H. in his 16th Idyl.

Hier'ocles, a Neo-Platonist who flourished at Alexandria during the 5th c., of whose life nothing is known. He wrote *On Providence, Fate, and the Harmony between the Divine Government and Man's Freewill*, of which only a few fragments remain (Morelli, Par. 1593), *On Justice, Reverence of the Gods, and the Domestic and Social Virtues*, now lost, except several extracts in Stobæus, and a commentary on the golden verses of Pythagoras, which contains some valuable information as to the Pythagorean doctrine, and of which the best edition is by Mullach (Berl. 1853). *Asteia*, a collection of facetiæ, has been ascribed to H., but probably belongs to a later era. The best edition of the *Asteia* is by Schier (Leips. 1768).

Hieroglyph'ics. In 1799 a French artillery officer, Bouchart, discovered at the redoubt of St. Julian an oblong slab of black syenite with three inscriptions, one in H. proper, one in Greek, and one in what the Greek text calls the enchorial or popular character. This is the famous Rosetta stone. It contains an address by the Memphis priests to Ptolemy Epiphanes. Besides this, the French Government publication *Description de l'Egypte* (new ed. in 36 vols. 1828–31) contained several monuments and papyri. Though the Dane Zoega had already in his *De Symbolicis* (1798), proceeding mainly on Coptic materials, pointed out that H. were phonetic signs, *not merely symbolical and mythical representations*, and Barthélemy had also suggested that the rings on the monuments contained the names of kings, the study of the Rosetta stone was hampered by this error being repeated, also by the notion that the enchorial or demotic was purely alphabetical and not partly symbolical, and the same as the hieratic writing in the older papyri. The enchorial is really Coptic, differing from H. in individual words and also in declensions. De Sacy first observed the recurring groups of characters representing Ptolemy, Bernice, and Alexander. These were decomposed into letters by the Swede Akerblad, who also added the enchorial groups of Chemi (Egypt), Phuro (the king), Nierpheni (the temples), Urb (priests). Thomas Young's *Conjectural Translation* appeared in 1814. It gives 100 alphabetical characters, and thirty additional recurring groups, and brings out the symbolic element in the enchorial. He also made some progress in the derivation of the cursive or hieratic writing from the H. In his *Rudiments of an Egyptian Dictionary in the Ancient Enchorial Character* (1830), he added to the ascertained names of kings, but his H. alphabet never went beyond the proper names. The demotic papyri at Berlin were further investigated by Rosegarten and De Saulcy, but the great name in this subject is that of Champollion le Jeune, who, following up the lines of Akerblad and Young, and starting from a profound knowledge of Coptic, soon arrived at the conception of homophone signs (*i.e.*, different figures representing one and the same sound), the necessary foundation of a H. alphabet. Deciphering the phonetic signs on several of the royal rings, which he compared with equivalent Greek inscriptions, comparing also the funereal papyri, he produced in 1824 his famous *Précis du Système Hiéroglyphique*. It distinguishes 232 alphabetic signs. Champollion was followed by Ipollite Rosellini, whose dictionary gives the value of the phonetic and determinative, and also of the symbolic H.; Françesco Salvolini, whose name is connected with the Rosetta stone and the Sallier papyrus, and who suggested that the phonetic sign might indicate the initial sound not merely of the name of the object, but also of the object of which it was the symbol; Richard Lepsius, who pointed out that many of Champollion's 'letters' were not of universal application; Hincks, who discovered that every letter has a normal vowel not written (but written in the hieratic); Birch, who described certain signs as determinative not of sense but of sound. Other writers on the grammar are Chabas, Deveria, and De Rougé in France; Goodwin and Heath in England; and Brugsch in Germany. The chief ancient account of H. is that left by Clemens of Alexandria. He mentions (1) the demotic (popular), or epistolographic, or enchorial (so distinguished from the Ptolemaic Greek), the idiom of private, domestic, and commercial affairs, the basis of the modern Coptic; (2) the hieratic, used for religion and science by the sacred scribes, a running hand formed from the H., and with more symbolical elements than the enchorial; (3) the H. proper, which practically meant the linear H. in the sacred books derived from the pictorial signs on the monuments. But Clemens speaks more of the pictorial H., which are either *kyriological*, *i.e.*, simple images, as *sun, moon, ship, scales, bed, bull, loaf, fish, goose*, &c.; or very obvious symbols—as where a flat roof with stars represents the night; or remoter symbols (generally for more abstract ideas), visible metaphors, in fact, the part being taken for the whole, an effect for its cause, &c. Thus a 'milk-pail' may mean milk, and a 'man throwing arrows' may mean tumult. The gods are often represented by their sacred animals. Clemens also mentions the 'anaglyphs,' an enigmatical or cabalistic character (in which a serpent represents the star-courses, and a beetle represents the sun). This, however, seems to have been a comparatively recent contrivance of the priesthood, who dealt largely in esoteric meanings. But while the oldest writing is a representation of objects, not of sounds, it must not be supposed that it was, like the Mexican, pure picture-writing. Only the simplest ideas could be expressed that way. A system of abbreviation and composition gradually grew up. Milk and wine are represented by the vessels which usually hold them. Water is shown by three zigzag lines, which are now seen on pottery all over the world. These lines became straight in the linear H. Add the figure of a kid, and you have the H. for *thirst*. *White* is denoted by a bulb, probably an onion. A palm branch means the *year*; and because the words for good and lute were the same, a lute stands for the good and beautiful. This important principle of homophony appears again in the identification of *eye* and *child*. The principle of determination is also important. It distinguishes the individual from the genus, and qualifies the former by an image of the latter; *e.g.*, the sycamore becomes a sign for all trees. It includes the grammatical signs, such as a short vertical stroke for noun masculine; the addition of a segment for noun

feminine; two extended arms with palms downwards negate the following sentence; dual and plural numbers are expressed by two and three vertical lines; and the personal pronoun by a human figure. Homophony led to the invention of syllabic writing, the pictorial hieroglyphic appearing as the first letter or syllable of the whole word, of which the phonetic elements follow. As many of the oldest Egyptian words were monosyllabic, so under this syllabic system there were some syllabic signs which were purely phonetic, *i.e.*, they are capable of indicating the sound of the word they represent without exclusive reference to the one object denoted by this word. These syllabic phonetics, as they are called by Bunsen, gradually become the later phonetic alphabet. As regards the number of H., there have been determined (1) of the signs of objects (whether descriptive or symbolic) at least 400, the most frequent objects being the human figure in various postures, and works of art; (2) of determinatives, as above defined, at least 120; (3) of phonetics, both syllabic and alphabetic, which do not lose their connection with particular things by acquiring a connection with particular sounds, about seventy; (4) of mixed sounds, *i.e.*, objective signs followed by one or two phonetic H. which represent the sound of the corresponding word, generally its last letter, at least fifty-seven. We may add some specimens of the H. numerals—

|	∩	c	⚲	7
1	10	100	1000	10,000

The units are expressed by strokes, but always in groups; as 6 or 3 + 3 = ||| over |||. We may also mention among the grammatical signs the roll of papyrus, which indicates a full stop; the cross bar (×) which indicates a verb; the stretched legs which indicate an active verb. See Chabas, *Papyrus Magique d'Harris* (4to, Chal. 1861); De Rougé, *Étude d'une Stèle Egyptienne* (Par. 1858); Brugsch, *Hieroglyphisch-Demotisches Wörterbuch* (4 vols. Leips. 1867-68); and *Grammaire Hiéroglyphique* (4to, Leips. 1872).

Hier'ophant, or Mys'tagogue, the priest who initiated candidates into the Eleusinian mysteries, in which he was supposed to represent the demiurge or creator of the world. He was necessarily an Athenian citizen descended from the hero Eumolpus, and free from any moral or physical defect. He held the office for life, and was not permitted to marry.

High Bailiff. See BAILIFF, HIGH.

High Commission Court, an oppressive ecclesiastical court established by Queen Elizabeth, was abolished by 16 Car. I. An attempt to revive it by James II. promoted the revolution of 1688.

High Constable. See CONSTABLE.

High Court of Justice. See COURT OF JUDICATURE, SUPREME, ACT.

High Places were thought by most ancient nations to be the best on which to worship their deities, as men there were nearer to heaven and to the object of their worship; hence it was common to build altars and chapels on the tops of mountains and hills, for the offering of sacrifices and other worship. That the Hebrews followed this practice, as well as other nations, for the worship both of false gods and of Jehovah himself, is abundantly evident from the Bible. Thus Abraham built an altar on a mountain at Bethel (Gen. xii. 8); and Samuel, Solomon, and all the people offered sacrifices on H. P. (1 Sam. ix. 12; 1 Kings iii. 2-4). Even after the building of Solomon's temple the practice was generally continued (2 Kings xii. 3, xiv. 4), until Hezekiah and Josiah abolished the H. P. and restricted the worship of Jehovah to the temple at Jerusalem (2 Kings xviii. 4, xxiii. 13).

High Priest was the head of the priesthood among the Israelites, and had certain functions which the ordinary priests were not entitled to perform. (1) The H. P. alone could enter the holy of holies in the tabernacle and the temple, which even he did only once a year, on the great day of atonement (Lev. xvi.); and (2) he alone could consult the Lord by means of the oracle of the Ephod (q. v.) and the Urim and Thummim (q. v.), although some modern critics maintain that this latter privilege —of giving oracles, as well as wearing the ephod—belonged originally to all the priests alike (*cf.* Chron. xv. 27; 1 Sam. ii. 28, &c.), and was only restricted to the H. P. by the priestly legislature of the post-exilian period. *Dress.*—Besides those articles of dress which he had in common with the ordinary priests, namely, an embroidered linen tunic, linen girdle, drawers, and turban (four pieces), the H. P. had a distinctive dress consisting of a breastplate, on which were set twelve precious stones, the ephod, the robe of the ephod, and an upper turban or metre (four pieces; Exod. xxviii.).

High Seas. By international law every country has certain exclusive rights over what is called the *mare clausum*, that is, the sea within three miles of its coast. Of these rights the most important is that of fishing. Beyond three miles from the coast the seas are called the H. S., and no nation has any exclusive right over them. It has recently been decided in the case of the *Franconia* that English courts have no criminal jurisdiction over foreign vessels within three miles of the English coast.

High Steward, a legal peer appointed by the crown to superintend the trial of any peer indicted for treason or felony. A peer so indicted can only be tried by the court of the H.S.

High Treason. See TREASON.

High'gate, a suburb of London, 5 miles N. of the General Post-office, is pleasantly situated on hilly ground. It contains many fine villas, seven churches, and several chapels and schools, an infirmary with 550 beds, and a smallpox hospital. The North London Cemetery is at H. Pop. (1871) 5339.

High'land Regiments, the general name of nine British infantry regiments that were originally raised in the Highlands, and that still wear the Highland costume. These are the 42d (see BLACK WATCH), the 71st (raised in 1777), the 72d (in 1777), the 74th (in 1787), the 78th or Ross-shire Buffs (in 1793), the 79th or Cameron Highlanders (in 1805), the 91st or Princess Louise's Argyleshire Highlanders, the 92d or Gordon Highlanders (in 1796), and the 93d or Sutherland Highlanders (in 1800). Though these regiments are recruited in the Highlands, some twenty per cent. of the men are English and Irish. They are distinguished by various tartans.

Highways, Law Regarding. Every parish is bound to keep the highway passing through it in repair unless there be legal provision to the contrary. Surveyors are by statute elected annually by the parishioners at their first meeting for the nomination of overseers of the poor. A highway is a road leading from one town to another, whether it be a footway, a horse and foot way, or a cartway. Every one has a right of thoroughfare. The general and amending Act of highways is the 25 and 26 Vict. c. 61. It provides that notice having been given by the clerk of the peace, at the instance of five or more justices, to churchwardens or overseers of parishes, justices in general or quarter sessions may issue a provisional order dividing their county or part of it into *highway districts*, or constituting the whole county a *highway district*, for the more convenient management of H., and directions are given for the legal execution of the scheme. Penalties are enacted against riding on footpaths, and various other public nuisances connected with it. No one is entitled to use any part of a highway except for passage or traffic, even though the use seem to be for the public benefit. Telegraph posts cannot be legally put up except under Act of Parliament. Ground under a highway belongs to the adjoining owners; hence an owner may work a mine under a road, so long as he leaves enough soil to support it. Any one but the owner breaking the surface is liable in damage for trespass. The laws of Scotland as regards H. are essentially the same as those of England. See BAR, TOLL.

Hig'gler is one who carries small articles from door to door and retails them. See HAWKER.

Hilary, St., of Poictiers, a father of the Church, born early in the 4th c., of heathen parents, on reaching maturity embraced Christianity, and about 350 was elected to the bishopric of his native city, Poictiers. He is chiefly distinguished by his zeal

against the Arians, which won him the title of *Malleus Arianorum*, and led to his banishment to Phrygia by Constantius II. (356). In his exile, however, H. still so harassed his opponents —at the Council of Seleucia (359) denouncing the Emperor as antichrist—that, to be rid of him, he was soon permitted to return to his see. Under Julian he laboured hard to extirpate the Arian heresy, and when in 364 Auxentius was nominated Bishop of Milan by Valentinian I., H. protested against the appointment, and created such confusion that he was ordered forthwith to retire to his diocese. He died January 7, 367. Of his writings nine exist of certain, two of doubtful authenticity, while seven have perished. See the *Vita Hilarii ex ipsius potissimum Scriptis collecta*, prefixed to the best edition of his works by the Benedictine Constant (Par. 1693, 2d ed. Veron. 1730).—**H. of Arles**, born about 400 in Gallia Belgica, was educated at the Abbey of Lérins, and took the monastic vows, which he abandoned in 429 for the bishopric of Arles. In 441 H. became involved in a controversy with Pope Leo I., the Great, arising from the deposition of a Bishop of Besançon, Chelidonius. The latter carried an appeal to Rome, whither he was followed by H., who refused, however, to recognise in the Pope more than an arbitrator. Leo thereupon reinstated Chelidonius, and, supported by a rescript of the Emperor Valentinian III. (445), deposed H. himself, who, fearing for his own liberty, had stolen from Rome, and crossed the Alps on foot. The dispute is an important one, as showing the antiquity of Ultramontanism (q. v.). H. died at Arles, 449. The only two of his works extant were published in the *Bibliotheca Patrum Maxima*, vol. viii. (Lyon, 1677), and in Barralis's *Chronologia Lirinensis* (Lyon, 1613), the latter also containing a *Vita Hilarii*, ascribed to Honoratus, Bishop of Marseille (460).

Hilary Term. See TERM.

Hildburghaus'en, a town of Germany, in the duchy of Sachsen-Meiningen, on the river Werra, and the Eisenach-Koburg Railway. It was the residence of the Dukes of Sachsen-H. till 1826; and has some interesting buildings, and also manufactures of cloth, tobacco, machinery, &c. Pop. (1875) 5162.

Hildebrand. See GREGORY VII.

Hil'den, a thriving town of Prussia, in the Rheinland, and on the Itterbach, 9 miles E.S.E. of Düsseldorf by rail. It has extensive manufactures of cotton and linen goods, cassimeres, &c. Pop. (1875) 6799.

Hil'desheim, a town of Prussia, in the province of Hanover, on the Innerste, 30 miles S.E. of Hanover by rail. It is a quaint, placid, old town, the see of a bishop since 822, and has a cathedral of date 1015, with famous bronze gates and glass paintings; a beautiful church of St. Godehard, with triple-towers, built in 1133, and restored in 1852; and the basilica church of St. Michael founded in 1022. It is still the see of a Roman Catholic bishop, and has considerable trade in corn, linen, and yarn, but slight industries. Pop. (1875) 22,581. On the Galgenberg, in the vicinity, were found sixty silver vessels of finest Roman make in 1868.

Hill Mustard. See BUNIAS.

Hill, Rowland, Viscount, an English general, belonging to the Shropshire Hills, was a son of Sir John Hill of Hawkstone, and was born August 11, 1772. At the age of fifteen he entered the army, and obtained speedy promotion. He was lieutenant-colonel of the 90th Regiment in its Egyptian campaign, and was sent to Spain in 1808 in command of a brigade. For distinguished services at Corunna, Talavera, and Arroyo de Molinos, he was created a baron and G.C.B., and was voted a pension of £2000, with the thanks of Parliament. He was present at Waterloo, and was second in command of the army of occupation in France. In 1828 he became commander-in-chief, and on his resignation from ill health in 1842, was created a viscount. H. died December 10, 1842.

Hill, Sir Rowland, author of the penny postal system, born at Kidderminster, 3d December 1795. In his youth he assisted his father in a school near Birmingham, and in 1835 was appointed Secretary to the Commissioners for the Colonisation of S. Australia. A pamphlet, published by him in 1837, in favour of penny postage, engaged the attention of the House of Commons; 2000 petitions were presented in its favour, and his plan was carried out early in 1840, after an experimental charge of 4d. had been tried. H. received an appointment in the Treasury, but Sir Robert Peel's Government dispensed with his services in 1841, on the ground that they were no longer required, and the more grateful public thereupon subscribed a testimonial to him of £13,360. In 1845 he became Chairman of the London and Brighton Railway, in 1846 Secretary to the Postmaster-General, and in 1854 Chief Secretary to the Post-Office. He was made a K.C.B. in 1860, and retired from office in 1864 with full pay of £2000 and a parliamentary grant of £20,000. In the same year he received the honorary degree of D.C.L. His brothers, **Matthew Davenport H.** and **Frederick H.**, have also signalised themselves by philanthropic activity.

Hill States of the Punjaub, India. A collection of twenty petty states, which are all in relation with the Punjaub Government through the Superintendent of the Hill States. They lie between the Sutlej and Jumna rivers, and stretch from the plains of Umballa to the borders of the Chinese Empire; area, about 5441 sq. miles; estimated pop. 386,800. The chiefs are all Rajputs, and most of them owe their power to the direct grant of the British after the Gurkha war in 1815.

Hilla, or **El-Hilleh,** a garrisoned town in the vilayet of Bagdad, in Asiatic Turkey, 56 miles S. of Bagdad, on both banks of the Euphrates, here 450 feet broad and crossed by a pontoon bridge. It is partly walled, has fifteen Shiite mosques, various bazaars, and is famous for its sour milk, fish, and dates. Its manufactures are silks (*kâs*), leather, and date-spirits. H. is built on the ruins of Babylon. Pop. variously estimated from 6000 to 30,000, mostly Shiite Arabs, Persians, and Jews.

Hill'el 'the Elder,' a Jewish Rabbi belonging to the sect of the Pharisees, was born at Babylon about B.C. 75, and died about A.D. 10. About B.C. 36 he settled in Jerusalem, where he supported himself and family by the labour of his hands, and at the same time attended the lectures of the Rabbis Shmemajah and Abtalion, paying the half of his earnings for admission. Such was his thirst for knowledge, and so well did he profit by his opportunities, that about B.C. 30 he was elected president of the Sanhedrim. In modern times H. has been called the teacher of Jesus (Renan), and the reformer of Judaism (Geiger). Be that as it may, 'by his self-denying and holy life, as well as by his great wisdom and learning,' he exercised such an influence both on the theology and literature of the Jews as to earn the title of 'the second Ezra,' or restorer of the law. He differed from his rival teacher, Shammai, by a more liberal interpretation of the law in some things, dictated by a more gentle and yielding spirit; and hence arose endless disputes between the disciples of the two. H. inculcated as the very kernel of the law, 'Whatsoever thou wouldst not that a man should do to thee, do not thou to him.'—**H. II.,** elected president of the Sanhedrim about 330 A.D., is chiefly remarkable for his introduction of the calendar still used by the Jews.

Hil'ted, in heraldry, signifies having a handle.

Hil'versum, a village of N. Holland, 15 miles S.E. of Amsterdam, has manufactures of cottons, carpets, spinning and dyeing wool, &c. Pop. 6300.

Himala'ya ('the abode of snow'), a range of mountains in the S. of Central Asia, the highest in the world, bounds the peninsula of India on the N., from Afghanistan to Burmah, separating it from Thibet; total length along the curve, nearly 15,000 miles; average elevation, from 16,000 to 18,000 feet. The limit of perpetual snow varies on the S. from 16,000 to 19,000 feet, on the N. from 17,000 to 18,000 feet; the lowest glacier extends as low as 10,500 feet. There are 45 peaks known to be higher than any in the rest of the world; the highest is Gouri Sunkur and Mount Everest, in Nepaul, 29,002 feet; the next, Dapsang, in the Karakorum range, 28,278 feet; the third, Kinchinjunga, above Darjeeling, 28,156 feet. The highest point ever reached by man is believed to have been in August 1855, when the brothers Schlagentweit ascended Ibi Gamin, in the Karakorum H., a height of 22,259 feet. The highest pass regularly used for commerce is believed to be the Parang Pass, in Spiti, 18,500 feet. Leh, the capital of Ladakh, is 11,257 feet above the sea, and there are Buddhist monasteries permanently inhabited 4000 feet higher. Trees grow

up to a height of 11,800 feet; but there are pastures in Thibet 16,000 feet; monkeys and tigers are seen up to 11,000 feet, leopards up to 14,000 feet; fish have been found in rivulets 1000 feet higher. The most elevated British sanatarium is at Chini, 9096 feet; Simla is 7156 feet; Darjeeling, 6905.

The geological structure is gneiss and a schistose formation. There are no plains and few lakes. The most characteristic trees on the lower slopes are the deodara and the rhododendron, and yet lower down, the *sal*. Fringing the plains of India lies the Terai, a strip of malarious jungle-grown marsh. In the H. rise the Ganges, the Jumna, the Sutlej, the Indus, and the Brahmaputra. The three last flow between, and penetrate by steep gorges, the loftiest ridges of the chain; and the gorge of the Indus terminates the H. proper on the W., as the Brahmaputra does on the E. Very little of British territory extends up the mountains, which chiefly belong to Cashmere, Gurhwal, Nepaul, Sikkim, and Bhootan; the northern slopes terminate in the plateau of Thibet. See Dr. Royle's *Botany of the H. Mountains* (Lond. 1839); Dr. Hooker's *Himalayan Journals* (Lond. 1854); and Wilson's *Abode of Snow* (1875).

Hinck'ley, a town of England, in Leicestershire, 99 miles N.N.W. of London by rail. It has a church of the 14th c. with a richly-carved oak ceiling, is the centre of the brown cotton hose industry, and carries on brewing, malting, lime-burning, and the making of needles and weaving frames. H. extends into Warwickshire. Pop. (1871) 6902.

Hinc'mar, a noted Frankish Churchman, was born in the year 806. He was trained as a monk in the Abbey of St. Denis, and having acquired high favour at the court of Karl the Bald, was appointed Archbishop of Rheims in 845. H.'s tenure of this dignity was distinguished by the independent attitude which he took up towards the Papal See. His election to the Archbishopric had been opposed by Lothar, the brother of King Karl, and by the Pope; but on this occasion H. triumphed. His later contests with the Papacy, however, were not so successful. H. had treated with the utmost severity the heretical theologian Gottschalk, who had been handed over to him for discipline by the Council of Mainz; and to this conduct Rothad, Bishop of Soissons, objected. H. accordingly entertained hostile feelings towards his bishop, and took advantage of the deposition of a priest by Rothad in 862 to provoke a quarrel. The priest appealed to H., who ordered his restoration; Rothad refused, and was in consequence deposed and imprisoned by a Council convened by H. at Soissons. Rothad thereupon appealed to Pope Nicholas, who summoned H. to appear at Rome in person, and answer to the charges against him. H. sent a legate, but as he still refused to restore the Bishop, the Pope heard the cause over again, acquitted Rothad, and compelled H. to yield. Throughout the remainder of his life the Archbishop exerted almost supreme authority over Church and State in the Western Frankish state, always using his great power in the interests of ecclesiastical liberty. He died at Epernay in 882. The collected works of H. were published by Sirmond (Par. 1645).

Hind, the name given to the female Stag (q. v.), but also to the females of foreign deer, or to the females of various species of Antelopes (q. v.). The young female deer, in ancient forestry, assumed the rank of H. on attaining its third year.

Hind, John Russell, F.R.S., an English astronomer, was born May 12, 1823, at Nottingham, where his father was a lace manufacturer. He early began the study of astronomy, and in 1840, through the influence of Sir Charles Wheatstone, obtained a situation in the Magnetical and Meteorological Department of Greenwich Observatory. In 1843 he was sent to determine the longitude of Valencia, and on his returnin 1844 was appointed observer in Mr. G. Bishop's private observatory at Regent's Park. Here he laboured with great assiduity, and discovered nine asteroids—four of them in the latter half of 1852. For this he received the Lalande medal from the Academy of Sciences, Paris, and a prize of 300 francs. H. is editor of the *Nautical Almanac*. He was also awarded the gold medal of the Royal Astronomical Society, and obtained a pension of £200 per annum. His chief works are the *Solar System* (1846), *Expected Return of the Great Comet of* 1264 *and* 1556 (1848), *Astronomical Dictionary* (1852), *Replies to Questions on Comet of* 1556 (1852), *Illustrated London Astronomy* (1853), *Elements of Algebra* (1855), and his *Descriptive Treatise on Comets* (1857).

Hind'ley, a rapidly increasing town of Lancashire, England, 3 miles S.E. of Wigan by railway, carries on cotton-spinning and cotton manufactures, and is surrounded by numerous coal-works. Pop. (1871), 10,627.

Hindu'ism. The religions of India are treated of generally under the heading INDIA; but it will be convenient in this place to give a brief notice of the system of religious faith, ceremonial observance, and social custom, which constitutes the life of the great bulk of the Indian people. According to the general census (1867–72) of British India, excluding the native states, the Hindus proper number 139¼ millions, or 73 per cent. of the total population. This classification, being based upon religious as opposed to ethnological principles, excludes not only the Mohammedans and Buddhists, but also the Sikhs and the pure aboriginal tribes. The census also shows that it is in the S. of the peninsula that H. is most prevalent. In Mysore, Madras, and Coorg, the Hindus form more than 90 per cent., diminishing to 86 per cent. in the N.W. Province, 79 per cent. in Bombay, including Scinde, 64 per cent. in Bengal, and only 35 per cent. in the Punjaub. But even among the Hindus thus distinguished, all gradations may be found in the acceptance of the fundamental doctrines of H. These fundamental doctrines may be said to gather round the one central principle of the recognition of the sanctity of the Brahmin caste; and H. in this sense is a convertible term with Brahminism. It is important to observe that H., though now a crystallised system, draws absolutely none of its binding authority from the early Sanskrit books. The Vedas, everywhere recognised as the Hindu Scriptures, nowhere even imply the existence of castes or of a distinct sacerdotal order. Their religion is simply nature-worship of a peculiarly pure type, external phenomena being personified as conscious beings (*devas* = the shining ones). The subsequent growth of caste, the separation of the Brahmins, and the adoption of the modern pantheon, have been plausibly assigned to the circumstance that the original Aryan-speaking race conquered and civilised, but did not thoroughly amalgamate with, the various aboriginal tribes of the peninsula. This circumstance, combined with the necessities of the climate, caused ceremonial purity and social exclusiveness to be regarded as religious duties; while the subject people, as some sort of compensation for their degraded condition, were enabled to impose upon their conquerors the toleration, if not the adoption, of their own indigenous gods, and their barbarous forms of worship. At the present day, the most popular deity throughout India, especially in the S., is not Brahma the creator, nor Vishnu the preserver, but Siva the destroyer, adored in conjunction with his bloody wife Kali. Of the three sects into which modern Hindus are commonly divided, two, the Sivites and the Saktas, are devoted respectively to Siva and his wife, while Brahma has no special following. Similarly, the horrible practices of *Suttee* (q. v.) and of female infanticide, and the extraordinary veneration in which the cow is held, are none of them of ancient date, but comparatively recent excrescences on the primitive system.

With regard to the future of H., it must be recollected that it is not a body of theological dogmas, such as might reasonably be expected to undergo development, but a deeply-rooted system of customary observance, which, in the unchanging East, among a people sunk in the most abject poverty and the densest ignorance, forms the one tie which binds man to man, family to family, and generation to generation. See H. H. Wilson's *Essays on the Religion of the Hindus*, Muir's *Sanskrit Texts*, Lassen's *Indische Alterthumskunde*, and Sherring's *Castes of Benares*.

Hindu' Kush, or **Indian Caucasus** (anc. *Paropamisus*), a lofty range of mountains in the S.W. of Central Asia, separated from the Himalayas by the valley of the Indus. This region is supposed to have been the cradle of the Aryan race. The highest mountain, from which the range takes its name, is Hindu Koh, estimated to exceed 20,000 feet; the highest pass is the Khawak Pass, 13,200 feet. The main geological structure is granite; vegetation is scanty even on the lower slopes. The chief rivers that rise in the range are the Oxus, running N.W. into the Aral Sea, and the Helmund, which flows S.W., and loses itself in the deserts of Persia.

Hindustan' (Pers. 'the land of the Hindus'), a name not uncommonly applied to the whole of the Indian peninsula, but properly limited to that extensive plain which lies between the Himalayas on the N. and the Vindhya mountains on the S., and

which is bounded by Bengal proper on the E. and the Punjaub on the W. This is the upper valley of the Ganges, comprising, according to British political divisions, the N.W. Province, Oude, and Behar. Here was the early home of the first Sanskrit-speaking immigrants, and here again was the centre of Mohammedan rule. The language spoken is Hindi, which is also used in the Central Provinces and part of the Punjaub. Concerning this language Professor Wilson states that it is spoken by more than 30,000,000 of people; its grammar is, in the main, that of Hindustani, while nine-tenths of the words are Sanskrit. The Hindustani language proper, which is also called Urdu ('belonging to the camp'), has been formed by an admixture of the original speech of the Mohammedan conquerors with that of the Hindus; about one-third is Arabic or Persian. It is the language of the native army, of domestic servants, and to some extent of the trading classes. As a vernacular, it is only in use in the Mussulman cities of Delhi and parts of Oude and Lucknow, and throughout the Punjaub. It has been called the *lingua franca* of India. See INDIA.

Hinge (from the verb 'to hang'), a joint such as is applied to a door or shutter to enable it to be opened or closed. In ancient times, doors, whether of wood, stone, or metal, were made to turn on projecting vertical pieces at the top and bottom, holes being made to receive them. The Greeks and Romans made hinges resembling a sort now in use. In the British Museum may be seen bronze hinges of Roman manufacture having two straps with projecting divisions of a hollow cylinder which are united by an axial pin. The doors of Solomon's temple were hung on hinges of gold. Modern hinges are chiefly made of iron or brass. They are contrived in a great variety of forms, some involving principles of applied engineering. 'Butts' are commonly used for doors and shutters, one kind of them, called the 'rising butt,' has the hollow cylinder divided helically, and so 'serves the double purpose of a spring to shut the door, and also of a rising hinge,' whereby the carpet or other obstruction may be cleared. 'Double-action spring' hinges allow of a door being opened both ways while it closes of itself. The common ⊢ shaped H. placed on gates and heavy doors is called a 'cross-garnet.'

Hingunghat', a town in the Central Provinces, British India, not far from the Wardha coal branch of the Indian Peninsula Railway; pop. (1872) 9415. It is the emporium of the local trade, especially for raw cotton, of which it exports £120,000 worth in the year. The H. cotton has earned a name in the Bombay market as one of the best indigenous staples, and the seed has been distributed in other parts of India. A model cotton farm was established here in 1868.

Hinn'om, Valley of. See GEHENNA.

Hinn'y, the name given to the hybrid progeny of the stallion and the female ass; the *mule* being the offspring of the male ass and the mare. The H. is an animal usually of smaller size than the mule, its body, as a rule, being also of clumsier form.

Hinojo'sa-del-Du'que, a city of Spain in the province of Cordova, 45 miles N.N.W. of the city of Cordova. It stands in a mountainous region, is an old Moorish town, and is cleanly and well built. H. has some linen and woollen manufactures. Pop. about 8000.

Hiou'en-Thsang, a famous Chinese traveller, born A.D. 603. He became a Buddhist priest, and in his twentieth year began to journey from convent to convent, comparing their respective versions of the Buddhist law. Struck by the discrepancies in these documents, he resolved to journey to India, and there collect the sacred books and consult the Buddhist sages. He set out in 628, and wandered through Dzungaria, Mongolia, and Transoxiana, finally passing by Balkh and Kabul into India. Thence he returned to China by Kashgar and Yarkand, laden with a valuable collection of 657 books relating to the Buddhist creed. He was received with great honour, and the Emperor offered to appoint him Minister, an offer which he declined. After spending his last years in a monastery in translating the works which he had gathered together during his travels, H. died in 664. He wrote a history of Western [illegible]ntries entitled *Ta-Thang Si-yu-ki Chi-oeull-kiouen*, which has [illegible] translated into French by M. Stanislas Julien (Par. 1857), and [illegible] account of his travels, which was continued by Hoeï-li, the whole work being also translated by M. Stanislas Julien (Par. 1853). These works contain much valuable information, especially as to Hindustan in the 7th c.

Hip, or **Hep**, the fleshy calyx-tube (fruit) of the rose, containing numerous coriaceous or bony achenes (seeds) beset with hairs, which excite itching if applied to the skin. When ripe, and the seeds removed, the scarlet remainder has a sweet, subacid, agreeable taste. Mixed as a pulp with twice its weight of sugar, a confection is formed which is used as a basis for pills and electuaries. Dr. Prior traces the derivation of H. to the middle-age Latin *jujuba*. See also *Ortus Sanitatis*, c. ccxx.

Hip Joint, a large ball-and-socket joint formed by the globular head of the femur being lodged in the cotyloid cavity or acetabulum of the innominate bone. The opposing surfaces are covered by cartilage, the bones are kept in apposition by various ligaments, and the whole of the joint is lined by a delicate membrane, termed a synovial membrane. Movement is allowed in every direction.

Disease of the Hip Joint.—Hip disease may be of an acute, subacute, or chronic inflammatory character, most commonly occurring in strumous subjects, before the age of puberty, the morbid action being generally excited by very slight causes, as over-exertion, a sprain, a fall, or exposure to cold. The hip joint being composed of the soft structures, the acetabulum, and the head of the femur, the diseases thereof may be described as *arthritic*, *acetabular*, and *femoral*; pain, suppuration, dislocation, and anchylosis being more or less common to each variety of the affection. The *arthritic* form may commence in any of the soft structures composing the joint, but most frequently in the cartilage covering the head of the femur, the symptoms being those attending acute inflammation—excruciating local pain *within* the joint, with spasms of the limb, marked by nocturnal exacerbations. The limb is everted, abducted, and motionless. There is usually some fulness about the anterior part or outer side of the joint, and sometimes elongation of the limb, from the capsule being distended with fluid, occasionally terminating in rupture of the capsule, and sudden dislocation of the bone on to the dorsum ilii. In the acute form, recovery may take place with stiffness, partial anchylosis, wasting, and shortening of the limb; but, in the majority of cases, abscesses are formed, resulting in shortening from absorption of the head of the bone, or dislocation out of the acetabulum. In the most favourable cases, a year or two will elapse before the limb can be used freely, and there is generally some stiffness. In the *acetabular* form there is pain *around* the hip, and often abscess in the iliac fossa, eventually passing down under Poupart's ligament, or by the side of the rectum, or through the sciatic notch into the gluteal region. The *femoral* form of hip disease is usually subacute, the prominent symptoms being a limping, shuffling gait with *eversion*, slight *abduction*, the knee being partially bent, and the limb apparently shorter than the other. There is usually pain in the hip, which is increased by pressure, standing, or walking, and also by abduction, rotation of the limb outwards, and particularly by striking the heel or knee. Abscesses, in this form of hip disease, occur under the glutei muscles, sometimes under the pectineus muscle, causing severe pain on the inner side of the thigh; and, at this stage, there is shortening with *adduction* and *inversion*, owing to the alteration in the muscular action. Advance of the disease is attended with fatty degeneration, absorption, or disintegration from the formation of abscesses. The treatment of hip diseases depends upon the form, the acuteness, and the severity of the local and constitutional symptoms. When inflammation has been subdued, absolute rest must be secured—as by the application of the starch bandage. When abscesses form they must be opened early, and when dislocation occurs it must be reduced, as a cure may occur with anchylosis. In certain severe cases there is no hope of cure except by excision of the diseased portions, and such operations have been recently performed with great success under Professor Lister's antiseptic mode of treatment.

Hippar'chus, the first and greatest of Greek astronomers, flourished in the 2d c. B.C. Suidas makes him a native of Bithynia, and gives 160–125 B.C. as the time during which he flourished. Ptolemy adds that he made observations upon the sun and moon at Rhodes. The titles of eleven works attributed to him alone remain, and from these and the state-

ments of later writers, a list of his many and important discoveries is compiled. He drew up a catalogue of stars, discovered the precession of the equinoxes and the motion of the moon's nodes, corrected the length of the year, showed that the sun varied its distance from the earth, and that a longer time elapsed between the spring and autumn equinoxes than between the autumn and spring, and made a wonderfully accurate determination of the distance of the moon. See Delambre's *Historie de l'Astronomie Ancienne* (1817), and Marcoz's *Astronomie Solaire d'Hipparque* (1828).

Hippar'ion, an extinct genus of horses or *Equidæ* (q. v.), which is considered by the evolutionists to represent a progenitor of the existing horse. The remains of the H. are confined to the Upper Miocene and Pliocene periods. It possessed *three* distinctly developed toes, the outer two, however, not touching the ground; while in the existing horse only one toe, the third, is fully developed, and the other two are represented in quite a rudimentary condition by the *splint-bones*. It is curious to note that in another fossil horse, the *Anchitherium*, of older (Upper Eocene and Lower Miocene) age than the H., all three toes touched the ground. The Anchitheriun may therefore be viewed as the parent-stock from which the H. was derived.

Hippocam'pus, a curious genus of Teleostean fishes, including the little forms familiarly known as 'sea-horses,' from the shape of the head. They belong to the order *Lophobranchii* ('tuft-gilled'), in which the gills exist as a series of tufts on the branchial arches, while the bones of the head are consolidated, and the scales are of the *ganoid* variety, the skeleton being cartilaginous. The sea-horses have long flexible tails, which they coil round fixed objects; and both rest and swim in an upright position, chiefly by means of the little dorsal fins. They are common in the English Channel, and may be found in large aquaria. One of the most curious features in their life history is the possession by the *male* H. of a ventral 'pouch,' in which the young are hatched and protected.

Hipp'ocras, a spiced wine, used medicinally, so called from Hippocrates, the celebrated physician. It was highly prized in the 14th and 15th centuries, when the then rare spices grains of paradise, cinnamon, and ginger were employed as flavouring ingredients.

Hippoc'rates, the most famous physician of antiquity, born in the island of Cos, about 460 B.C., was the son of Heraclides, an Asclepiad, and Phaenarete, a Heraclid. After being instructed in medicine by his father and by Herodicus, and having practised in his native island, he travelled through various parts of Hellas, and died at Larissa, in Thessaly, about 357. These meagre facts are supplemented with a vast mass of fable. There are few ancient writers about whom so much has been written as H. Of the writings, more than sixty in number, which have come down to us under his name, only a few are held genuine—viz., *Prognōstikon; Aphorismoi; Epidēmiōn Biblia; Peri Diaitēs Oxeōn; Peri Aerōn, Hydatōn, Topōn; Peri tōn en Kephalē Trōmatōn.* Most of the others are believed to have been written by his followers. There were also many commentaries on his writings by ancient physicians, the most important being that of Galen. H. divided the causes of disease into two great classes, the one comprising the variations of climate and situation, and the other different kinds and quantities of food taken by individuals. He argued from natural analogy that heat and cold, moisture and dryness, succeeded one another in the body throughout the year. His 'Humoral Pathology' recognised four humours (blood, phlegm, black and yellow bile), in which diseases first settled, and the crasis or due blending of which was health. A patient recovering experienced certain changes in his humour called *coctions*, which were followed by a *crisis* or expulsion of the morbid matter occurring at definite periods, called 'critical days.' His treatment was cautious, attending chiefly to diet, and watching the operations of nature. The apophthegms interspersed through his writings are terse and telling; but his works themselves carry conciseness to obscurity. The best editions of his entire writings are those of C. G. Kühn (3 vols. Leips. 1825–27), and of Littré, with a French translation (10 vols. Par. 1839–61). See also Dr. Adams' English translation of *The Genuine Works of Hippocrates* (2 vols. 1849).

Hipp'ocrene (Gr. *hippos*, 'a horse,' and *krēnē*, 'a spring'), a fountain on Mount Helicon, in Bœotia, which the winged horse Pegasus (q. v.) was said to have struck forth with his hoof. Sacred to Apollo and the Muses, it bestowed the gift of song on all who drank of its waters. H. has been identified with a spring at Makariotissa.

Hippodami'a, in Greek mythology, a daughter of Œnomaus, king of Pisa in Elis, and the Pleiad Sterope. An oracle had foretold Œnomaus' death to be connected with his daughter's marriage, and he therefore proclaimed that none should wed her unless he had first vanquished himself in a chariot race, while all who lost should be put to death. Many tried and failed, till Pelops, by bribing Myrtilus, Œnomaus' charioteer, to take out the linchpins of the king's wheels, won the race. Œnomaus killed himself, and Pelops thus obtained both his kingdom and daughter. For the sequel of the myth see Pelops.

Hipp'odrome (Gr. *hippos*, 'a horse,' and *dromos*, 'a course'), the Greek term for a racecourse, corresponding to the Latin Circus (q. v.). There seems to have been little difference between the two, except in point of width, the Romans allowing only four chariots to start at once, while with the Greeks the number was unlimited. In the centre of the course stood two pillars (*stēlai*), 400 yards apart, one forming the starting, and the other the turning post, the chariots having to make the circuit twelve times. In the *At Meidan* (Turk. 'horse place') at Constantinople we have a fine specimen of an ancient H. Constructed by Severus and adorned by Constantine, it was originally 800 yards long and 200 wide, but has been greatly encroached on by modern buildings. The Byzantine hippodromes long outlived the Roman circi, and under Justinian (A.D. 501) we find two factions—the Blues or Venetians, and the Greens—which, originating in the H., carried their feud into public and private affairs, and in 532 were the cause of party fights in which 30,000 persons perished. These parties ended only with the Byzantine Empire, though the H. itself does not appear to have been used after 1204. H. is now applied, like circus, to any exhibition of horsemanship.

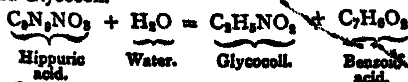
Hipp'ogriff (Gr. *hippos*, 'a horse,' and *gryps*, 'a griffin'), a fabulous monster, half horse half griffin, frequently alluded to by the poets, *e.g.*, by Milton in *Paradise Regained*, books iv. v.

Hippol'ytus, a bishop of Portus in the 3d c., was a disciple of Irenæus. It is supposed that he was banished to Sardinia A.D. 235, and on returning the next year was martyred at Ostia. A book of great value as a source of information regarding the early Christian Church, professing as it does to refute thirty-two heresies, although it deals chiefly with Gnosticism, was brought from Mount Athos in 1842, and being regarded as the work of Origen, was published in 1851 under the title of *Originous Philosophoumena ē kata Pasōn Haireseōn Elegchos*. But on the back of a statue of H. which was dug up on the site of his chapel, in the year 1551, there was found a list of his works, including a book *Peri tou Pantos*, a book which is claimed by the author of the above work. The *Elegchos* is therefore, on this and other grounds, ascribed now to H. Most of his other works have either perished or only exist now in fragments. See Bunsen's *H. and his Age* (1852); Döllinger's *Hippolytus und Kallistus* (1853); Wordsworth's *St. Hippolytus* (1853); Volkmar's *Hippolytus und die Röm. Zeitgenossen* (1855).

Hippoph'agi (Gr. 'horse-eaters,' from *hippos*, 'a horse,' and *phagein*, 'to eat'), a title bestowed by the Greeks on two tribes—the H. Sarmatæ (Slavs) and the H. Scythæ (Ugrians)—who dwelt to the N.E. of the Caspian. The nomad Mongols of those parts still use horse-flesh and fermented mare's milk as articles of diet.

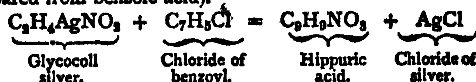
Hippopot'amus (Gr. *hippos*, 'a horse,' and *potamos*, 'a river'), a genus of *Ungulate* mammals represented by a single species, the *H. amphibius*, or 'river-horse' of S. African rivers. It forms the type of a special family, which has been constituted for its reception, and which is distinguished by having four hoofed toes on each foot—the animal thus belonging to the *Artiodactyle* or 'even-toed' group of Ungulata. The head is large, and the body massive and clumsy; the average length 11 or 12 feet. The muzzle is very broad; the eyes and ears are of small size, and the skin of very thick texture, and but sparsely covered with hairs. The teeth are represented by four incisors, two canines, and twelve or fourteen molars in each jaw, the crowns of

the latter teeth being very broad, and adapted for grinding vegetable matters, such as roots and grasses, on which the animal feeds. The upper canines are of small size, but



Hippopotamus.

their lower neighbours attain a very great size, and project in the form of unshapely tusks from the jaw—these lower canines having chisel-shaped edges. The H. very nearly approaches the Elephant (q. v.) in its bulk and strength, and appears, on the whole, to be comparatively inoffensive, but attacks its enemies with great fury when roused or irritated. Various African explorers have remarked its habit of suddenly rising from the depths of some pool or river in which it had been taking its *siesta* during the heat of the day, and overturning canoes and other river-craft. A male H. and his mate have lived for some years in the gardens of the Zoological Society of London. These animals have bred in captivity; one specimen, appropriately named 'Guy Fawkes,' because born on November 5, died at an early period of its existence. The H., as seen in captivity, immerses itself in its water tank, leaving only the nostrils above water, and remains in its bath for extended periods. The prevailing colour is a dark-brown, which appears to assume a greyer tint with age. In habits, the H. is gregarious, and roams about in bands of from twenty to thirty. It is captured by pitfalls, and is also killed by means of an apparatus consisting of a poisoned spear driven into a heavy log of wood which falls down upon the neck of the animal, through the cord which attaches the log being broken by the animal's passage. The H. may also be harpooned in its native rivers, and is thereafter chased until it succumbs to the hunters. The Dutch name of the H. is the 'zee-koe,' 'lake' or 'sea cow.' The flesh is valued for its delicacy, and the fat is also utilised, while the hide makes a thick and valuable leather, and the teeth afford ivory. A second species (*Chæropsis Liberiensis*), said to differ from the common H. in possessing only two lower incisors, inhabits W. Africa.



Fossil species of H. occur in Tertiary deposits, the most familiar extinct form being the *H. major* of Pliocene and Pleistocene formations, found in Britain and over S. Europe. Fossil species of H., belonging to the genus *Hexaprotodon* (possessing six molars in each jaw), occur in the Miocene deposits of the Siwalik Hills of India.

Hippu'ric Acid occurs in considerable quantity in the urine of herbivorous animals, and was first obtained by Rowelli from the urine of the cow and camel. It is also present, though in minute quantity, in the human urine, its amount increasing in certain diseases, such as chorea, diabetes, &c. To prepare it, fresh cows' urine is evaporated to a sixth of its volume and mixed with excess of hydrochloric acid. A dense crystalline precipitate of impure H. A. results, which may be purified by boiling with milk of lime, filtering, precipitating the solution with carbonate of potash, again filtering, and finally precipitating with excess of hydrochloric acid. H. A. is a colourless substance, which crystallises in long needles. It is very slightly soluble in cold water, but more readily in boiling water and alcohol. It is insoluble in ether. Its solution reddens litmus, and it unites with bases to form salts. When its solution is boiled for some time with dilute acid, H. A. takes up the elements of water and is decomposed, yielding Benzoic Acid (q. v.) and Glycocoll.

$$\underbrace{C_9H_9NO_3}_{\text{Hippuric acid.}} + \underbrace{H_2O}_{\text{Water.}} = \underbrace{C_2H_5NO_2}_{\text{Glycocoll.}} + \underbrace{C_7H_6O_2}_{\text{Benzoic acid.}}$$

This change takes place in cows' urine when it putrifies, and is employed practically in the manufacture of benzoic acid. Conversely, if benzoic acid be swallowed, it is excreted as H. A. H. A. has been prepared artificially by heating the silver salt of glycocoll (prepared from acetic acid) with chloride of benzoyl (prepared from benzoic acid).

$$\underbrace{C_2H_4AgNO_2}_{\text{Glycocoll silver.}} + \underbrace{C_7H_5Cl}_{\text{Chloride of benzoyl.}} = \underbrace{C_9H_9NO_3}_{\text{Hippuric acid.}} + \underbrace{AgCl}_{\text{Chloride of silver.}}$$

Hippu'ris, a genus of aquatic plants, belonging to the natural order *Haloragaceæ*. *H. vulgaris* is the common mare's tail which is abundant in Britain, and also occurs in N. America. It is one of the plants that grow in the hot water proceeding from the geysers in Iceland. In France the plant is called *Pesse d'Cau*, and in Germany *Schafthalm*.

Hippuri'tes, a fossil genus of shells, the exact zoological position of which was for long a matter of doubt, but which appears to be rightly included in the class *Lamellibranchiata*, represented by the oysters, cockles, &c. The difficulty of deciding as to the nature of these shells arose from the peculiar shape of these structures. The shell is inversely conical, and may attain a length of 12 inches or more. It was attached, like the familiar oysters, to the sea-bed by the larger conical valve, and was closed by a smaller and free valve with a central *umbo* or 'beak.' Dr. S. P. Woodward says that these 'shells are the most problematical of all fossils; there are no recent shells which can be supposed to belong to the same family, and the condition in which they usually occur has involved them in greater obscurity.' The H. are confined to the Cretaceous or Chalk rocks, and occur in Britain, S. Europe, N. America, W. Indies, Egypt, and Algeria. *H. Toucasiana* is a familiar species.

Hi'ring is a contract by which one engages the service or property of another for recompense. The term is never applied to any contract for the use of money. You *borrow* five shillings, and you *borrow* a thousand pounds at such a rate of interest. (See BORROWING.) The chief legal questions which occur between parties under contracts of H. are connected with loss of the subject or damage done to it. The leading principle of the law is that the hire covers ordinary wear and accidental loss or damage, unless these are caused by the fault of the hirer. Very nice legal questions however arise. Suppose a man engaged to do a piece of work for a given sum, and does it very badly, is he entitled to be paid? This would clearly depend on circumstances. The fault might lie with whoever engaged him having selected an incompetent man, or it might lie in the man having misrepresented his qualifications. An important question is, should the hirer be called on to show that he used due care, or the owner to prove want of due care on the part of the hirer? According to English law the *Onus Probandi* (q. v.) lies on the owner; according to Scotch law it lies on the hirer.

Hirsch'berg, a town in the province of Silesia, Prussia, on the Bober, 65 miles W.S.W. of Breslau by rail. It is beautifully situated at the base of the Riesengebirge, has a large Gothic church (Protestant), and is encircled by double walls. H. is the centre of the Silesian linen trade. Pop. (1875) 12,970, of whom more than half are Protestants.

Hispan'ia, the Latin, as **Ibe'ria** was the Greek, title for the south-western peninsula, now divided into Spain and Portugal. The name H. was derived by Bochart from the Phœnician *sapan* or *span*, 'a rabbit;' but W. von Humboldt's derivation from the Basque *españa*, 'a border' is preferable. Iberia, on the other hand, is thought to contain the same root as Aryan (q. v.). Who the earliest inhabitants of H. were—whether Celts or Basques—is still a disputed question, the answer to which must be found in an investigation of the ancient names occurring in Ptolemy, Strabo, Pliny, and other writers. An analysis of these seems to indicate that the Celts were the conquering, the Basques the conquered race. Thus, as a rule, the Celtic names are those of towns or fortresses, the termination *briga* being especially prominent; while the Basque are characteristic of natural objects—*e.g.*, in *Asturia* we recognise the Euskarian *asta*, 'rock,' and *uria*, 'water.' Against this theory, however, must be set the names Durius (Celt. *dwr*, 'water') and Vinnius (Celt. *pen*, 'head'). The Phœnicians were early

acquainted with H., where they seem to have exercised a great civilising influence as founders of trading cities on or near the coast. The names Gadeira (Cadiz), Asido (Medina Sidonia), and Carthagena are identical with the Tyrian or Carthaginian Geder (*gadir*, 'an enclosure'), Sidon, and Carthage; and similarly Malaga, Seville, Lisbon, Tarragona, Cordova, &c., all point to a Phœnician origin. (See HAMILCAR, HASDRUBAL, and HANNIBAL.) The conquest of H. by Rome, commenced by Scipio Africanus Major (q. v.), was almost complete in B.C. 171. The constant presence of Roman armies necessarily exercised an important influence on the language and customs of the natives, and the fusion of the Iberian and Roman races was greatly accelerated by the foundation under Augustus of many important colonies, *e.g.*, *Cæsar Augusta* (Zaragoza), *Pax Augusta* (Badajoz), and others. The modern name Portugal is also Latin, being a corruption of *Pax Julia*. The history of the conquest of H. (409) by the barbarians is given under SPAIN. See W. von Humboldt's *Prüfung der Untersuchungen über die Urbewohner Hispaniens* (Berl. 1821).

Hispanio'la ('little Spain'), the name given by the Spaniards to the island of Hayti (q. v.).

Hissar' ('citadel'), the chief town of the district of the same name, province of the Punjaub, British India, on the western Jumna Canal, 102 miles W. of Delhi; pop. (1868) 14,133. It was founded in 1352 by the Emperor Feroz Shah, for a hunting residence, and was supplied with water from his canal. A large area is still covered with ruined tombs and broken bricks. In the neighbourhood is a large Government farm for breeding cattle.—The *district* of H., which is almost entirely shut in by the native states of Bikanîr and Puttealah, has an area of 3539 sq. miles; pop. (1868) 484,681. The soil is a sandy desert, except where watered by the canal; it suffered severely in the famine of 1868-69. The crops are millet, gram, wheat, cotton, and coriander. The trade centres in the town of Bhawani, and chiefly consists of cotton and cotton goods, sugar, brassware, and salt.

Histol'ogy. See ANATOMY.

Hit, a town in the vilayet of Bagdad, Asiatic Turkey, 90 miles W.N.W. of Bagdad, on the right bank of the Euphrates. It is noted for its bitumen and naphtha springs, which yielded material for building Babylon. H. is the *Is* of Herodotus. Pop. 2000.

Hitch'cock, Edward, D.D., LL.D., an American geologist, born at Deerfield, Massachusetts, May 24, 1793. He became Principal of Deerfield Academy in 1815, Congregational pastor at Conway in 1821, and President of Amherst College in 1845, with the chair of geology. Under his care this school made most satisfactory progress. As the state geologist, a position he was appointed to in 1830, he made an entire geological survey of Massachusetts, the first attempt of the kind in any country. He was also for a time geologist for a district of New York State and of Vermont. In 1850 he was commissioned by the Government of Massachusetts to examine the agricultural schools in Europe, and he afterwards published a valuable report. He was the first President of the American Geological Association. H. died 27th February 1864. Among his works, which extend to more than 20 volumes, are *Geology of the Connecticut Valley* (1823), *Reports on the Geology of the State of Massachusetts* (1831-42), *Ichnology of New England* (1840, supp. 1865), *Fossil Footmarks in the United States* (1848), *Elementary Geology* (1840, enlarged 1854), *Religion of Geology* (1851), the last two the most popular of his writings, and *Reminiscences of Amherst College* (1863).

Hitch'in, a town of Hertfordshire, England, 14 miles N.W. of Hertford, on the river Hiz, and a station on the Great Northern Railway. It has large breweries, and carries on a trade in corn, malt, and flour. Straw-plaiting gives employment to a considerable number of females. Pop. (1871) 7630.

Hit'eren, an island on the coast of Norway, 47 miles W. of Trondhjem, and 28 miles long. Area, 220 sq. miles. Pop. 2300, living on the shores and subsisting by fishing.

Hitopade'sa (from Sansk. *hita*, 'good,' and *upadesa*, 'advice'), is the name of a famous Sanskrit collection of fables which is highly valued by the Hindus for its ethical instruction. It forms part of a larger work—the *Pantschatantra* (q. v.). The stories in one shape or another have found their way into nearly every national literature in Asia and Europe. The H. has been edited by Johnson (2d ed. 1864) and by M. Müller (1865).

Hitt'ites, or descendants of Heth, the second son of Canaan (Gen. x. 15), inhabited the southern part of the land of Canaan, and seem to have been one of the most important of its tribes. In the time of Abraham they were settled in Hebron and its neighbourhood (Gen. xxiii.). They are mentioned in almost all the lists of the Canaanitish tribes; sometimes the Canaanites, H., and Amorites (or Hivites), or the H. and Amorites stand for the whole; and in one passage (Josh. i. 4; *cf.* Deut. xi. 23, 24) the H. alone. In later times they were found in the N. of Palestine, under a confederacy of petty kings, who were conquered by the Egyptian king Seti I. (about 1340 B.C.), and their town of Kadesh (Edessa, mod. *Hums*), situated on an island in the Orontes, taken. At a still later period they imported horses and chariots from Egypt (1 Kings x. 29), by which they became a terror to their neighbours (2 Kings vii. 6). Although there is no mention of their deity in connection with Solomon's wives (1 Kings xi. 1), it appears from the Egyptian monuments that the H., like the Hyk-shos, worshipped the god Seti or Seth, known to the Egyptians as Tiphon. The local goddess of Kadesh was Anata or Anaitis, the Bellona or Canaanitish goddess of war.

Hitz'ig, Ferdinand, a distinguished German exegete and critic of the Old Testament, was born 23d June 1807, at Hauingen in Baden, studied at Heidelberg, at Halle (under Gesenius), and at Göttingen, where he graduated and became a lecturer in the university. In 1833 he was called to Zurich, which he left in 1861 for Heidelberg; and there he laboured till his death, 22d January 1875. His lectures covered the whole ground of Old Testament study and, the Semitic tongue, nor was he a stranger in New Testament criticism. Free from dogmatic prejudice, H. may be reckoned among the historico-critical rationalists. But he surpassed all his compeers in the acuteness, boldness, and ingenuity of his hypotheses. His *Begriff der Kritik am A. T.* and his *Übersetzung und Auslegung des Propheten Josaias* (Heid. 1833) founded H.'s fame. The latter work was followed by commentaries on the Psalms, the twelve minor prophets, Jeremiah, Ezekiel, and Daniel, the Song of Solomon, Proverbs, and (in 1874) Job. Among other works are the *Urgeschichte und Mythologie der Philistäer* (1846), *Johannes Marcus und Seine Schriften* (1843), and the *Geschichte der Volkes Israel* (1869).

Hivao'a, the island of the Marquesas, in the S. Pacific, about lat. 10° S. and long. 139° W. It is traversed by a mountain range that attains a height of 4200 feet. The inhabitants, 6500 in number, are amongst the wildest Polynesians, and have remained unaffected by various Catholic and Protestant missions.

Hiv'ites (Heb. 'midlanders' or 'villagers'), a tribe of Canaanites mentioned in the history of Jacob as occupying territory near the centre of Palestine (Gen. xxxiv. 2), where they were also in the time of Joshua (Josh. ix.). The main body, however, seems to have been in the N., at the foot of Hermon and Lebanon (Josh. xi. 3; Judges iii. 3; *cf.* 2 Sam. xxiv. 7). But as they were not one of the most important tribes, they seem sometimes to be included under the Amorites.

H'Lass'a, or simply **Lass'a**, the capital of Tibet, on the N. side of the Himalayas, in a mountainous region, 11,700 feet above the sea. It lies on the right bank of the Kichu Sangpo, an affluent of the Brahmaputra, 40 miles N.E. of Palti Lake. Here is the Buddha-la, or hill of Buddha, the residence of the Dalai-lama, hierarch of Buddhism throughout Mongolia. A fine road leads from the town to the hill, which is covered with splendid temples and palaces, burdened by a wealth of ornamental gold and jewels. H'L. is visited by thousands of pilgrims, many of whom stay to complete theological and other studies, and all of whom bring presents for the Dalai-lama. There is a large trade in gold, velvet, silk, cashmere, and precious stones. Pop. estimated at 50,000. H'L., from which foreigners are excluded, was visited by Captain Montgomerie in 1866.

Hlodowig, or **Chlodowig** (Lat. *Clovis* and *Chlodovechus*, whence *Ludovicus*. H. is the same name as the German *Ludwig* and the modern French *Louis*), son of Childeric, king of the Salian Franks, who in the 5th c. occupied the region of the Lower Rhine, began to rule in 481, when he was about fifteen years of age. In 486 he fell upon Northern Gaul, overthrew Syagrius, the nominal representative of Rome, and shortly afterwards married Hlotchild (Fr. Clotilde), a Christian, daughter of a Burgundian chief. After his victory over the Allemans at Tolbiac in 496, he was baptised in Rheims, and after forcing Gondebald, king

of the Burgundians, to own himself his 'man,' in 507 he broke the Visigothic power in the S. of Gaul, where his barbarity stirred up the bitter enmity which the S. long bore for the N. of France. Shortly afterwards Anastasius, emperor of the East, sent him the title of *Consul Romanus*, and in 511 he died. H. was a bloodthirsty, treacherous savage, with a great deal of coarse energy and dogged ambition. He loaded the clergy with gifts, and had an important influence on the rise of the Church militant. See Kitchin's *History of France* (vol. i. 1873).

Hoad'ley, Benjamin, D.D., an English prelate, was born at Westerham, Kent, November 14, 1676, and educated at Norwich and Cambridge. In 1701 he became lecturer at St. Mildred's-in-the-Poultry, London, and in 1704 obtained the rectory of St. Peter-le-Poor. H. early displayed great controversial ability, and soon became the acknowledged champion of Whig or Low Church principles, his most famous disputes being with Calamy on the reasonableness of conformity, and with Atterbury on non-resistance. Though much opposed by the clergy, his views were popular, and applauded by Parliament, and Mrs. Howland, a sympathetic admirer, presented him to the living of Streatham. In 1715, on the accession of George I., he became Bishop of Bangor, but never visited his diocese. A sermon preached by him in 1717 on the text 'My kingdom is not of this world,' contending that the Church could claim no civil power, provoked the celebrated Bangorian controversy, in which he was opposed by Sherlock, Hare, Law, &c. From Bangor he was transferred to Hereford in 1721, to Salisbury in 1723, and to Winchester in 1734, where he died, April 17, 1761. His works were published in 3 vols. fol. in 1773.

Hoang-ho ('yellow river'), a great river of China, rises in Lake Ala-nor, in Tibet, flows first in a north-easterly direction through part of Mongolia, then S., passing the Great Wall, and forming the boundary between Shen-si and Shan-si, and finally W. and N.W. traversing Ho-nan and Shan-tung, and entering the Gulf of Pe-chi-li. It is rapid and tortuous, and in its lower course scarcely navigable. Its name is derived from the yellow clay it deposits along its banks and at its mouth. Its chief affluent is the Wei-ho, and the principal towns it passes are Lan-chu and Kai-fung. In its lower course the bed of the H. often lies above the level of the surrounding country, and one of the most fertile provinces in the empire is protected from inundation by embankments and canals maintained at a cost of 7,000,000 dollars yearly. The H., which has a length of about 2400 miles, entered the Yellow Sea some 300 miles further S. till 1853, when it broke into its new course.

Hoarfrost. See DEW.

Hoarse'ness. See THROAT, DISEASES OF.

Ho'bart Town, the capital of Tasmania, is beautifully situated at the foot of Mount Wellington (4166 feet), on the river Derwent. The harbour is of the first rank, capable of accommodating ships of any tonnage. The town is laid out in the form of a square, and the streets are wide, straight, and lighted with gas. The public buildings are numerous and handsome, the chief being the governor's residence, houses of parliament, and townhall. There are also Anglican and Roman Catholic cathedrals, and thirty-one other places of worship. The city likewise contains sixty-two private, seven public, and three ragged schools. Brewing, jam-making for export, and shipbuilding, are the chief industries of H. T., which carries on an extensive trade with the neighbouring colonies (principally with Victoria) and with the mother country. A line of railway connects it with Launceston on the N. side of the island. H. T. is a favourite health resort of the wealthy citizens of Melbourne, Sydney, and Adelaide during the summer months. Pop. 19,000.

Hobb'ema, Minderhout, a well-known Dutch landscape painter of the 17th c. Except that he was a contemporary of Berghem, Lingelbach, and J. van Loo, who executed the figures in H.'s landscapes, we know nothing of his life, though, from a similarity of styles, it has been conjectured that he was a pupil of Ruysdael. His pictures, mostly forests with ruins, are scattered over the galleries of Vienna, Berlin, &c.

Hobbes', Thomas, an influential English thinker, the son of a Protestant clergyman, was born at Malmesbury, 5th April 1588. After study at Oxford, and travel in Europe as a tutor, he became secretary to Bacon, and through his patron, Lord Devonshire, made the friendship of Ben Jonson and Herbert of Cherbury. In 1628 appeared his translation of *Thucydides*, meant to prevent the Civil War. After repeated visits to the Continent, in which he met Mersenne and Galileo, he in 1642 published *Elementa Philosophica de Cive*. On the breaking out of Civil War he withdrew to France, where he corresponded with Descartes and Gassendi, and composed his *Human Nature*, his *De Corpore Politico*, and the *Leviathan* (1651), which cost him his post of mathematical tutor to Charles II., who, while bending to the clamour of the Church against H.'s supposed atheism, treated H. with great kindness, and gave him a pension. Returning to England in 1652, he wrote his famous *Letter on Liberty and Necessity*, which called forth the eloquence of Bishop Bramhall. H. was also engaged in a mathematical controversy with Wallis. While the House of Commons passed a censure on his books, Cosmo de Medici and many other great foreigners came to visit H. and to do him honour. After his eighty-fifth year this wonderful old man wrote his life in Latin verse, and published translations of the *Iliad* and the *Odyssey*. His *Behemoth, or History of the Civil War from 1640 to 1660*, was not published till after his death, which took place 4th December 1679. H. was a man of singularly quiet and simple life. Dr. Kennet in his *Memoirs of the Cavendishes* relates how he took exercise in the morning, and retired after dinner to his study, 'where ten or twelve pipes of tobacco were laid out for him.' His converse with great persons never spoiled his native independence of character. He has no equal in English literature for boldness and originality of speculation, or for absolute lucidity of expression. He first discussed government on grounds of reason, and started the fiction of an original contract, creating the Leviathan or Commonwealth for mutual protection and defence. But in destroying the religious and patriarchal theories of society, he laid the basis for despotism, by transferring all rights from the subject to the monarch, except that of self-preservation. Power came from the people, and was given for the people's good, but H. did not recognise a right of resistance, the responsibility of princes, or the supremacy of representative assemblies. The first part of the *Leviathan*, 'On Man,' contains a powerful analysis of the simple and complex passions. The standard of public and private interest is enlightened self-interest; all feelings are self-regarding; the power of the state and the perception of public utility are the real sanctions of conscience. To this we add religion; for H. (himself a sceptic) declared faith in Christ and obedience to the state to be necessary to salvation. In morals H. was answered by Cumberland, Clarke, and Wollaston. A magnificent edition of his works in 11 vols. was published by Sir William Molesworth in 1842-45.

Hobb'y (*Falco subbuteo*), a species of *Falconidæ* or Falcons (q. v.), occurring throughout Europe, and also in Asia and Africa. It is of a slate-grey colour on the upper parts, the feathers exhibiting yellowish-white edges, and the under parts being of lighter tints than the upper. The average length is from 11 to 13 inches. The H. is by no means a common British bird. It was used by the falconer to bring down smaller game.

Hob'oken, a city of New Jersey, on the river Hudson, adjoining Jersey City, was founded by the Dutch in the 17th c. Lying opposite New York, it was formerly a favourite place of residence for the merchants of that city. H. is the terminus of four lines of European steamers, and of the Morris and Esser, the Delaware, Lackawanna, and Western Railways. It supplies New York with coal, has large foundries, and manufactures machinery and lead-pencils. H. contains several good schools, including the Stevens' Institute of Technology, which has eight professors, and the Martha Institute. Pop. (1870) 20,297.

Hoche, Lazare, a great French general, born at Montreuil, 25th June 1768, was at first a stable-boy, then joined the army, and when the Revolution came had risen to the rank of sergeant. He soon got a lieutenant's commission, and served at Thionville and Neerwinde under Dumouriez. Carnot saw his ability, and sent him as brigadier-general to Dunkirk, invested by the Duke of York, where his success gained for him the command of the army of the Moselle. Here, however, Brunswick kept the line of the Vosges, until H. effected a junction with Pichégru on the Rhine, when the Austrians evacuated Alsace. In 1794 he was called to the command of the army of the W. He showed great skill, patriotism, and humanity in dealing with the fanatical Chouans, who maintained a guerilla war in a difficult country. He crushed the Quiberon expedition of Charette, and

disapproved of the *noyades* and other excesses by which the republican cause was disgraced. After taking part in the abortive descent on Bantry Bay, the brave soldier at the head of the army of the Sambre and Meuse made a brilliant dash across the Rhine to Giessen, where the articles of Leoben stopped him. After the *coup d'etat* of Fructidor, for which H. had offered Barras and the majority of the Directory the use of his army, in spite of the rage of the *Clichien* party, he succeeded Moreau in the command of the army of Germany. H.'s military talent and sincere republicanism might have altered the whole history of France, but he died suddenly, probably by poison, on 8th September 1797. He received a magnificent funeral. See the biographies of H. by Privat (1798), Rousselin (1798), and Dourille (1844).

Hoch'heim, a town in the province of Hessen-Nassau, Prussia, on the banks of the Main, 3 miles W. of Mainz by rail. It has given name to a superior class of Hock wines. Pop. 2494.

Hoch'kirch, a village in the kingdom of Saxony, 7 miles S.E. of Bautzen, notable as the scene of one of the battles in the Seven Years' War, in which Friedrich the Great was completely routed by the Austrians under Daun, October 14, 1758.

Hoch'städt, a town of Bavaria, on the Danube, where took place the 'battle of Blenheim' (q. v.), so called by the English from a neighbouring village, the scene of a decisive incident in the fight.

Hodg'kinson, Eaton, a distinguished engineer, was born at Anderton, near Norwich, Cheshire, February 26, 1789. When twenty-one years of age he settled in Manchester, and there begun the study of mechanics. He became Professor of Mechanical Engineering in the University College, London, in 1847. Six years earlier he had been elected a Fellow of the Royal Society, when he received the royal gold medal for his *Experimental Researches on the Strength of Pillars of Cast-iron and of other Materials.* These were carried on at the expense of Sir W. Fairbairn (q. v.) of Manchester, with whom he also co-operated in determining, experimentally and theoretically, the best form and proportions of the Britannia Tubular Bridge (q. v.). His valuable investigations on the strength of materials and the resistance of structures to stresses of all kinds were published in the *Transactions* of the British Association, in the *Philosophical Transactions*, and in the *Manchester Transactions.* H. died, June 1861, at Broughton, near Manchester.

Ho'dograph of a moving particle is the curve passing through the extremity of those lines which, drawn from a fixed point as origin, represent in direction and magnitude the velocities of the particle at the different points of its path. The H. of a projectile moving in a parabola is evidently a vertical straight line, since the horizontal component of the velocity at every point is constant. Again, the H. of a point moving uniformly in a circle is another circle whose centre is the origin from which the velocities were laid down. The H. of a planet is a circle which is, however, placed excentrically with respect to the origin. The method of construction of this curve shows that, just as the tangent at any point of an orbit gives the direction in which the particle is moving, so the tangent to the H. gives the direction of acceleration. This curve was invented by Sir W. R. Hamilton; and its application to planetary motion has resulted in most simple and elegant geometrical constructions. See Hamilton's *Quaternions*, Thomson and Tait's *Natural Philosophy*, Tait and Steele's *Dynamics of a Particle*, and Clerk Maxwell's *Matter and Motion.*

Hodom'eter is an instrument which, by an arrangement of toothed wheels connected with the axle of a vehicle, registers the number of revolutions which the wheel makes, and thus affords data for the calculation of the distance traversed.

Hod'son, Major William, one of the leading characters of the Indian Mutiny. In the early years of his service in India, he had been selected for civil employment under the Lawrences in the Punjaub. The outbreak of the Mutiny in May 1857 revealed his peculiar qualities. He was immediately appointed to the staff, and was intrusted with the raising of a new regiment of irregular cavalry—'Hodson's Horse.' Through the siege of Delhi he performed admirable service as chief of the intelligence department, which brought him into close communication with the rebel royal family. On the capture of the city, he received orders to bring in *alive* the last of the Mogul Emperors, who had taken refuge in the tomb of Humayun, outside the walls. This he safely effected, and then went to fetch the Shahzadas, or royal princes. They also surrendered to him; but on the way to the city he ordered his prisoners to strip themselves of their jewels, &c., and then he shot them dead with his own hand. The general wrote, 'H., as a partisan officer, has not his equal.' A few months afterwards H. was himself killed in the final storming of the Kaisar Bagh, the royal palace at Lucknow. See *Life of Major William H.* by his brother, and Sir J. W. Kaye's *History of the Sepoy War.*

Hoe, a simple tool used in gardening and agriculture for freeing the ground from weeds, stirring up earth, thinning drilled seedlings, and other like operations. In gardening two varieties of H. are used: (1) the Dutch H., which has a flat cutting blade attached to its long handle in the same plane, and is worked by pushing only, for under-cutting weeds and dressing walks; and (2) the common or draw H. which has its blade fastened at a right angle to the handle. The chief use of this kind of H. is in cleaning drilled crops, and thinning or hoeing drilled seedlings, as in the case of turnips; but it is also found to be a useful implement in many other agricultural operations. A horse-H. is a machine having a series of H. blades mounted upon it, which is used for cleaning and tilling between drills. Special forms of hoes for use on sugar and cotton plantations are extensively manufactured at Birmingham.

Hoe'ven, Jan van der, a Dutch naturalist, was born February 9, 1801, at Rotterdam. He studied medicine at Leyden, where he became Professor of Zoology in 1835. He is the author of several important works and numerous memoirs; but his greatest is *Handbock der Dierkunde* (2 vols. 1827–33, 2d ed. 1846).—His elder brother, **Cornelis Pruys van der H.**, is a medical professor at Leyden and the author of several historical medical works.

Hof, a town of Bavaria, in Upper Franconia, on the Saale, 40 miles N.E. of Bayreuth by rail. It has manufactures of woollens, cottons, hosiery, beer, and iron wares, and an active transit trade. It was partly destroyed by fire in 1823. Pop. (1875) 18,267.

Ho'fer, Andreas, the Tyrolese patriot, was born November 22, 1767, at St. Leonard's, in the valley of Passey, where his father was an innkeeper. H. succeeded to his father's business, combining with it wine-selling and horse-dealing, until the wars of the first Napoleon gave him the opportunity of obtaining distinction. The courage and boldness of H. made him leader among his compatriots, and under his command the Tyrolese took an honourable part in the wars of Austria against the French. Shortly before the battle of Wagram, a formidable insurrection against the French Emperor was raised in the Tyrol at the instance of the Archduke Johann of Austria, and of this H. became the ruling spirit. Such was his success, that in the three days, April 11 to April 13, 1809, the province was completely cleared of the enemy; but Napoleon having defeated the great armies of Austria, this local triumph was of comparatively little moment. The Tyrol was ceded by Austria to France, and H., though he struggled to the uttermost, was eventually driven into hiding. He was betrayed into the hands of the French by a priest named Douay, who had formerly been his friend; taken to Mantua, tried and condemned, and there shot, February 20, 1810. H.'s heroic defence of his country was subsequently acknowledged by the ennobling of his family, and a statue of him has been erected at Innsbrück, where he is buried. See the biographies of H. by Weber (Innsbr. 1852), Rapp (Innsbr. 1852), and Weidinger (3d ed. Leips. 1861).

Hoff'mann, August Heinrich (H. von Fallersleben), a German poet and philologist, was born at Fallersleben, Lüneburg, 2d April 1798, educated at the Helmstedt and Brunswick gymnasia, and the universities of Göttingen and Bonn. A friendship contracted with the brothers Grimm (1818) led him to abandon the study of theology for that of the German language and literature. Appointed keeper of the University Library, Breslau (1823), H. became Extraordinary Professor of the German Language and Literature in that university 1830), and Ordinary Professor (1835); but lost his post through the publication of *Unpolitische Lieder* (1842), and for six years wandered, a political refugee, through Germany, Switzerland, and Italy. Re-established (1848) in his Prussian civic rights, and pensioned, H. married, and settled successively on the Rhine and at Bingerbrück, Neuwied, and Weimar, at the last place editing unsuccessfully the *Weimarisches Jahrbuch* (Hanov. 1854-

1857). In 1860 he was appointed librarian to the Duke of Ratibor. His chief works are *Horæ Belgicæ* (12 vols. Leips. and Berl. 1830–62), *Geschichte des Deutschen Kirchenliedes bis auf Luther* (Bresl. 1832; 3d ed. Hannov. 1861), *Die Deutsche Philologie im Grundriss* (Berl. 1836), philological studies; editions of *Reineke Vos* (Berl. 1834) and *Theophilus* (2 vols. Hannov. 1853–54); and *Gedichte* (6th ed. Hannov. 1864), *Rheinleben* (Neuwied, 1865), *Soldatenlieder* (Mainz, 1851), *Fünfzig Kinderlieder* (Leips. 1843), &c., original poems.

Hoffmann, Ernst Theod. Amadeus (properly **Wilhelm**), a German novelist, born January 24, 1776, at Königsberg in Prussia, studied law there, and entering the state service, was appointed Government Assessor for Posen (1800). Some of his caricatures offending his superiors, H. was transferred as councillor to Plock and (1803) to Warsaw. The entrance of the French (1806) into that city cut short H.'s diplomatic career, and for nine years he was forced to support himself by contributing to a Leipsic musical journal, and acting as director to a Dresden opera company. But 1816 saw him re-established as a councillor in Berlin, where he died, July 24, 1822. Among his works may be noticed *Phantasiestücke in Callot's Manier* (Bamb. 1814; 3d ed. Leips. 1825); *Lebensansichten des Kater Murr* (2 vols. Berl. 1821–22); and *Der Doppelgänger* (Brünn, 1824). H.'s *Ausgewählte Schriften* appeared at Berlin (10 vols. 1827–28), and a complete edition of his works (12 vols. 1857). In the genius of H. there is a strange compound of ghostly fantasy and mocking satire; and in spite of certain repellent qualities that disfigured both the man and his works, his novels have the supreme merit of riveting the attention of the reader. See J. E. Hitzig, *Aus H.'s Leben und Nachlass* (2 vols. Berl. 1823).

Hoffmann, Friedrich, a distinguished German physician, was born at Halle, February 19, 1660. He studied at Jena and Erfurt, returning to Jena in 1681 to take his doctor's degree. After several years spent in travelling through England and Holland, he began practice at Minden in Westphalia in 1685. Three years later he removed to Halberstadt; and in 1693 was appointed Professor of Medicine in the University of Halle, by Friedrich, Elector of Brandenburg, afterwards King of Prussia. In 1708, at the King's request, he removed to Berlin, but returned in 1712 to Halle, where he died, November 12, 1742. As a physician and professor of medicine he was second only to Boerhaave (q. v.), who at that time made the school of Leyden famous. He wrote numerous works, many of which were collected and published at Geneva in 1740. His great works, however, are his *Medicina Rationalis Systematica* (9 vols. 1718–40) and his *Medicina Consultatoria* (12 vols. 1721–39).

Hoffmann's Anodyne Liquor, the *compound spirit of sulphuric ether* of the London pharmacopœia, is a mixture of ether, etherial oil, and alcohol, being similar in properties to *Spiritus ætheris*, which is composed of ether, one, and rectified spirit, two parts. It is a powerful diffusive stimulant, expectorant and antispasmodic, in doses of from thirty to sixty minims.

Hofmann, August Wilhelm, a German chemist, was born April 8, 1818, at Giessen, where for a time he acted as assistant to Liebig. In 1845 he came to England to superintend the Royal College of Chemistry, which now forms part of the Royal School of Mines. He has contributed many valuable papers on organic chemistry to various chemical and scientific journals, and is especially known for his researches in connection with aniline dyes. H. has edited along with Dr. Bence Jones several of the editions of Fownes' *Manual of Chemistry*, and is himself the author of a work on the subject entitled *Einleitung in die Moderne Chemie* (3 vols. 1867). In 1868 he was appointed Professor of Chemistry in Berlin.

Hof'wyl, a Swiss village 6 miles N. of Bern, noted as the seat of an educational and agricultural establishment founded by Von Fellenberg (q. v.) in 1808, and carried on by his relatives till 1840.

Hog ('the grunting animal;' Welsh, *hwch*; Bret. *houc'ha*, 'to grunt'), the name given to various genera of mammals belonging to the order *Ungulata* (q. v.), and to the *Omnivorous* group of the order. The H. is *Artiodactylate ungulata*, as the feet are even-toed, and have each two functional or well-developed toes, with two rudimentary digits in addition; the latter not reaching the ground. The canine teeth are largely developed, especially in the males, in which they form tusk-like organs, and the lower incisors or front teeth are usually inclined forwards. The molar teeth may number from six to fourteen in each jaw. The stomach generally exhibits a semi-complex structure, but is by no means of compound nature, as in the ruminantia. The H. has a truncated snout of cylindrical shape, and provided with a cartilaginous tip; the conformation of the snout and its muscular development making it an efficient burrowing organ. The skin in many cases is sparsely covered with coarse hair or bristles, but in the wild H. or varieties, hair may be abundantly developed. The tail is never of great length, and in some cases is represented by a mere tubercle. Of the H. the most familiar is the wild H. or boar (*Sus scrofa*), still found in the European forests, where it is hunted by dogs, and where its pursuit constitutes a sport by no means unattended with danger. In olden times the wild H. was hunted on foot with the spear; in modern days the chase is kept up on horseback, the huntsmen being seconded by dogs and armed with the rifle. The domesticated varieties of our pigs have sprung from the wild boar, the nearest descendants of which in England are probably to be found in the Hampshire forest-pigs. In its natural state the H. feeds on acorns, nuts, and roots, and is a cleanly animal; the depraved habits and tastes of its domesticated descendants having been induced by artificial feeding. The flesh is palatable; and the wild boar is not unknown in Britain as a dainty morsel, the *gout* of which is supposed to be increased and improved by its high or semi-putrescent condition. The Jews and Mahometans esteem the H. an unclean animal, and the use of the flesh is forbidden by their religious tenets. The flesh of the domestic pig undoubtedly serves as a harbour for the embryo-form of the *Tænia solium* or common tapeworm of man. But when the flesh is thoroughly cooked, all danger from the parasites ceases, as continued exposure to a high temperature kills them. The H. produces from eight to twelve young twice annually. When duly trained, it exhibits a high degree of intelligence. The India wild H. or boar is closely allied to the European species, and is especially destructive to fields of sugar-cane. The pursuit of this animal—popularly named 'pig-sticking'—affords amusement to English residents in India. The bush H. of S. Africa (*Cheiropotamus Africanus*), also named the Bosch Vark by the Dutch, has large tusks and swollen cheeks, while the hair is long; the ears being well developed with prominent tufts. The average length is 5 feet, and the height 2½ feet. The colour is dark brown, sometimes varied with lighter tints. The Babyroussa H. (q. v.), another notable species, is found in the E. Archipelago. There is also in Papua a H. named the *Sus Papuensis*, attaining a length of 1½ or 2 feet. The wart hogs of Africa are so named from the possession of a warty process under each eye.

Ho'garth, William, a celebrated English painter and engraver, was born in Ship Court, Old Bailey, London, 10th December 1697, and bound apprentice to Ellis Gamble, a goldsmith of Cranbourn Street, in 1712. Starting in business on his own account (1720) as an heraldic engraver, H. presently applied himself to copper-engraving, his eighteen illustrations to Butler's *Hudibras* appearing in 1726–27. In 1729 he formed a secret marriage with a daughter of Sir James Thornhill (at whose academy he had studied in 1724), and during the years 1727–30 turned out dozens of portraits, with no great profit to himself. But the series of the 'Harlot's Progress' (1733, destroyed by fire, 1755) at once marked the true bent of H.'s genius, won him a name, and, by the sale of 2000 plates, laid the foundation of his later competence. Then came in quick succession (1734–38) the 'Rake's Progress,' 'Strolling Actresses in a Barn,' and the 'Distressed Poet,' all adding largely to the reputation of this 'Juvenal in oils.' After a few mistaken essays in the field of historical painting, H. came back to the more congenial line of modern satire, and issued his 'Distressed Poet' (1741); 'Marriage à la Mode' (1745), bought in 1797 by Mr. Angerstein for £1381, and now in the National Gallery; 'Industry and Idleness' (1747), 'March to Finchley' (1748), 'Calais Gate' (1749), &c. In 1750 H. bought a villa at Chiswick, in 1757 was elected a councillor and honorary member of the Imperial Academy of Augsburg, and the same year succeeded his father-in-law as sergeant-painter to George II. He died in Leicester Square, London, 25th October 1764, and was buried at Chiswick, his wife surviving him thirty-five years. Numerous editions of H.'s works have been published both at home and abroad, the best being those by T. Clerk (1812) and Nichols (3 vols. Lond.

1820–22). See *W. H., Painter, Engraver, and Philosopher*, by G. Sala, in the *Cornhill Magazine* (vol. i.–ii.), collected and republished in 1867, and G. F. Waagen's *Kunstwerke und Künstler in England und Paris* (3 vols. Berl. 1837–39).

Hogg, James, 'the Ettrick Shepherd,' a Scottish poet, was born in the Forest of Ettrick, Selkirkshire, January 25, 1772. From his boyhood he followed the occupation of a shepherd, and early won a local reputation as a song-writer. In 1801 he became acquainted with Scott, to whom he handed over a number of the old ballads collected in the *Border Minstrelsy*, and in 1803 he issued the *Mountain Bard*. After making an unlucky farming speculation, he became editor of the *Spy*, an Edinburgh journal, a contributor to *Blackwood's Magazine*, and an intimate associate with various literary celebrities, among others with Scott and Wilson, the latter of whom widely popularised, and in a coarse way idealised, him in the *Noctes Ambrosianæ*. H. published the *Queen's Wake* in 1813, married in 1814, and was again unsuccessful as a farmer, after which he devoted himself mainly to literature, and wrote both in prose and verse with considerable profit until his death at Altrive, November 21, 1835. Besides the *Queen's Wake*, his best work, he produced *Madoc of the Moor*, *The Pilgrims of the Sun*, *Queen Hynde*, *The Jacobite Relics of Scotland*, *The Border Garland*, several wild but interesting Scottish stories, *Lay Sermons*, and a *Life of Sir Walter Scott*. His larger poems, sometimes disfigured by affectation and ineptitudes, abound in rich description, thrilling weirdness, and subtle, delicate imagination. His lyrics, of which the finest are the *Skylark*, and *When the Kye comes Hame*, are characteristically Scottish in their stirring or plaintive melody, their sweet intensity of pathos, their fresh, natural colour, and their genuine Arcadian sentiment. A collected edition of H.'s poems, with a biography of the author, was published at London by J. Wilson, in 5 vols. 1850–52.

Hogmanay', a name in use in Scotland for the last day of the year. The word is very variously explained; some, for example, deriving it from a French phrase, *au qui menez*, 'to the misletoe lead,' others from *hoggu-nott*, or *hogenat*, a Scandinavian word for 'killing-night,' *i.e.*, the eve of the feast. *Hagmena*, doubtless the same as H., is a N. of England name for the last *period* of the year.

Hog Plum, the name current in Brazil and the W. Indies for the fruit of several species of spondias, a genus belonging to the natural order *Anacardiaceæ*, and so called from being extensively used to fatten swine. The genus has a wide distribution through the tropics of both hemispheres, furnishing in the Society Islands, Abyssinia, India, &c., an article of native food. Various species, as *S. mangifera*, *S. tuberosa*, and *S. Mombin*, are also valued for sundry medicinal qualifications.

Hog Rat, the name given to a species of Rodent (q. v.) quadrupeds, belonging to the genus *Capromys*, and found in S. America and Cuba. It is also named sand rat, is somewhat hoglike in shape, and inhabits trees. The tail is long and hairy, and the average size is that of a small rabbit.

Hogs'head, an ancient measure of capacity, still used in Britain and America as a standard measure for wine and beer. The wine H. contains 63 gallons, the beer H. 54. In the United States a H. of tobacco varies from 750 to 1200 pounds in the different States.

Hohenlin'den, anc. *Hollinden* ('the hollow place of the lime-trees'), a village in Upper Bavaria, Germany, 25 miles E. of Munich, is famous as the scene of the defeat, inflicted during a snowstorm, on the Austrians, under the Archduke Johann, by the French, led by Moreau, December 3, 1800. The Austrian losses amounted to 8000 killed and wounded, 11,000 prisoners, and 100 pieces of artillery. The victory, which led to the peace of Lunéville, is the subject of one of Campbell's fiery lyrics.

Hoh'enlohe, a former Countship and Principality of Franconia, S. Germany, with an area of 680 sq. miles, and a pop. in 1805 of 108,600, was mediatised by the Rhein-Bund in 1806, and is now partly included in Bavaria and partly in Würtemberg. The family, which was founded in the 12th c. by Count Gottfried, friend of the Emperor Heinrich VI., divided (1551) into two main branches, still existing—the Lutheran H.-Neuenstein, with the lines H.-Lagenburg, H.-Oehringen or Ingelfingen, and H.-Kirchberg (died out in 1861); and the Roman Catholic H.-Waldenburg, with the lines H.-Waldenburg-Bartenstein and H.-Waldenburg-Schillingsfürst. In 1744 the Counts of H. were made Princes of the Empire. **Friedrich Ludwig**, Prince of H.-Ingelfingen (born 1746, died 1818), received the command of the Prussian army when the Duke of Brunswick was wounded at Jena, and infamously capitulated at Prenzlau with 17,000 men, October 28, 1806. **Ludwig Aloysius**, prince of H.-Waldenburg-Bartenstein (born 1765, died 1829), fought with distinction against Napoleon under French, Dutch, and Austrian colours, and was made marshal and peer of France. **Alexander Leopold Franz Emmerich**, Prince of H.-Waldenburg-Schillingsfürst (born 1794), was educated by Jesuits, became a priest, wrote mystical books, caused some sensation as a miraculous healer, and died, 1849, as Bishop of Sardica *in partibus*. **Clodwig**, prince of the same line, was born 31st March 1819, and became Minister of Foreign Affairs for Bavaria, and did much to promote a good understanding with Prussia. As vice-president of the Zollverein (1868–69) he showed himself a friend of German unity, incurring the bitter hostility of the Bavarian anti-unionists. He was forced to resign office on the eve of the Franco-Prussian war, but was appointed French ambassador in 1874.

Hoh'enstaufen, a princely German family founded in the middle of the 11th c. by Friedrich von Büren, and which derived its name from Von Büren's Castle of Hohenstaufen ('high rock'), on the Danube, 30 miles below Stuttgart. Von Büren's son, Friedrich von Staufen or H., distinguished himself so much at the battle of Merseburg (1080), that Heinrich IV., whose daughter Agnes he married, made him Duke of Swabia. Friedrich came into conflict with the Welfs or Guelfs, and his family were called by the Italians Ghibellines from their castle of Weiblingen. The sons of Friedrich—Friedrich II. and Konrad, Dukes of Swabia and Franconia—on Heinrich V.'s death grasped unsuccessfully at the imperial title, and after a fierce war they were forced to yield in 1135; but in 1138 Konrad was elected emperor, and the imperial office remained in the family above a century, being held by Konrad III. (q. v.), Friedrich I. (q. v.), Heinrich VI. (q. v.), Philip (q. v.), Friedrich II. (q. v.), and Konrad IV. (q. v.). The last prince was poisoned in Southern Italy in 1254, and the male line of the Hohenstaufens died with his son Konradin, who fell in 1268 when striving to gain the kingdom of Naples. In 1280 a branch of the family, descended from Constance, daughter of Manfred (q. v.), half-brother of Konrad IV., became rulers of Sicily, Constance having married Peter III. of Aragon. See Raumer's *Geschichte der H.* (4th ed. 6 vols. 1871).

Hoh'enstein ('high rock'), a town in the kingdom of Saxony, 10 miles W.S.W. of Chemnitz by railway. It is a seat of the cotton manufacture, and possesses a mineral spring. Pop. (1875) 5726.

Hohenzoll'ern, or **Zoll'ern**, is the name of a castle on a conical peak in the northern slope of the Swabian Alps, near the town of Hechingen, the cradle of an illustrious line of German princes. The family of H. traces its descent back to a Graf Thassilo, said to have founded the castle about the year 800. The first to assume the name of H. or Zollern were two counts, Burchard and Wezel, who fell in battle about 1061. Graf Friedrich III. von Zolre, who died about 1200, was one of the most trusty councillors of the Emperors Friedrich I. and Heinrich VI., and was by the latter appointed Burggraf of Nürnberg. Through his Austrian wife he came into possession of extensive estates in Franconia and Austria. His grandson Konrad II. made over the original family title and estates to his nephew Friedrich; retaining for himself the newly-acquired lands and the title Burggraf of Nürnberg. Since that time the H. family has been maintained in the two lines, the elder or *Franconian* and the *Swabian*. Friedrich III., son of Konrad II., head of the former line, acquired in Baireuth and its mines a valuable addition to his domains. Before 1330 several townships and the city of Anspach (Ansbach) were added by purchase. And by the middle of the 14th c. the Burggrafs of Nürnberg were the most powerful lords in all Franconia. Friedrich V. was made a prince of the empire in 1363. In 1411 the Emperor conferred the domain of Brandenburg on the house of H., and in 1415 the title of Elector. Friedrich III., eleventh in succession from the first Elector of Brandenburg, became, as Friedrich I., the first king of Prussia; and in the person of William I. of Prussia, in descent from the first king, the house of H. has attained to the imperial crown of Germany. The Swabian line did not become prominent until the 16th c., but gradually added the territory of Sigmaringen, Vöhringen,

and Hechingen to the patrimonial domain of H.; and about the beginning of the 17th c., this line separated into the branches of H.-Hechingen and H.-Sigmaringen. In virtue of family compacts made in 1695, 1707, and 1821, the representatives of both these branches retired into private life (7th December 1849), with the rank of princes, leaving the seigniory of H. to Friedrich-Wilhelm IV., King of Prussia, as being head of the whole house of H. The principality of H. is accordingly now a Prussian province. It consists of a long strip of land, extending from the Neckar southward across the Danube to near the lake of Constance. It is completely encircled by Baden and Würtemberg, has an area of 439 sq. miles and (in 1871) a pop. of 65,558. See Barth's *Hohenzoll. Chronik* (Sigmar. 1860).

Höh'scheid, an important industrial town of Rhenish Prussia, 17 miles S.E. of Düsseldorf. Its chief industries are in lead and iron. Pop. (1875) 9958.

Hokian'ga, a river and township in the N. Island of New Zealand, near its northern extremity. The river enters the sea by a spacious estuary, forming a safe and commodious harbour, its mouth being in 35° 30' S. lat., 173° 26' E. long. Large quantities of timber, chiefly that of the valuable Kauri Pine (q. v.), are exported from the district.

Hokitik'a, a town on the W. coast of the Middle Island of New Zealand. Shortly after the discovery of the Westland diggings in 1865, H. sprang into existence, rapidly growing into a town of 10,000 inhabitants, with a gold export of more than £750,000 in a single year. H. has since declined with the gold fields, on which it is dependent, and in 1876 its population was only 3600, or, inclusive of the neighbouring district, 7380. H. is situated at the mouth of a small river of the same name, with a bad bar harbour.

Hol'bach, Paul Heinrich Dietrich, Baron d', a philosopher of German origin, was born in 1723 at Heidelsheim, in the Palatinate. Coming to Paris with plenty of money, he gathered about him a social clique of Encyclopædists, such as Diderot, Galiani, D'Alembert, Ragnal, Helvetius, Marmontel, &c. His house was for years the centre of 'free' thought in France. H., a kindly, luxurious, rather dull man, was personally a great favourite. He wrote on physics, chemistry, and mineralogy for the *Encyclopédie*, translating many scientific works from the German. In his *Christianisme Dévoilé* (1767) he attacked both the dogmas and the moral teaching of Christianity, and denied that religion was essential to political security. In 1770 appeared his *Système de la Nature*, republished as *Le Bon Sens*, a very popular work among the lower classes, who were caught by the simplicity of its crude materialism, and which Voltaire indignantly criticised in his article 'God' in the *Encyclopédie*. *Le Système Social* is an attempt to construct a scheme of social order and duty without reference to religion. H. died 21st January 1789. See *Memoires* of the Abbé Morellet, Grimm's *Correspondance*, and *Les Diners de Baron D'H.*, by Mme. de Genlis.

Hol'bein, Hans (the Younger), a great German painter, was born about 1497, Grünstadt and Augsburg contending for the honour of being his birthplace. Taught painting by his father, H. the Elder, he attracted notice as early as 1512, and four years later settled at Basel, where he seems to have led a gay, roystering life, and whence, in 1526, he proceeded to England with a recommendation from his friend Erasmus to Sir Thomas More. H. spent three years in More's house upon the Thames, and in 1529 was appointed court-painter to Henry VIII. with a salary of £30 a year. The year following H. revisited Basel, where he had left a wife and family, but immediately returned with them to England, and in this land of his adoption passed the remainder of his days in the busy practice of his art. The date of his death has been a subject of much controversy. By Walpole and others he is stated to have fallen a victim to the plague of 1554. But we find no record of any such pestilence in that year, and the recent discovery of H.'s will, bearing date of administration November 29, 1543, may be regarded as decisive of the question. Consequently the many 'Holbeins' subsequent to the latter year have had to be reattributed. The whole subject, indeed, of this master's works is a perplexing one. Even of his masterpiece, 'The Family of the Burgomaster Meyer,' two copies exist—the one at Darmstadt, the other in the Dresden Gallery—concerning which connoisseurs differ as to which is the original, which the *replica*. Among H.'s other works may be noticed a 'Last Supper' and 'Passion' at Basel; an 'Adoration of the Shepherds and Kings' at Freiburg; the 'Barber-Surgeons receiving their Diploma from Henry VIII.,' in the Barbers' Hall, London; and portraits of Erasmus, Gyzen, Moretto, Melanchthon, and Jane Seymour, in the galleries respectively of Berlin, Dresden, Hanover, and Vienna. H. was further an admirable wood-engraver—his 'Dance of Death' (q. v.) being most familiar to us—whilst his skill as a designer for glass-painting is shown in the noble windows of King's College Chapel, Cambridge. The freedom and accuracy of his drawing, the truth and brilliancy of his colour, and his exquisite finish, entitle him to be reckoned among the great masters. See Hegner, *Hans Holbein der Jüngere* (Berl. 1827); Bartolozzi, *H.'s Portraits of the Court of Henry VIII.* (Lond. 1828); Wornum's *Life of H.* (Lond. 1867); and Woltmann, *Holbein und seine Zeit* (Leips. 1867, 2d ed. 1874). The *H. Society*, founded in 1868, has for its object the encouragement of a taste for old wood-engravings by the production of photo-lithographic copies.

Hol'berg, Ludvig, one of the greatest names in modern Danish literature, was born at Bergen in Norway, November 6, 1684, and studied at Copenhagen University. After visiting Germany, Holland, France, and England, he returned to Copenhagen, where in 1718 he was made Professor of Metaphysics, and two years later Professor of Oratory and member of the 'Consistorium.' From this period date his satires, the first-fruits of his literary activity. *Peder Paars*, a heroic satire in iambics (1719–20), *Hans Mikkelsens Fire Skjemtedigte* (1722), *Hans Mikkelsens Metamorphosis* (1726), were already written when, led by an accident to write for the stage, he found there a field peculiarly favourable to his genius. In quick succession he produced a long series of comedies, *Hans Mikkelsens Comedier* (7 vols. 1723–54), which form the groundwork of the Danish comic drama. They are full of lively, powerful humour, and present a great variety of original characters. *Nils Klims, Underjordiske Reise*, a satirical romance, was written in Latin (1741), but was soon translated into several languages. H. also turned his attention to history, producing *Danmarks Historie* (finished 1762–63), *Jödiske Historie* (1742), *Almindelig Kirkehistorie* (1739), as well as four volumes of parallel lives of heroes and heroines in Plutarch's manner (1753–57). His *Epistler* (5 vols. 1748–54) are full of thought and wit, but *Moralske Fabler* (1751) are comparatively uninteresting. He was ennobled in 1746, and died 28th January 1754. K. L. Rahbek published in 21 vols. *Udvalgte Skrifter*, but it is only in recent years that the Holberg Society have produced critical editions of his greatest writings by Liebenberg, Brunn, &c. See Prutz, *H., Leben und Schriften* (Stuttg. 1857); Smith, *H.'s Levnet og Populære Skrifter* (Copenh. 1858); Legrelle, *H. considéré comme Imitateur de Molière* (Paris, 1864).

Hol'cus, a genus of grass, two species of which are indigenous to Britain. See Soft Grass.

Hold, the interior part of a ship nearest the keel, which runs from stem to stern. In merchantmen the cargo is mainly stowed in the H., which, in men-of-war, contains the ship's stores. It is divided into compartments by bulk-heads.

Holding, a term of Scotch feudal law equivalent to *tenure* (see Tenures) in England. H. expresses the services due to the Superior (q. v.), and marks by the words—*Feu* (q. v.) or *Blench*—the nature of the connection between the superior and Vassal (q. v.). When any one holds *feu*, he holds his land for a yearly payment. *Blench* denotes a nominal duty, as a penny Scots. See also Dominium, Ground Annual, Burgage Tenure.

Holding Over, an English law term, denoting the keeping possession of land or a tenement beyond the term of agreement. In this case the tenancy is held to be renewed on the same terms and for the same period. But if notice of quitting has been given on either side, and the tenant refuse to go at the proper time, he is liable in double rent. In Scotch law see Relocation, Tacit.

Hol'idays (in law). The national H. in England are Christmas Day, Good Friday, and the Queen's birthday. 34 and 35 Vict. c. 17 makes Easter Monday, the Monday in Whitsun Week, the first Monday in August, and the 26th December, bank H. in England and Ireland. Bank H. in Scotland, under the same Act, are New Year's Day, Christmas Day, Good Friday, and the

first Mondays of May and August. If either of the two first falls on a Sunday, the following Monday is a holiday. If a bill of exchange falls due on a Sunday, it must be paid the day before; when it falls due on a bank holiday, it is payable the day after. The sole authority by which a legal holiday can be constituted in any part of the United Kingdom is an Act of Parliament.

Hol'inshed, Raphael, an English chronicler, born about the beginning of the 16th c., was educated, says Anthony à Wood, at one of the universities, and died about 1580. He wrote *The Chronicles of Englande, Scotlande, and Irelande* (2 vols. Lond. 1577; mod. ed. 6 vols. 1807–8), in which he was assisted by William Harrison, who composed the most valuable part—the prefatory account of England in the 15th c.—John Hooker, who translated the *Conquest of Ireland* from Giraldus Cambrensis, and Richard Stanihurst, who produced the portion describing Ireland. H. is now mainly known for having furnished Shakespeare with materials for his English historical plays.

Hol'kar, the hereditary appellative of the great Mahratta family that rules at Indore in Central India. The founder, Mulhar Rao H., a Sudra of the shepherd caste, and a cavalry soldier in the army of the Peishwa, died in 1766. He was succeeded by Ahalya Barji, the widow of his son, an extraordinary woman, who reigned for thirty years, and founded the city of Indore. She is now worshipped in Malwa as an incarnation of the deity. The descendants of her adopted son are still on the throne. The H. dynasty were the military rivals of Scindiah (q. v.) of Gwalior. See Grant Duff's *History of the Mahrattas* (Lond. 1826). See also INDORE and MAHRATTAS.

Holl'and ('hollow-land'), a name frequently given to the former republic of the Seven Provinces and to the present kingdom of the Netherlands, was originally that of an old countship almost co-extensive with the modern provinces of North and South H. See NETHERLANDS.

Holland, North, a province of the Netherlands, mainly consists of the peninsula that encloses the Zuider Zee on the W., and also comprises, of the series of islands stretching N. therefrom—Wieringen, Texel, Vlieland, and Ter Schelling. Area, 955 sq. miles; pop. (1875) 629,345. The peninsula is traversed from Amsterdam in the S. to Helder in the N. by the great N. Holland Canal, and is separated from the mainland by the Y (*Het Ij*), the Wijkermeer, and N. Sea Canal, carried across a narrow neck of land (*Holland op Zijn Smalst*). The fertile and well-cultured marsh land is drained by many steam-pumps, watermills, and canals, and protected from the sea by enormous dunes and dykes. There is much cattle-rearing, and the chief products are cheese, butter, and oats. In the S. lay the old Haarlem Lake (q. v.). The chief town is Amsterdam.—**South H.**, a province lying between the former and the mouths of the Rhine, is bounded E. by Utrecht and Gelderland, and W. by the North Sea. Area, 1162 sq. miles; pop. (1875) 748,162. It is flat and low-lying, and includes the islands Voorne, Putten, Over-Flakkee, Ijsselmonde, Rozenburg, Beijerland, Strijen, &c. There are many canals, sloughs (*sloten*), and ponds (*polder*), and the chief rivers are the Old Rhine, Ijssel, Lek, Merwede, Hollands-Diep, and Maas. The islands have a loamy soil, and yield corn and flax; the so-called Westland is famed for its fruit and vegetables. The principal industries are cattle-rearing, cheese-making and fishing. The capital is the Hague, and other towns are Rotterdam, Leyden, Gouda, Dordrecht, and Delft.

Holland, Henry Richard Fox Vassall-Holland, third baron, an English statesman, nephew of Charles James Fox, was born at Winterslow House, Wilts, 23d November 1773, and succeeded to the title in 1774. He was educated at Eton and Christchurch, and carefully trained by his uncle for a political career. In 1798 he made his maiden parliamentary speech, and was thereafter a frequent debater in the House of Lords. He protested against the imprisonment of Napoleon, opposed the slave-trade and the corn-laws, and was throughout life a staunch and consistent Whig. He was Lord Privy Seal under Lord Grenville for a few months, and was in opposition with his party till 1830, when he became Chancellor of the Duchy of Lancaster in Lord Grey's Ministry, and subsequently in that of Lord Melbourne. He died October 22, 1840. H. was a generous patron of literature and the fine arts, and his courtly grace of manner and amiability of character endeared him to many friends. His own contributions to literature are not unimportant. He wrote two fine biographies of Guillen de Castro and Lope de Vega (Lond. 1805, 2d. ed. 1817), and translated three Spanish comedies (Lond. 1807); drew up an admirable life of his great uncle, which he prefixed to an edition (1808) of Fox's *History of the Reign of James II.*, and edited the *Memoirs of Lord Waldegrave* (Lond. 1822). Two posthumous works from his pen, *Foreign Reminiscences*, and *Memoirs of the Whig Party*, edited by his son, **Henry Edward Fox**, fourth **Lord H.** (born 1802, died 1859), were published respectively in 1850 and 1854. The Princess Marie Lichtenstein, adopted daughter of the last Lord H., has published an interesting history of *Holland House* (2 vols. Lond. 1873).

Holland, Sir Henry, Bart., an English physician, born at Knutsford, Cheshire, October 27, 1788, studied at London, Glasgow, and Edinburgh, and took his degree of M.D. at the last of these universities in 1811. After travelling for two years in the E. of Europe, an account of which he published in 1815, he settled in London, and rose to great eminence in his profession, being elected a Fellow of the Royal College of Physicians in 1828. He was appointed Physician in Ordinary to the Prince Consort in 1840, to the Queen in 1852, and was made a baronet in 1853. His practice was one of the largest in London, and he attended in succession seven Prime Ministers. During many years he annually set apart two months for foreign travel, and it was after returning from a tour in Russia that he died suddenly on October 27, 1873, at the age of eighty-five. His intellect was vigorous and unimpaired to the last. His best-known works are *Medical Notes and Reflections* (1839), *Chapters on Mental Physiology* (1852), *Essays on Scientific and other Subjects* (1862), *Recollections of Past Life* (1872), and *Fragmentary Papers on Science* (1875). His son, Sir Henry Thurston H., born 1825, is M.P. for Midhurst, and was Assistant Secretary for the Colonies, 1870–74.

Hollow-Ware, a trade term for hollow articles of cast-iron or wrought-iron, as pots, saucepans, and kettles. The maufacture of 'tinned' H. W. is chiefly carried on in the midland district of England, while that of 'black' or untinned is concentrated in the W. of Scotland.

Holl'y, the genus *Ilex*, belonging to the natural order *Aquifoliaceæ*, consists of about 150 species, ranging through the tropical and temperate regions of the world (excepting N. W. America), and especially abundant in S. America. *I. Aquifolium*, or common H., so well known for its useful and decorative purposes, exists through Europe as an indigenous plant, penetrating also into Western Asia. In Britain it is a true native (ascending to 1000 feet in the Highlands), though very often planted in copses, &c., and its frequency is further increased from the fruit being eaten by birds and the seed thereby distributed. The varieties produced and perpetuated by cultivation for ornamental purposes are very numerous and diverse in aspect. The beautiful hard and fine-grained white wood is in considerable demand for such purposes as the handles of small tools, inlaying work, &c. In the neighbourhood of large towns H.-trees are frequently shamefully mutilated by unscrupulous persons stripping off the bark to make birdlime, or stealing the berried branches at Christmas time. Another prominent species, known as Paraguay tea, or by its native name of *Maté*, is the *I. Paraguayensis* of botanists. In S. America it occupies the same place in domestic economy that Chinese tea does with us. See MATÉ.

Holl'yhock. Of this old-established and favourite garden plant the origin is a species of *Malvaceæ* named *Althæa rosa*, a native of China and the S. of Europe. By attentive cultivation the flower has been greatly developed in size, and diversified in its colour-shades, so that the gardeners' kinds now form a long list. The leaves furnish a blue dye, and in Greece a demulcent drink is prepared from the roots.

Holmes, Oliver Wendell, M.D., an American writer of prose and verse, was born at Cambridge, Massachusetts, August 29, 1809. He graduated at Harvard in 1829, took a doctor's degree in 1836, was made Professor of Physiology and Anatomy at Dartmouth in 1838, and in 1847 became Professor of the same subject in the Massachusetts Medical School, Boston. He is the author of *Poetry* (1836), *Terpsichore* (1843), *Urania* (1846), *Astræa* (1850), *Elsie Venner, a Romance of Destiny* (1861), *Songs in many Keys* (1864), *The Guardian Angel* (1868); but his fame is chiefly due to his *Autocrat of the Breakfast-Table* (1857), and its companions *The Professor at the*

Breakfast-Table (1860), and *The Poet at the Breakfast-Table* (1872), delightful prose papers full of shrewd wisdom tinged with poetry, of wit and rich humour shaded and mellowed with pathos. His verses are generally turned with the happiest fluency and grace, and abound in piquant touches of sentiment and sparkling flashes of satire. H. has also written several medical pamphlets, in which his literary felicity adds a charm to his scientific knowledge.

Holocan'thus, a well-known genus of *Teleostean* fishes, belonging to the sub-order *Acanthopterygii* and to the family *Squamipennes* ('scaly-finned'). The body is very broad and compressed, and the fins more or less spinous. The species of H. are confined to tropical seas. A familiar form is the *H. semicirculatus*, or semi-lunar H., so named from the crescentic shape of the blue and white lines marking the sides of the tail and body. The ground colour is black. Other species are the ringed H. (*H. annularis*), the spotted H. (*H. maculosus*), the ciliated H. (*H. ciliaris*), the emperor H. (*H. imperator*), and the arched H. (*H. arcuatus*).

Hol'ocaust. See SACRIFICE.

Hol'ograph (Gr. *holos*, 'whole,' and *graphē*, 'a writing'), in Scotch law, is a deed written by the granter. Owing to the difficulty of forgery, it is held valid without attestation, or Testing Clause (q. v.). When stated in the deed that it is in the handwriting of the granter, it is presumed to be so though the contrary may be proved. When it does not bear to have been written by the granter, it may be proved to have been so by comparison of admittedly genuine handwriting, or by the evidence of those who saw it written. A H. deed not attested does not prove the date which may be given to it. In English law there is no distinction between H. deeds and other deeds.

Holopty'chius (Gr. *holos*, 'whole,' and *ptychē*, 'a wrinkle'), a well-known genus of fossil *Ganoid* (q. v.) fishes, possessing scales of *cycloidal* form, and included in the division *Glyptodipterini*, in which two dorsal fins are developed, the pectoral fins being lobate. This group in turn forms a division of the sub-order *Crossopterygidæ*, in which the fins are 'fringed.' The genus H. had the two dorsal fins set far back on the body, whilst the pectorals were very long and the ventrals placed near the tail. The scales, which are of the *ganoid* kind, are rounded, overlapping, and have wrinkled surfaces, while the tail is unequally lobed. The H. is confined to the Devonian or Old Red Sandstone rocks. The genus *Rhizodus*, of the Carboniferous formations, is closely allied to H. Some specimens of H. attain a length of 12 feet.

Holothu'ria, Trepang', or **Bêche-de-Mer**, names given to the members of an order (*Holothuroidea*) of *Echinodermata* (q. v.), allied to the sea-urchins, starfishes, &c., and which are known by the name of 'sea-cucumbers.' See BÊCHE-DE-MER.

Hol'stein (anc. *Holtsatia*, 'the settlement in the woods'), a former duchy of Denmark, and since 1866 part of the Prussian province of Slesvig-H. (q. v.). It lies between the Baltic and the N. Sea, and is separated in the N. from Slesvig by the Eider river and Slesvig-H. Canal, and in the S. from Hanover by the Elbe. Towards the centre it extends in low hills and sandy heaths, affording excellent grazing and is watered by the Stör, Eider, and Trave. In the E. the soil is rich and well cultivated, but in the W. the surface is low and marshy, protected from the sea by dykes. The chief industries are cattle-rearing, husbandry, and cheese and butter making. Among the natural products are peat, salt, amber (from the Baltic coast), and lime. The principal towns are Kiel and Altona. A considerable number of the inhabitants are Frisians, and the spoken languages are German and Danish. Most of the peasants speak Platt-Deutsch. The Duchy of H. was formed in the 14th c. out of a countship of the same name, and was increased by the addition of the countship of Stormarn, the Frisian district of Ditmarsh (q. v.), and the province of Wagrien. The King of Denmark, as Duke of H., was a member of the German Confederation.

Hol'ster (Dutch, *holster*, 'a case for a pistol,' akin to Old Eng. *heolster*, 'a hiding-place or recess'), a leather case for a horseman's pistol, placed at the fore part of a saddle.

Holte'nia, a peculiar genus of sponges, inhabiting the deep seas, and known as an 'anchoring sponge,' from the fact that the body has no stem or root, but fixes itself in the mud of the sea-bed by a long beard or bunch of delicate thread-like spicules. The *H. Carpenteri*, named after Dr. Carpenter, one of its discoverers, is the familiar species. H. is one of the *Siliceous* or flinty sponges.

Holy Alliance, the name given to an arrangement signed at Paris (26th September 1815) by the sovereigns of Russia, Prussia, and Austria. It was the conception of the Czar Alexander, inspired by Mdme. Krudener. The parties engage in the name of the Holy Trinity to treat one another as brothers, and to act as Christian fathers to their subjects and armies. At the Congress of Aix-la-Chapelle (1818) France joined the alliance, which was really a conspiracy for mutual intervention in the case of revolution against the legitimate despotic dynasties of the day—a league against the public good or political liberty. Its programme, in fact, resembled the declaration of war made in 1792 by Austria and Prussia against the new-born freedom of France. This was clearly seen in the Troppau circular (8th December 1820), which recommended intervention in Naples, where the liberal Constitution of Cadiz had been proclaimed, and which was answered by Castlereagh (then British Foreign Secretary), to the effect that (apart from the constitutional reasons preventing a British sovereign from becoming a party to such an alliance) it was only where British interests were seriously threatened that he could recognise a lawful ground for interfering in a political revolution. In the same way, at the Congress of Verona (October 1822), Wellington protested against the suggestion of Chateaubriand and others that the French army should assist the cause of despotism in Spain. Upon the revolt of the Spanish colonies in South America there was some talk of 'holy pressure' being applied by the Continental powers on behalf of the mother country. This gave rise to the Monroe Doctrine in the United States, which declared that any attempt to coerce the South American Republics would be regarded by the States as an unfriendly act; and also that European colonisation of America would be resisted. The H. A. does not seem to have long survived the Czar Alexander. The unctuous blasphemy of its terms makes it unique in the literature of diplomacy. To Canning belongs the chief credit of keeping Britain free from all complicity.

Holy Coat is our Saviour's seamless coat (*cf.* John xix. 23), which tradition says was discovered, along with the cross on which he was crucified, by Helena, the mother of the Emperor Constantine, on her visit to Palestine in 326. Part of the cross she gave to the city of Jerusalem, and sent the rest to her son; the coat she sent to Treves, where it has been preserved as a priceless relic ever since, having been exhibited to admiring multitudes so late as 1844. The miracles wrought by it are commemorated on the 1st October in the Gregorian Calendar.

Holy Family, an art term comprehending all representations of the Virgin and Child, alone or attended by SS. Anna, Joseph, John Baptist, or others of her kinsfolk. Christ is most frequently represented as lying on his mother's lap, or standing at her knee, whilst St. John—who is often depicted as the older of the two—stands by, attended by a lamb, or at least bearing his *Ecce Agnus* staff, and already dressed in camel's hair. Joseph, when present, often sits in the background reading. In Murillo's famous H. F. in the National Gallery, the first and third persons of the Trinity hover above the group, the Father as an aged man upborne by angels, the Spirit in the form of a dove. The term H. F. is also sometimes incorrectly applied to 'votive pictures,' where, besides the leading figures, others of the donors themselves, or of their patron saints, are introduced in attitudes of adoration. Such is Raphael's 'Madonna di San Sisto' at Dresden.

Holy Ghost, or **Holy Spirit**, in Christian theology, is the third person of the Trinity (q. v.). As the second person is called the Son or the Word, as the image or revealer of God, so the third is called Spirit, as his breath or power. He is called prominently *holy*, to indicate both his nature and operations, being absolutely holy in his nature, and the cause of holiness in all creatures. See PROCESSION OF THE HOLY GHOST.

Holy Grass, the common name for *Hierochloa borealis*, a sweet-scented grass found sparingly in Britain near Thurso, but abundant in Iceland, and also met with in Asia, America, and New Zealand. In Germany it is strewn at the doors of churches on special occasions; hence its name.

Hol'yhead, a seaport of Wales, in the county of Anglesey, on the N. side of the island of the same name, 25 miles W. of Bangor, and 275 N.W. of London by railway. It has been the chief mail-packet station for Ireland since the time of William III., and is a splendid harbour of refuge, protected by a colossal breakwater of hard H. limestone. The nearest English port to Dublin, it is connected with Kingston, 70 miles distant, by telegraphic cable. The passage from Dublin to H. takes four hours, and thence to London by mail-train, seven hours. Outside the harbour is H. Bay, with the Skerries light in the N. Together with Beaumaris, Amlwch, and Llangefni, H. returns one member to Parliament. Pop. (1871) 5916.—**H. Island** (Welsh, *Ynys Gybi*) lies to the W. of Anglesey, from which it is separated by a *traeth* that dries at low water, and is crossed by the bridges of the great Irish coast road and the Chester and H. Railway. Area, 6000 acres; pop. (1871) 7191. It is 7 miles long from N.W. to S.E., and 3 miles broad, and is for the most part barren and hilly, affording some good pasture. The coast, haunted by seafowl, is mostly precipitous, and is much caverned. On the South-Stack islet to the N.W. stands a lighthouse.

Holy Island, or **Lin'disfarne**, an islet, or island peninsula, 4 miles long and 2 broad, lies off the Northumberland coast, 13 miles S. of Berwick, and 3¼ from Beal, on the Great Northern Railway. It is distant 2 miles from the mainland, with which, however, it is connected by sands at low tide. It has a village (pop. 876), and interesting remains of an old castle and of the once famous abbey. An episcopal see was planted here under Oswald, King of Northumbria, in the first half of the 7th c., by Aidan (q. v.), a Scotch monk from Iona, whom the king invited hither to revive the Christianity which had nearly perished in consequence of the victories of the heathen Mercians. The bishopric was removed for safety from Danish marauders to Chester-le-Street (893), and finally to Durham.

Holy Land. See PALESTINE.

Holy Phial, or **Sainte Ampoule**, an inexhaustible flask of oil said to have been brought from heaven by a dove to St. Remy at the coronation of Hlodowig I. (496) at Rheims, and thenceforward employed at the coronation of every French king down to Louis XVI. The H. P. was broken during the Revolution, but a fragment survived until the Bourbon restoration, and was found still to contain a portion of the sacred oil, which was used at the coronation of Charles X. (1825).

Order of the H. P.—An ancient French order of knighthood, composed of the four chief nobles of Champagne, who, at French coronations were delivered over to the clergy of Rheims Cathedral as pledges for the safe return of the H. P.

Holy Places for the first three or four centuries of the Christian era meant those places hallowed by the presence of our Lord, especially the scenes of his nativity, crucifixion, resurrection, and ascension. After a certain time these H. P. began to be visited for the purpose of stimulating devotion, or under the notion that prayer in them was more acceptable to God than when made elsewhere. The first great impulse to these pilgrimages was given by Helena, the mother of the Emperor Constantine, who, according to Eusebius, visited Jerusalem in 326, and 'left a fruit of her piety to posterity' in two churches built 'one at the cave of the Nativity, the other on the mount of the Ascension.' According to the same authority, Constantine caused first an oratory and then a magnificent church to be built over the holy sepulchre. A traveller from Gaul who visited Palestine in the 4th c. mentions a basilica which was built by Constantine on the place of the birth of Christ at Bethlehem. Before the middle of the 4th c. it was reported that the very cross on which Christ suffered had been discovered; the latest tradition on the subject being that it was found by the Empress Helena. From the 4th c. other places began to acquire a sacred odour, as the scene of a martyr's sufferings or the shrine of his relics, and received the name of H. P. By the close of the 5th c. a custom began to prevail of sending penitents to various shrines, partly as a penance, and partly to obtain the intercession of the saint of the place.

Holy Roman Empire. See ROMAN EMPIRE.

Hol'yrood ('holy cross'), a royal palace in Edinburgh, long the chief seat of the Scottish court, is a venerable pile standing at the foot of the ridge ending in the Castle Rock, and at the entrance to the Queen's Park, with a romantic background formed by Arthur's Seat and Salisbury Crags. The old palace of H., founded by King James IV., was the court residence of Queen Mary and James VI. The present building is a quadrangle with cloistered interior court and lordly turrets in the prevailing taste of Louis XIV.'s reign, designed by Sir William Bruce of Kinross, and built in the time of Charles II. It has been temporarily occupied by Charles Edward Stuart, the exiled Comte d'Artois, afterwards Charles X. of France, George IV., and the present Prince of Wales. It is occasionally visited by the reigning sovereign on her way to and from the Highlands. The picture gallery (150 feet by 27) contains some 100 portraits of Scottish kings, one or two authentic, the rest imaginary, from Fergus I. to James VII., by De Wit.

The Abbey of H.—An abbey of canons regular of the order of St. Augustine, founded by David I. about 1128, was removed hither from within the castle walls in 1174. A well-known legend of the 15th c. tells of the rescue of David from a stag at bay by the miraculous appearance of a cross, and of the king's commemorative dedication of an abbey to the Black Rood of Scotland (q. v.). The abbey received many gifts and privileges, and early became one of the wealthiest of Scottish ecclesiastical foundations. It was a royal residence from the 13th c. till the erection of an adjoining palace by James IV., whose marriage with Margaret Tudor was here celebrated in 1503. The abbey was burned by the English in 1385, in 1544, and in 1547, was always restored, and after the Reformation was used as Canongate parish church (1560–1670). In 1687, James II., who here for a time held a viceregal court, reserved it for Roman Catholic service. During the Revolution of 1688 it was partly destroyed by the mob, and lay in neglect for many years. In 1758 it was covered with a roof of heavy freestone, which gave way two years later, greatly injuring the ground work and column shafts. The roofless nave of the old abbey still exhibits, among many later additions, various traces of 12th c. work, and contains the tombs of David II., James II., James V., Rizzio, &c. The precincts and park afford a sanctuary for debtors. See ABBEY.

Holy Water, the use of, in the Christian Church, is a practice probably of pagan origin (*cf.* Virgil's *Æn.* vi. 230). The *Aquaminarium* or *Perirrantērion* was a vessel of water mixed with salt and blessed by a priest placed at the entrance of heathen temples, with which the worshippers might sprinkle themselves as they entered, or be sprinkled by the priest with an *aspersorium* or *aspergillum* (sprinkling brush). During the first centuries the Fathers spoke of the custom as purely heathenish, and condemned it as impious and detestable, but it seems, from the directions regarding it in the Forged Decretals (q. v.), to have taken considerable hold in the Church by the 8th c. or 9th c. H. W. was used in all benedictions of palm and olive branches, vestments, corporals, candles, houses, herds, fields, and in private houses. The chief use of it in modern times is for worshippers marking the sign of the cross on their forehead as they enter a church. The practice is not observed by Protestants.

Holy Week, the week preceding the festival of Easter, was observed in the Church from a very early period with peculiar solemnity, as it included the anniversaries of the principal events connected with our Lord's Passion—Palm Sunday (q. v.) and Good Friday (q. v.). By the end of the 4th c. the observance of H. W. was in full operation, various enactments having been made for that purpose. The whole week was observed as far as possible as a strict fast, from midnight on Palm Sunday till cock-crow on Easter day, when the fasting and mourning gave place to rejoicing. All business was suspended, the law courts were closed, all actions at law ceased, and all work was, as far as possible, laid aside for seven days before and after Easter. Those in prison for debt and all but the more heinous crimes were liberated, slaves were manumitted, and liberal almsgiving prevailed. The observance of the week properly began on the Saturday before Palm Sunday, when the raising of Lazarus from the dead was commemorated, with reference to John xii. 1-9.

Hol'ywell, a thriving town of Wales, in Flintshire, to the S.W. of the estuary of the Dee, 4½ miles N.W. of Flint by rail. It has large manufactures of cottons, flannels, Roman cement, and paper, and in the vicinity are extensive limestone quarries, and mines of coal and lead. H. sends one member to Parliament. The Well of St. Winifred, perhaps the most copious spring in the kingdom, was formerly believed to possess sovereign virtues, and attracted many pilgrims. Pop. (1871) 7961.

Hom'age (Med. Lat. *homagium*, from *homo*, 'a man,' a vassal being spoken of as his superior's 'man'), the service by which, in the middle ages, a vassal acknowledged his dependence on his feudal superior. (See FEUDALISM.) *Liege H.* implied absolute allegiance, which could not be broken; but *simple H.* bound him making it only while he held the fief for which it was rendered. The word H. is not used in Scotch law, and in English law only signifies the acknowledgment which the lord of the manor receives from a tenant.

Homalop'tera (Gr. 'level-winged'), a division of the insect order *Diptera* (q. v.), sometimes also named *Pupipara*. In this group the *Hippoboscidæ* or forest-flies and the bat-lice (*Nycteribiidæ*) are included. The larvæ of some species have the power of producing other larvæ within their bodies by a process of internal budding or gemmation.

Hom'burg (H. von der Höhe), formerly the capital of the landgrafdom of Hessen-Homburg, has been since 1866 a town in the Prussian province of Hessen-Nassau, 50 miles N. of Frankfurt. Formerly notorious for its public gaming-tables, H. is still famous for the beauty of its scenery and its mineral waters. The parks and public buildings are on a magnificent scale. Pop. (1875) 8294.

Home, Henry, Lord Kames, a Scottish philosopher, was born at Kames, in Berwickshire, in 1696, and came to the Scotch bar in 1724 without passing through a university. He was, however, an omnivorous student. In 1728 appeared his *Remarkable Decisions of the Court of Session from* 1716 *to* 1728. In 1752 H. was made a judge in the Court of Session. His marriage with Miss Drummond gave him an opportunity of introducing large agricultural improvements (summer fallow, &c.) at Blair Drummond. In reclaiming Kincardine Moss he set a useful example; and as a member of the Board for Scotch Fisheries, Arts, and Manufactures, and of the Commission for the Management of Forfeited Estates, he encouraged enclosures, drainage, the flax trade, and sheep-breeding. As a civil judge he was extremely learned, but too metaphysical and impulsive. His house in Edinburgh was the centre of a small intellectual coterie. H. died 27th December 1782. Among his professional writings may be mentioned his *Abridgment of Statute Law*, *Historical Law Tracts*, *Principles of Equity*, and *Elucidations Respecting the Common and Statute Law of Scotland*. But his chief literary activity was displayed in metaphysics. In his *Essays on the Principles of Morality and Religion*, published under the name of Sopho in 1757, he attacked his friend David Hume's analysis of conscience, justice, property, &c. H.'s later works, *Introduction to the Art of Thinking*, *Elements of Criticism*, and *Sketches of the History of Man* (1761–74), contain many amusing speculations based on insufficient data. His last production was *Loose Hints on Education* (1781), written in his eighty-fifth year. See Tytler's *Memoirs of the Life and Writings of H.* (2 vols. Edinb. 1807).

Home, John, a Scottish dramatist, born at Leith, 22d September 1722, studied for the Church, and became minister of Athelstaneford. There he wrote his tragedy of *Douglas*, which was first acted at Edinburgh in 1756. It was hailed with boundless enthusiasm, and had an equally flattering reception at Covent Garden, London, in 1757. But the Scottish clergy were so indignant at a clergyman's having written a play that H. was forced to resign his living. Lord Bute then appointed him to a sinecure office, and in 1760 he received a pension of £300 a year. After writing the now utterly forgotten dramas of *Agis*, *Aquileia*, *Alonzo*, and *The Fatal Discovery*, and long associating with Hume, Blair, Robertson, and the other Scottish literary men of the time, H. died 5th September 1808. The plot of *Douglas* is romantic and pathetic, but the dialogue is generally flat and conventional, with a few happy lines and touches of true feeling. See Henry Mackenzie's *Life of J. H. the Dramatist* (Edinb. 1822).

Hom'elyn, a species of *Raidæ* or Rays (q. v.), zoologically termed the *Raia maculata*, and found on the S. coasts of England, whence it is obtained for the London markets. The thornback and H. are nearly allied. The eyes are large, and the sides are marked with dark spots.

Ho'mer, the earliest and the greatest of epic poets, stands forth as a grand shadowy being to whom all nations have paid willing homage. The ancient biographies of H. which have come down to us cannot be regarded as authentic history; still from these, and from the universal belief of the ancients in his individuality, as well as from the internal evidence of the poems themselves, the almost unanimous verdict of English and of later Continental criticism has been in favour of a personal author of the *Iliad* and *Odyssey*. The honour of giving birth to him was disputed by seven cities—Smyrna, Chios, Colophon, Salamis, Rhodos, Argos, Athenæ. Of these, the first seems to have the best claim. Legendary evidence, dialect—the Ionic—the allusions and general colouring of the poems favour this view. The chronology of H. is very uncertain. His period, however, was unquestionably long before the recognised system of reckoning dates by Olympiads (776 B.C.). Herodotus places H. at least 400 years before his own time, *i.e.*, about 884 B.C. His date is generally set down as 962–927 B.C.; that of the composition of the *Iliad* and *Odyssey* as 940–927 B.C. In this view he would be born about a dozen years after the death of Solomon, when the revolt of the ten tribes broke up the Hebrew monarchy, and led to the establishment of the kingdoms of Judah and Israel. We have said that the idea of an authorship of the two great Greek epics other than that of H. never entered the minds of the ancients. For nearly eighteen centuries of the Christian era his claim remained all but undisputed. In 1795, however, F. H. Wolf, in his famous *Prolegomena*, endeavoured to overthrow the doctrine of the unity of the Homeric poems, and to show that these were really small, separate, and independent epic songs written down, interwoven, and fashioned into one great work, by Pisistratus (q. v.). In this startling statement Wolf but reproduced the unheeded or forgotten conjectures of Casaubon (1559–1614), and Bentley (1662–1742), not to speak of other scholars, French and Italian. Wolf's theory, startling though it was, and albeit met with much opposition, and subjected to material modifications by subsequent discussions, has never been wholly overthrown. Moreover, it has done more towards a critical understanding of the *Iliad* than any work on the same subject. The question that lies at the bottom of all Wolf's inquiry is, whether the Homeric poems were *written* or not. Into this question, though in itself extremely interesting, we shall not here inquire. What chiefly concerns us is that H. was a minstrel—an *aoidos*—a character well known in this country, and famous in the medieval literature of Europe. H. was the prince of minstrels, but as much above all succeeding ballad-mongers as Sir Walter Scott excels the village minstrel. His poetry, viewed as the model and consummation of the epic minstrelsy, is characterised by intense national feeling, great pictorial ornamentation, and a freshness which gives to the events of the far-distant past the aroma of yesterday. It is pervaded throughout by a solemn grandeur and a serene divinity, which gave to it, to the *Iliad* especially, the character of a Bible or Psalter in the eyes of the ancient Greeks. The chief English versions either of both epics or of one are those of Chapman, Hobbes, Pope, Cowper, Sotheby, Derby, and Worsley. See the Histories of Greek Literature by Colonel Mure and K. O. Müller, the special works on H. by Gladstone, and *H. and the Iliad* by Professor Blackie.

Hom'icidal Ma'nia (the *Monomanie meurtrière* of the French) is a blind, irresistible tendency to destroy life, developed under certain morbid conditions of the brain. The disposition to injure others, or to destroy life, may be constant or paroxysmal in an insane person, and may be associated with general incoherence, delusions, illusions, or hallucinations. The motive for the act may be *destruction*, the insane person being under an impulse of blind rage; or it may be *preservation*, he being under the impression that his life is in danger from the person he assaults; or it may originate from a sense of *moral obligation*, being in obedience to a command supposed to be divine. There are certain congenital conditions of the brain truly morbid, and frequently associated with hereditary tendency, in virtue of which the individual, though sane, is on the borderland of insanity, and it not unfrequently happens that excitation of the brain from organic or functional disease, or from the stimulus of alcoholic drinks, results, in such cases, in an outburst of H. M. When such outbreaks are obviously associated with delusions, and where there is marked hereditary tendency, the person is deemed insane and irresponsible, unless it be the case that the excitation has been the result of stimulants voluntarily taken. But there are also cases of H. M. described as *emotional insanity*, in which a

criminal act may be committed in consequence of cerebro-mental disease, without any apparent lesion of the perceptive and reasoning powers, and the mental disorder may be of a sudden and transitory nature. In such cases there is, probably, always some preceding morbid feelings, both mental and physical, and in some cases there may be suspicion of revenge. In emotional H. M., the result of disease, there is usually no premeditation, no motive, or only a trivial one; no accomplice, and no effort to escape. The attack may be excited by the sight of a weapon, or by hearing of a murder, and the deed is usually perpetrated with the utmost *sang froid*, and is not followed by any remorse. According to the law, every person is assumed to be responsible for his acts unless the contrary is proved; but a person may be sound *intellectually* and know what is right and what is wrong, and unsound *emotionally*, being powerless to refrain from doing what is wrong. Numerous cases of this kind have been brought to light in connection with medical jurisprudence. See Krafft-Ebing's *Die Lehre von der Mania Transitoria für Aerzte und Juristen dargestellt* (Erlangen, 1865); *American Journal of Insanity* (1872); *Edinburgh Medical Journal* (1862); *Journal of Mental Science* (1872); Tardieu, *Étude Médico-Legale sur la Folie* (1872); Brierre de Boismont, *De la Folie Raisonnante*, &c. (1867); Despine, *Psychologie Naturelle* (1868); the works of Esquirol and Marc, and *Psychological Medicine*, by Drs. Bucknill and Tuke (3d ed. 1874).

Hom'icide, in law, is the killing of a human being. It may be *justifiable* as done from necessity, or *excusable* as done unintentionally or in self-defence, or *felonious* as done from malice and forethought. It is then either *Murder*, *Manslaughter*, or *Suicide*. H. is justifiable in preventing an atrocious crime, the principle of the law being that when any one tries to commit a capital crime it is lawful to kill him to prevent it. It is not lawful to shoot a man for trespassing; but to shoot a burglar might probably be held justifiable, as done in self-defence.

Hom'ildon Hill, near Wooler in Northumberland, was the scene of a battle (14th September 1402) between the Scotch under the command of Murdach Steward, son of the Regent Albany, and Archibald Earl Douglas, and the English, led by the Earl of Northumberland and his son Hotspur. The former, who were returning home from a successful raid, were disastrously defeated, and their commanders taken prisoners.

Homilet'ics (Gr. *homilētikē*, sc. *technē*, 'art') is the science that treats of homilies, and the best way to compose and deliver them; a subject on which numerous treatises have been written since St. Augustine wrote the first one, namely, his *De Doctrina Christiana*.

Homilia'rium (Eccl. Lat. 'a collection of homilies'). At an early period the custom began to prevail in the Church of preaching, for one reason or other, the homilies or sermons of others. In course of time this led to the formation of collections of homilies written by eminent writers, intended especially for the use of those who were too ill-instructed to compose discourses of their own, but who were strictly enjoined to preach them in the vernacular of their congregation. A collection of discourses written by the Venerable Bede was much used in this way. In the end of the 8th c. Karl the Great ordered Paul Warnefrid to prepare an improved H., and recommended it to be used in the churches of Gaul. An English H. was compiled by Ælfric, perhaps the Archbishop of York (1023-51), which was probably founded on several earlier ones. A metrical English H. was composed about the middle of the 13th c., and has been partly edited by Mr. Small, librarian to the University of Edinburgh. The *Liber Festivalis*, printed by Caxton 1482, was a H., as were also the Homilies (q. v.) published under Edward VI. and Elizabeth.

Hom'ilies, of the Church of England, are a collection of discourses, appointed to be read in churches 'on any Sunday or holy day when there is no sermon,' but no longer in use. There are two books of them, of which the first was composed (probably by Cranmer, Ridley, and Latimer) and published in the reign of Edward VI. (1547). The second was perhaps prepared at this time also, but did not appear till they were both published together, along with the ARTICLES (q. v.), under Elizabeth (1562).

Hom'ily (Gr. *hŏmilia*, 'intercourse'), in its classical sense meant the instruction given by a philosopher to his pupils, which was generally given in familiar conversation. It was thus applied in the Christian Church to a simple, popular address by a presbyter to a congregation. It passed into Latin in the same sense about the 5th c., and became the technical term for a religious address founded on a passage of Scripture. The earliest homilies so called are those of Origen (3d c.). The most famous that have been preserved, besides Origen's, are those of Clement of Alexandria, Chrysostom, Augustine, Athanasius, Gregory Nazianzen, Gregory the Great, Cyril of Jerusalem, and Cyril of Alexandria. At the present day the name is used loosely as a synonym for sermon; when any definiteness is attached to it, it means an exposition of a passage of Scripture.

Homœop'athy (Gr. *homoios*, 'like,' and *pathos*, 'affection') is a system of medicine introduced into practice in Germany by Samuel Hahnemann at the close of the last century, the fundamental therapeutical law being *similia similibus curentur*, 'let like things be cured by like,' the phrase being expressive of the relation between the effects of the medicine and the disease. In reasoning out his theory, Hahnemann ascribed to all preceding physicians the adoption of one or other, or of both combined, of two fundamental therapeutical principles, one of which he called *allœopathy*, and the other *antipathy*; in the former, remedies being administered from their presumed power over the hidden causes of disease; and in the latter, from their producing in the healthy body symptoms of a kind opposed to those of the disease, on the principle of *contraria contrariis curentur*. H. is, in theory, a universal as well as an exclusive method, and the only method by which disease ever has been or ever can be cured by art; and, in consequence, the practice of medicine, other than upon the principle of H., has always been a 'fatal art,' except by accident. The theory of H. was reasoned out, inductively, before a single experiment had been made. In order to reduce the theory to practice, it was necessary to ascertain the precise action of medicinal substances on the healthy organism; and to accomplish this, experiments were made, and a record of effects kept, out of which a 'proving' of the medicines was compiled, the design of the 'proving' being to ascertain, with the utmost possible accuracy, all the properties of the substance *proven*. The fundamental rules for the practice of H. may be stated thus:—(1) Ascertain the effects of medicinal substances upon persons in health; (2) select the remedies whose action corresponds with the symptoms of the patient under treatment; (3) give the remedy by itself alone; (4) the dose should be so small as not to cause any general disturbance of the system, its action being limited to that portion of the body which is in a morbid condition. To fulfil the latter condition it was necessary to ascertain, by experiment, the effect of medicinal agents upon diseased structures, the amount of effect depending upon the form in which they were administered, and the condition of the person to whom they were administered. This led to the adoption of the wholly novel system of infinitesimal doses; for Hahnemann maintained that the $\frac{1}{1000000}$th of a grain of belladonna was sufficient for the purpose of homœopathic cure in the case of scarlatina. Medicinal doses in H. are all expressed by fractions. There is first the *mother tincture*, one drop of which being added to 99 drops of alcohol constitutes the *first dilution*, and is marked 1. A drop of the first dilution is then added to 99 drops of alcohol, which constitutes the *second dilution*, and is marked 2; and so on until number 30 is reached, which is the highest recommended. On the same principle one grain of an insoluble substance may be triturated with 99 grains of sugar of milk, and so on till the sixth trituration is reached, when it is *presumed* that all substances become soluble in alcohol, and, afterwards, alcoholic dilutions are made, in the same way as the vegetable tincture, until the thirtieth dilution is reached. The $\frac{1}{100}$th of a drop of a tincture, or of a grain of an insoluble substance, is the most powerful dose in H., and the decillionth of a drop is the weakest recommended, an almost inconceivably minute fraction of any complex substance. From the year 1818 to 1836, H. was forbidden to be practised in Austria, except under powerful patronage; but in the latter year Dr. Fleischmann undertook the charge of an hospital in Vienna for the treatment of cholera patients on the condition that he was to be allowed to employ H. in their treatment; and, shortly after the Emperor issued an ordinance legalising the practice of H. by any duly qualified medical practitioner. From Germany, H. spread over Europe and America, and was intro-

duced into England, in the year 1827, by Dr. Quin, physician to the King of the Belgians.

H. being a system of medicine essentially revolutionary, both in theory and practice, has met with violent opposition, as might have been anticipated, more especially as Hahnemann and his disciples applied to those who differed from them in opinion the offensive sobriquet *allœopathist* and *antipathist*. H. begins with an assumption, *similia similibus curentur*, and ends with an assumption, *the curative property of a medicine is developed in a much higher degree by an inconceivably minute than by a palpable dose*. The system of H. breaks down if it fails in one point, the fundamental principle being comprehensive and exclusive. Since the days of Hahnemann, the science and practice of medicine has made rapid and sure advances, more especially in the great departments of physiology, chemistry, and pathology; and by the aid of the microscope disease-processes have been investigated with an accuracy undreamt of in his day, and with the effect of undermining the system so vauntingly propounded. The class of parasitic diseases embraces now, not simply the tapeworm and the acarus scabei, but many diseases formerly supposed to be due only to organic change; and if the germ theory of disease be accepted as a fact, more especially in its relation to the specific forms, the homœopathic system necessarily collapses, both in theory and practice; for if certain diseases depend upon the existence and multiplication of living organisms within the body, the only possible *cure* consists in the destruction of these organisms by *antidotes*.

Homoganglia'ta. See HETEROGANGLIATA.

Homologa'tion, a term of Scotch law, signifying an act approving of a deed; the effect being to make that deed, though defective, binding to the person who homologates. The paying of interest due under the deed, or discharging an obligation come under in it, is held to be H. There is no identical term in English law; but there are similar ones, as *Confirmation*, *Part performance*, *Estoppel* (q. v.), &c.

Homol'ogous, in geometry, is a term applied to two or more magnitudes which correspond exactly as regards their external circumstances. Thus, the sides which are opposite the corresponding angles of similar triangles are H. sides. In *biology*, organs are termed H. when they correspond in structure and development, though they may differ in their functions.

Homol'ogy is a term now employed by comparative anatomists to designate those organs found in the same body, or in the bodies of different animals, which are structurally composed of the same anatomical elements. Thus the arm of a man, the wing of a bat, the wing of a bird, the fore-leg of a horse, the pectoral fin of a fish, and the flapper of a seal or whale, are all modifications of the anterior extremity of a vertibrate animal, and they are homologous structures. H. is the correlative of *analogy*, a term employed to designate relations in function, but not in structure. Thus the wing of a bird is not homologous with the wing of a butterfly, because it is constructed in a different way, but it is analogous to it, inasmuch as both serve the purposes of flight.

Homoou'sios (Gr. from *homos*, 'the same,' and *ousia*, 'substance') was the term adopted by the Council of Nice (325) to express the relation existing between the Son of God and the Father, or that the divine nature of the former is exactly the same as that of the latter, in opposition to the doctrine of the Arians that the Son, having a beginning and being derived from the Father, was inferior to the latter. *Homoiousios* was the term adopted by the Semi-Arians, as a compromise between the Catholic doctrine and that of the Arians.

Homop'tera (Gr. *homos*, 'the same,' and *pteron*, 'a wing'), a division of *Hemipterous* insects, in which the front wings are entirely membranous; the sucker originating in the inferior part of the head near the thorax, and the wings folding over one another when at rest. The females are provided with an ovipositor, and the antennæ are of small size. To this division belong the *Aphides* or plant-lice; the *Coccidæ* or cochineal insects; the *Cicadas*, and lantern-flies (*Fulgora*).

Ho-nan' ('south of the river'), a province of China, partly bounded on the N. by the Hoang-ho (q. v.). It is singularly fertile lowland, except in the S.W. angle, which is traversed by the Pe-ling mountains. The Hoang-ho is in various parts higher than the surrounding country, which it frequently inundates. Kai-fong, the capital, lies on the right bank of the great river; it was the capital of the empire in the reign of Fubi, and is the residence of the remnant of the Jews of China.

Hondu'ras, a Central American republic, is bounded E. by the Caribbean Sea, W. by the Pacific and San Salvador, N. by Guatemala and the Gulf of H., and S. by Nicaragua. Area, 47,108 sq. miles; pop. about 400,000. It has a mountainous interior, diversified by plateaux, terraces, and fertile valleys, the great chain being the Sierra Madre, which separates at Mereidon into two branches, the Selaque Mountains (10,000 feet), and the easterly range that bears the name Espiritu Santo and Grita. The E. coast is low, and in part abounds with lagoons, as the Laguna de Cartago, and Laguna de Cartine; to the W. of long. 85°, however, it rises in rugged cliffs, and is fringed with islands, among which are the Bay Islands belonging to Jamaica. H. only touches the Pacific at Fonseca Bay, where it has several good harbours. The chief rivers are the Segovia, 300 miles, the boundary between H. and Nicaragua; the Patuca, with its affluent the Guayape, noted for its rich gold-washings; and the Ulua, navigable for 90 miles by steamers. The climate is hot, and the rainy season is heralded by violent hurricanes. The valleys and lowlands are clad with the rich vegetation of the tropics; the plateaux yield abundantly the fruits and plants of the temperate zone, and the mountains are covered with forests of mahogany and other cabinet-wood trees. Besides timber, the country produces gums, drugs, dye-stuffs, sugar-cane, tobacco, coffee, cotton, and cochineal. H. is rich in gold, silver, copper, coal, and marble, which are, however, little wrought. Most of the inhabitants are engaged in cattle-rearing. The exports amounted (1872) in value to £306,250. Cottons and silks are imported from England, cutlery and machinery from the United States. The capital is Comayagua, and the eastern ports are Omoa, Trujillo, and Puerto Cortes. Of the inhabitants, 180,000 are Indians, 200,000 mestizoes, 6000 negroes, and the remainder whites of Spanish descent. The religion is Roman Catholic, and there is little public education. The executive is vested in a President, elected for four years, the legislative in a Senate and Chamber of Deputies. In 1876 the foreign debt amounted to £5,990,108. A railway across H. is to extend from Puerto Cortez to Fonseca Bay, 225 miles, but only 53 miles were completed in 1875. H. was discovered by Columbus in 1502, and taken possession of by the Spaniards in 1523. Later it formed part of the Spanish Guatemala, but became a republic in 1824. After being torn for years by civil war, H. began in 1872 a wretched struggle with Guatemala and San Salvador, which only ended on the exhaustion of both sides, June 1876. See *H., Descriptive, Historical, and Statistical*, by E. G. Squier (Lond. 1870).

Honduras, Bay of, (H. in Spanish means 'deep water'), in the Caribbean Sea, between Honduras, Guatemala, and Balize, receives, among other streams, the Balize, Montagua, and Ulua, and contains many islands, of which the largest is Turneffe.

Honduras, British. See BALIZE.

Hones (Old. Eng. *hân*, Ice. *hein*, 'a whetstone') and **Whetstones** are employed for whetting or sharpening edge-tools and cutting instruments generally. They are composed largely of silica in a finely divided state, and to it their abrasive action is due. Some are used with sperm or neat's-foot oil, others with water, and a few dry. The finer varieties are prepared in different forms, called 'slab,' 'slip,' and 'pencil.' Oilstones for fine cutlery are procured in Leicestershire and North Wales. The hard kinds of the water-of-Ayr stone are also useful as whetstones. The *batts* or keen gritty sandstones obtained in Devonshire, Yorkshire, and Fifeshire are employed for whetting scythes, &c. The Turkey and German H. or oilstones, found respectively in Asia Minor and in slate-hills near Ratisbon, are most esteemed. The other varieties imported into Great Britain are commercially known as the Arkansas, Washita, Peruvian, and Persian oilstones, the Italian water-hone, the Canadian whetstone, and the Norwegian and Russian *ragstones*.

Hon'esty. The small genus *Lunaria* of the natural order *Cruciferæ* is a native of Central and Southern Europe; and in the first catalogue extant of an English garden, viz., that of Gerard (1596), we find the two species *L. biennis* and *L. rediviva*

are included. The former he calls 'white satin or honestie,' and the name H. is no doubt taken from the *transparency* of the large silvery partition of the seed pouch.

Hon'ey (Old Eng. *hunig*, Ger. and Dut. *honig*, Dan. *honning*, Swed. *honing*, Icel. *hunáng*) is the sweet syrupy substance extracted by bees from the nectaries of flowers, and deposited by them in cells of wax, an assemblage of which forms a honeycomb. (See WAX.) H. consists essentially of grape-sugar or glucose, in the modified forms known chemically as dextrose and lævulose; and peculiarities of its flavour and colour are more due to the nature of the flowers whence it is obtained than to the kind of bees which collect it. In the Scotch Highlands H. is very largely obtained from heather flowers, and the product is brownish in colour, with a distinct flavour of its own. English H. is chiefly obtained from furze and broom flowers, and, of course, from the cultivated flowers of gardens. The celebrated Narbonne H. owes its peculiar flavour to rosemary and other allied labiate flowers, and it is imitated by artificially flavouring common H. with rosemary. H. in Russia and Eastern Europe is very largely derived from lime-tree flowers, which yield a much-esteemed variety, and from the flowers of the buckwheat plant. Many plants yield H. having noxious or poisonous properties, of which the Trebizond H., derived from *Azalea pontica*, is a famous example. A considerable quantity of H. is imported into England from the forests of S. America. H. is extracted from the comb by simply straining in a very gentle heat, and when so run it forms a thin, transparent syrup. Gradually semi-crystalline grains form in it, and ultimately the H. separates into a thin syrup and a solid sugary portion. H. is often of use medicinally from its laxative influence, and it enters into many minor pharmaceutical preparations, both on account of its pleasant taste as well as for a certain amount of pectoral and demulcent effect it possesses.

Honey Bear (*Cercoleptes candivolvulus*), a species of Carnivorous mammalia inhabiting S. America, and also known by the names Kinkajou and Potto. Its average size is that of a large cat, and its colour is a light brown, marked with darker bands. The tongue is very long and protrusible, and is used, as indicated by the name of the animal, for searching in the nests of wild bees for the honey there accumulated. The tail is prehensile, and assists the animal in climbing upon trees. The H. B. appears to be nocturnal in its habits, and is readily domesticated.

Honey Buzzard (*Pernis apivorus*), a species of Raptorial birds included in the sub-family of the *Milvinæ*, or Kites. It derives its name from its habit of feeding on insects, and especially on bees. Honey itself does not form part of the food, but the persistence with which the bird pursues insects is remarkable. The average length is 22 inches, the females being larger than the males. The colour is a dark or blackish-brown above, the under parts are of a lighter brown. The tail is variegated with light and dark bands of brown. The nest is constructed in high trees, and the eggs, two in number, are reddish coloured.

Honeycomb Moth, or **Bee Moth**, the names given to a species of moths belonging to the genus Galleria, included in the family *Pyralidæ*, or that of the vine moths. They have broad wings, indented on the outer edge. *G. cereana* is a familiar species. Its colour is a dusky grey. It constructs galleries amid the honeycombs of bees. The larvæ are yellow with brown dots, and live in the pupa state within thick white cocoons. Two broods are produced each year in April and August, and the larvæ become moths in three weeks.

Honeydew, a sugary secretion from the leaves of plants in hot weather.

Honey-Eaters, or **Honey-Suckers**, the name popularly given to the birds belonging to the family *Meliphagidæ*, of the order Insessores, sub-order Tenuirostres. They are for the most part found only in Australia, are sociable in their habits, and of handsome plumage. Their bills are long, slender, and curved, while their tongues are feathered, to enable them the better to extract the honey which forms their principal food, though they also feed upon fruits and small insects. Among the principal species the following may be noted:—The New Holland creeper (*Meliphaga Novæ Hollandiæ*), very common in New S. Wales; the bell-bird (*Myzantha melanophrys*), whose tinkling note is a welcome indication that water is to be found not far off; the rifleman or rifle-bird (*Ptilornis paradisea*); and the regent-bird (*Sericulus melinus*), the adult male of which is of a golden yellow, beautifully contrasted with a velvety black. The tui-tui or poe, of New Zealand (*Prosthemadera Novæ Zelandiæ*), is of the size and colour of a starling, with two bunches of white feathers on the throat, supposed to resemble a clergyman's bands, whence it is known to the colonists as the parson-bird. It possesses considerable powers of song and mimicry, and is also esteemed as an article of food.

Honey Guide ('Indicator'), the name applied to a genus of Scansorial or climbing birds, from the fondness they evince for wild bees and their honey. The beak is long and curved. The H. G. are included in the cuckoo family (*Cuculidæ*), and have the third to the fifth quills the longest in the wings. The great H. G. (*I. major*) occurs in S. Africa, whilst other species are found in India and Borneo. The lesser H. G. (*I. minor*) is also a S. African species. The colour of the former is dark-brown above, and greyish-white below. Both sexes assist in incubation, and the eggs, which number three or four, are of a brownish-white hue.

Honey Locust-Tree. See LOCUST-TREE.

Honeystone, or **Mell'ite**, a mineral found in some parts of Prussia and Austria, which crystallises in square octohedrons, and can be cut with a knife. In chemical composition it is essentially mellate of alumina.

Hon'eysuckle. In poetry and popular usage the woodbine (*Lonicera Periclymenum*) is meant by H., but, says Dr. Prior, 'it is very doubtful to what plant the word properly belongs.' Gerard in 1599 applies it as we do, whereas Parkinson makes it denote meadow clover. The large genus *Lonicera*, which takes its name from a German botanist, belongs to the natural order *Caprifoliaceæ*, and is distributed through the temperate and warm regions of the northern hemisphere. In addition to our common species, two others now appear in British floras, viz., perfoliate H. (*L. caprifolium*) and fly H. (*L. xylosteum*). The latter is perhaps native in two or three counties of S. England, the first is certainly only an introduction. Both are commonly planted in shrubberies, &c., as is also trumpet H. (*L. sempervirens*), a handsome climbing N. American species with evergreen leaves and scarlet flowers. *L. Japonica* is frequently figured in Chinese drawings.

Hon'fleur, a town of France, department of Calvados, on the left bank of the Seine, 7 miles S.E. of Havre. Its streets are narrow and winding, and it contains several interesting buildings of the 16th c. It has a well-sheltered port, large fisheries, imports of coal, wood, and iron; and exports of fruit, eggs, poultry, &c. There is some shipbuilding, and sugar, biscuits, and oil are manufactured. Pop. (1872) 15,475.

Hong-Kong properly **Hiang-Kiang** (the place of 'fragrant streams'), an English island off the S.E. coast of China, at the mouth of the Chu-kiang, 75 miles S.E. of Canton. Area, 29 sq. miles; pop. (1874) 121,985, of whom 115,564 are Chinese, 4931 Europeans and Americans, and 1490 natives of Manilla. The island is 9 miles long, of irregular shape, bare and mountainous, rising to a height of 1825 feet. The rocks are chiefly granite, serpentine, and syenite. H. has a fairly good climate. From May to October (83°–90° F.) there is much rain and great heat; but the four winter months (40°–75° F.) are dry, and even occasionally chilly. The change of temperature is, however, apt to engender disease of the kidneys. On the N. side of the island is the city of Victoria, with a deep commodious harbour. It extends for about 3 miles along the bay, from the foot of the hills to the water's edge, and has a cathedral, a governor's house, a bishop's palace, an exchange, an hospital, good free schools for the poorer Chinese, and fine public gardens. The chief imports (value, 1875, £[illegible],811) are cotton goods, opium, and ships' supplies; the exports (value, 1875, £1,154,910) are tea (11,702,812 lbs.), silk, spices, opium, rice, and China ware. In spite of the increase of direct communication with the various ports, H. still remains the great financial centre of the China trade. Bombay, Calcutta, San Francisco, Canton, Macao, and Singapore steamers go and come almost daily, and the harbour is thronged by thousands of junks and other sailing vessels. In 1872 the total tonnage of vessels entering and clearing was 3,777,676. Other havens for large steamers are Aberdeen on the S. coast and Kow-lung on the peninsula of the same name,

opposite Victoria. The colony, which includes a maritime strip of the mainland, is under a governor and legislative council, and yields a surplus (£14,290 in 1874) of revenue after defraying the expense of a strong police force of Indian Sepoys. The island was ceded in perpetuity to Great Britain in 1843.

Hon'iton, an old town of England, Devonshire, in the rich valley of the Otter, 17 miles N.E. of Exeter by rail. It gives name to the fine 'H. lace' still manufactured here, and in most of the towns and villages of Devonshire. The industry was introduced in the time of Elizabeth by the Lollards. H. returned two members to Parliament till it was disfranchised in 1868. Pop. (1871) 3464.

Honolu'lu, the capital of the Sandwich Islands, is situated on the S. shore of the island of Oahu, in lat. 21° 18′ N. and long. 157° 55′ W. It has a fine deep harbour, formed by a breach in the coral reef that girds the islands, and lined with spacious wharves. The city is embowered in tropical foliage, and has a healthy, equable climate, with a temperature ranging from 60° to 87° F. Its chief buildings are the royal palace, the parliament house, a Roman Catholic cathedral, an Anglican church, the hospital, a post-office, and a theatre. Steamers touch here regularly in the passage between Australia, New Zealand, China, Japan, and San Francisco. In 1872 there entered the port 138 merchant vessels (96,957 tons), of which 86 were American, and 47 whalers. The exports, chiefly sugar, paddy, tallow, coffee, wool, and whale oil and bone, amount in value (1872) to 1,402,685 dollars; the imports, building materials, cottons, woollens, silks, provisions, lumber, &c., to 1,583,583 dollars. Pop. (1872) 14,852.

Hon'or, in English law, is a superior manor or seigniory. An H. may be held by grant or prescription; but the crown cannot create one without an Act of Parliament. There are eighty in England.

Honora'rium, the name given to a counsel's or physician's fees, which were presumably a present given beforehand. Consequently a lawyer or physician could not legally recover unpaid fees; but this no longer applies to physicians.

Hono'rius, the name of several popes. The first was Bishop of Rome from 625 till 638, and was condemned as a heretic by the 6th Œcumenical Council at Constantinople, 680 A.D., for having adopted the doctrine of the Monothelites. This circumstance has been a serious obstacle in the way of the supporters of papal infallibility, and the questions suggested by H.'s heresy and condemnation have been keenly discussed. See Hefele's *Die Honorius-frage* (1870).—**H. II.** was appointed Pope under imperial influence in 1061, a few weeks after Alexander II. had been nominated by Hildebrand and the other cardinals. He was repudiated by two councils, never exercised papal authority, and died in obscurity in 1072.—Another H., sometimes called **H. III.**, but generally reckoned **H. II.**, Pope from 1124 to 1130, was compelled by Count Roger of Sicily to surrender the papal fiefs of Calabria and Apulia; his elder brother Arcadius (q. v.) obtaining the East. A fourth **H.**, from 1216–1227, crowned Friedrich II. emperor, was a friend of the new Mendicant order, and also of the Teutonic knights; and yet another from 1285–87, who chiefly busied himself with Sicilian politics.

Hono'rius, Fla'vius, second son of the Roman Emperor Theodosius I., was born in 384. On the death of his father in 395, the empire was divided, and H. succeeded quietly to the western portion. But as he was a minor, all affairs were at first entrusted to Stilicho (q. v.), whose prudence and force of character did much for H.'s reign, until he fell a victim to the intrigues of the eunuch Olympius at Ravenna in 408. This able general, whose daughter Maria H. had married, repulsed the Visigothic irruption in 402–3, as well as that of Rhadagaisus in 405–6; but after his death Alaric again entered Italy, and sacked Rome in 410, dying however in the same year. Constantius now appeared to deliver the empire, defeating the usurper Constantine in 411, and turning back the barbarians, for which services he was rewarded with the hand of H.'s sister Placidia, and declared Augustus by H., but survived only seven months. In this reign Britain, Gaul, Spain, and Pannonia fell away from the Roman Empire. H.'s residence, at first fixed at Milan, was in his later years at Ravenna, where he died, 27th August 423. His character was feeble, faithless, and cruel. See Gibbon's *Decline and Fall of the Roman Empire*.

Honourable Ordinaries. See ORDINARIES.

Honours, Military and Naval. See SALUTES.

Hon'theim, Johann Nikolaus von, a famous opponent of papal tyranny belonging to the ranks of the Catholic hierarchy, was born at Trier (Treves), 27th June 1701, and educated at Louvain, Leyden, and Rome. On his return to Trier, he was appointed to various offices of importance in State and Church by the Elector Georg, and was finally, in 1748, made a Suffragan of the Archbishop. His *Historia Trevirensis Diplomatica* was published in 1750, the *Prodromus* in 1757; but the work *De Statu Ecclesiæ Liber Singularis* (Frankf. 1763), put forth under the pseudonym Justinus Febronius, attracted a wider and keener interest than the others. It was designed to further union amongst the distending Christian sects and parties, and in defending the liberties of the Church it attacked overweening papal assumptions. The hostility of Rome did not directly assault H., powerfully supported as he was; but the perpetual harassment to which he was subjected led him in his old age to make a partial retractation. He died at Montquintin, 2d September 1790.

Honved' ('defenders of the land'), a name used in Hungary in 1848 for the volunteers raised to repel the incursions of the Serbs, then used for the whole national army during the revolutionary war. The force of honveds now existing was constituted in 1868. It is supplementary to the regular army and landwehr, and is composed of such able-bodied men as are not yet or no longer required to serve either in the army or in the Hungarian reserve. Most of the force are very young men.

Hood, Robin, a celebrated outlaw, who is traditionally assigned to the beginning of the 13th c. The first mention of him is in the *Vision of Piers the Plowman* (1362–78), 'But I can rymes of Robyn hood' (Pass. v. l. 402); and the next in Wyntown's *Orygynale Cronykil* (circa 1420), where 'Lytell John and Robyne Hude' are both spoken of rather kindly (B. vii. ll. 3523–24). Wynkin de Worde printed *The Lytel Geste of Robyn Hood* about 1495, and Major, early in the 16th c., described him as 'of all thieves the prince and the most gentle thief.' R. H. is the subject of many ballads and legends, for which see the *R. H. Collection*, 2 vols., published by Ritson in 1795, and enlarged by J. M. Gutch in 1847, and *Percy's Reliques*. Mr. Thomas Wright, in his *Essay on the Middle Ages*, doubts the existence of such a person; but the Rev. J. Hunter, in *Critical and Historical Tracts*, stoutly maintains his historic reality, and endeavours to identify him with a certain Robyn Hod, sometime a porteur to King Edward II. Thierry suggests that he was a Saxon patriot carrying on a guerilla warfare against Norman oppression, while others consider that he was a follower of Simon de Montfort; and Ritson submits that his name was Robert Fitzooth, and that he had a claim to the Earldom of Huntingdon, but in support of this there does not appear a shadow of evidence. The haunts of the R. H. of popular tradition were Barnsdale in Yorkshire, and notably Sherwood Forest in Nottingham, where Stow relates that he 'entertained 100 tall men and good archers with such spoils and thefts as he got, on whom 400 (were they ever so strong) durst not give the onset. He suffered no woman to be oppressed, violated, or otherwise molested. Poor men's goods he spared, abundantly relieving them with that which by theft he got from abbeys and the houses of rich old carles.' His prowess in combat, skill in archery, and, above all, his levelling of rich with poor by force of arms, have made him a pre-eminent favourite of the people, along with his companions, the most famous of whom are his henchman Little John, his mistress, Maid Marian, and his jovial chaplain, Friar Tuck.

Hood, Samuel, Viscount, an English admiral, was the son of the vicar of Thorn Cliffe, Devonshire, and was born 12th December 1724. He entered the navy in 1740. As commander of a fifty-gun ship he captured a French frigate of equal strength in 1757, and another in 1759, when he was made post-captain. He served in the Mediterranean till the close of the war in 1763. In 1780 he was sent as rear-admiral to the W. Indies, and brilliantly distinguished himself in the actions with the Comte de Grasse on 9th and 12th April 1782. In 1784 he was elected member for Westminster. As admiral in the Mediterranean he took Toulon in 1793, and before evacuating it destroyed the arsenal and many ships of war. He drove the French out of Corsica in 1794. In 1796 he was appointed

Governor of Greenwich Hospital. He was created a baronet in 1778, an Irish peer in 1782, and a viscount in the peerage of Great Britain in 1796. H. died June 27, 1816. His younger brother, Alexander, created Viscount Bridport in 1801, was also a celebrated admiral. He died 3d May 1814.

Hood, Thomas, an English poet and humorist, of Scotch extraction, was the son of a bookseller in London, where he was born, May 23, 1799. He was apprenticed to an engraver; but his health being delicate, was sent to Dundee to recruit, and his first literary effusion appeared in the *Dundee Advertiser* in 1814. Returning to London in 1820, he became sub-editor of the *London Magazine*, and the success of some poetical efforts made him choose authorship definitely as a profession. In 1825 he published *Odes and Addresses to Great People*, conjointly with his brother-in-law, J. W. Reynolds, and in 1826 *Whims and Oddities*. His *Comic Annual*, which amusingly caricatured passing events, appeared regularly from 1830 to 1838, an additional volume in 1842, and *H.'s Own* was started in 1838. *Up the Rhine* appeared in 1839, and he edited the *London Magazine* from 1841 to 1844, when he began *H.'s Magazine*. All his life he struggled against bad health, and a long and wasting illness, borne with much gentleness, terminated in his death on May 3, 1845. See *Memorials of T. H.*, edited by his son and daughters, published in 1860. H. was a master of the grotesque and the ridiculous, the prince of punsters, and a poet of clear shining lustre. His writings breathe a tender sympathy with suffering and poverty, and a large-hearted charity. *The Bridge of Sighs*, *Eugene Aram*, *The Song of the Shirt*, *The Lady's Dream*, *The Deathbed*, and many of his minor poems, are things of exquisite beauty, and will live with the language. His entire works with Life, in 10 vols., were printed in 1869-73, edited by his son, Thomas Hood, who was born in 1835, was for many years editor of *Fun*, and died November 20, 1874.

Hoofs (Old Eng. *hôf*, Dut. *hoef*, Ger. *huf*, Dan. *hov*, anything that *shields* or *covers*), the name given to the largely developed 'nails' which protect and invest the toes of many mammals. Their typical development is well seen in the horse, the care of whose hoof and the treatment of the diseases to which it is subject are matters of extreme importance. Brittle H. arise from inattention, from long periods of dryness, and sometimes from general debility. When H. 'crack,' they become liable to sores and ulcers which are very difficult to heal. Careful washing and frequent oiling are the best preventives of disease. Undue paring is a cause of lameness. Rest and attention to the general health are the chief things to be attended to in the treatment of ordinary affections of the H., but when the H. are cracked or worn, blistering and other measures may become necessary. See HORSE-SHOEING.

Hooft, Pieter, a Dutch historian, born at Amsterdam, 16th March 1581; after studying at Leyden University, he travelled for a time in Germany, France, and especially Italy. On returning to Holland he devoted himself to historical study and writing after the manner of Tacitus, whose works he translated into Dutch. *Het leven van Koning Hendrik IV.* (Amsterd. 1626-52); *Geschiedenis der Huis Medici* (Amsterd. 1649); *Nederlandsche Historien* (2 vols. Amsterd. 1642-54; newer ed. by Hecker, 5 vols. Grön. 1843-46), embracing the years 1556 to 1587, are his most important works. H. was also a distinguished lyrist and tragic poet. His *Gedichten* (Amsterd. 1656; edited by Bilderdijk, 3 vols. Leyd. 1823) and his letters (edited by Huydecooper, 1738) are regarded as models. H. died at the Hague, 21st May 1647. His influence on the development of Dutch has been very great.

Hoogh'ly (*Hugli*), the most southern mouth of the Ganges, on which Calcutta is situated, and the only one now used by large ships. This name is applied from the junction of the Bhagirutti and Jelinghi at Nuddea town to the sea at Saugor Island, 160 miles in all; at the latter point the estuary is 15 miles wide, opposite Calcutta only 1 mile, now spanned by a floating bridge which cost £220,000. The tributaries are the Damudah and the Rupnarain, both on the right bank. Sandbanks are continually forming in the channel, and destructive cyclones sometimes occur; the bore or tidal wave is well known. The H. retains the sanctity of the Ganges, and on its bank are many historic sites. It is navigable up to Chandernagore, and the port of Calcutta extends along 10 miles.

Hooghly, the chief town of the district of the same name, province of Bengal, British India, 27 miles N. of Calcutta. Pop. (1872), together with the former Dutch settlement of Chinsurah, 34,761. H. is said to have been founded in 1537 by the Portuguese, who were expelled by the Mohammedans in 1628. The first English factory in Bengal was planted here in 1642. The principal building is the Imambara, a religious college of Mussulman learning with a large endowment. The first printing-press in Bengal was set up here in 1778.—The *district* of H., which borders the H. river on the W., has an area, including Howrah, of 1424 sq. miles; and a pop. (1872) of 1,488,556, or 1045 to the sq. mile, the greatest density in all India, and probably throughout the whole world. The soil is very fertile, and supplies vegetables and fruit for the Calcutta market; the manufactures and through trade are also considerable.

Hook, Theodore Edward, novelist and dramatist, was born in London, September 22, 1788. He was educated at Harrow and Oxford. Almost fabulous stories are told of his powers as an improvisatore, but they were wonderful enough to astound Coleridge and mystify Sheridan. The hero of a hundred drawing-rooms, he was petted and fêted by the leaders of society. The Prince Regent, fascinated by his splendid versatility, procured for him the Treasurership of the Mauritius with £2000 a year. To that island H. was sent in 1813, where he spent five delightful years. But in 1818 there was a deficit of £20,000 in the treasury, and H. was found guilty of the grossest carelessness and recalled. His life, from 1818 to its close, is one of extraordinary vigour, both in the pursuit of literature and pleasure. In these twenty-three years he produced thirty-eight volumes, besides numberless squibs, papers, and sketches. In 1820 he started the *John Bull* newspaper, to attack Queen Caroline and champion high Toryism. He was in prison from 1823 to 1825 for his debt to the crown, which he never made any attempt to discharge, although he was making on an average £3000 a year by his writings. His *Sayings and Doings* appeared from 1824 to 1828; *Maxwell*, his best novel, in 1830; *Love and Pride* in 1833; *Gilbert Gurney*, almost an autobiography in fiction, in 1835; *Jack Brag* in 1837; *Gurney Married* in 1839, and *Peregrine Bunce* in 1842. H. died August 24, 1841. See *Life and Remains of T. E. H.*, by the Rev. R. H. D. Barham (2 vols. 1849).—**Rev. Walter Farquhar H., D.D.**, son of the Rev. Dr. J. Hook, and nephew of the preceding, was born March 13, 1798, and educated at Winchester and Oxford. Ordained in 1821, he became Chaplain-ordinary to George IV., and subsequently to William IV. and Queen Victoria. He was vicar of Leeds from 1837 till 1859, when he was appointed Dean of Chichester, during which time he did much in the way of church and school extension. Though a High Churchman, he was a liberal educationist. His *Ecclesiastical Biography* and *Church Dictionary* are standard works of reference. He also published the *Lives of the Archbishops of Canterbury*, and many sermons and pamphlets. He died October 20, 1875.

Hooke, Robert, a distinguished natural philosopher, was born at Freshwater in the Isle of Wight, July 18, 1635. In 1664 he became Professor of Geometry in Gresham College, London, and in 1677 was appointed secretary to the Royal Society, in the formation of which, seventeen years earlier, he had taken a most active part. In the *Transactions* of this Society are numerous and most valuable papers by him, bearing on almost every department of physical science, and foreshadowing many of the discoveries of his contemporaries and successors. His suggestion of the law of gravitation, and his researches into the cause of the colours of thin plates, roused a controversy between him and Newton. Among other valuable inventions he constructed the spirit level, the marine barometer, a reflecting quadrant, and a dividing engine; he suggested the freezing and boiling points of water as convenient and fixed standards for measuring temperature, and the pendulum as a standard measure; he enunciated the law of elasticity—*ut tensio sic vis*—and invented the well-known and most valuable *universal joint*. His chief works are *Micrographia* (1666) and *Lectiones Cutlerianæ* (1678-79). He died at London, March 3, 1702.

Hook'er, Richard, one of the greatest of English theologians and prose writers, was born of a poor family at Heavitree, in or near Exeter, about 1554. His schoolmaster, seeing his abilities, brought him under the notice of Jewel, Bishop of Salisbury, who gave him a pension and had him admitted as

a clerk or sizar to Corpus Christi, Oxford. In 1577 he was made Fellow of his college, and in 1579 Hebrew lecturer, and in the same year was, for some unknown cause, expelled. He became preacher at St. Paul's, London, and after, in 1586, making a marriage which proved very unhappy, settled in the living of Drayton, Beauchamp, Buckinghamshire. In 1584–85 he was, through Archbishop Whitgift's influence, elected Master of the Temple, where Travers, the afternoon lecturer, maintained Presbyterianism, while H. upheld Episcopacy. 'The pulpit,' says Fuller, 'spake pure Canterbury in the morning, and Geneva in the afternoon.' In 1591 H. received the living of Boscombe, near Salisbury, where he wrote his *Ecclesiastical Polity*, of which the first four books were published in 1594, the fifth being issued in 1597. In 1595 he removed from Boscombe to the better living of Bishopsborne, near Canterbury, where he died, 2d November 1600. The sixth and eighth books of the *Polity* were published in 1651, the seventh in 1662. It has been argued by Walton and others that the three last books were distorted by the Presbyterian friends of H.'s wife; but this, though probable, has not been conclusively proved. Mr. Keble, however (the latest and best editor of H.), has shown that the sixth book is utterly lost, and that what now stands for it is matter quite irrelevant, though possibly obtained from H.'s papers. The *Ecclesiastical Polity* is an elaborate defence of the English Church, based on philosophical rather than on theological grounds, H. asserting, in opposition to the dogmatism of the Presbyterian Cartwright, that 'no form of church government had ever been of indispensable obligation;' that divine order exists in moral relations as well as in written revelation, and that the human reason can distinguish the laws of this order as well as the eternal from the temporal in Scripture. The reasoning, though sometimes hazy, is generally conducted with depth, cogency, and calm dignity; H.'s tranquil eloquence being nobly free from the angry partisanship of his age. Hallam, in his *Const. Hist.* (c. iv.), says that H. 'mingled in these vulgar controversies like a knight of romance among caitiff brawlers, with arms of finer temper, and worthy to be proved on a nobler field.' But for a certain arrogant scorn of the question at issue, this might be accepted as a just representation. H.'s style is unadorned in comparison with that of the other great Elizabethans. It is grave and elaborately rhythmical, its stately periods flowing on with a golden wealth of language and solemn music. Its faults are want of simplicity, occasional intricacy and awkwardness, and an unpleasant frequency of Latin idioms. See Isaac Walton's *Life of H.* (2d ed. 1670), and the biography in Keble's edition of H.'s Works (4 vols. Lond. 1836). The first book, with a prefatory memoir by R. W. Church, forms a volume (1868) in the *Clarendon Press Series.*

Hook'er, Sir William Jackson, F.R.S., a celebrated English botanist, was born at Norwich in 1785. He was Professor of Botany in Glasgow University from 1821 to 1841. In 1836 he was knighted, and in 1841 became director of the botanical gardens at Kew, where he died, August 12, 1865. His chief works are the *Monograph of the British Jungermanniæ* (1812–16), *Icones Filicum* (in conjunction with Dr. Greville, 2 vols. 1826–37), *The British Flora* (1830), the later editions of which have been published under the joint editorship of H. and Dr. Walker Arnott, *Icones Plantarum* (1837–60), *A Century of Orchidaceous Plants* (1846–53), *British Ferns* (1862).—**Joseph Dalton H., M.D., C.B., F.R.S.**, the only surviving son of the preceding, was born at Glasgow in 1817. In 1839 he accompanied the *Erebus* to the Antarctic Ocean as assistant-surgeon, and on his return published *Flora Antarctica*, a valuable contribution to the geographical distribution of plants. In 1847 he journeyed to the Himalayas, where he remained four years studying the flora. His *Himalayan Journals* (1852) are a most valuable addition to botanical literature. In 1855 he was appointed assistant-director of the Kew Gardens, and succeeded to the directorship on his father's death in 1865. In 18[illegible] he was President of the British Association. In 1871 he brought home a valuable collection of plants from Morocco. He is at present (1877) the President of the Royal Society of London, a position to which he was elected in 1873. His latest works are *The Student's Flora of the British Islands* (1870), and *The Flora of British India* (1874).

Hooks and Eyes are well-known useful fastenings for wearing apparel and other articles. They are made from iron or brass wire or sheet-metal by the aid of machinery. There are numerous modifications of the ordinary hook, which has the body bent into a 'beak' that engages in a circular eye, both of the articles having lateral rings for attachment to the garment. The hook is sometimes provided with a 'spring' or 'tongue' for preventing the eye becoming accidentally disengaged.

Hook-Squid, a name given to certain genera of Cuttle-fishes (q. v.), from the hooked processes with which the suckers of the arms are furnished. These hooks not only increase the prehensile power of the arms, but serve to attach the one elongated tentacle to the other, so as to bring the muscular power of these two largest arms to bear upon any object. The H. S. are allied to our common squids, and belong to the family *Teuthidæ*. The genus *Onychoteuthis* includes the most familiar species.

Hoop Ash. See NETTLE-TREE.

Hoop'er, John, an English Protestant martyr, born in Somersetshire about 1495, and educated at Oxford. He became a Cistercian monk, but embracing the Reformation, was obliged to leave England in 1540, and lived in France and Switzerland till Edward VI.'s accession. In 1550 he was nominated Bishop of Gloucester, and was imprisoned for some months for a refusal to wear vestments. The matter was compromised, and he received the Bishopric of Worcester *in commendam* in 1552. On Queen Mary's accession he was committed to the Fleet, tried by Gardiner on January 28, 1555, and, refusing to recant, was burned at Gloucester, February 9, 1555, meeting death with admirable courage. His works were published by the Parker Society in 2 vols. in 1843 and 1852.

Hoop'ing-Cough, or **Pertuss'is**, is an infectious and sometimes epidemic specific disease, preceded and accompanied by fever, attacking children mostly during the spring and autumn months. H.-C. has a period of incubation, usually of five or six days after exposure, followed by fever and catarrh, which may last from one to eight days or longer, being the first stage of the disease. The second stage is indicated by a remission of the fever, and the appearance of the characteristic *whoop*, the disease being then fully formed. The approach of the fit is indicated by a titillation of the glottis, a sharp pain in the chest, and a spasmodic contraction of the diaphragm, so rapid and convulsive that the air is almost instantly expelled from the lungs, nearly suffocating the patient. When the diaphragm relaxes, the violent inspiration which follows gives rise to the characteristic *whoop*. In ordinary cases the paroxysms recur every two hours, but in more severe cases, especially during the second and third week, every quarter of an hour or oftener, the patient being well during the intervals. The duration of the second stage is from two to eight weeks, but the whole duration is exceedingly variable, sometimes terminating in two or three days, or extending over several months. H.-C. is frequently complicated with inflammation of the mucous membrane of the bronchia, of the soft tissues of the lungs, of the stomach or intestines, or of the serous membranes of the brain. H.-C. is induced by a specific poison, probably of the nature of a vegetable parasite, the germs being communicable from one subject to another by *fomites*, and is, consequently, a preventible disease. It seldom affects the same person oftener than once, and but few children escape it. The mortality from H.-C. is considerable, and is greater in towns than in the country. *Treatment:*—Narcotics, such as belladonna, hemlock, hyoscyamus and opium, have no specific action, but are useful in allaying the paroxysms and shortening the spasmodic period. Cochineal is an anodyne which sometimes affords relief, but all treatment is merely palliative; for in H.-C., as in typhus, cholera, and many other affections of a similar class, the nature of the agent which modifies and gives a specific character to the disorder is unknown. The disease is most successfully treated by topical applications administered by inhalation.

Hoop'oe (*Upupa*), a genus of Insessorial birds, belonging to the group *Tenuirostres* (q. v.), and forming the type of a special family (*Upupidæ*). In the genus *Upupa*, the bill is slender and curved throughout, and the nostrils are covered by a scale. The tarsi are invested with broad scales or plates, and the tail is long and even. The outer toe is longer than the inner, and the claw of the hinder toe is long and straight. The name H. is derived from the cry of the bird, the common species of which (*U. epops*) is found in N. Africa, on the European continent,

and in Asia, and occasionally, though rarely, in England. The H. attains a length of 13 inches. Its colours are white, buff, and black. It has a remarkable crest of feathers, of a reddish-buff hue, tipped with black. Its food consists of insects. The nest is built in hollow trees, and the eggs—of a light grey—vary in number from four to seven. The young are hatched in June. To the family *Upupidæ* also belong the genus *Epimachus*, or that of the plume-birds, and the genus *Neomorpha*, inhabiting New Zealand.

Hoops. See CRINOLINE.

Hoorn, a seaport in the province of N. Holland, in the Netherlands, on the Zuider Zee, 10 miles E. of Alkmaar. Its walls have given place to promenades, and there is considerable shipbuilding and fishing. It has a naval college, and a trade in butter and cheese. Pop. (1875) 9503.

Hop (the name was adopted from the Netherlands along with the culture of the plant about the year 1520) belongs to *Humulus Lupulus*, sole British representative of the natural order *Cannabinaceæ* or *Cannabineæ*. The plant is indigenous in Mid and South England, and is elsewhere native throughout temperate Europe, Asia, and N. America. It is a perennial, producing yearly long, weak, tough, roughish, twining stems, and opposite, lobed, coarsely-toothed leaves, which bear a general resemblance to those of the vine, but are harsh to the touch. The male and female flowers are produced on separate plants. The males grow in loose drooping panicles, whilst the females form yellowish-green catkins or stroboli, which are produced either singly or in clusters, and are composed of a number of membranous partly overwrapping concave scales, each having two inconspicuous flowers at its base. These catkins increase in size during the progress of ripening, and when full grown, constitute the brewer's 'hops.' Their active qualities reside principally in an adherent golden yellow powder (*lupuline*), and in brewing they serve the important purposes of checking acetous fermentation, and thus rendering the beer capable of being kept, of clarifying the beer, and of imparting to it an agreeable bitterness and flavour. Extract, tincture, and infusion of hops are used medicinally as soporifics, and the young shoots for use as asparagus are a common article of sale in some of the Continental vegetable markets.

Cultivation of Hops.—The cultivation of hops as a branch of agricultural industry is chiefly carried on in the S.E. counties of England, Kent being the great 'H.-garden' of England. The growth of hops gives to the country a peculiar aspect, as the plants, being climbers, have to be supported on multitudes of poles. The H. attains its full growth in the third year of its existence, and it requires considerable attention. The chief manures used to favour its growth are animal matters, such as hair, skin, blood, fish, &c. The H.-picking season begins in September. Thousands of persons of the poorer classes then migrate to the H.-fields from London and other large towns. The hops are conveyed to the *kilns* in which the process of drying is carried on; this process is conducted most carefully, in order to avoid inducing chemical changes, which would destroy the quality of the lupuline. Huge bags are made up of the dried hops and conveyed to market for sale. Hops exhibit many varieties in favour with growers, each variety being found to be adapted to certain soils. The *Golding hops*, numbering many sub-varieties, as the Jones' variety and the Farnham variety, are in the highest repute. In 1875, 254,444 cwts. of hops (value £1,188,054) were imported from the Continent and America. In Britain about 550,000,000 gallons of ale and porter are brewed annually, and to each bushel of malt used in brewing about 1 lb. of hops is added. The duty formerly levied on hops has been removed, and hence every encouragement is given to the cultivation of this product abroad. The addition of hops to malt liquors not only imparts to them an aroma and flavour, but also tends to keep them in a wholesome condition. See BEER.

Hop Clover is *Trifolium procumbens*, and so called from the resemblance of its heads of flowers to little catkins of hops.

Hope, Thomas, an English author and connoisseur, descended from the Hopes of Amsterdam, was born in London about 1770. At eighteen becoming master of a large fortune, he spent eight years of travel in the study of the architectures of the East, and on his return to England applied these studies practically to the enlargement and decoration of his mansion in Duchess Street, Portland Place, London. In 1805 H. published *Household Furniture*, a work which, though ridiculed in the *Edinburgh Review*, gave a great impulse to decorative art in England. To it succeeded *Costume of the Ancients* (1809), *Modern Costumes* (1812), and a novel, *Anastasius, or Memoirs of a Modern Greek at the Close of the 18th c.* (1819). The last, published anonymously, was at the time commonly ascribed to Byron, and called forth a eulogistic criticism from Sydney Smith, the *Edinburgh* assailant of 'the gentleman upholsterer.' H. married Louisa Beresford, daughter of the Archbishop of Tuam, and died February 3, 1831. Two posthumous works of H. are his *Historical Essays on Architecture* (3 vols. 1831), and the brilliant but extravagant treatise *On the Origin and Prospects of Man* (2 vols. 1837), which was subsequently suppressed.—**Alexander James Beresford H., M.P., LL.D.**, son of the preceding, was born in 1820, and educated at Harrow and Trinity College, Cambridge, where he took his B.A. in 1841. In 1842 he married Lady Mildred Cecil, a daughter of the Marquis of Salisbury, in 1844 founded a missionary college (St. Augustine's) at Canterbury, and in 1865-67 was President of the Royal Institute of British Architects. H. sat for Maidstone 1841-52, and again in 1857; was defeated for the University of Cambridge (1859) and for Stoke-upon-Trent (1862), but was elected for the latter borough in 1865, and for the University, which he still represents, in 1868. He is the author of *Letters on Church Matters by D.C.L.*; *Worship in the Church of England* (1874), &c., and is best known as a prominent member of the High Church party.

Hop Flea (*Haltica concinna*), a species of *Coleoptera* or beetles, belonging to the family *Chrysomelidæ*. It attains a length of $\frac{1}{10}$th of an inch. This small insect does great damage to the young shoots. The turnip flea beetle (*H. striolata*), and the grapeleaf flea beetle (*H. chalybea*), also belong to this genus.

Hop Fly (*Aphis humuli*), a species of plant-lice or *Aphides* (q. v.), *Hemipterous* insects, infesting many trees and shrubs, and causing great damage, especially to young plants. It has even been asserted that on its absence the prosperity of the hop crop chiefly depends. The H. F. is not a true fly. Like other aphides, it produces winged males and females at the end of autumn, and these in turn produce eggs, from which, in the succeeding spring, wingless females are developed. The curious fact has also been noticed that these wingless females produce generations of others without the presence of any male insects, the latter not appearing until the succeeding autumn. The H. F. is of green colour, banded with black.

Hôpital, Michel de l'. See L'HÔPITAL.

Hop'kins, Samuel, D.D., an American theologian, born at Waterbury, Connecticut, U.S., September 17, 1721, studied at Yale College, became pastor at Housatonic (now Great Barrington), Massachusetts, and at Newport, where he died, December 20, 1803. He wrote a number of sermons, a Life of President Edwards, a system of theology (new ed. Bost. 1852), &c., and has given rise to the *Hopkinsians*, a Calvinistic sect who hold that all sin is selfishness, and all virtue disinterested benevolence.

Hora'tius, Flacc'us Quin'tus, a great Latin lyrist, [illegible] most popular in modern times of all Greek and Roman [illegible] was born December 8, 65 B.C., near Venusia ([illegible] where his father, a Venusian freedman, who h[illegible] lector (*coactor*) either of the public revenue, or of the money at auctions, had bought a sm[illegible] spent his earliest years, and here, acc[illegible] story told in one of his lyrics, h[illegible] sleeping in the summer woods [illegible] over him by the wild dove[illegible] his father, though a poor Rome under one Or[illegible] pupils H. has comp[illegible] and twenty he s[illegible] in B.C. 43 he [illegible] ending a[illegible] fled. es[illegible]

a kind of clerkship in the quæstor's department, on the salary of which he managed to live with great frugality. About this time he produced his *Epodes*, and won the reputation of being a brilliant, stinging satirist. In 39 B.C. he was introduced through Virgil and Varius to Mæcenas, who became his lifelong patron and friend, and about 33 B.C. gave him the 'Sabine farm,' immortalised in his verse, a small estate in the secluded valley of Ustica, 30 miles from Rome. In this retreat H. spent much of his later years, delighting to escape again and again from the dust and din of the capital to its shady hills and cool streams. About 27 B.C. he won the patronage of Augustus, who proposed to make him his secretary, an offer which the poet declined, and who gave him a fine villa at Tibur. His juvenile republican fervour had cooled, and he celebrated the praises of the Emperor in strains of glowing and partly sincere adulation. He became intimate with the leading Roman authors and statesmen, and his life glided tranquilly and happily away in refined epicurean pleasures, in polishing his verses, and in light, rural occupations. H. died, shortly after the death of Mæcenas, aged nearly fifty-seven, on November 17, 8 B.C. His works include the *Satires* (bk. i. about 35 B.C., bk. ii. about 33 B.C.); the *Epodes* (about 31 B.C.); the *Odes* (bk. i., ii., iii., about 24 B.C., bk. iv. about 14 B.C.); the *Epistles* (bk. i. about 20 B.C., bk. ii. uncertain); the *Carmen Seculare* (17 B.C.); the *Ars Poetica* (uncertain, but belonging to his last years). H.'s *Odes* have not the unstudied grace, spiritual rapture, and dewy freshness of such lyrics as those of Burns, but they are inimitable in artistic effect; they embalm in the most translucent and mellifluous Latin poetic flowers culled from the Greek song-writers, while there is a distinctively national character in their occasional stateliness, their solemn moral teachings, and the fragrance which they breathe of the old rural life of Italy. The *Satires* and *Epistles* are H.'s most natural and original works. They are written in a style at once terse, polished, and colloquial; they are full of shrewd wisdom melting into humour, of earnest precepts enlivened by personal gossip and racy anecdote; and they contain the most vivid pictures of ancient Roman life both in the luxurious capital and in the neighbouring country district. The *editio princeps* of H. was issued at Milan in 1470. Among the best modern editions are those of Orelli (3d ed. 1850–52), Haupt (1861), Macleane, and Wickham (1875). Of the very numerous translations of H. into English, the best are those of Conington, Martin, and Newman.

Hör'de, a town of Prussia, province of Westphalia, on the river Emscher, 33 miles S. of Munster, with which it is connected by railway. It lies in the centre of great coal-mines, and has quite recently set up immense ironworks. Pop. (1875) 12,852.

Horde'olum, or **Stye,** is a faruncul̄us or small boil projecting from the edge of the eyelid, implicating merely the cellular tissue. If slow in bursting, the abscess may be opened with the point of a lancet.

Hordeum, a genus of Grasses (q. v.). See BARLEY.

Horeb. See SINAI.

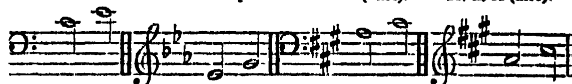
Hore'hound, so called from its *whitish* appearance ('hoar,' old Eng. *har*, in the sense of white or grey, is still seen in -frost, and is common in the form *hoary*), and from its being 'y supposed to be a cure for the bite of a mad dog. With - words, H. is applied to three plants belonging to nera of the natural order *Labiatæ*. Common or *Marrubium vulgare*), occasionally met with as wild plant in Britain, is widely distributed part of Asia, and N. Africa, and has, ...lised in N. America. It was once but has fallen into disuse except as mplaints. *Ballota nigra* is pre- general resemblance to the It is equally well known nd is common in many ame distribution as family likeness is found in Scotland; is a to

have been brought into the rustic pharmacopœia. Its other name of gipsywort was given, says Lyte (1578), 'because the rogues and runagates which call themselves Egyptians do colour themselves black with [the juice of] this herb.'

Hori'zon (from Gr. *horizō*, 'I bound'), the apparent line of meeting of the earth and sky. The true astronomical H. for any point in the earth's surface is the great circle on the sphere of the heavens corresponding to the terrestrial circle whose pole is situated at that point.

Hor'mayr, Joseph Freiherr von, statesman and historiographer, was born at Innsbruck, January 20, 1781. In 1801 he became secretary to the court at Vienna, in 1809 planned the operations for the expulsion of the French from the Tyrol, and subsequently, in spite of the greatest difficulties, maintained the defence of the country. Called in 1815 to be imperial historiographer, he in 1828 passed into the diplomatic service of Bavaria, and died at Munich, 5th November 1848. Among his works are *Geschichte der Gefürsteten Grafschaft Tirol* (1806–08); *Œsterreichischer Plutarch* (1807–20, in 20 vols.); *Alleg. Geschichte der Neuesten Zeit* (1817–19, 2d ed. 1851); *Das Land Tirol und der Tirolerkrieg von* 1809 (1845).

Horn or **Hoorn, Cape,** is the most southerly point of America, the extremity of an island of the same name, in the archipelago of Tierra del Fuego, lat. 50° 59′ S., 67° 16′ W. The island is a bare precipitous rock, with a perennially antarctic climate. The cape was first doubled by Schouten, a native of Hoorn, in 1569, and since then this course has been preferred to the Strait of Magellan.



Horn (Fr. *horn*, Ital. *corno*), a wind instrument consisting of a coiled brass tube with mouthpiece and bell-shaped opening. The tones, produced simply by the agency of lips and breath, are the 'Harmonics' (q. v.) of the sound represented by the whole length of the tube, and are called 'open notes.' Let the hand partially close the 'bell,' and the intermediate or 'shut' notes are obtained. C is the normal key, but by the use of certain crooks the pitch may be changed; in other words, the H. may be played in any key. The H. 'part' is written in C and in the treble clef, but the *sounds* may belong to another key, and even the C horn plays an octave below, *e.g.*—

WRITTEN.

PLAYED.

H. in C. H. in E♭. H. in A (bass). H. in A (alto).

Horns with pistons and those with valves give the whole scale in 'open' notes. In the orchestra there are usually two, sometimes four horns. The 'English H.' is little used.

Horn'beam. Gerard says of the wood of the common H. that it grows 'so hard and tough with age as to be more like horn than wood.' Either this or its former use to yoke horned cattle may have originated the name. In scientific nomenclature it is known as *Carpinus Betulus*, a native of S. England as well as the bulk of European countries and W. Asia. It only occurs as a planted tree in Scotland and Ireland. Along with the oak, beech, and nut, it belongs to *Cupuliferæ*, by some merged into *Amentiferæ*, by others kept as a distinct natural order, and there are three other species of the genus also inhabitants of the N. temperate zone. The foliage of common H. resembles that of beech, but is opaque, not shining, and, like the beech, the leaves may remain attached to the twigs long after autumnal death. This qualification, combined with non-injury from renewed cutting and clipping, has led to an extensive employment of the plant for hedge-making, especially for those used as screens in nursery gardens. If in erecting a fence the plants are arranged so as to cross each other, and are bound together at the points of intersection after removal of the adjacent bark, they will unite at these places, and in process of time a living palisade can be formed of any length. Some very curious illustrations of this fact are

detailed and figured by Mr. M'Nab in vol. x. of *Transactions of Edinburgh Botanical Society*. When well-grown, *C. Betulus* rises into a beautiful tree 50 to 70 feet high; its wood is white, heavy, close-grained and tough, burns well, and produces good charcoal.

Horn'bill (*Buceros*), the name given to various species of Conirostral birds, from the large size and texture of the bill. The wings have their third and fourth quills longest. The tail is long, and the tarsi broadly scaled. The face and throat are nearly bare, and the head commonly bears a horny protuberance of helmet-like shape and of varying size. The familiar species of H. are the common or rhinoceros H. (*B. rhinoceros*), the white-crested H. (*B. albocristatus*), the crested H. (*B. cristatus*), the two-horned H. (*B. bicornis*), and the woodpecker H. (*B. pica*). The beak of the H. is of small size when the bird is hatched, but increases disproportionately as growth proceeds. The bird inhabits Africa and India. The common H. is mainly of black colour, but dusky grey below. The tail is grey and the bill yellow. Its length is about 10 inches. The white-crested H. is of a deep black colour, but the crest is white.

Horn'blende, an important group of minerals, crystallising in oblique rhombic prisms, varying in colour from white to black through all shades of green, grey, and brown, and ranging between degrees 5 and 6 of the scale of hardness. Silicia is the principal ingredient, with variable quantities of oxides of aluminum, calcium, iron, magnesium, and fluorine. There are two distinct groups of varieties, the light coloured and the dark coloured. Among the former are placed *Actinolite*, which includes most of the light-green kinds, and *Asbestus*, which occurs in easily separable fibres, and includes the well-known *mountain leather* and *mountain cork*. These contain little alumina or iron. *Common H.* is typical of the dark-coloured varieties, and is an essential constituent of certain rock, such as syenite, trap, H.-slate, &c.

Horn'book was at first a tablet with the letters of the alphabet either printed or written in black-letter, and covered with a thin plate of transparent horn to preserve it from injury, whence the name. The Lord's Prayer was generally placed beneath the alphabet, and the Roman numerals were likewise frequently added. Before the invention of printing, a H. was of vellum, covered with written characters. Hornbooks were in common use as the first reading-primers for children down to the time of George II. They have now dropped wholly out of use, but the name survives as applied to a book which contains the earliest rudiments of any branch of knowledge. There are very few extant specimens of old hornbooks. Tablets of this kind seem to have been mostly English.

Horn'castle, a town of England, Lincolnshire, at the confluence of the Bain and Waring, 21 miles E. of Lincoln, and 130 N. of London by railway. It has a church of St. Mary, with a square tower, dating from the time of Henry VII., a free grammar school, founded in the reign of Elizabeth, a trade in corn, wool, and coals, and some malting and brewing. The great H. horse-fair (8th–21st August) is perhaps the most important in the kingdom, and attracts Continental dealers. Pop. (1871) 4865. H. has traces of a Roman station, and is the Old English *Hyrn-Ceastre* or 'castle at the horn or angle.'

Horne, Richard Hengist, an English poet whose merit is somewhat greater than his fame, was born in London in 1803. Besides certain dramatic pieces, *Cosmo de Medici*, *The Death of Marlowe*, *Gregory the Seventh*, &c., he has written two notable works, an epic poem, entitled *Orion* (1843), and *A New Spirit of the Age* (1844), a collection of critical essays, partly the work of Elizabeth B. Browning. The former, although sarcastically published at a *farthing* (new ed. 1876 at 9s.), is really a poem of some classic purity and eloquence. In 1846 appeared his *Ballad Romances*. From 1852 to 1869 H. lived in Australia, latterly holding the office of 'Gold Commissioner.' In 1877 he published *Letters of Mrs E. B. Browning addressed to R. H. Horne* (2 vols.), chiefly concerning 'A New Spirit of the Age.'

Horne, Thomas Hartwell, D.D., a biblical critic, was born October 20, 1780, and was educated at Christ's Hospital The death of his parents prevented him from passing on to the University, and he was compelled to become a lawyer's clerk. All his leisure, however, was devoted to learned study, and in 1818 appeared his *Introduction to the Critical Study and Knowledge of the Holy Scriptures*, which procured him the degree of M.A. from Aberdeen. Next year he was ordained by the Bishop of London. He was afterwards made B.D. of Cambridge, and D.D. of the University of Pennsylvania. H. published no fewer than forty-five works, some of them against Roman Catholic dogmas. He died 27th June 1860. See *Reminiscences of T. H. Horne by his Daughter* (Lond. 1862).

Hor'net (*Vespa crabro*), a species of *Vesparia* or wasps, common in England, but rare in Scotland. It is the largest of the British wasps. The H. is coloured black on the chest or thorax, the head is reddish, and the abdomen is yellow, with three brown points or marks on each joint. It is a singularly vicious insect, and has become the symbol of any very troublesome assailant. The nest is frequently built in the neighbourhood of man, and is found in outhouses and like situations. H. communities do not contain a large number of individuals; but in the disposition of the colony the same division of members is found that is seen in bees and ants—namely, into males, females, and neuters or makers.

Horning, a term of Scotch law denoting the process by which a debtor is charged to pay his debts before he or his estate is seized. By special statute letters of H. are authorised to pass on bills of exchange, the protest on which has been recorded in any competent court; but it is now largely superseded by other statutory forms of enforcing decrees.

Horn'pipe, an old English instrument ('horne-pipes of Cornewaile'—*Chaucer*) still in use in Wales, consisting of a wooden pipe with horn at each end. Also the name of a lively dance accompanied by the H. formerly.

Horns (Lat. *cornua*) are the appendages developed from the *epidermis* or outer layer of the skin in many mammals. They vary greatly in texture, structure, and situation. The H. of sheep, goats, and antelopes are *hollow*, and hence the name *Cavicornia* (q. v.) given to this group of animals. These hollow H. are further persistent; in other words, they are never cast or shed. In the *Cervidæ* (q. v.) or Deer (q. v.), on the contrary, the H. are *solid*, and are named *antlers*. They are usually much branched, the complications of form increasing with age, and they are cast each year, to be reproduced of increased size at the breeding season. These antlers are borne on the frontal bone, and the process of annual growth may fitly be compared to that whereby new bone is produced to repair an injured portion. Another difference in form between the H. of antelopes and those of deer is that the former are not branched, although they may be ringed or annulated. In man, horny growths, consisting of modifications and abnormal developments of the epidermis, have been developed, and have required removal by a surgical operation. Several specimens of H. removed from various situations in the human body are contained, *e.g.*, in the Anatomical Museum of the University of Edinburgh; and an account of some of the more remarkable growths of this kind may be found in Syme's *Principles of Surgery*; and in Sir James Paget's *Surgical Pathology*, devoted to pathological anatomy. The number of H. developed in animals is usually two; but in certain species of antelopes (*e.g.*, th Chickara or four-horned Indian antelope) four H. occur.

Manufactures of Horn.—The H. of animals as used fo[r] facturing purposes are of two kinds, having altogeth[er] properties and applications. The hard or bony deer' exclusively used for the handles of pocket and ot[her] for this purpose the antlers of the axis or spotte[d] *maculata*) are extensively imported into this cipal source of hollow horn for manuf[acture] common ox, the horns of which are quantities from S. America, Aus[tralia] of oxen, being exactly the s[ame] also used for all purpos[es] horn is imported fro[m] Hope, and forms [a] demand for hor[n] tips which th[e] button m[akers] knife-[handles] Fo[r]

men in making spoons, but these are now largely supplanted by cheap metal spoons. Cuttings, scraps, and waste of horn are of great value in the manufacture of prussiate of potash, and of artificial manure.

Horny Tissues, the name given in physiology to such tissues as enter into the composition of horns, hairs, nails, hoofs, whalebone, and other substances. In its simplest state horn appears to consist of an albuminous substance, which is distinguished from albumen and fibrin chiefly by containing a larger amount of sulphur. Hair, for example, contains 10 per cent. of sulphur; nails, 6 to 8 per cent. The horny tissues have a greater or less quantity of the substance to which Simon gave the name of *keratin*. These tissues are not soluble in water, ether, or alcohol; but are soluble in caustic potash, and in sulphuric, nitric, and hydrochloric acids. The H. T. in morphological and microscopic composition exhibit a close analogy with the skin structures. Horn proper is modified *epidermis*—the latter being the outer layer of the skin, while feathers and allied products are secreted by the *dermis* or under layer. In hair and feathers an appreciable proportion of *silica* or flint exists; and colouring matters—notably iron and copper—are obtained by analysis.

Horol'ogy (Gr. *hōra*, 'any defined portion of time,' and *logia*, 'a discourse') is the science which treats of the construction of machines for marking and measuring the flight of time. The motions of the heavenly bodies relatively to the earth give our first standard intervals of time, the year, the month, the day; and it is the subdivision of the last and smallest of these into intervals more convenient for practical purposes that is the great concern of H. The first apparatus in use was, no doubt, the sun-dial (see DIAL), which registered the progress of the sun through the sky by a shadow cast upon a graduated plate. It was, however, useless during night, or when the day-sky was overclouded. The next decided advance was the construction of the Clepsydra (q. v.), which measured the hours by the efflux of water from a graduated vessel. It was introduced into Rome by Scipio Nusica about 158 B.C. Subsequent improvements were made by the addition of a toothed wheel and index, which were driven by the outflowing water. By the substitution of a descending weight to drive the wheel, water was dispensed with, but now a regulator was necessary to render the downward motion of the weight uniform. With the invention of the first escapement, the construction of clocks proper may be said to begin. In 1288 a clock was set up in Old Palace Yard; and in the succeeding century clock-towers became a feature in Bologne, Strasburg, Courtray, and other Continental towns. The clock set up by Heinrich von Wick in Paris in the year 1379 is one of the most famous of these earlier mechanisms. No great improvement was made till the middle of the 17th c. In 1641 an English clockmaker, Harris by name, perceived the possibility of regulating the action of the escapement by means of a pendulum, which Galileo had shown to be practically, for small oscillations, isochronous in its beats. It was Huyghens, however, the Dutch physicist, who first constructed a pendulum clock. The escapement or crown wheel, which had hitherto been set vertical, was by him set horizontal, and the pallets were attached to the horizontal rod from which the pendulum hung.
...m this time all clocks which could lay claim to any accuracy

pendulum; and the pendulum, in virtue of its isochronism, reacts upon the escapement, rendering its action, and therefore the motion of the whole clock-train, more uniform. The time of beat of the pendulum is, however, seriously effected by external circumstances; and this must tell upon the *rate* of the clock. If the beat becomes slower, the clock must lose; if faster, it must gain. The most serious error in this respect arises from the change of length of the pendulum due to variation of temperature. To remedy this, several methods have been suggested and employed, the most notable of which are Harrison's *gridiron* pendulum, and Graham's *mercurial* pendulum. (See PENDULUM.) Other minuter errors are no doubt occasioned by the fact that the pendulum in ordinary clocks is moving freely only during a small portion of its oscillation, on account of the pressure existing between the pallet and the escapement wheel, and also possibly by the further well-known fact that, except for arcs of vibration, small in comparison to its length, the pendulum is not sufficiently isochronous, but that, in our more accurate astronomical clocks, the variation in beat might be appreciable. The former defect is very evident in Graham's celebrated *dead-beat* escapement, which is so admirable in many other respects. To remedy these minor errors, Sir William Thomson has devised a new astronomical clock, whose special merits are the small oscillation which the second's pendulum makes (not more than half-a-centimetre on each side of its middle position), and the simple mechanism of the escapement, in which the pallet touches the tooth of the escapement-wheel during $\frac{1}{100}$th of the time of the pendulum's oscillation. For a detailed description of this escapement, see *Nature* for January 11, 1877 (page 228, vol. xv.). When the moving power is a mainspring, the motion is regulated in the first place by the escapement and balance-wheel. The same great cause of error, variation of temperature, exists here also, and compensation is necessary. (See BALANCE-WHEEL.) The most important improvement in this direction, especially for marine chronometers, since the time of Earnshaw, has been made by Mr. Hartnup. For each chronometer there is a certain particular temperature for which the compensation is perfect. Hartnup finds that the rate is fastest at this temperature; and that the rate at any other temperature is calculated with great accuracy by subtracting from the maximum rate the number obtained by multiplying the square of the difference of temperature by a certain constant co-efficient. His method has been experimentally tested, and proved far superior to any other in present use. Evidently a great desideratum in a good chronometer is that this critical temperature be as nearly as possible the mean temperature at which the chronometer is used. The escapement in spring-clocks and watches has undergone various modifications. Here we cannot do more than mention the various kinds by name, referring to some treatise on the subject for their description. Those in most general use are the *lever*, the *duplex*, the *vertical*, the *horizontal*, and the *detached* escapements. The last is that employed in the modern chronometer. The escapement and balance-wheel, however, are not sufficient to regulate the uncoiling of the spring; and that for this reason—the more the spring uncoils, the slower is its rate of uncoiling, the weaker therefore the motive force which it exerts upon the mechanism. To equalise this variable force, a very beautiful contrivance called the *fusee* has been introduced. The fusee is in reality a variable lever, conical in shape, and communicating with the works by means of the toothed fusee-wheel, which is fixed concentrically at its base. The mainspring is contained in a cylindrical box, which, by its uncoiling, it makes rotate. This rotation is communicated to the fusee through the medium of the chain; and as this chain uncoils from the fusee, the point at which it acts upon the fusee is pushed further and further from the centre of rotation, the *leverage* is therefore increased, and the force necessary to give the fusee a certain rotation diminished. As delicacy in the construction of timepieces increased, it soon became apparent that there should be an apparatus to keep the machine going while it was being wound up—that there should be, in technical words, a *maintaining power*. Huyghens kept his clock in motion by an arrangement of pulleys and an endless cord. Harrison's contrivance, known as the *going fusee*, is that now in general use. In the hollow of the fusee-wheel, a circular spring is fitted in such a manner that, by its reaction, it keeps up the motion of the fusee-wheel while the winding-up is taking place. It is impossible here to describe the mechanisms which are necessary for striking the hours, half-hours, and quarters, or

to more than mention the complications which *repeating-watches* require.

The manufacture of watches gives an excellent example of the principle of division of labour. The maker who sends out the finished article to the public does not construct a single part of the mechanism himself—he merely combines what he gets from other sources. The motion-work comes from one, the escapement from another, the spring from a third, and the case, dial, glass, &c., from other quarters. The *movements* of watches are chiefly constructed in Lancashire, and especially in Prescot; and from Clerkenwell district, London, the great majority are turned out upon the market. Switzerland, long a great centre of watchmaking, has of recent years been in great part superseded by America. See Reed's *Treatise on Clock and Watch Making;* Derham's *Artificial Clockmaker;* Denison's *Rudimentary Treatise on Clocks;* Earnsham's *Explanations of Timekeepers;* and Berthoud's *Histoire de la Mesure du Tems.*

Horop'ter, a term used in physiological optics to denote that combination of all those points in space which, for any one position of the eyes, appears single. The H. is really a circular line, of which the chord is formed by the distance between the eyes, whilst the size of the circle is determined by three points, viz., by the two eyes and the point towards which their axes converge.

Hor'oscope (Gr. *hōra*, 'an hour,' and *skopeō*, 'I observe'), in astrology, was a representation of the relative positions of the heavenly bodies at the birth of an individual. It was supposed to indicate his future destiny.

Hors-de-Combat (a French phrase, meaning literally, 'out of the fighting'), is applied to a combatant or combatants quite disabled from continuing a struggle.

Horse (*Equus*), a genus of mammalia included in the order *Ungulata* (q. v.), or that of the 'hoofed' quadrupeds, and in the *Perissodactyle* (odd-toed) section of that order. In former systems of mammalian classification, the H. formed the type of a distinct sub-order named the *Solidungula* ('single-toed'). This name is still retained to designate the division in which the H. and its neighbours, the zebras and asses, are included. The characters of the Solidungula are—(1) that a single toe only is developed. This toe is enclosed in a largely developed nail—the hoof. In the extinct H. named *Hipparion* (q. v.) two rudimentary toes existed, while in the still older fossil H. *Anchitheriun* all three toes touched the ground. The existing H. has two very rudimentary toes, represented by the 'splint-bones,' but these, while demonstrating the probable descent of the H. from a three-toed form, are of no account in its existing structure. (2) A discontinuous or interrupted series of teeth exists in each jaw. Canine teeth of small size are developed in the males only, and fall out sooner or later. The skin is hairy, and the neck is provided with a mane. The teeth number six incisors, two canines (in the males only), eight premolars and six molars in each jaw, and the incisors are of similar form in each jaw. In the H. seven cervical or neck-vertebræ, twenty-four dorso-lumbar segments, five sacral, and seventeen caudal or tail vertebræ exist. The skeleton of the limbs exhibits a special development in connection with the running powers of the animal. In addition to the length of the *phalanges* or bones of the fingers, the wrist is specially adapted to the requirements of the horse's life, from its situation in the middle of the fore-limb; the wrist-joint of the H. being popularly but erroneously termed the 'knee.' The 'heel' is similarly situated in the hind-limb, and constitutes the 'hock.' The movements of the limbs are restricted to a fore and backward movement, the fore-arm being fixed in the position of *pronation*—a state exhibited by the fore-arm of man when the palm of the hand is turned downwards, the elbow resting on a fixed surface. The upper arm and thigh are enclosed within the skin and muscular tissues, and are not perceptible or distinct externally. Seven carpal or wrist bones exist. The bones of the pelvis are very long, and the crests of the *ilia* or haunch bones are wide. The thigh has a third trochanter, and the upper extremity of the fibula is abortive. There are six or seven tarsal or ankle bones. In connection with peculiarities in the skeleton, the *muscles* of the H. evince many striking and special features. The milk-teeth include six incisors, two canines, and four premolars in each jaw; the molars, as in other mammals, being wanting in the milk set. The milk-teeth are present at birth, with the exception of the outer incisors, which are developed during the first few months of life. A wide interval or *diastema* exists between the canines and molars. The groove or hollow existing in the incisor teeth becomes filled with foreign matter, and as the tooth wears, a very characteristic mark is thus produced. As age advances, this mark, owing to the wear of the tooth, disappears, and hence the value of the mark as a test of the age of the H. The *digestive system* of the H. is estimated to attain a length eight times that of the body. The stomach is single, and does not exhibit the complications characteristic of the *Ruminantia* (q. v.). There is a very large *cæcum* (or first portion of the large intestine). No gall-bladder is developed, but in the division or septum separating the ventricles of the heart a cartilage is found. The hemispheres of the brain (*cerebral hemispheres*) are long, and do not project beyond the cerebellum when the brain is regarded from the upper surface. The *testes* of the male pass into a *scrotum*, and the penis is large and provided with a prepuce. The *uterus* exhibits a division at its fundus or base, with two *cornua* or 'horns.' The mare goes with young eleven months, and during the development of the embryo the *Allantois* (q. v.) covers the whole of the internal surface of the chlorion, and ceases to invest the amnion.

The *Solidungula* is divided into two genera—the genus *Equus*, represented by the H., with horny patches on the inner sides of both fore and hind limbs, while the tail is bushy; and the asses (*Asinus*) with horny patches on the inner sides of the fore limbs only, while the tail is tufted. The *domestic history* of the H. resembles that of all animals which have been domesticated by man: a process of *variation* has been inaugurated, the results of which are seen in the remarkable differences perceptible between the breeds or races of these animals. The clumsy dray-H. and the fleet, supple, well-bred racer are apparently quite different animals, and save for the fact that both are horses, might be considered, as far as external characters are concerned, to represent distinct species. But one distinct species of H. is recognised as having formed the parent-stock from which the breeds or races have been derived. This species is the *Equus caballus*, the original habitat of which appears to have been Central Asia. In Tartary, at present, herds of wild horses are found, exemplifying the primitive state of the species, and in the N. American prairies, where the 'mustangs' or wild horses—propagated from domesticated forms allowed to run wild—are found in great numbers, the return to the natural and primitive state is also witnessed. These herds appear to be led by an old and wary male, who directs the movements of his companions. The young males are said to be excluded from the old herds, and are forced to exist in herds by themselves, until they are able to select or attract females, and thus to form a little community or family circle of their own. The wild H. of Tartary is usually of a reddish-brown hue, and has a very dark mark along the spine. In Tartary the flesh of the H. is eaten, and its milk is used for food, while the skin and hair supply the nomadic tribes with materials for making tents and clothing. The American mustang is a powerful animal, showing a nearer approach to the Tarpan or Tartary H. than to domesticated breeds. It roams through the prairies in vast herds, and is caught chiefly by means of the *lasso*. The *Arabian* H. has long been celebrated for its docility, intelligence, and powers of endurance. The *Kochlami* breed of Arabian horses is perhaps the most celebrated of all the varieties, and is esteemed an exceedingly valuab' animal on account of its variety and purity of blood.

articles of dietary, 10 or 12 lbs. of oats *per diem* being a fair average quantity of corn for a H. Bruised oats are to be preferred, and horses in hard work are the better of having a bran-mash given them once or twice weekly, provided they can be allowed to rest the day afterwards. The care of the mare during gestation and parturition, and other details of like nature, belong to the province of veterinary medicine. It is here sufficient to say that interference with the normal process of parturition in the H. is seldom called for. *Castration* is performed by veterinary surgeons on foals when a year old; and after attaining the third year the H. may be gradually and gently inured to hard work. See the works of Youatt, Gamgee, Fitzwygram, and Sydney.

Horse Chestnut, or **Chesnut**, a tree that, from its highly ornamental appearance, is now extensively planted throughout Europe wherever the climate will permit its growth. It is the *Æsculus Hippocastanum* of Linnæus, belonging to the natural order *Sapindaceæ*, and was introduced from the East about the middle of the 16th c. Northern India is often named as its native home, but it is not now known there in a wild state (Boissier, *Fl. Orient*, i. 497). It thrives well in Britain, generally towards mid-May standing forth prominently in all the gorgeousness of leaf and blossom, in striking contrast to the unassuming but more useful trees. Both foliage and flower, even to a casual observer, proclaim a foreign origin. The pyramidal panicle of flowers when in perfection is very beautiful; they soon, however, become tarnished, and most of the blossoms speedily drop off, a small proportion only maturing seed. The capsular, three-celled fruit, beset with spines, fall when ripe, and splitting open, display the roundish polished seed. These 'nuts' are too bitter for human food, and to express this coarseness in contrast to the edible chestnut there is little doubt the prefix 'horse' was given. Deer, goats, and sheep will eat them, but they are refused by the horse. The timber, owing to rapid growth, is soft and of little value. An American species of H.-C. (*Œ. Ohioensis*) is inferior in beauty to the above. In the sub-genus *Pavia*, with a smooth fruit-capsule, are included some handsome trees and shrubs, of which the red-flowered H.-C. (*P. rubra*), the yellow-flowered H.-C. (*P. flava*), and *P. discolor* are in cultivation for ornament. The seeds of *P. Indica* are, according to Dr. Royle, eaten in the Himalayas in time of scarcity, and the fruit is applied externally for rheumatism.

Horse-Fly. See FOREST FLY.

Horse Guards, a large old-fashioned stone building in Whitehall, London, with an archway leading to St. James' Park, where the business of several departments of the War Office is carried on, including the Fortification and Barrack branches, and the Home District and Paymaster Control offices. In 1871 the military functions here exercised were placed under the control of the Secretary of State for War, whose authority had previously been limited to the civil administration of the War Office. See *The Horse Guards*, by Lieut.-Colonel Hort (Lond. 1850).

Horse Guards, Royal, the 3d heavy cavalry regiment, and one of the finest in the British army, formed in the year 1661. As part of the household brigade, the R. H. G. are usually stationed in or near London. Though seldom sent on foreign service, they fought in the Peninsula and at Waterloo. The uniform is blue, with helmet and cuirass, and the horses are black. Strength of regiment in 1876—27 officers, 64 non-commissioned officers, [illegible] rank and file, with 275 horses.

[illegible] Leech. See LEECH.

feats, *e.g.*, leaping from one horse to another when running at full speed. Perhaps the earliest regular treatise on H. is that by Xenophon, from which it appears that the horse was ridden either barebacked or with a cloth or skin secured by a band. Stirrups came into use about the 5th c., but regular saddles were not known till the 14th c., and were first made chiefly of wood. The tournaments encouraged the love of riding, and riding-schools arose at Naples and elsewhere. Louis XIII. received lessons from Pluvinel in the court of the Louvre. The folio volume of De la Guerinière on H., with plates by Parrocel, appeared in 1733. See Mayhew, *Illustrated Horse Management*, Daumas, *Horses of the Sahara*, and Waite, *Graceful Riding*.

Horse-Power is the unit employed in estimating the power of a steam-engine, and is a measure of the work which that machine can do. It is equivalent to 33,000 foot-pounds, where a foot-pound is the work which must be done to raise a pound weight through a distance of one foot at the surface of the earth.

Horse-Racing, a favourite sport of great antiquity. It was introduced into the Grecian games 648 B.C., and a race for mares alone, called Calpe, was instituted 150 years later. The Romans were very fond of the sport; but it is extremely improbable that they introduced it into England. It may, however, be reasonably traced to the tournaments of the middle ages. In the time of Henry VIII. it was a common amusement. James I. patronised and fostered it, and Charles I. instituted a royal plate and kept a stud at Newmarket. About this time barbs and other Eastern horses were imported, and the breed became greatly improved, the most famous sires of winners being Darley's Arabian and the Godolphin Arabian, the latter purchased from a cart in Paris. Since then there has been very little foreign importation, nor has it been needed; as severe yet careful training, combined with high feeding, have made the English racer for swiftness and endurance immeasurably superior to the steed of the desert. Queen Anne ran horses in her own name, the Prince Regent kept a magnificent stud, and the sport has latterly been stamped not only with royal but with parliamentary approval, the House of Commons having adjourned every Derby-day since 1847 till now.

Chester is the oldest meeting in England, but the metropolis of racing is Newmarket, which has the finest course and training-ground in the world, and where seven meetings are annually held. The Heath is the property of the Jockey Club, the supreme turf tribunal, composed (1877) of 102 members. There were in this year ninety-eight places of sport in England, fourteen in Scotland, and eleven in Ireland. In Great Britain 1907 races were run in 1876, in which 2054 separate horses competed, and the prizes offered were £300,000. Thirty-four royal plates were granted of 200 guineas each. The greatest sporting carnival is the summer meeting at Epsom; the most fashionable meetings are 'royal' Ascot, and 'glorious' Goodwood.

Formerly, horses of five and six years of age competed for the great prizes of the year, which are now limited to three-year olds. These are the Two Thousand Guineas (Newmarket, April), the Derby (Epsom, May), and the St. Leger (Doncaster, September). The One Thousand Guineas and the Oaks are for fillies alone. There are about 2500 thoroughbred brood-mares in Great Britain, and the price of a promising foal runs from a few hundreds to £2000. Nearly 300 foals are entered for the Derby, of which about one-tenth come to the post. The fastest recorded time for the Derby course of $1\frac{1}{2}$ miles is 2 m. 43 s., accomplished by Blair-Athol in 1864. The weights of the jockeys (who are lavishly paid) for the three-year old races are 8 st. 7 lb. for colts, and 8 st. 3 lb. for fillies, but handicap races with the weights varied, according to the powers of the horses, are very common. Steeplechasing over rough ground is also popular.

Enormous sums change hands on every racecourse, as, besides private speculators, there are scores of professional betting-men. Betting-houses have been recently abolished, but Tattersall's, the great turf-exchange, still remains.

The sport has become acclimatised in many European countries and in the colonies. The French, by purchasing many of the finest English stallions and brood-mares, are becoming formidable rivals. In America, trotting-races are much in vogue. See *History of Horse-Racing*, published by Saunders, Otley, & Co., 1863; also the *Racing Calendar*, an annual publication.

Horse-Radish. The genus or sub-genus *Armoracia*, belonging to the natural order *Cruciferæ*, of which *A. rusticana* or

common H.-R. is well known for its use as a condiment, &c., whilst its large coarse root-leaves and tall stem, bearing a profusion of white flowers, renders it prominent in the kitchen-garden. So tenacious of life is the root-stock, that pieces thrown from the garden to the manure-heap, or washed down by a stream to some suitable resting-place, are quite sufficient in course of time to found a bed of the plant in such out-of-the-way localities that it has the position and surroundings of a wild plant. It is not, however, a native of Britain; indeed, its exact origin is unknown. As mentioned under Aconite, the 'root' of that plant has several times been mistaken for H.-R., and with terrible results. In the former it is tapering, of a dark-brown colour externally, and the first taste is bitter. In H.-R. there is not the tapering form, the external colour is dirty white, and odour and taste are at first pungent and acrid.

Horse-Radish-Tree. The root of *Moringa pterygosperma*, like horse-radish, is pungent to the taste, hence the name the tree has acquired. The seeds, called ben-nuts, yield oil of ben, used by watchmakers. It is a native of India.

Horses, Sale and Exchange of. The property in horses is not easily changed without consent of the owner, for a purchaser does not become proprietor of a stolen horse unless it has been bought in *open* market, according to statutory directions. The owner of a stolen horse legally sold may redeem it on payment or tender of the price within six months after it is stolen. A warranty of *soundness* regarding a horse implies an assurance against constitutional defects. A temporary defect does not make a horse legally *unsound*. The law is the same regarding exchanges as in sales. Delivery on one side at least is required to prove a contract of exchange. An agreement for the sale of a horse is held to be an agreement 'relating to the sale of goods,' and so to come under the Statute of Frauds; therefore a written receipt for the price, containing the warranty or other condition of sale, is admissible, stamped as a receipt, as evidence of the contract. When a defect contrary to the warranty is discovered, the horse must be returned immediately, unless there be a stipulation to the contrary.

Horse-Shoeing. The art of fitting an iron protection to the hoof of the horse is one of great antiquity. It is unfortunate that the art, as commonly practised by modern farriers, shows but little improvement upon old methods. It proceeds upon the idea that every variety of hoof must be made, through paring and other treatment, to conform to the one type of shoe—an idea which is the root of much mischief in farriery. The hoof is subjected to a process of paring, which, in the hands of a careless smith, is simply tantamount to the destruction of the support which should suffice for the lodgment of the shoe; and an equally careless and empiric method of fastening shoes may be credited with causing a vast amount of lameness. Instead of the wholesale paring to which the hoof is usually subjected, the outer crust, impacted by the pressure of the old shoe, should be lightly and carefully removed with the knife. In particular, the 'frog,' or triangular prominent space between the 'bars' of the sole, requires careful treatment; this portion, one of the most necessary supports of the foot, being frequently destroyed by the shoer. The toe, or front of the hoof, should also be very slightly pared, so as to form a flat surface for the reception of the 'clip' of the shoe, which is often large and very clumsily made. Various modifications of fastening the shoe must be adopted and used in different cases, but the nails should, as a rule, be driven if anything obliquely into the hoof, and then carefully hammered down on the outer surface after the points are broken off. Filing and rasping the ends of the nails are unnecessary. A well-made shoe should last for three weeks at least. The light-running horse should be provided with a shoe of plain structure without heels or tips. The shoe of the heavy draught-horse, on the contrary, requires tips and heels to afford stout points of resistance, but the heels are often clumsily made and too large in size. The treatment of *corns*, to which the feet of horses are liable, consists in judicious paring and shoeing, with the avoidance of undue pressure. Corns usually appear in the angles of the hoof, between the heel and bars. Leather pads, with or without tow-stuffing, are to be regarded only as temporary methods of relieving tender soles.

Horses, Stealing. Any one stealing a horse, or any one counselling or helping the thief, is liable in a penalty ranging from two years' imprisonment, with or without hard labour, to fourteen years' penal servitude.

Horsh'am, a picturesque old town of England, in Sussexshire, on a branch of the Arun river, 37 miles S.S.W. of London by rail. It has a large church of St. Mary dating from the reign of King John, a Gothic courthouse, and a grammar-school founded by Richard Collier in 1532. There is an extensive trade in corn, timber, &c. H. sends one member to Parliament. Pop. (1871) 7831.

Hors'ley, Samuel, a learned prelate, born in London in 1733. He was educated at Westminster and Cambridge, and soon after taking orders succeeded his father as rector of Newington Butts. In addition to this living, which he held for many years, not a few of the good things of the Church were showered on him by influential patrons. His learned leisure was firstly given to science, and he was appointed Secretary to the Royal Society in 1773, having been elected a Fellow in 1767. In 1776 he projected a complete edition of Newton's works, in five quarto volumes, the last of which appeared in 1785. During their publication he fought his famous theological duel with Dr. Priestley. The latter's *History of the Corruptions of Christianity*, defending materialism and unitarianism, was the subject of a furious onslaught in a charge delivered by H. to his congregation, and a vigorous epistolary battle ensued, H. publishing his seventeen letters to Dr. Priestley in 1789. The orthodox party were delighted, and honours and emoluments crowded thickly on their champion. He received in succession the bishoprics of St. David's, Rochester (with the deanery of Westminster), and St. Asaph's. In the House of Lords he was a warm supporter of Pitt. He died 4th October 1806. H. was a variously gifted man, a weighty scholar, a learned theologian, an ardent politician, and a vigilant prelate; he awakens a certain respectful admiration, which would be considerably strengthened if we could only persuade ourselves that he really knew anything of the religion he so forcibly upheld. A complete list of his very numerous works on classical, mathematical, scientific, and biblical subjects will be found in Nichols' *Literary Anecdotes of the Eighteenth Century*, published in 1812. See the collected edition of his theological works (Longman, 6 vols. 1845).

Horticul'tural Soci'eties are now so wide spread through civilised countries, that their utility is fully proved by their general acceptance, and it may appear remarkable, in the history of such an ancient art as horticulture, that their growth lies within the compass of the present century. There is no doubt that not only the large societies holding international meetings, but also the associations belonging to provincial districts, and even to individual villages, have effected much good for horticulture. The Royal Horticultural Society of London, which obtained its charter in 1808, is looked upon as the parent English society. The Caledonian Horticultural Society at Edinburgh dates from 1809. The first society of the kind was formed at Altenburg in 1803, and now almost every town of Germany has one; the various societies form a union, and meet in a botanical congress yearly. The *Société d'Horticulture de Paris* was established in 1827, and has done much to encourage gardening, both by the annual distribution of prizes and by the publication of the *Annales d'Horticulture*.

Hor'ticulture, from Lat. *hortus*, or **Gar'dening,** from *garten*, is the name given to the cultivation of a piece of enclosed for the production of flowers, culinary veget fruits. It is thus broadly separated from Agricu and from Arboriculture (q. v.). Still it touche partments of industry by including what is practical maintenance of market, nursery, a and we further find that certain staple various items of the arboriculturalist' trusted in a smaller extent to recognition of, and painstaki servation and common s the vegetable kingdom cultivation be the fa or the cottager's

In the se portant p surrou ret

clayey loam; or, according to their degree of friability, as a free loam, a stiff loam, &c. In general, much more depends on the texture of a soil, and its capacity for retaining or parting with water and heat, than on its chemical composition. The depth of soil of a garden should not be less than two to four feet. As to situation, a garden should be so placed that it may receive the full benefit of a free untainted atmosphere, and so obtain whatever is desirable from light, heat, moisture, and aerial circulation. The water arrangements must be negative and positive, that is to say, a complete system of underground drainage must be formed, and at the same time a water supply should never be wanting. Of course, the detailed practice of gardening varies considerably in different countries on account of the difference of climate, &c.

To become a proficient gardener in the present day, the individual must acquire his knowledge by a system of physical and mental work, commencing in early life. In particular, he must cultivate his powers of observation and reasoning, and he ought to educate himself to be a botanist as well as a gardener. The neglect of this in the past is apparent in the confusion and nonsense that even still exists in the gardener's nomenclature. The range of a gardener's duties is very wide. He should understand soils, their proper working, and the organic and inorganic manures with which it is necessary to improve them; the varieties of animal and vegetable life injurious to the plants under his charge, and the most effective preventives and antidotes; the diseases and accidents of plants; the implements used in horticulture; the structures and edifices, fixed, portable, and temporary, that are best approved in the various departments of a garden; the operations of propagation, whether by seeds, cuttings, layers, grafting, or budding; the art of selecting and improving plants in culture, and all the addenda of transplanting, potting, training, pruning, sheltering, retarding, and resting; the rotation of crops; the operations of horticultural design and taste; the forcing department; the exact culture of diverse kinds of ornamental trees, shrubs, and herbs, of the numerous kitchen-garden and orchard products, and of such specialties as the orchids amongst flowers, and the pine-apple among fruits. Finally, to bear himself in such a manner to those around him that all may work in happy unison with him.

The earliest accounts we have of gardens are those recorded in the Bible. The Egyptians, the Persians, and other remote nations, prided themselves on their magnificent gardens. Those of Epicurus, and of Pisistratus, Cimon, and Theophrastus, were the most famous in Greece. The gorgeous gardens of Lucullus, Sallust, Crassus, Pompey, Seneca, &c., show the delight which the Romans took in them. The Romans were, perhaps, the first who introduced the art of H. into Western Europe. But it was not until the reign of Henry VIII. that H. made a[illegible]y particular advance in England. We learn, indeed, from Dr. Bulleyn's *Bulwark of Defence* (1562), that excellent apples, pears, plums, cherries, and hops were of native growth, but these were supplemented by important additions from Holland and France, and the impetus thereby rendered developed H. very considerably during the remaining Tudor and succeeding reigns up to the Civil War. This is amply shown by the writings of Gerard and Parkinson (1597, 1629, and 1643). Since then, H. has made continuous scientific progress.

[illegible]rus, the Latinised form of *hor*, *har*, or *her*, was the name [illegible] Egyptian god, identified by Herodotus with the Greek [illegible] H. generally appears as the deity of the sun or of [illegible] day, and his name is probably connected with the [illegible] 'light.' The Egyptian myth latterly recognised [illegible]me, the elder a son of Seb (Kronos) and Nut [illegible] son of Osiris and Isis, but their functions [illegible] represented under the symbol of a falcon.

[illegible] Hungarian historian, born at Szentes, [illegible] October 1809, was educated at [illegible] priest's orders in 1830. In [illegible]n at the Vienna There[illegible]an, in the neighbour[illegible]nnection with the [illegible] the see of [illegible] of Educa[illegible] escape [illegible] Paris, [illegible]

and has since been repeatedly elected by Szegedin to the Hungarian Diet. His most important works are *A Magyarok' Törtenete* ('History of Hungary,' 1842–46, new ed. 1861); *Huszonöt év Magyarország Törtenélböl* ('Twenty-five Years of Hungarian History,' 2 vols. 1863); *Magyarország Függetlenségi Harczának Törtenete* 1848 *és* 1849-*ben* ('History of the War of Independence in Hungary in 1848–49,' 3 vols. 1865), and *Felelet Kossuth Leveleire* ('Answer to Kossuth's Letters,' 1867). H. is now (1877) President of the Historical Academy at Pesth.—There is also an **Istvan H.** (born 1784, died 1846) who has a place in the historical literature of Hungary.

Hose'a (Heb. 'help,' or 'helper'), one of the twelve 'minor' Hebrew prophets, 'prophesied in the days of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah, and in the days of Jeroboam (II.) king of Israel' (about B.C. 790–725), and probably in the kingdom of Israel. The book of his prophecies, which appears to contain a general summary of the leading thoughts contained in his public addresses, may be divided into two parts, i.–iii. and iv.–xiv.; the first giving a symbolical representation of the past, present, and future history of the people of God; the second expanding and illustrating the revelation of the first, in describing their adoption, rebellion, chastisement, and rejection, the conversion of the Gentiles, and the future repentance and restoration of Israel.

Hoshungabad', the chief town of the district of the same name, in the Central Province, British India, on the left bank of the Nerbudda river, 338 miles S. of Agra, and 144 E. of Mhow. Pop. (1872) 8032. It is a centre of the trade in Manchester piece-goods, and exports raw cotton and grain.—The *district* of H., which occupies the S. valley of the Nerbudda, has an area of 4222 sq. miles; pop. (1872) 440,186. In the valley is the 'black cotton soil,' which produces gram, wheat, and oil seeds, and an increasing quantity of cotton. The export trade in these commodities is very large. Coal is found commonly, and the district is now traversed by railway.

Ho'siery, a term derived from the Old English *hos*, the name given to close-fitting breeches reaching down to the knee, which were worn in early times. It now includes specially the manufacture of stockings, but also that of all close-fitting underclothing made principally of worsted yarn with the peculiar elastic structure resulting from the stocking-stitch. The plain stocking-stitch is made of a single continuous thread of yarn, and results from drawing one loop successively through a series of other loops. The ordinary way of accomplishing this, with two or more wires, is so universally familiar that it requires no description here, and it would be equally useless to attempt to describe the numerous fancy stitches and ornamental forms which result from various combinations of stitches. The H. trade is an extensive and valuable industry, centring chiefly in Nottingham and Belper in England, but there the work is done in factories with the stocking-frame, the original form of which was invented by Mr. Lee of Cambridge in 1589. On the stocking-frame a flat web is only produced, which in the case of stockings and all 'round' articles has to be seamed up by hand labour. A variety of ingenious machinery, chiefly of American invention, has of recent years been adapted for automatically knitting round hosiery, and some of these are now being much used in domestic work and small establishments. The most favourably known are the Lamb Knitting Machine and the 'Little Rapid.'

Hos'mer, Harriet, an American sculptor, and the daughter of a physician who became a professor in the Medical College of St. Louis, was born at Waterton, Massachusetts, 3d October 1831. In youth she strengthened a feeble constitution by active outdoor exercise and a raid into the Far West, ending in a visit to the Dakota Indians. After studying anatomy at St. Louis, where she produced a beautiful 'Hesper,' among other original pieces, she went to Rome in 1852, and was received into Gibson's studio. The statue of 'Puck,' sent to Boston in 1856, won her the favour of the American public. Among her more important works are busts of 'Daphne' and 'Medusa,' the full-lengths of 'Œnone' and 'Beatrice Cenci,' the colossal 'Zenobia in Chains,' and the 'Sleeping Fawn' exhibited at the Paris Exposition of 1867. A faithful disciple of Canova, through the influence of Gibson she works out the classic ideas of her school with a vigour and versatility that give a vital gr[illegible] to its cruder conventionalities. She resides in Rome.

Hos'pice (Fr. from Lat. *hospitium*, 'a place where strangers are entertained,' from *hospes*, 'a guest'), a place for entertaining travellers in the Alps, and inhabited by monks. There are hospices on the Simplon, Little St. Bernard, Mount Cenis, and Great St. Bernard—the last being the oldest H. See HOSPITAL.

Hos'pital (probably derived through the Latin from Sanskrit *gosha*, 'a station for cows,' and *pâti*, 'master'), as the name indicates, meant originally any place where guests are received gratuitously. Such a place was also called *hôtel dieu*, *maison dieu*, and *hospice*. At first the Catholic bishop had the charge of the poor, whether sick or not, of widows, orphans, and strangers. Then for a period one-fourth of the fixed revenue of the Church was assigned to the poor. But as hospitals were founded by private benevolence, some were made ecclesiastical benefices, and put under the superintendence of the bishop as titular, while others became purely lay institutions. The civil and canon laws also mention a variety of similar *domus religiosæ* in the Eastern Empire, viz., the Xenodochium, where pilgrims and strangers were received; the Noscomium, managed by Parabolani for the benefit of the sick; the Procotrophium, for the poor and beggars; the Orphanotrophium, for orphans; the Brephotrophium, for abandoned children; the Gerontozomium, for the aged poor and for maimed persons; the Grotophonium, where a certain class of women were received. Separate provision was made at an early date for lepers. The *Hôtel Dieu* of Paris is one of the oldest of such institutions in the West. It is referred to in a decree of the Council of Paris (829) ordering the canons to give a tenth of their church lands to the H. of St. Christopher. There was from time to time great abuse of these endowments, the popes sometimes granting collations in perpetuity. The Council of Trent accordingly directed the will of the pious founders to be observed, and, anticipating the English doctrine of *Cy-près*, where the expressed purposes failed, that a kindred charity, in the discretion of the bishop, should be carried out. The greater number of the hospitals were in the hands of Augustinian monks, and the wish of the reforming party in the Church was to take the charities from secular priests, and put them under the management of respectable laymen, who should submit inventories and accounts to the bishop. Minor hospitals have been established for the administration of the sacraments, and in large towns for the entertainment of members of particular religious orders engaged in travel. The latter were called *hospices*, and were disfavoured by the Church as against convent discipline. Under the canon law all hospitals enjoyed the privileges of the Church, and an exemption from all taxes, even that for the building of schools. (For the modern representatives of these institutions, see De Liefde, *Six Months among the Charities of Europe*, 2 vols., 1865.)

In Scotland, one-half of the educational endowments, or about £79,000, is devoted to *hospitals*. This does not include places which, like Cowane's and Spittal's in Stirling, Hutcheson's in Glasgow, Gillespie's in Edinburgh, were really almshouses for the 'aged,' 'poor,' 'decayed guild brethren,' and the like. In many cases, also, either by custom and change of circumstances, or by Provisional Order under the 'Endowed Institutions (Scotland) Act, 1869,' the funds have been applied educationally in paying the school fees of poor children, or in supplementing the salaries of teachers. In a few cases the converse process has taken place. Some endowments are absolutely wasted on account of the restrictive conditions which cannot be fulfilled. The large funds held by the Guildry of Aberdeen and the Incorporated Trades of Stirling admittedly require a change in administration. The word *H.*, however, as applied to an institution for the maintenance, education, and clothing of orphan or destitute children, was introduced from England in 1624 by George Heriot. His scheme, founded on Christ's H., London, has been largely imitated, and there are now in Scotland twenty-six hospitals, educating 1510 foundationers (chiefly from the petty tradesmen and skilled artisan classes) between the ages of seven and fourteen, at a cost varying from £12 to £54 per head—a cost by no means proportional to the educational results. Opinion has of late run strongly against the monastic system, which is said to depress the intelligence and moral standard of the children; and under the Act of 1869 the Merchant Company of Edinburgh and the governors of the Bathgate Academy have converted their institutions into great day schools, and introduced the principle of competition among applicants for foundations. The two advantages of the monastic system, viz., regular attendance and wholesome diet, may always be secured by a judicious system of boarding out. Three-fifths of the foundationers in Scotland are orphans. There is always an entrance examination. In Fettes College the foundationers provide their own clothes. There has, no doubt, been a pauperising influence, as in Heriot's H., where many persons bought burgess tickets in order to entitle their children to admission. A royal commission, which reported in 1875, recommended universal boarding out, admission of day scholars, and the institution of scholastic foundations for secondary instruction. The great H. of Heriot, with its income of £20,000, spends considerable sums on apprentice fees, bursaries, and the system of free day schools for the Edinburgh poor. This last improvement was made under an Act of Parliament in 1836. The other large hospitals of Edinburgh are John Watson's (founded in 1759 'to prevent child murder by receiving pregnant women,' but altered by statute in 1822), which receives fatherless boys and girls, chiefly from the professional part of the middle class; Donaldson's, founded in 1833, which gives part of its accommodation to deaf mutes. The smaller Scotch hospitals, not before mentioned, are the Boys' and Girls', Gordon's, Orphan and Destitute Females, Orphan Asylum, and Shaw's at Aberdeen; Spier's in Ayrshire; Muirhead's at Dumfries; Morgan's and the Orphan Institution at Dundee; the Orphan and Trades Maiden at Edinburgh; Cauvin's at Duddingstone; Elgin Institution; the Scott Institution at Greenock; Brookland's at Kirkpatrick-Durham; Douglas Free School at Newton-Stewart; Schaw's at Prestonpans; Stiell's at Tranent; Speyside Charity, Grantown.

Of medical hospitals it is impossible to give any detailed account. They are partly endowed, partly supported by private subscriptions. The oldest of the London hospitals are St. Thomas, Bartholomew's, and Bethlehem, all founded in the middle of the 16th c. Many more belong to the reign of George II. when (in 1736) the Edinburgh Royal Infirmary was founded. This infirmary revised its constitution by Act of Parliament in 1870. It is now managed by the representatives of the Court of Contributors, and some *ex officiis* managers. New premises, on a very large scale, are being erected. There is, of course, a tendency to specialise the work of each H., and in those larger ones (as the Middlesex) which remain general, the organisation of the treatment of disease is more strictly carried out. Hence, the great value of hospitals as practical schools of medical study. The nine great hospitals of Dublin have for many years been under a Statutory Board of Superintendence, who have an income of £36,000. Here and there (as in Chalmers' H., Edinburgh) the *maison de santé* or *sanatorium* principle has been attempted, a higher class of patients paying moderate fees for board and advice. Gratuitous *dispensaries* of medicine are usually worked in connection with the larger hospitals.

In regard to civil hospitals, the 19th c. has been marked (1) by a great advance in the scientific construction of H. buildings; (2) by a recognition of the necessity of having *educated* nurses; (3) by the voluntary service (sometimes religious, sometimes secular) of many educated ladies in the capacity of nurses.

Hospital.—In English law a H. is a corporation founded for a charitable object. By 39 Eliz. c. 5 any one seized of an estate in Fee Simple (q. v.) may by deed enrolled in Chancery found a H. for relief of the poor, to continue for ever, and by two more statutes of the same reign the Lord Chancellor is empowered to issue a commission to inquire into abuses and breaches of trust in H. foundations.

Hospitals, Military, form part of the Army Medical Department, which is under the control of the Director General, assisted by the Administrative Officers of the Medical, Sanitary, and Statistical Branches. The latter (viz., the Surgeon-General and Deputy Surgeon General) preside at Medical Boards and inspect hospitals, barracks, and camps. The Army Hospital Corps consist of two ranks: (1) captain of orderlies; (2) lieutenant of orderlies. The compounder of medicines acts as ward-master, and a corporal generally acts as pack storekeeper. There are station hospitals and hospitals at district headquarters for the reception of sick from all corps in garrison. The tendency under Lord Cardwell's unification system is to separate medical officers (who are appointed by the Director-General) entirely from regiments, and attach them to a general medical

organisation for the army. In general, all non-commissioned officers and soldiers, and their wives and children, are entitled, subject to the regulation stoppages, to attendance, medicine, and diet. All the foreign invalids pass through Netley to their appropriate district hospitals. The staff of the *general hospitals* includes a governor or commandant, separate medical and sanitary officers, a registrar, and superintendent of nurses. The governor, who is nominated by the Commander-in-chief, has very large powers, including military authority over officers. It cannot be said that the Army Medical Department is as yet permanently organised. See *The Army Medical Regulations and Circulars of* 1873-76.

Hospital, Naval. The chief features of naval hospitals are that the medical officers (who often act gratuitously in civil hospitals) are always paid; that the patients being of different ranks, very different arrangements have to be made; that they are subject to the public rules of the service (*e.g.*, a post-captain as superintendent, and one nurse to every seven patients); that the officers survey invalids and pensioners, examine recruits, and issue stores to the service afloat. The chief naval hospitals are the Melville, Chatham; the Royal, Plymouth; the Haslar, Portsmouth. The last is on a magnificent scale, with a 'Zymotic Department,' for the treatment of exanthematous fevers, a large system of baths, and 50 acres of ground. Greenwich H., with an income of £138,000 (part of which used to come from the old tax known as 'Merchant Seamen's Sixpences'), has practically given up the in-pensioner principle, and now distributes ninepence a day to seamen and marines over seventy years of age, and who have been naval pensioners for ten years, and fivepence a day to those over fifty-five who have been pensioners for five years.

Hospitall'ers (Fr. from Lat. *hospitium*, 'a place for receiving strangers'), were at first religious fraternities which gave food and lodging to pilgrims. From one of these institutions at Jerusalem arose, about the beginning of the 12th c., the order of the Knights Hospitallers afterwards known as the Knights of St. John of Jerusalem (q. v.).

Hos'podar, formerly the usual title for the princes of Moldavia and Wallachia, is a Slavic word signifying lord or master, and appears in dialectically differing forms such as *Gospod* and *Gospodar*. The native Rumanian title is *domnu*, a corrupt form of the Latin *dominus*.

Host (Lat. *hostia*) means literally a sacrificial victim or offering. Thus in the Vulgate *hostia* is the word used for that which is rendered 'sacrifice' in English in Rom. xii. 1.; and it is applied to Christ in Eph. v. 2 and Heb. x. 12. It then came to be applied to the bread and wine of the Eucharist taken together as representing the body of Christ, but was afterwards restricted to the bread alone. The Roman Catholic practice of the adoration of the H., a wafer of unleavened bread, is connected with the doctrine of Transubstantiation (q. v.).

Höst, Jens Kragh, one of the most prolific of Danish writers at the close of the 18th and in the first half of the 19th c., in history, æsthetics, law, and language, was born of Danish parents, 15th September 1772, at St. Thomas in the West Indies. When H. was four years old his parents came to Copenhagen. He graduated at the university in 1792, and from that year held various legal appointments till 1808, when difficulties arising from a too free expression of his opinions led him to retire into private and literary life. He died 26th March 1844. H. was one of the Scandinavian 'Literaturselskab,' whose object was to use literature to promote the union and unity of the Scandinavian kingdoms. The best-known work of H. is *Grev Struensee og hans Ministerium* (3 vols. 1824; improved in Germ. trans. 2 vols. 1826-27), but several other of his historical writings are valuable, especially those treating of the time of Christian VII.

Hostil'ius, Tullus, according to the Roman legend, was the third King of Rome, succeeding Numa B.C. 670. In his reign a war with Alba was decided by the famed combat of the Horatii and Curiatii, and was followed by others with Veii and Fidenæ. In the last, H., hard pressed, vowed temples to Pallor and Pavor, and after the victory tore asunder with chariots the Alban dictator, razing his city, and transferring its inhabitants to the Mons Cælius of Rome. His defeat of the Sabines H. similarly owed to a vow to double the number of the Salii, or priests of Mamers; but in 638, a pestilence arising, he, like Numa, attempted conjurations, and with his whole house was consumed by fire from heaven. The destruction of Alba and fusion of the Roman and Alban tribes probably contain germs of historic truth; according to Niebuhr, 'this point of real history stands like an oasis in the midst of legends.'

Hot'bed, in gardening, a bed or heap of fresh horse-dung, spent tan, leaves, or other moist composts, fermenting and evolving heat, for raising plants. When the violence of the fermentation has passed, and the bed has acquired the desired temperature, mould is laid on the top, and potted seeds and plants placed therein; and the whole is covered with a glazed frame. Kitchen vegetables, as salad plants, cucumbers, and melons, are frequently raised in a H. The exposure should be southerly, and protection from high winds by high walls and trees should be afforded.

Hotchpot, in English law, means the bringing together of sums of money or of effects with a view to dividing them. When a child has received an advance from the personal estate of a deceased father, he must bring that advance into H. before he will be allowed to share with the other children; that is, the advance is placed to the debit of him who has received it, in dividing the personal estate of the deceased under the statute of distribution. In Scotch law see COLLATION.

Hotels', Law Regarding. Commissioners and officers of excise are prohibited from granting to the keepers of hotels or spirit shops a license to retail any *excisable* liquor to be consumed on the premises unless the magistrates' license for the sale of beer has been previously obtained. For Scotch law see FORBES MACKENZIE ACT, NAUTÆ, CAUPONES, STABULARI. English and Scotch law see INNKEEPER.

Ho'tham, a suburb of Melbourne, but under distinct municipal government. It is situated on the N.W. side of the city. Pop. 16,000.

Hot'house, in gardening, a term loosely applied to glazed structures provided with heating apparatus for the sustenance and growth of plants that cannot be grown out of doors. In this signification it embraces the Conservatory (q. v.) and Greenhouse (q. v.). A H., however, differs from these in having a high temperature requisite for rearing tropical plants constantly maintained. The damp stove and the dry stove, the bark stove, and the forcing-house for forcing the growth of fruits, are all used in hothouses. See HOT-WALLS.

Hott'entots, a native race of S. Africa, occupying a region that stretches N. from Cape Colony to Mossamedes, and is bounded on the W. by the Atlantic, and E. by the Kala-harri waste. Their country is divided by the two great tribes into Damara-land in the N., and Namaqua-land (q. v.) in the S.; part of the latter section, known as Little Namanqua-land, lying to the S. of the Orange River, is included in Cape Colony. The basin of the Orange River as far W. as the Orange Free State, and S. to the province of Victoria W. is thinly peopled by the degraded Bosjesmans (*Saab*), the Griquas (*i.e.*, bastards, see GRIQUALAND), are a tribe of mixed Dutch and Hottentot origin. The purer Namanquas, Damaras, and Ovampos are tall, warlike, intelligent people. They call themselves collectively Quai-quae or Koi-Koin, and the name H. (written by Dampier *Hodmadods*) is probably either a sobriquet (*Hot en Tot*) given to the race by the Dutch in mimicry of their clicking speech, or, as Pritchard suggests, a corruption of *H'outeniqua*, the name of a particular tribe. By Latham the H. are ranked among the Atlantidæ, while Blumenbach classes them with the Ethiopians. They curiously combine many features of the Mongolian and the Negro. Slim, well-built, with high cheekbones, sallow complexion, and oblique, widely separated eyes, they have thick lips, flat noses, and woolly hair. When young, the Hottentot has generally a graceful figure, but in advanced life the females especially are extremely ugly, having loose, distended breasts and nates of unusual dimensions. The speech of the pure H. is the so-called 'click' language (see BUSHMAN LANGUAGE), abounding in horrid nasal clicks (expressed by *t'*) and gutturals, and attractive only as a storehouse of the native folklore. The H. are mostly nomad hunters or rearers of cattle, living in kraals or villages. They make their own weapons (poisoned arrows, javelins, and spears), some coarse earthenware, the sheepskin cloaks that form their sole attire in winter, rude kinds of reed flutes, and three-stringed guitars. Though almost destitute of any religious ideas, they have eagerly received the instruction of various Moravian missionaries. They were made known

to Europeans as a distinct race in 1509, when they were found to occupy the country as far S. as Table Bay. The Dutch settlers acquired the flocks and herds of many of the tribes in exchange for rum and brandy, and eventually held the natives in their employment as slaves. A considerable number of H. are now engaged as good, steady workmen throughout Cape Colony. See Fritsch, *Drei Jahre in Südafrika* (1869) and *Die Eingebornen Südafrika* (1872); Dr. Bleek, *Comparative Grammar of the S. African Languages* (Cape Town, 1862); *Reynard the Fox in S. Afria, or Hottentot Fables and Tales* (Lond. 1864); and *Brief Account of Bushman Folklore and other Texts* (1875). A *Bushman-English Grammar and Dictionary* by Dr. Bleek (1877) is in course of preparation for the press.

Hotto'nia, a small genus of aquatic plants belonging to the natural order *Primulaceæ*, and named after Hotton, an early Leyden professor of botany. *H. palustris*, called water-violet, is not an uncommon English plant, but does not extend into Scotland. It may readily be known by its submerged, imperfectly whorled, pectinate leaves, and its erect raceme of whorled lilac flowers with a yellow eye, rising from 5 to 9 inches above the surface of the water. It is a good plant for aquaria.

Hot-Walls, in gardening, are walls built hollow for the passage of steam or hot-water pipes, or with flues for the circulation of heated air from a furnace. They are employed in rearing fruit-trees, placed against them, and for the preservation of tender plants in localities higher than the 50° of latitude.

Houghton-le-Spring, a town of England, in Durhamshire, 6 miles N.E. of Durham, and 6½ S.W. of Sunderland by rail. It has a large trade in the fine coal, limestone, and freestone of the district, besides extensive iron foundries, breweries, brick-kilns, &c. H. was long the residence of Bernhard Gilpin, 'the Apostle of the North.' Pop. (1871) 5276.

Hought'on, Richard Monckton Milnes, first Baron, poet and politician, only son of R. P. Milnes, Esq., of Fryston Hall, Yorkshire, was born June 19, 1809. He graduated at Trinity College, Cambridge, in 1831, and entered Parliament as member for Pontefract in 1837, which seat he held till 1863, when he was created a peer. Originally a Conservative, he afterwards became a supporter of the Whigs, advocating free trade, popular education, religious equality, and concurrent endowment. He sympathised with oppressed nationalities, and interested himself in penal reform, introducing a bill for the establishment of reformatories in 1846. He has published various works of travel and on politics, and has always been a generous friend of struggling merit. Several of his biographical sketches were reissued as *Monographs, Personal and Social*, in 1873. H.'s *Poems of Many Years, Palm Leaves*, &c., were collected in 1876, and published with a preface by himself. They display fine fancy, are rhythmical, and written in a pure and simple style. Among the most popular are two dainty ballads, *The Brookside* and *Good Night and Good Morning*. H. edited the first complete collection of Keat's poems in 1877.

Hound (Old Eng. *hund*, akin to Lat. *can*-is, Gr. *kuon*, and Sansk. *çvan*, perhaps onomatopœic, from the bark of the animal), a very general name given especially to dogs which are used in hunting. The H. is a dog possessed of great powers of scent. The Bloodhound (q. v.), Deerhound (q. v.), and Fox-hound (q. v.) are good examples; but these breeds have become mixed with other varieties, and in many cases have greatly deteriorated. In general, hounds are short-haired and powerfully-built, with broad muzzles, strong jaws, and pendant ears. The eyes are of moderate size, and the tail is slender.

Hound's-Tongue, an equivalent of Cynoglossum, a genus of *Boraginaceæ*, distributed through temperate and tropical regions. The name is derived from the texture of the leaf surface of some of the species. Common H. (*C. officinalis*) ranges through Europe, N. Africa, Siberia, and W. Asia: in Britain it is not uncommon in sandy ground near the coast, and to a less extent in fields and waste places inland. The genus contains about forty species.

Houns'low, a town of England, in the county of Middlesex, 3½ N.W. of Richmond, and 12 W. of London by rail. Before the opening of the railway to Southampton and Bath, H. had a most extensive posting business, nearly 500 coaches passing through it every day. The neighbouring heath was a favourite haunt of highwaymen down to the present century. It is now partly occupied by military barracks, partly enclosed, and the town is surrounded by many fine villas. The chief industries are carriage-building, market-gardening, and brickmaking. Pop. (1871) 9394. H. is the *Hondeslawe* of Domesday Book, and the Heath was a royal preserve till the time of Charles II.

Hour, an interval of time, twenty-four of which make up one day. The division of the common day, or time during which the sun is above the horizon, into twelve portions dates from a remote antiquity; but the similar division of the night was introduced first at Rome during the Punic wars. These intervals of time varied in length with the variations of day and night, which result from the sequence of the seasons. In modern reckoning, the twenty-four hours which make up one whole day are usually divided into two sets of twelve hours each, reckoning from midnight to midday, and from midday to midnight. The Italians, however, use twenty-four hours beginning with sunset, while astronomers are in the habit of making their day begin at midday, and reckoning twenty-four hours till the succeeding midday.

Hour-Glass, a kind of clepsydra, which measures the passing of time by the running of water or sand from one glass to another. Its indications must, of course, depend much upon the temperature and humidity of the atmosphere.

Housaton'ic, a river of N. America, rises in Berkshire county, Massachusetts, 1000 feet above sea-level, flows S. through Connecticut, and falls into Long Island Sound at Milford Point, after a course of about 120 miles, 14 of which are tidal. The H. is a picturesque stream, and supplies water-power to numerous manufactories.

House. In England it is not lawful to break into any one's house in execution of a civil warrant, but stratagem may be used to enter peaceably. Force may be used to execute a criminal warrant. The law holds the employment of any force requisite to defend a H. against trespassers or burglars justifiable. It is, of course, impossible to lay down a rule as to what force may be requisite to its end, each case depending on its own circumstances. (See HOMICIDE.) In Scotland a messenger may get leave from the court to break open the door in execution of a civil or criminal warrant. See BURGLARY, HOUSEBREAKING.

House'breaking is the most criminal form of theft. It is committed if the natural security of the house has been overcome. But it is not committed if the thief enters by an open door or window. When entry is effected by connivance with a resident of the house, the accomplice is also guilty of H., and should the crime amount to burglary in the actual thief, it will be burglary in the accomplice. See BURGLARY.

Housebuilder Moth (*Oiketicus Sandersii*), a peculiar genus of Moths (q. v.) occurring in the W. Indies, and so named from the habit of the larvæ in fastening bits of wood and leaves together, so as to form a habitation for itself. It (H. M.) appears to possess the power of closing the aperture at will. The females are wingless, and the body of the male is hairy. The antennæ are of comb-like form at the base, and the wings are covered with hairs.

House'burning; in Scotch law, see FIRE-RAISING; in English law, see ARSON.

House-Fly (*Musca domestica*), a species of *Diptera* or flies, belonging to the family *Muscidæ*, in which the antennæ are three-jointed, the proboscis having a fleshy lobe at its tip, while the maxillary palpi are single-jointed. The larvæ are footless grubs, and have hook-like mandibles or jaws. The H.-F. has a peculiar tongue, formed of the modified *labium* or lower lip. When a fly alights on a piece of sugar, this tongue may be seen unfolded, the broad extremity dividing into two flat, leaf-like bodies, furnished with suckers with which the insect laps up the sweet morsels. The inside of the broad tip of the tongue is rough and file-like, and it is by the action of this organ that the polish of books and furniture is damaged. The early stages of the H.-F. are passed amid manure, and it remains in the pupa or chrysalis state from eight to fourteen days. The H.-F. is infested by fungi; and the ichneumon-flies also prey upon it. The feet are terminated by minute discs furnished with a gummy secretion and provided with suckers, whereby the animal is enabled to walk on flat surfaces.

House'hold Troops, six of the best-appointed of British regiments, consist of the 1st and 2d Life, Royal Horse, Grenadier, Coldstream, and Scots Fusilier Guards. As their peculiar functions are to escort royalty and to defend the capital, their usual quarters are in the metropolitan and Windsor barracks. Their strength in 1876 was 1302 cavalry, with 825 horses, and 5950 infantry, and their pay and allowances, £283,607.

House'-Leek. The word leek here has no connection with the onion family, being simply the Old English *leac*, a 'plant,' so the H.-L. means a plant grown on a house. We confine it to *Sempervivum tectorum*, a European and W. Asian species of the natural order *Crassulaceæ*, which has for centuries been grown on the roofs of houses, outbuildings, &c., in Britain, as a handy relief for such casualties as burns, cuts, stings, and ulcers. In country places the bruised leaf is still used for these purposes. The sempervivums, as the name indicates, are remarkable for retention of vitality under adverse circumstances. The species number about forty, and with allied genera have recently come greatly into vogue for garden-beds and rock-gardens.

House'maid's Knee is an inflammation of the bursa or sac intervening between the patella or knee-cap and the skin, and is generally caused by pressure from kneeling. Treatment:—when inflamed, leeching, followed by tepid lead-lotions, or poultices; when chronic, painting with tincture of iodine, tapping, and injecting with iodine, or passing a seton through the sac. If suppuration has taken place, the sac must be freely opened, and the pus evacuated.

House of Commons and **House of Lords.** See PARLIAMENT.

House of Correction. The distinction between H. of C. and other prisons is abolished. See PRISONS, REFORMATORY.

House Rents. In England an action to recover H. R. can be brought till six years after the date of falling due. In Scotland H. R. prescribe in three years, under the Triennial Prescription Act of 1579. For English law, see LANDLORD AND TENANT; for Scotch law, see LEASE, CONTRACT OF.

Houss'a, or **Hauss'a**, a territory of the Sudan, Central Africa, in about 12°–13° N., and long. 5°–10° E. It is in part low land, inundated during the rainy season by the Niger and its affluents, and in part elevated tableland, enclosed by ranges of rocky hills. Some tribes of the Houssas are independent, others are subject to the Fellatahs.

Hous'ton, a city of Texas, U.S., on both sides of the navigable Buffalo Bayou, 50 miles N.W. of Galveston by rail. It is the railway centre of Texas, has manufactures of cotton, soap, Portland cement, ploughs, carriages, &c., and three daily and five weekly newspapers. The place is named after Samuel Houston (q. v.). Pop. (1870) 9382.

Houston, Samuel, an American general, born near Lexington, in Virginia, 2d March 1793. In his boyhood he ran from home, and for several years lived with the Cherokee Indians, after which he enlisted in the army, and fought with distinction against the English and the Creek Indians, being severely wounded at Tallapoosa, March 24, 1814. He next practised as a lawyer at Nashville, and successively became major-general, representative in Congress, and Governor of Tennessee. Three months after his marriage in 1829, he suddenly left his wife and civilisation, and was formally admitted a chief of the Cherokees. He emerged from his wigwam to take command of the Texan army in the war against Santa Anna, and on April 21, 1836, gained the brilliant victory of San Jacinto, which secured the independence of Texas. He was elected President of Texas in 1836, and again in 1841; and his administration, though beset with difficulties, was able and successful. On the absorption of Texas by the United States, H. was returned as senator for that State. In 1859 he was appointed Governor of Texas, but he retired on the outbreak of the Civil War. He died at Huntersville, Texas, July 25, 1863.

How'ard is the name of the family which popularly ranks as the noblest of English noble houses. The origin of the name is doubtful. By some it is derived from Hereward, 'the last of the English.' But a plausible derivation (see Isaac Taylor's *Names and Places*, p. 361) regards it as another form of Hogarth, said to have been originally Hog-ward; so that by the irony of history the boast of having 'all the blood of all the Howards' in one's veins vaunts descent from a race of swineherds. The famous *family* of H. cannot be traced further back than **Sir William H.**, Chief-Justice in the days of Edward I. His grandson became an admiral of the fleet and sheriff of Norfolk. The growing dignity of the Howards was greatly advanced by the marriage of the admiral's grandson to the co-heiress of the noble house of Mowbray, dukes of Norfolk. The son of this union, **Sir John H.**, was a distinguished supporter of the White Rose, fought gallantly in France, became sheriff of Norfolk and Suffolk, and was made treasurer of the royal household. His services against the Lancastrians at sea and by land was finally rewarded by being created first Lord H., and then in 1483 Duke of Norfolk; he was further named Earl Marshal of England, and Lord Admiral of England, Ireland, and Aquitaine. But he fell at Bosworth, and his family were deprived of his dignities. His son, who had been made Earl of Surrey, after three years' imprisonment had the family honours restored, and served the Tudors well at Flodden (q. v.). His son, third Duke of Norfolk, was father of the gallant but ill-fated Earl of Surrey (q. v.), who died on the scaffold by Henry VIII.'s procurement, and narrowly escaped a like fate himself. The head of the fourth Duke came to the block on Tower Hill, for treasonous intrigues on behalf of Mary of Scotland. James I. and Charles II. between them restored the H. family to its ancient honours, which are now enjoyed by the fifteenth Duke of Norfolk. The family is now chiefly conspicuous by its adherence to Roman Catholicism. The earldoms of Carlisle, of Suffolk, and of Effingham are held also by representatives of this family; and the Barons H. de Walden and H. of Glossop are members of the English peerage. Several titles now extinct were at various times conferred on Howards; and innumerable untitled county families can still count kinship with the head of this illustrious house.

Howard, John, the philanthropist, was born at Hackney, London, 2d September 1726. His father was a wealthy upholsterer, from whom he inherited a considerable fortune. In 1756, when on a voyage to Lisbon, he was taken prisoner by the French, and remained for some time in captivity. It was probably his own experience of a prison that first suggested to him the resolution he afterwards took, of devoting his life to bettering the condition of prisons and prisoners. For this purpose he began to visit jails in 1773, and spent the rest of his life in travelling repeatedly throughout the whole of England and over the whole of Europe, with the satisfaction of knowing that his labours were in most instances productive of good results. In 1777 he published his *State of Prisons in England and Wales, with Preliminary Observations, and an Account of some Foreign Prisons* (new ed. 1780). In 1785 he began to visit the principal lazarettos in Europe, of which he published an account in 1789. He died at Kherson, on the Black Sea, 20th January 1790, from a fever caught in the course of his benevolent labours. Besides the great work of his life, he did much good in his own district by building artisans' cottages and establishing schools. H. was fond of horticulture and of scientific study and experiments, some of which he communicated to the Royal Society. See Dixon's *H. and the Prison World of Europe* (5th ed. Lond. 1854), and Field's *Correspondence of H.* (Lond. 1855).

Howe, John, one of the greatest of the Puritan divines, was born at Loughborough in Leicestershire, May 17, 1630, educated partly at Cambridge and partly at Oxford, ordained in 1653, and settled as pastor at Great Torrington in Devon. The energy and duration of his religious exercises were something marvellous. He began with his flock 'at 9 A.M., prayed during a quarter of an hour for blessing upon the day's work, then read and explained a chapter for three quarters of an hour, then prayed for an hour, then preached for an hour, and prayed again for half an hour, then retired for a quarter of an hour's refreshment—the people singing all the while—returned to his pulpit, prayed for another hour, preached for another hour, and finished at 4 P.M. with one half-hour more of prayer, doing it all singly, and with his whole soul in it all' (Morley's *English Literature*, pp. 613–14). In 1657 he was made chaplain to Cromwell, securing the esteem and praise of the fiercest enemies of his party. At the Restoration he retired first to Devon and then to Ireland, but in 1676 became pastor of a Nonconformist congregation in London. In 1685 he settled at Utrecht as a school-

master, but returned to London after James's Declaration, and died 2d April 1706. His great work, *A Good Man the Living Temple of God*, was published partly in 1676; the second part not till 1702. Others once famous, and still worthy of fame, are *The Solemn Inquiry Concerning the Possibility of a Trinity* (1695), *The Redeemer's Tears over Lost Worlds* (1685), *On the Carnality of Religious Contention* (1693), and *The Redeemer's Dominion over the Invisible World* (1700). See Henry Rogers's *Life and Character of John H.* (Lond. 1836).

Howe, Richard, Earl, a British admiral, second son of the second Viscount Howe, was born in 1725. In 1739 he left Eton and entered the navy, obtaining the rank of post-captain when twenty years of age for important services in intercepting French stores for the Pretender. His seizure of two French frigates off Newfoundland in 1755 was the prelude to the Seven Years' War. He destroyed the fort of Aix in 1757, reduced Cherbourg in 1758, and in the disaster at St. Cas his presence of mind in covering the re-embarkation of the British saved many lives. Next year he showed conspicuous bravery in the great battle of Quiberon, and captured two French ships. After the war he became in succession a lord of the Admiralty, Treasurer of the Navy, and Commander-in-Chief in the Mediterranean. In 1776 he took New York and Philadelphia, in 1778 defeated D'Estaing off Rhode Island, and in 1782 relieved Gibraltar. In the latter year he was created a Viscount of the United Kingdom, and an Earl in 1788. On 1st June 1794 he completely routed the French fleet off Ushant, and was made a Knight of the Garter. He suppressed a mutiny at Portsmouth in 1797, and died August 5, 1799. He was a bold and skilful officer, and the ablest sea-captain of his time. See Barrow's *Life of Lord H.* (Lond. 1838).

Howe, Samuel Gridley, M.D., an American physician, was born at Boston, Mass., November 10, 1801. He served as surgeon in the Greek war of independence (1824–27), and organised a medical staff, of which he was made the head. After his return to America, he became interested in the education of the blind, visited Europe with the view of studying the various systems in use, and suffered imprisonment in Prussia for six weeks for attempting to carry help to the Poles. Since 1832 he has been superintendent of the Perkins Asylum for the Blind, Massachusetts; and in 1871 was one of the United States Commissioners to San Domingo. His chief works are *An Historical Sketch of the Greek Revolution* (1828), and *Reader for the Blind* (1839).

How'itt, William and Mary, two popular and meritorious English authors. William H. was born at Heanon in Derbyshire in 1795, and married in 1823 Mary H. (Miss Botham), born at Uttoxeter in 1800. In the year of their marriage they jointly published *The Forest Minstrel*, and in 1827 the *Desolation of Eyam* and other poems. Besides contributing largely to periodical literature, they have since published, jointly and separately, very many works. A residence in Heidelberg from 1840 to 1842 led them to study German and Scandinavian literature, an outcome of which was their *Literature and Romance of Northern Europe* (2 vols. 1851–52). W. H. has written the *History of Priestcraft*, *Student Life in Germany*, *The Homes and Haunts of the British Poets*, *The Ruined Castles of Great Britain and Ireland*, *Land Labour and Gold*, an account of two years' residence in Australia (1852–54), a *History of the Supernatural*, &c. For some time Mr. H. edited the *People's Journal*, which was started in 1846, but has long ceased to exist. M. H.'s best-known works are *The Seven Temptations*, dramatic sketches, *Wood-Leighton*, a novel, a series of *Tales for the People and their Children*, and translations of the tales of Fredrika Bremer and Hans Ch. Andersen.

How'itzers (Ger. *haubitze*, from *haufen*, 'to fill'), light field-guns for throwing shells at short ranges.

Howl'er, or Howling Monkey, a name given to certain genera of *Platyrhine* or New World monkeys, from the loud noises they are capable of making. The voice is rendered powerful and resonant by the presence of large sacs within the larynx or organ of voice. The tail is prehensile. The Ursine H. (*Mycetes ursinus*) is one of the best-known species. This animal is of a reddish-brown hue, and has a prominent beard. The howling monkeys herd in large troops in tropical forests, and make most discordant noises.

How'rah, the chief town of the district of the same name, in Bengal, British India, included within Hooghly (q. v.), on the right bank of the Hooghly river, which is here nearly one mile wide, exactly opposite to Calcutta; pop. (1872) 97,784. It is really a transpontine suburb of Calcutta, with which it was connected in 1875 by a massive pontoon bridge, at a cost of £220,000. H. is the terminus of the East Indian Railway. It has busy dockyards, flourishing mills and manufactures, the botanical gardens and Bishop's College; here also reside many of the business people of Calcutta. At the end of last century it was a mere village.

Howth, a seaport of Ireland, in the county of Dublin, on the N. side of H. Head, 10 miles E.N.E. of Dublin by rail. Its harbour, constructed by Government at a cost of half a million sterling, is obstructed by sandbanks. The chief industry is fishing. Pop. (1871) 1948.—**H. Head**, an almost insulated promontory, enclosing the N. side of Dublin Bay, is 3 miles long and 2 broad, and has bold picturesque shores. The hill of H. is visible for many miles. The name is a corruption of the Danish *hoved*, 'a head;' but the original designation is *Ben Edair*, 'the hill of Edair,' probably a legendary chief of the Tuatha de Danann.

Hoy'a, a genus of *Asclepiadaceæ* containing some of the most ornamental among the plants cultivated in our hothouses. *H. carnosa* receives the name of wax-flowers from the peculiar aspect of its blossoms.

Hoy, next to Pomona, the largest of the Orkney Islands, lies 15 miles S.W. of Kirkwall. It is a precipitous mass of sandstone, 15 miles long and 6 broad, rising from the sea in rugged cliffs 1000 feet high in the W., and opening here and there in deep gorges. Of its three peaks, the Ward Hill reaches a height of 1555 feet. Pop. (1871) 1385. To the S.W. is a grotesque insulated pillar 300 feet high, called the Old Man of H. The island is haunted by myriads of seafowl.

Hualla'ga, or Ucaya'li, a tributary of the Amazon, 500 miles long, rises in the Peruvian Andes, flows in a northerly direction to join the Mainas, and form the Marañon. It is wholly within Peru.

Huaman'ga, the former name of the city of Ayacucho (q. v.).

Huancaveli'ca, or Guancabeli'ca, the capital of a province of Peru, on the E. side of the Andes, 11,000 feet high, has extensive mines of gold and quicksilver. Pop. 5000.

Huanu'co, an old town of Peru, in the beautiful valley of the H., a tributary of the Maïnas, in the Andes. It lacks means of transit for the sugar and corn crops of the valley. Pop. 5000.

Huaraz', the chief town of a province of the same name, Peru, beautifully situated on the Santa, 150 miles S.E. of Trusillo. The inhabitants are mostly mestizoes, engaged in agriculture and gardening. Pop. 8000.

Huas'co, a seaport of Chili, province of Atacama, at the mouth of a river of the same name, 90 miles S.W. of Copiapo. It owes its prosperity to the mining of copper, of which it exports £345,000 worth annually. Pop. 7000.

Hubb (Habb), the only river of Scinde, India, besides the Indus, which finds its way to the sea. It rises in Kelat, forms for some distance the boundary between Scinde and Beloochistan, and after a total course of 100 miles, falls into the Arabian Sea N.W. of Cape Monze. The water has been greatly utilised for irrigation by a Mohammedan proprietor.

Hu'ber, François, a Swiss naturalist, was born at Geneva, July 2, 1750. Though blind for the greater part of his life, he made valuable investigations into the habits of bees, receiving much assistance from his wife and a domestic servant named Burnens. His results were collected and published in his *Nouvelles Observationes sur les Abeilles* (1796). He was latterly aided by his son, **Pierre H.** (born 1777, died January 1841), who was the author of a valuable work entitled, *Histoire des Mœurs des Fournis Indigènes*. H. died at Lausaune, December 22, 1831.

Hu'ber, Ludwig Ferdinand, a German author of note, was born at Paris in 1764, became secretary to the Saxon legation at Mainz in 1787, was editor of the *Allgemeine Zeitung* from 1798 to 1803, and died 24th December 1804. His *Sammtliche Werke*, consisting chiefly of plays original and adapted from the French, were published by his wife in 4 vols. 1806–9.—**Therese H.**, wife of the preceding, was the daughter of the illustrious scholar Heyne (q. v.), and was born at Göttingen, 7th May 1764. She was married first to Johann Georg Forster (q. v.),

and after his death to H. As a novelist she has a distinct place in German literature. She writes for her own sex chiefly. An edition of her works, in 6 vols., was published by her son (Leips. 1830–33).—**Victor Aimé H.**, an historico-literary and political writer, son of Ludwig F. and Therese H., was born at Stuttgart, 10th March 1800, became Professor of the History of Literature at Rostock in 1833, went to Marburg three years later as Professor of Modern Languages and Literature, and from 1843 to 1850 held the same appointment in the University of Berlin. He died at Wernigerode in the Harz, 19th July 1870. H. had a wide knowledge and a fine appreciation of the Romance literatures. Among his chief works are the *Geschichte des C.* (1829), *Chronica del lid* (1844), *Die Neu-Romantische Poesie in Frankreich* (1833), *Die Skizzen aus Spanien* (1828–35), *Reisebriefe aus Belgien* (1855).

Hu'bert, Saint, Bishop of Liège, son of Bertrand of Guienne, was chief functionary at the court of the Frankish king Theodoric. At the suggestion of his friend and teacher Bishop Lamprecht of Maastricht, and through sorrow for the death of his wife Floribane, he sought a hermit's life, but after the martyrdom of Lamprecht returned to succeed him as Bishop of Maastricht and Liège in 708. He died in 727, and the legend tells that long afterwards his body was found still undecayed. In 827 he was canonised, and his corpse buried in a Benedictine monastery named Ardenne, whose name was changed to St. H. Another legend tells how, when H. was hunting one Good Friday in the Ardennes Hills, he came upon a stag with a gleaming crucifix between its horns, which admonished him for his passionate love of the chase, and persuaded him to a life of contemplation. Oddly enough, this story made him the patron saint of hunters. Many orders of knighthood were formed in his honour, courts held great hunting feasts on his name-day (3d November), and the common people believed that St. Peter had intrusted him with the *key* to the cure of possessed persons and those bitten by mad dogs.

Hu'bertsburg, a former royal hunting-castle in the circle of Leipsic, Saxony, near Müegeln, was built by Augustus III. in 1721. It is now an asylum and prison. The Peace of H., which ended the Seven Years' War, was signed here, 15th February 1763.

Hub'li, a flourishing town in the district of Dharwar, province of Bombay, British India, 290 miles S.E. of Bombay. Pop. (1872) 37,961. It stands on the main road from the S. Mahratta country to the Malabar coast, on the line of the proposed State Railway, and is a great emporium for cotton.

Hüb'ner, Rudolf Julius Benno, an historical painter of the 'Düsseldorf' school, born (1806) at Oels in Silesia, studied (1821) under W. Schadow (q. v.) at Berlin, where he exhibited his earliest work, 'Boaz and Ruth,' but in 1826 followed his master to Düsseldorf. H. travelled in Italy, and on his return settled (1839) at Dresden, where he has since resided, and where in 1841 he obtained the Professorship of Painting in the Academy. His works are marked by great purity of colour and design, but are somewhat deficient in depth and energy. Chief among them are the 'Fisherman' (1828), 'Samson Breaking the Pillars,' 'Christ and the Evangelists' (1835), and 'Happiness and Sleep' (1842).

Huc, Évariste Régis, a French missionary to China, was born at Toulouse, 1st August 1813, was educated there and in Paris, and ordained by the Lazarist fathers in 1839. He devoted himself to the Chinese Mission, and sailed immediately after his ordination. He studied eighteen months in Macao, and then, with dyed skin, pigtail, and Chinese costume, started for the interior. After directing a Chinese mission in the southern provinces, H. resided for a time in Pekin, whence he passed into Mongolia, translating several religious works into the Mongol tongue. In 1844 the Vicar Apostolic of Mongolia sent H. on the chief mission of his life, an expedition through Mongolia into Thibet. This was undertaken in company with M. Gabet, another Lazarist, and a Thibetan convert; and in spite of enormous difficulties, delays, and dangers, Lassa was reached by the missionaries. Their stay there was interrupted by Chinese influence; and in 1846 H. was again at Macao. He sailed homewards in ill health in 1849, and spent the remainder of his life in literary labour. H. died March 31, 1860. His *Souvenirs d'un Voyage dans la Tartarie, le Thibet et la Chine* (1852, Eng. trans. by Hazlitt, 1852) is one of the most interesting of books of travel; and his *L'Empire Chinois* (1854), and *Le Christianisme en Chine, en Tartarie et en Thibet* (1857–58), have also been translated into English.

Hudd'ersfield, a town of England in the W. Riding of Yorkshire, at the confluence of the Holme and the Colne, 16 miles S.W. of Leeds by railway. It ranks next to Leeds in the manufacture of woollens and mixed fabrics; among its products being doeskins, beavers, fancy trouserings, mohairs, rugs, Angolas, Bedford and worsted cords, quiltings, challies, &c. There are also extensive steam-engine and boiler factories, chemical-works, dye-houses, fulling-mills, &c. Among the public buildings are the church of St. Peter, rebuilt in 1837 at a cost of £10,000, St. Paul's Church, built by the Parliamentary Commissioners in 1830, St. Thomas's Church, with a richly carved pulpit of Caen stone, a circular cloth hall with circumference of 2640 feet, a chamber of commerce, and a proprietary college connected with the London University. The houses are almost entirely built of sandstone. H. has various charities, including the Dole Land of 25 acres, and a large hospital. Pop. (1871) 74,358. H. sends one member to Parliament. In the vicinity are numerous coal-mines and quarries. The united stream of the Holme and Colne is lined with mills in its course of 3 miles before reaching the Calder. At Lockwood, about half a mile from the town, are the Spa baths, the waters of which are strongly sulphurous. H. has more than quadrupled in wealth and population during the present century.

Hud'son, a town of New York, U.S., on the E. bank of H. River, at the head of navigation, 115 miles N. of New York, and 36 S. of Albany. It has fifteen churches, an old-established academy, orphan asylum, &c., and a thriving river-trade. Pop. (1870) 8615.

Hudson, a river of New York, U.S., and one of the most important streams of N. America, is formed by two branches, which rise in the Adirondacs, 4000 feet above sea-level, and unite some 40 miles from their respective sources. In its upper portion the H. is circuitous and much interrupted by cataracts, the Great, Jessups, Hadley, and Glen's Falls, but from the last-named point it strikes a southerly course, which it maintains to its mouth in New York Bay. It has a total length of 300 miles, and is navigable to Hudson (117 miles) for first-class shipping, and to Troy, the highest tidal point (166 miles), for smaller craft. The western tributaries are the Sacandaga, Mohawk (q. v.), Catskill, Rondout, and Wallkill; the eastern, the Schroon, Hoosick, Battenkill, Kinderhook, and Croton. The chief towns upon the banks of the H. are Troy, Albany, Hudson, Newburg, and New York. It is connected by canals with Lakes Erie and Champlain, and by the Delaware and Hudson Canal with the coal-fields of Pennsylvania; and a plan is now on foot to render the upper waters navigable as high as Fort Edward, 28 miles above Troy, by means of locks and dams. The H. abounds in fish, shad, sturgeon, and bass; and salmon have been lately introduced. It owes its name to Henry Hudson (q. v.), who discovered it in 1609.

Hudson, George, 'the railway king,' was born in York in 1800. On the birth of the railway system he was a bold and eager speculator, and erelong became the central figure of that astounding movement. His early schemes were enormously successful, and brought him a large fortune. He was thrice elected Mayor of York, and from 1845 to 1859 he was member for Sunderland. But his rocket-like ascent was followed by a no less sudden collapse. Some of his companies sank, the prosperity of others was found to be only upon paper, and thereupon his name ceased to conjure. Greatly impoverished, he spent the remainder of his life chiefly abroad. Some friends bought him an annuity; but he died, shortly after its purchase, December 14, 1871. See Carlyle's *Essay on G. H.*

Hudson, Henry, an English discoverer, whose name is commemorated by a bay, river, strait, and city in America. The only records of his life are from 1607 to 1610, when he made four voyages in search of a northern passage, the first in a small ship manned by eleven men. In his third voyage he sailed up the Hudson River. In 1610 he discovered Hudson's Bay, and hoping he had solved the north-west problem, determined to winter there. His crew thereupon mutinied, and sent him adrift with a few others in a boat, which was never again heard of. See Purchas' *Pilgrimes* and Parker's *Voyages*, also the *Voyages of H. H.*, edited by G. Asher (Lond. 1860).

Hudson, Sir James, diplomatist, grandson of the first Marquis Townshend, was born in London in 1810. He was educated at Rugby and Westminster, and was page and private secretary to King William IV. He acted as Secretary of Legation at Washington from 1838 to 1843, when he was transferred to a similar post at the Hague. In 1845 he was appointed Secretary of Legation at Rio Janeiro, where he ultimately became Minister, and after a brief official residence in Florence he was sent to Turin in 1852 as Minister-Plenipotentiary. Here he gave his hearty sympathy to the new-born movement towards Italian unity and liberty, and was instrumental in enlisting Sardinia as an ally against Russia. He was created a K.C.B. on 2d May 1855, and a G.C.B. in 1863, on his retirement from Turin.

Hudson's Bay, an extensive inlet in the heart of British N. America, lies between 51°–64° N. lat. and 78°–95° W. long., is about 800 miles long by 600 broad, and communicates with the Atlantic by Hudson's Strait, and with the Polar waters by Fox Channel. Area, 300,000 sq. miles. H. B. is indented by James Bay on the S., Button Bay on the W., and Chesterfield Bay on the N.W. The south-western shores are low and marshy, but elsewhere they are rocky and often precipitous. The surface is studded by numerous sandbanks and islands (of which Southampton Island in the N. is the largest), and is frozen over for eight months of the year. Innumerable rivers of no great size fall into H. B., the Churchill, Nelson, Severn, and Albany being the most important. H. B. was discovered in 1517 by Sebastian Cabot (q. v.), but received its name from Henry Hudson (q. v.).—**H. Strait** connects H. B. with Davis Strait, and so with the Atlantic. It is 450 miles long, and 60 to 100 wide, and is blocked with ice the greater part of the year.

Hudson's Bay Company, a corporation chartered 2d May 1670 by Charles II. with the perpetual exclusive right of trading in the territory watered by all the streams flowing into Hudson's Bay. The company in succession erected forts on the Rupert, the Moose, Albany, and Nelson rivers, and at first confined its operations within modest dimensions. The Indians were willing to barter the skins of the animals they trapped for trifles, and the trade was consequently, notwithstanding its limitation and the fierce hostility of the French, so lucrative that the capital of the company, which had been paying large dividends, was trebled in 1710. The forts were gradually increased and strengthened, and by 1781 the field of operations included the basins of the Saskatchewan and Coppermine rivers and had reached Athabasca. The charter had never been confirmed by Parliament, and was therefore on an unsatisfactory footing, but private traders were so opposed by the company that it maintained a monopoly of the fur trade until 1783. In that year a rival society on a large scale, the North-Western Company of Montreal, was projected, which established stations beyond the Rocky Mountains, and a violent and even bloody contest for supremacy ensued. The older company sold pieces of land on Lake Winnipeg and Red River to colonisers, and the younger company disputing this power, destroyed the settlement. At length in 1821 an amicable settlement took place, the surviving partners of the North-Western Company agreeing to coalesce with the H. B. C. The united company at once obtained an extension of its powers. An Act of Parliament (1st and 2d Geo. IV., cap. 66) gave it the sole right for twenty-one years of trading in the 'Indian territories,' or in the entire country west of its territory in Rupert's Land, which monopoly was renewed by the crown in 1838 for a further term of twenty-one years. Until 1859 the corporation had therefore the entire possession of all British North America, excepting the basin of the St. Lawrence and of territory since ceded to the United States. The 4,000,000 sq. miles governed by them were partitioned into four departments—the Montreal, Southern, Western, and Columbian—under the management of 25 chief factors, 28 chief traders, and a staff of about 1400 employés; the forts extending from Labrador to the Pacific and from the St. Lawrence to the Arctic Ocean. On the whole the administration was just and humane, the Indians being treated with kindness and consideration. In 1869, on the suggestion of Earl Granville, then Colonial Secretary, the territory of the company was transferred to the Dominion of Canada for £300,000, and was finally transformed into the province of Manitoba in 1870. The commerce of the company remains unaffected, notwithstanding the loss of its power and monopoly. The trade, which is almost entirely in furs, exported to and sold by auction in London was, till recently, carried on with the natives by a standard valuation based on the market price of a beaver. The proceeds of furs and other imports in 1876 were £291,566, the profits for the year £98,345, and the capital employed in carrying on trade £1,003,710.

Hué, Phu-thua-thien, or **Fu-chuan,** the chief town of Anam, on a river of the same name, and 10 miles from its entrance into the Gulf of Tonquin. It was fortified under the direction of French officers (1801–20), is well built, and has a large citadel, but is accessible only to small vessels on account of a bar in the river. The royal palace is a large building; most of the dwelling-houses are of bamboo. H. is a great weapon-depôt for the interior. Pop. 100,000.

Hue and Cry, a term of English law denoting the supposed pursuit of a felon. Upon every robbery committed the Statute of Winchester, 13 Geo. I., directs that pursuit shall be made from town to town and from county to county, and that H. and C. shall be raised till the felon be delivered to the sheriff. And that the H. and C. may be more effectual, the Hundred (q. v.) was bound to answer for any robbery committed within its bounds unless the felon was taken. This liability is now restricted to liability in damage for mischief done by riotous assemblies. No action can be maintained where the damage is less than £30. Maliciously to raise a H. and C. against any one is criminal, and renders the offender liable in damages.

Huel'va, the chief town of a province of the same name, Spain, on a peninsula at the confluence of the Odiel and Tinto, 63 miles W.S.W. of Seville by rail. It has an extensive tunny fishery, and has greatly increased in importance since the recent opening of the rich copper-mines in the vicinity. In 1872 the exports, chiefly copper, manganese, wine (£11,900 worth), oranges, raisins, oil, almonds, and figs, amounted in value to £651,559; and the imports, mainly British coal, iron, and machinery, to £240,197. There entered the port (1872) 1054 vessels of 188,745 tons, of which 237 were British. H. is the ancient *Onuba*, a place of Phœnician origin, and was fortified and called by the Arabs Velba or Vuelba. Pop. 8423.

Huer'ta, Vicente Garcia de la, a Spanish poet, was born at Zafra, Estremadura, in 1734, studied at Salamanca, and repairing to Madrid, obtained the post of keeper of the royal library, and was elected a member of various literary societies. H. was an ardent and successful upholder of the national drama, as against the French or classical school of Luzan and his followers, but he was often blinded by an exaggerated patriotism, and apt unduly to depreciate the works of his opponents. *La Raquel* (1778), a play turning on the amour of Alfonso VIII. with a Jewish maiden, led to H.'s temporary banishment to Oran, but won an immense popularity, which it still retains. H. died at Madrid, March 12, 1817. He published *Vocabulario Militar Español* (Mad. 1760), Lives of the great soldiers of Spain; *Obras Poeticas* (2 vols. Mad. 1778–79); and *Teatro Español* (17 vols. Mad. 1785–86), a collection of old Spanish plays.

Hues'ca, a town of Spain, capital of a province of the same name, stands a mile distant from the W. bank of the Tisuela, and 40 miles E.N.E. of Zaragoza by railway. It is a bishop's see, has a fine Gothic cathedral of the 15th c., a townhall, bull-arena, &c., and is girt by ruinous walls, of whose ninety-nine towers two only remain. The university, founded by Pedro IV. in 1354, is now suppressed; but Charles V.'s Colegio de Santiago, Jayme Callen's Colegio de San Vincente (1587), and the Seminario de Santa Cruz (1580) still exist. Pop. 9874. H. was the Roman *Osca*, and the *Wcschka* of the Moors, who held it from 713 to 1096, when it was wrested from them by Pedro I., and long continued to be the residence of the kings of Aragon.

Hues'car, a town of Granada, Spain, on the Guardal, 75 miles N.E. of Granada, has manufactures of linen and woollen fabrics. Pop. 7332.

Hu'et, Pierre Daniel, a French scholar and prelate, was born at Caen, February 8, 1630. After being educated at the Jesuit College in his native town, he visited Queen Christina of Sweden with his friend Bochart, and there found the MS. of Origen that first suggested his special study of that father's works. In 1670 he was appointed tutor to the Dauphin, toge-

ther with Bossuet, with whom also he superintended the publication of the classics 'in usum Delphini.' In 1674 he became a member of the Academy. In 1676 he took orders, and in 1678 received the abbacy of Aunay, in 1685 the bishopric of Soissons, and in 1693 the bishopric of Avranches. Resigning this in 1699 on account of failing health, he was made Abbot of Fontenai, near Caen. He died January 26, 1721. H. was a man of wide sympathies, and many scholars of opposite creeds were among his friends. He has importance partly as a worker in the history of literature, partly as an opponent of the Cartesians, to whom he at one time belonged. His chief works are *Origenis Commentaria in Sacras Scripturas* (2 vols. Rouen, 1668); *Demonstratio Evangelica* (1679); *Quæstiones Alnetanæ* (1690); *Traité de la Situation du Paradis Terrestre* (1691); *De Navigationibus Salomonis* (1698); *Histoire du Commerce et de la Navigation des Anciens* (1716). An interesting autobiography of H., *P. D. Huetii Commentarii de Rebus ad eum Pertinentibus* (The Hague, 1718) was translated into English by Dr. Aikin (2 vols. Lond. 1810), and into French (Par. 1853). See the Abbé Flottes's *Étude sur Daniel Huet, Évêque d'Avranches* (Montpel. 1857).

Hu'feland, Christopher Wilhelm, a physician famous in his own time, born 12th August 1762, at Langensalza in Thuringia, was first (1783–93) a physician at Weimar, then (till 1801) professor at Jena, and finally Clinical Professor at Berlin, where he died, 25th August 1836. He was a man of probity, but of weak character, who by seeking to please all parties involved himself in perverted views and inconsistencies, which he had afterwards to retract. Yet in practical matters he did lasting service in various ways, and his work *Ueber die Ursachen, Erkenntniss, und Heilung der Skrofelkrankheit* (Berl. 1795), was translated into several languages.
